• **NITROSO-NITRO-RESORCIN** $C_6H_4(NO)_2$ i.e. $C_6H_4(OH)(NO_2)O(NOH)$ [1:2:3:4]. Formed from nitro-resorcin [85°] and nitrous acid (De la Harpe a. Reveudin, *B.* 21, 1405). Brown needles, not melted at 200°, explodes at a higher temperature.

NITROSO-ORCIN $C_8H_7Me(NO)(OH)$. Formed from orcin, $NaOH$ aq., and amyl nitrite (Krämer, B. 17, 1883). Dark-red prisms. When heated with orcin and H_2SO_4 it gives the dyestuff $C_{11}H_7NO_2$.

Di-nitroso-orcin $C_8H_5Me(NO)_2(OH)$, [1:2:4:3:5]. Formed by adding H_2SO_4 containing N_2O_5 to a solution of orcin (Stenhouse a. Groves, Q. J. 31, 544). Yellow prisms. Blackens about 140° without melting. Alcoholic hydroxylamine hydrochloride at 100° yields $C_8H_5Me(NO)_2$, whence Ag_2O forms $C_8H_5Me(NO)_2$, [47°] (Goldschmidt, B. 20, 1607). The compound $C_8H_5Me(NO)_2(OH)$ yields, on oxidation by potassium ferricyanide, the product $C_8H_5Me(NO)$, [103°], crystallising in pale-yellow needles.

NITROSO-OKANTHRANOL $C_{11}H_7NO_2$. Formed by boiling 'hydro-anthracene nitrite' with alkalis (Liebermann, B. 14, 471). Orange flakes, sol. alkalis.

NITROSO-OXINDOLE *v.* ISATIN OXIM.

NITROSO-OXY-METHYL-QUINOLINES $C_8H_7N:C_8H_5Me(NO)(OH)$. The following crystalline compounds have been obtained by the action of nitrous acid on the oxy-methyl-quinolines (Noelting a. Trautmann, D. 23, 3665):—(B. 3)-nitroso-(B. 4)-oxy-(B. 1)-methyl-quinoline; (B. 1)-nitroso-(B. 4)-oxy-(B. 2)-methyl-quinoline; (B. 4)-nitroso-(B. 1)-oxy-(B. 2)-methyl-quinoline; (B. 1)-nitroso-(B. 4)-oxy-(B. 3)-methyl-quinoline; and (B. 2)-nitroso-(B. 1)-oxy-(B. 4)-methyl-quinoline. Friedländer and Müller (B. 20, 2014) have obtained in like manner (Py. 1, 3)-nitroso-oxy-(Py. 4)-methyl-quinoline crystallising in red needles.

NITROSO-OXY-DI-PHENYL-AMINE

$C_6H_5(NO)(OH).NPh$ [4:3:1]. Formed from $C_6H_5(OH).NPh(NO)$ and alcoholic HCl (Kohler, B. 21, 909). Red needles, m. sol. alcohol.

NITROSO-(B. 4)-OXY-QUINOLINE

$C_8H_7(NO)(OH)N$. Formed from *o*-oxy-quinoline and nitrous acid (Lippmann a. Fleissner, M. 10, 794). Yellow needles. The isomeric nitroso-(B. 2)-oxy-quinoline crystallises from $HOAc$ in golden needles (Mathéus, B. 21, 1880).

(Py. 2)-Nitroso-(Py. 1, 3) di-oxy-quinoline

$C_8H_7 \begin{smallmatrix} CO_2C(OH) \\ N:C(OH) \end{smallmatrix}$. [208°]. Formed by the action of nitrous acid on (Py. 1, 3)-di-oxy-quinoline (oxycarbostyryl (Baeyer a. Homolka, B. 16, 2216). Orange prisms. Decomposed by conc. HCl aq. into isatin and hydroxylamine. $SnCl_2$ yields tri-oxy-quinoline.

NITROSO-PHENOL *v.* Mono-oxim of QUINONE.

NITROSO-PHENYL-ACETIC ACID *v.* Oxim of PHENYL-GLYOXYLIC ACID.

p-NITROSO-DI-PHENYL-AMINE

$C_6H_5(NO).NPhH$. [143°]. Formed from di-phenyl-nitrosamine and alcoholic HCl (O. Fischer a. Hepp, B. 19, 2391; 21, 677, 2614). Green plates (from benzene). With phenyl-hydrazine hydrochloride it yields a compound $C_{18}H_{15}N_3O$ [112°]. Free phenyl-hydrazine in ether yields amido-diphenylamine [75°] and $C_6H_5N_2O$ [173°]. *p*-Bromo-aniline yields $C_6H_4Br.N_2$ [243°]. Tin and HCl reduces it to $C_6H_5(NH_2).NPhH$ [65°] (Ikuta, A. 243, 274). Aqueous $NaOH$ yields aniline and quinone-oxim.— $BHCl$: bronze tables or needles.

Acetyl derivative [97°]. Red prisms. **Nitrosamine** $C_6H_5(NO).NPh(NO)$. [98°].

NITROSO-PHENYL-BENZYL-THIO-UREA $PhC(NO).NH.CS.NPh$. [172°]. Crystals (from alcohol) (Koch, B. 24, 894).

NITROSO-PHENYL-(α)-NAPHTHYL-AMINE $C_{18}H_{15}(NO).NPh$. [150°]. Formed from phenyl-naphthyl-nitrosamine and alcoholic HCl (Fischer a. Hepp, B. 20, 1247). Brownish-yellow crystals. Yields $C_{10}H_7(NH_2).NPh$ on reduction. Boiling dilute H_2SO_4 splits it up into aniline and quinone oxim.— $BHCl$: green plates.

TRI-NITROSO-PHLOGRUCIN

$C_6(NO)_3(OH)$. Prepared by the action of KNO_3 and $HOAc$ on phloroglucin (Benedikt, B. 11, 1374). Needles, sol. water and alcohol.— K_2A''' : needles, exploding above 130° .

TF β -NITROSO-PROPANE *v.* Oxim of DI-NITROSO-ACETONE.

NITROSO-PROPIONIC ACID *v.* Oxim of PIRUVIC ACID.

NITROSO-PROPYL-ANILINE $C_6H_7N_2O$ *i.e.* $C_6H_7(NO).NPrH$. [59°]. Formed from the isomeric $C_6H_7.NPr(NO)$ and alcoholic HCl (Wackor, A. 243, 291). Steel-blue needles, v. sol. alcohol. Yields $C_6H_7(NH_2).NPrH$ on reduction, and quinone-oxim and $NPrH$ on boiling with alkalis. $NaNO_2$ and HCl yield $C_6H_7(NO).NPr(NO)$ [69°].

Nitroso-di-propyl-aniline $C_6H_7(NO).NPr_2$. [42°]. Formed from di-propyl-aniline (241°) and HNO_3 (Mandl, M. 7, 99). Green trimetric crystals, *a:b:c* = 576:1:277. Yields quinone-oxim and dipropylamine on warming with potash. HOY forms $C_{12}H_{19}N_2O_2$. [140°].

NITROSO-PROPYL-CRESOL $C_{10}H_{13}NO_2$ *i.e.* $C_6H_7MePr(NO)(OH)$. *Cymoquinone oxim* [140°] is formed from propyl-cresol, KNO_3 , and $HOAc$ (Mazzara, G. 12, 167). The isomeric $C_6H_7MePr(NO)(OH)$ melts at 167° .

NITROSO-R β SORCIN $C_6H_7(NO)(OH)$, [4:3:1]. *Oxy-quinone oxim*. Formed from $C_6H_7(OH)(ONa)$ and amyl nitrite (Fèvre, Bl. [2] 39, 585; C. R. 96, 790). Golden crystals (containing aq.), turning brown at 112° . Its solution is turned deep green by a ferrous salt. $SnCl_2$ reduces it to amido-resorcin. H_2O_2 yields nitroresorcin (Ulzer, M. 9, 1123).— NH_4A' 2aq.— KA' aq.— NaA' — AgA' : brown needles.

Methyl ether MeA' (Aronheim, B. 12, 80).

Ethyl ether EtA' . Yellow flakes.

Di-nitroso-resorcin $C_6H_7(NO)_2(OH)$, [4:2:3:1]. Formed by the action of nitrous acid on resorcin (Fitz, B. 8, 631; Kostanecki, B. 22, 1345). Yellowish plates (containing aq.). Explodes at 115° . Forms coloured lakes. Yields di-amido-resorcin on reduction.— NH_4A' — NaA' : dark-green powder.

NITROSO-RESORCIN DISULPHONIC ACID.

The salt $C_6H_7(NO)(OH)(OK)SO_3K$ is formed by the action of KNO_3 and $HOAc$ on potassium resorcin disulphonic acid (Ulzer, M. 9, 1127). It forms violet crystals.

NITROSO-SUCCINIC ACID $C_4H_5NO_4$ *i.e.* $CO_2H.CH_2.C(OH).CO_2H$. Obtained from its mono-ethyl ether, which is got by allowing di-nitroso-succinic-succinic ether to stand with water (Ebert, A. 229, 65). Crystals, decomposing below 126° .— CaA'' 4aq.

Mono-ethyl ether $EtHA'$. [112°].— NH_4EtA'' .— $CaEtA'$ 2aq.— $CaC_2H_3NO_2$ 2aq.— $BaC_2H_3NO_2$ aq.— $Zn(EtA'')$ — $AgEtA''$.

An isomeric ether $EtHA''$ [54.7°] is obtained by the action of $NaOEt$ on the oxim of oxalacetic

ether (Piutti, *C. O.* 1888, 1400; 1890, 988; Hantzsch, *B.* 23, 11).

Di-ethyl ether Et.A'. Oil. Identical with the oxim of oxalacetic acid.

Di-nitroso-succinic acid
 $\text{CO}_2\text{H.C}(\text{NOH}).\text{C}(\text{NOH}).\text{CO}_2\text{H}$. [180°]. Formed from carboxy-tartronic acid and hydroxylamine (Müller, *B.* 16, 2985). "Prisma.—Ag.A'": explosive pp.

NITROSOSULPHATES and **NITROSO-SULPHURIC ACIDS** v. **SULPHATES** and **SULPHURIC ACID** in vol. iv.

NITROSO-THIOGLYCOLLIC ACID

$\text{HS.C}(\text{NOH}).\text{CO}_2\text{H}$. Formed by boiling nitroso-thiohydantoin with baryta-water (Maly a. Andreasch, *M.* 1, 168; *B.* 13, 601). Crystals, v. sol. ether. Gives a blue colour with FeCl_3 . Decomposed by boiling water or alcohol into CO_2 , hydrogen sulphocyanide, and H_2O .—BaA' aq.

NITROSO-THIOHYDANTOIN $\text{C}_2\text{H}_3\text{N}_2\text{OS}$. Formed from thiohydantoin and HNO_2 (Maly, *B.* 13, 967). Crystalline powder, sl. sol. water.

NITROSO-THYMOL v. *Oxim* of **THYMOQUINONE**.

DI-NITROSO-TOLUENE $\text{C}_6\text{H}_4\text{Me}(\text{NO})_2$ [6:8:2or1]. [c. 144°]. Formed by oxidising toluquinone dioxim with K_2FeCy (Nietzki, *B.* 21, 432; Mehne, *B.* 21, 734). Amorphous insoluble powder, volatile with steam. Gasified on fusion. Reconverted by hydroxylamine into toluquinone dioxim.

NITROSO-*o*-TOLUIDINE $\text{C}_6\text{H}_4\text{N}_2\text{O}$ i.e. $\text{C}_6\text{H}_4\text{Me}(\text{NO})(\text{NH}_2)$ [1:5:2]. [116°]. Formed by heating toluquinone mono-oxim (nitroso-*o*-cresol, with acetate and chloride of ammonium (Mehne) *B.* 21, 731). Small green needles with blue reflex. Yields NH_3 and nitroso-*o*-cresol on heating with aqueous NaOH . Hydroxylamine yields toluquinone dioxim.

Nitroso-*m*-toluidine
 $\text{C}_6\text{H}_4\text{Me}(\text{NO})(\text{NH}_2)$ [1:2:5]. [178°]. Formed in like manner from nitroso-*m*-cresol. Resembles its isomeride and yields the same dioxim on treatment with hydroxylamine.

***o*-NITROSO-VALERIC ACID** is the *Oxim* of **PROPYL-GLYOXYLIC ACID**.

***γ*-Nitroso-valeric acid**
 $\text{CH}_3.\text{C}(\text{NOH}).\text{CH}_2.\text{CH}_2.\text{CO}_2\text{H}$. *Oxim* of *acetyl-propionic acid*. [963]. Formed from *β*-acetyl-propionic acid (levulic acid) and hydroxylamine (Müller, *B.* 16, 1617). "Prisma. Yields levulic acid on treatment with tin and HCl . H_2SO_4 at 100° forms methyl-succinimide (Bredt, *A.* 251, 816; cf. Rischbieth, *B.* 20, 2671).—BaA', 2aq.—AgA': white pp.

Ethyl ether Et.A'. Oil.

***δ*-Di-nitroso-valeric acid**
 $\text{CH}(\text{NOH}).\text{C}(\text{NOH}).\text{CH}_2.\text{CH}_2.\text{CO}_2\text{H}$. [136°]. Formed from glyoxyl-propionic acid and hydroxylamine (Wolf, *A.* 260, 93). Prisms. Converted by conc. H_2SO_4 at 70° into furazyl-propionic acid $\text{O} < \text{N} : \text{CH} / \text{N} : \text{O} \cdot \text{CH}_2.\text{CH}_2.\text{CO}_2\text{H}$ [86°].—BaA', 3aq: thin needles.

NITROSO-XYLENOL v. *Oxim* of **XYLEQUINONE**.

ISO-NITRO-STEARIC ACID $\text{C}_{18}\text{H}_{33}(\text{NO})\text{O}_2$. Formed by boiling stearic acid (100 g.) with HOAc (1500 c.c.) and HNO_2 (250 g. of S.G. 1.48) for four days (Claus, *J. pr.* [2] 48, 161). Yellowish

buttery mass, v. sol. ether and alcohol, insol. water and ligroin. Yields stearic acid on reduction. It is therefore not a true nitro-compound. —K.A'.—K.A'' KHCO_3 .—Na.A': granular mass, insol. ether.—SrA'.—CuA'.—CuA'': light-green.

NITRO-STYRECHNINE v. STYRECHNINE.

NITRO-STYRENE. The *o*, *m*, and *p*-isomerides $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}:\text{CH}_2$, melting at 14°, -5°, and 29° respectively, are formed by boiling the acids $\text{C}_6\text{H}_4(\text{NO})_2.\text{CHBr}.\text{CH}_2.\text{CO}_2\text{H}$ with aqueous Na_2CO_3 (Einhorn, *B.* 16, 2313; Prausnitz, *B.* 17, 597; Basler, *B.* 16, 3005). The corresponding dibromides $\text{C}_6\text{H}_4(\text{NO})_2.\text{CHBr}.\text{CH}_2.\text{Br}$ melt at 52°, 79°, and 78° respectively.

***ω*-Nitro-styrene** $\text{C}_6\text{H}_4.\text{CH}:\text{CH}.\text{NO}_2$. [58°]. (250°-260°). Formed by heating benzoic aldehyde with nitro-methane and ZnCl_2 for 8 hours at 160° (Priebs, *A.* 225, 819). Formed also by boiling styrene with HNO_2 (Simon, *A.* 31, 269; Blyth a. Hofmann, *A.* 53, 297). Yellow crystals, yielding benzoic acid on oxidation. When freshly prepared it is soluble in NaOH aq, but the solution slowly decomposes, yielding benzoic aldehyde and resin. Diluted H_2SO_4 yields benzoic aldehyde, hydroxylamine, and CO . Conc. HCl aq yields hydroxylamine and $\text{PhCHCl}.\text{CO}_2\text{H}$ [78°].

***ω*-Di-nitro-styrene** $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}:\text{CH}(\text{NO}_2)$. [107°]. Formed, together with the *ω*-isomeride, by nitration of *ω*-nitro-styrene (Priebs). Yellow needles (from alcohol).

***ω*-Di-nitro-styrene**. [199°]. Formed as above, and also by the action of HNO_2 and H_2SO_4 on *p*-nitro-cinnamic acid at 0° (Friedländer a. Mähly, *A.* 229, 224; *B.* 16, 851). Yellow crystals, sol. KOH aq. Dilute H_2SO_4 decomposes it into *p*-nitro-benzoic aldehyde, hydroxylamine, and CO .

***ωm*-Di-nitro-styrene**. [122°]. Formed from *m*-nitro-cinnamic acid, HNO_2 , and H_2SO_4 at 0° (Friedländer a. Lazarus, *A.* 229, 233). Yellowish plates (from water). Conc. H_2SO_4 at 100° gives CO and *m*-nitro-benzaldioxim.

***o*-NITRO-STYRYL-ACROLEIN** $\text{C}_6\text{H}_4\text{NO}$, i.e. $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}:\text{CH}.\text{CH}:\text{CH}.\text{CHO}$. [153°]. Formed from *o*-nitro-cinnamic aldehyde, aldehyde, and very dilute NaOH (Einhorn, *B.* 17, 2026). Pale-yellow crystals (from dilute alcohol).

***o*-NITRO-STYRYL-ACRYLIC ACID**
 $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}:\text{CH}.\text{CH}:\text{CH}.\text{CO}_2\text{H}$. [218°]. Formed from *o*-nitro-cinnamic aldehyde, Ac_2O , and sodium acetate, and obtained also by oxidising $\text{C}_6\text{H}_4(\text{NO})_2.\text{C}_6\text{H}_4.\text{CO}.\text{CH}_3$ with aqueous NaOCl (Diehl a. Einhorn, *B.* 18, 2331). Slender felted needles, v. sol. hot alcohol.

***o*-NITRO-STYRYL-GLYOXYLIC ACID**
 $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}:\text{CH}.\text{CO}.\text{CO}_2\text{H}$. [136°]. Formed from *o*-nitro-benzoic aldehyde, pyruvic acid, and HCl aq (Baeyer a. Drewson, *B.* 15, 2862). Crystals. Converted by alkalis into indigo.

DI-*m*-NITRO-DI-STYRYL KETONE. [282°]. Sparingly soluble flakes (Von Miller a. Rohde, *B.* 22, 1838).

***o*-NITRO-STYRYL METHYL KETONE**
 $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}:\text{CH}.\text{CO}.\text{CH}_3$. [60°]. Formed, together with the *p*-isomeride [110°], by nitration of styryl methyl ketone (Baeyer a. Drewson, *B.* 15, 2858; 16, 1953). Formed also by boiling $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}(\text{OH}).\text{CH}_2.\text{CO}.\text{CH}_3$ with Ac_2O , or $\text{C}_6\text{H}_4(\text{NO})_2.\text{CH}:\text{CH}.\text{CO}.\text{CH}_2.\text{CO}.\text{CH}_3$ with dilute

H₂SO₄ (Fischer a. Kuzel, *B.* 16, 35). Long needles, sol. alcohol.

m-NITRO-STYRYL-QUINOLINE C₁₇H₁₂N₂O₂ i.e. C₆H₄:C₆H₄N.CH:CH.C₆H₄(NO₂). [132°]. Formed by heating methyl-quinoline (lepidine) with *m*-nitro-benzoic aldehyde and KHSO₄ at 160° (Heymann a. Königs, *B.* 21, 1429). Needles (from alcohol).

An isomeride [139°] is formed from (*Py.* 3)-methyl-quinoline and *m*-nitro-benzoic aldehyde (Wallach, *B.* 16, 2009; Wartanian, *B.* 23, 2616). It gives the crystalline salts B'HCl.—B'HNO₃.—B'O₂H₂(NO₂).OH.—B'H₂PtCl₄ 1½ aq.

p-Nitro-styryl-quinoline. [165°]. Formed from (*Py.* 3)-methyl-quinoline and *p*-nitro-benzoic aldehyde (Bulach, *B.* 20, 2047; 22, 235). Needles. Yields a dibromide C₁₇H₁₂N₂O₂Br₂ [276°] which turns brown at 230°.

NITRO-DI-STYRYL-DI-VINYL-KETONE v. NITRO-PHENYL-BUTYNYL PHENYL-BUTYNYL KETONE.

NITRO-o-SULPHO-BENZOIC ACID C₆H₄NSO₃ i.e. C₆H₄(NO₂)(SO₃H)(CO₂H) [4:2:1]. [110°]. Formed by oxidising nitro-toluene sulphonic acid (Hart, *Am.* 1, 350; Hedrick, *Am.* 4, 411; Kastle, *Am.* 11, 177). White needles (from hot water).—KHA' aq: long needles.—KA'.—BA'A'.

Chloride C₆H₄(NO₂)(SO₂Cl)(COCl). [60°].

Amide C₆H₄(NO₂)(SO₂NH₂)(CO₂H). [172°]. Formed by oxidising *p*-nitro-toluene sulphonic amide with K₂FeCy₄ or alkaline KMnO₄ (Noyes, *Am.* 8, 171; 11, 161). Small granules (from hot water), melting at 177° when slowly heated, but at 172° when quickly heated. Changes slowly when kept at 180° into the anhydride

C₆H₄(NO₂)<SO₂>NH [209°] which yields the salts KO₂H₂N₂SO₃, S. 96 at 18.5°, Ba(C₆H₄N₂SO₃)₂ 8aq, and AgC₆H₄N₂SO₃. The free amic acid yields the salts Ba(C₆H₄N₂SO₃)₂ aq, AgC₆H₄N₂SO₃ ¼ aq, and Ag₂C₆H₄N₂SO₃ aq.

Nitro-*m*-sulphobenzoic acid C₆H₄(NO₂)(SO₃H)(CO₂H) [x:3:1]. Formed by nitrating *m*-sulphobenzoic acid (Limpricht a. Uslar, *A.* 106, 27). Crystalline.—BA'A' 3aq.—BA'A' 1½ aq.—BaH₂A' 4aq: radiating prisms.

Nitro-*p*-sulphobenzoic acid C₆H₄(NO₂)(SO₃H)(CO₂H) [2:4:1]. Formed by oxidising (2, 1, 4)-nitro-toluene sulphonic acid (Hart, *Am.* 1, 352).—KHA'.—BA'A' 2aq: granules.

Nitro-*p*-sulphobenzoic acid C₆H₄(NO₂)(SO₃H)(CO₂H) [3:4:1]. [181°]. Formed by nitrating *p*-sulphobenzoic acid (Hart, *Am.* 1, 342; Remsen, *A.* 178, 288). Prisms.—KHA' 1½ aq.—BA'A' 4aq.—BaH₂A' 6aq.—CaA' 6aq.—CuA' 5aq: bluish-green crystals.

NITRO-SULPHO-TOLUIC ACID C₆H₄NSO₃ i.e. C₆H₄Me(NO₂)(SO₃H)(CO₂H) [1:6:4:3]. Formed by oxidation of nitro-*m*-xylene-sulphonic acid C₆H₄Me(NO₂)(SO₃H) [1:3:6:4] with KMnO₄ (Limpricht, *B.* 18, 2191).—AK' ¼ aq: fine white silky needles.

NITRO-SULPHYDRO-CINNAMYL ACID C₆H₄(NO₂).CH:C(SH).CO₂H. [240°]. Formed from C₆H₄.CH:C(SH).CO₂SON, nitric acid, and H₂SO₄ (Bondzynski, *M.* 8, 855). Crystals (from alcohol).—BA'A₂: long needles.

NITRO-*o*-SULPHYDRO-CINNAMOYL SULPHOCYANIDE C₆H₄(NO₂).CH:C(SH).CO₂SCN. The *o*-compound [189°] is formed, together with the *p*-derivative [251°] by nitrating sulphydro-cinnamoyl sulphocyanide. These bodies may

also be got from thioglycolyl sulphocyanide and the corresponding nitro-benzoic aldehyde (Bondzynski, *M.* 8, 355). Both are crystalline.

NITRO-SULPHYDRO-METHYL-IMIDAZOLE. Methyl derivative C₆H₄Me(NO₂)SMe. [85°].

Formed from NMe<CH=CH>C(SMe):N and dilute HNO₃ (Wohl a. Marekwald, *B.* 22, 1358). Yellow needles, sl. sol. cold water.—R'H₂PtCl₄. [197°].

NITRO-SULPHYDRO-PHENYL-IMIDAZOLE. Methyl derivative C₆H₄Ph(NO₂)(SMe).

[116°]. Formed from NPh<CH:CH>C(SMe):N and dilute HNO₃ (Wohl a. Marekwald, *B.* 22, 1357).

NITROSYL BROMIDE, CHLORIDE, and SULPHATE v. Nitrogen oxybromides and oxychlorides, p. 569; and Nitro-sulphonic acid, vol. iv. p. 601.

NITRO-TEREPHTHALIC ACID C₆H₄NO₂ i.e. C₆H₄(NO₂)(CO₂H)₂ [2:4:1]. [270°]. Formed by nitrating terephthalic acid (De la Rue a. Müller, *A.* 121, 90; Burkhardt, *B.* 10, 145). Crystalline.

—Ag₂A': powder (Skraup, *M.* 7, 148).

Methyl ether Me₂A'. [70°]. Prisms (Ahrens, *B.* 19, 1636).

Amide C₆H₄(NO₂)(CONH₂)₂. Prisms. **NITRO-TEREPHTHALIC ALDEHYDE**

C₆H₄(NO₂)(CHO)₂. [86°]. Formed from terephthalic aldehyde, KNO₃, and H₂SO₄ at 110° (Löw, *A.* 231, 364). Large needles (by sublimation). With acetone and NaOH at 60° it gives the indigo-reaction.

NITRO-THIENOL C₆H₄S(NO₂)(OH). [116°]. Formed by treating a dilute H₂SO₄ solution of amido-thiophene with nitrous acid and boiling for some time. Colourless needles. Sol. water and ether. Dissolves in alkalis with a yellow colour (Stadler, *B.* 18, 2319).

NITRO-(*o*)-THIENYL-GLYOXYLIC ACID C₆H₄(NO₂)S.CO.CO₂H. [92°]. Formed by oxidation of nitro-thienyl methyl ketone [123°] (Peter, *B.* 18, 541). Crystals.

NITRO-(*o*)-THIENYL METHYL KETONE C₆H₄(NO₂)S.CO.CH₃. Two isomerides [86°] and [123°] are formed by nitrating (*o*)-thienyl methyl ketone with fuming HNO₃ at -8° (Peter, *B.* 17, 2646; 18, 541). They both yield the same di-nitro-thienyl methyl ketone [187°].

m-NITRO-THIOBENZOIC ALDEHYDE (C₆H₄(NO₂).CHS)? A grey powder formed by passing H₂S into an alcoholic solution of *m*-nitro-benzoic aldehyde (Bertagnini, *A.* 79, 269). Insol. ordinary solvents.

NITRO-THIONYL-ANILINE C₆H₄(NO₂).N(SO). Formed from nitro-aniline and thionyl chloride (Michaelis a. Hümme, *B.* 24, 755). The *m*-compound melts at 63.5°; the *p*-isomeride at 70°. Decomposed by hot water.

NITRO-THIOPHENE C₆H₄(NO₂)S. [44°]. (225° cor.). Prepared by passing air charged with thiophene vapour through fuming HNO₃ (Meyer a. Stadler, *B.* 17, 2648; 18, 538). Pale-yellow monoclinic prisms.

Di-nitro-thiophene C₆H₄(NO₂)₂S. [52°]. (290°). Formed, together with the isomeride [78°], by further nitration of nitro-thiophene (Meyer a. Stadler, *B.* 17, 2648, 2779; 18, 530, 1778). Yellow monoclinic plates, m. sol. water.

Converted by repeated steam-distillation into the isomeride [78°]. A drop of KOHAq added to the alcoholic solution gives a splendid red colour, destroyed by excess of KOH. Forms the

double compounds $C_6H_4(NO_2)_2SC_2H_5$ [50°] and $C_6H_4(NO_2)_2SC_2H_5$ [162°].

Di-nitro-thiophene [78°]. Formed as above. Yellow needles, volatile with steam.

NITRO-THIOPHENE SULPHONIC ACID $C_6H_4(NO_2)(SO_3H)_2$. Formed from nitro-thiophene and fuming H_2SO_4 (Stadler, B. 18, 534). White hygroscopic crystals.—AgA'.

Chloride. Oil.

Amide $C_6H_4(NO_2)S(SO_2NH_2)_2$ [173°].

NITRO-(a)-THIOPHENIC ACID $C_6H_4NSO_3H$, i.e. $C_6H_3(NO_2)(CO_2H)$. [140°]. Formed from (a)-thiophenic acid and conc. HNO_3 at 50° (Römer, B. 20, 116). Needles, slowly changed by water into a variety melting at about 135°. A little NaOH colours its alcoholic solution magenta. CuA'.—AgA': needles.

Ethylether EtA'. [71°].

NITRO-THYMOL $C_6H_4Me(C_6H_4)(NO_2)(OH)$. [140°]. Formed by oxidation of nitroso-thymol (R. Schiff, B. 8, 1601; Liebermann, B. 10, 612).

Di-nitro-thymol [55°]. Formed by nitration of thymol or its sulphonic acid (Lallemand, A. Ch. [3] 49, 152). Crystalline.—KA'.—BaA', 5aq.—CaA', 5aq.—AgA': lemon-yellow pp.

Ethyl ether EtA'. [53°]. Tables (from alcohol) (Ladenburg a. Engelbrecht, B. 10, 1218).

Tri-nitro-thymol. [111°]. Got by nitrating di-nitro-thymol. Yields a methyl ether [92°] (Atochley, Z. 1871, 415).

NITRO-TOLUAMIDOXIM $C_6H_4MeNO_2$, i.e. $C_6H_4Me(NO_2)C(OH)(NH_2)$ [4:2:1]. [161°].

Formed by heating nitro-toluic nitrile with alcoholic hydroxylamine (Weise, B. 22, 2430). Needles.—B'HCl: white crystalline mass.

o-NITRO-TOLUENE $C_6H_4Me(NO_2)$ [1:2]. Mol. w. 137. [218°]. S.G. 1.168 (Streng, B. 24, 1987). S.V. 142.3 (Lossen, A. 254, 73).

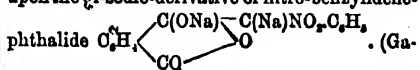

Formed, together with the *p*-isomeride, by nitration of toluene (Glénard a. Boudault, C. R. 19, 505; Hofmann a. Muspratt, A. 53, 221; Kekulé, Z. [2] 3, 225; Rosenstiehl, A. Ch. [4] 27, 438). Formed also by elimination of NH_3 from (2, 1, 4)-nitro-*p*-toluidine (Beilstein a. Kuhlberg, A. 155, 1; 158, 348). Liquid; solidifies at -10.5°. After administration to dogs it appears in the urine as *o*-nitro-benzoic acid and crystalline $C_6H_4N_2O_5$, 2aq (Jaffé, Russ. Zeit. Pharm. 1878, 513; Noyes, Am. 5, 99). Long boiling with alkaline K_2FeCy_3 yields *o*-nitro-benzoic acid. Zinc-dust and alcoholic NaOH reduce it to *o*-azoxy-toluene [59°] (Quitermann, B. 20, 2016). Its product of sulphuration differs from that of *p*-nitro-toluene in giving no red colour when boiled with alkalis (Reverdin a. Harpe, Bl. [2] 50, 44).

m-Nitro-toluene $C_6H_4Me(NO_2)$ [1:3]. [16°]. (230°). S.G. 1.168. S.V. 144.0. Occurs in small quantity in crude nitro-toluene (Monnet, Reverdin, a. Nöling, B. 12, 445; 18, 1837). Prepared from *o*- or *p*-toluidine by successive acetylation, nitration, saponification, diazotisation, and boiling with alcohol (Beilstein a. Kuhlberg, A. 155, 24; 158, 348; Buchka, B. 22, 829). Yields *m*-nitro-benzoic acid on oxidation. $SnCl_4$ in $HClAq$ reduces it to pure *m*-toluidine, while zinc-dust and $HClAq$ yield chloro-*m*-toluidine also. Boiling with KOH in MeOH forms $(C_6H_4Me)_2N_2Q$ [89°].

p-Nitro-toluene $C_6H_4Me(NO_2)$ [1:4]. [54°]. (234°) (Streng, S.V.S. 121.7 (Schiff, A. 223, 261).

Formed, together with the *o*-isomeride, by nitration of toluene. Trimetric crystals. Much less volatile with steam than *o*-nitro-toluene. Oxidised by boiling alkaline K_2FeCy_3 to *p*-nitro-benzoic acid (Noyes, B. 16, 52). Reduced by iron and $HClAq$ to pure *p*-toluidine, while zinc and $HClAq$ yield chlorinated toluidine. Zinc-dust and NaOH reduce it to $(C_6H_4Me)_2N_2$ [144°], two azoxy-compounds $(C_6H_4Me)_2N_2O$ [75°] and [70°] and $(C_6H_4Me)_2N_2H_2$ [126°] (Janovsky a. Reimann, B. 23, 40). CrO_3Cl_2 followed by water yields nitro-toluquinone (Etard, C. R. 87, 989). NaOMe yields a brownish-red product reduced by $SnCl_4$ to $C_6H_4(C_6H_4NH_2)_2$ (Bender a. Schultze, B. 19, 3237).

ω-Nitro-toluene $C_6H_4CH_2(NO_2)$. *Phenyl-nitro-methane*. Formed by the action of acids upon the β -sodio-derivative of nitro-benzylidene-

briél a. Koppe, B. 18, 1254; 19, 1145). Liquid, boiling with decomposition at 226°. Reduced by tin and HCl to benzylamine. By heating with fuming HCl at 150° it yields benzoic acid and hydroxylamine. Gives a white crystalline sodium derivative.

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1:2:4]. Mol. w. 182. [70°]. (300°). S.V.S. 137.5 (Schiff). S. (CS.) 2.19 at 17°. Obtained by nitration of toluene (Deville, A. 44, 307; Cahours, C. R. 24, 555; Nöling a. Witt, B. 18, 1336) and *o*- or *p*-nitro-toluene. Obtained also by eliminating NH_3 from di-nitro-toluidine [195°] (Staedel, A. 259, 220). Monoclinic needles, al. sol. cold alcohol. Yields tolylene-*m*-diamine on reduction (Baeyer, B. 7, 1638). By partial reduction with ammonium sulphide the *p*-nitro-group is reduced, giving $C_6H_4Me(NO_2)(NH_2)$ [1:2:4] of melting-point [78°]. On the other hand, by alcoholic $SnCl_4$ (8 mols.) the *o*-nitro-group is first reduced, giving $C_6H_4Me(NH_2)(NO_2)$ [1:2:4] of melting-point [107°] (Anschütz a. Heusler, B. 19, 2101).

s-Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1:3:5]. [93°]. Formed by eliminating NH_3 from di-nitro-*o*-toluidine [208°] or di-nitro-*p*-toluidine [166°] (Staedel, B. 14, 901; A. 217, 189; Neville a. Winther, C. J. 41, 416; Hübner, A. 222, 75). Yellow needles (from HOAc mixed with benzene), v. sol. benzene and alcohol. Volatile with steam. Yields di-nitro-benzoic acid [204°] on oxidation.

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1:2:3]. [63°]. Formed by heating (2, 3, 1, 4)-di-nitro-toluic acid with dilute $HClAq$ (Rozanski, B. 22, 2681). Hair-like needles (from dilute HOAc).

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1:2:5]. [48°] (N. a. L.); [52-57°] (H.). Formed by heating (1, 4, 8, 6)-di-nitro-toluic acid with dilute $HClAq$ at 250° (Rozanski, B. 22, 2679). Formed also from toluquinone dioxim and HNO_3 (Nietzki a. Guitermann, B. 21, 428). Yellow crystals (from ligroin). Appears also to occur among the products of the nitration of toluene (Limpriht, B. 18, 1402).

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1:2:6]. [61°]. Formed by eliminating NH_3 from di-nitro-*p*-toluidine [168°] (Staedel, A. 217, 206; 225, 384). Formed also by nitration of toluene. Needles (from alcohol).

Di-nitro-toluene $C_6H_4Me(NO_2)_2$ [1:3:4] ? [60°]. S. (CS₂) 2-188 at 17°. A product of nitration of *m*-nitro-toluene (Beilstein a. Kuhlberg). Long needles (from CS₂).

(a)-Tri-nitro-toluene $C_6H_3Me(NO_2)_3$ [1:2:4:6]. Mol. w. 227. [82°]. S. (CS₂) 386 at 17°. Formed by nitration of toluene (Wilbrand, A. 128, 178). Flat needles, v. sol. hot alcohol. Forms with aniline a compound $C_6H_4Me(NO_2)_2 \cdot PhNH_2$ [84°] (Hepp, A. 215, 365).

(8)-Tri-nitro-toluene $C_6H_3Me(NO_2)_3$ [112°]. Formed, together with the (γ)-isomeride, by nitration of *m*-nitro-toluene (Hepp). Triclinic prisms (from acetone).

(γ)-Tri-nitro-toluene $C_6H_3Me(NO_2)_3$ [104°]. Formed as above (Hepp). Trimetric plates; *a:b:c* = 937:1:672. V. sl. sol. cold alcohol.

NITRO-TOLUENE-α-PHOSPHONIC ACID

$C_6H_4(NO_2)_2 \cdot CH_2 \cdot PO(OH)_2$. Formed by dissolving toluene α-phosphonic acid in fuming HNO₃ (Litthauer, B. 22, 2144). Yellow needles, decomposing at 217° without melting. The acid $(C_6H_4(NO_2)_2 \cdot CH_2)_2 \cdot PO \cdot OH$ melts at 212°.

NITRO-TOLUENE SULPHINIC ACID

$C_6H_4Me(NO_2)_2 \cdot SO_2H$. Formed by reduction of $C_6H_4Me(NO_2)_2 \cdot SO_2Cl$ by sodium amalgam (Otto a. Grüber, A. 145, 24). Crystalline. —NaA' 3aq.

Di-nitro-toluene sulphinic acid

$C_6H_3(CH_3)(NO_2)_2 \cdot SO_2H$. Formed by reduction of di-nitro-toluene-sulphonic chloride with zinc-dust (Perl, B. 18, 71). V. sol. water and alcohol.

Salts. —A'K. —A'Ba. —A'Pb 3aq: minute prisms.

o-NITRO-TOLUENE SULPHONIC ACID

$C_6H_4Me(NO_2)(SO_2H)$ [1:2:5]. Formed from $C_6H_4Me(NO_2)(NH_2)(SO_2H)$ [1:2:4:5] by heating its diazo-derivative with alcohol at 100° (Foth, A. 230, 305).

Chloride $C_6H_4Me(NO_2)(SO_2Cl)$. [50°].

Amide [133-5°]. Long needles.

o-Nitro-toluene sulphonic acid

$C_6H_4Me(NO_2)(SO_2H)$ [1:2:4]. Formed by sulphonating *o*-nitro-toluene or by nitrating toluene *p*-sulphonic acid (Beilstein a. Kuhlberg, A. 155, 18; Engelhardt a. Bek, Z. [2] 5, 209; Kornatzki, A. 221, 180).

Salts. —BaA', 2aq. *S. (of BaA') 58 at 19-5°. —PbA', 2aq. S. (of PbA') 77 at 18°.

Chloride. Oil (Otto a. Grüber, A. 145, 23).

Amide [128°] (O. a. G.); [139°] (K.); [144°] (Neale, A. 203, 73). Yields a benzoyl derivative $C_6H_4Me(NO_2) \cdot SO_2NHBz$ [180°] whence the salts $C_6H_4Me(NO_2) \cdot SO_2NKBz$, $Ca(C_6H_4Me(NO_2) \cdot SO_2)_2$ 2aq and $Ba(C_6H_4Me(NO_2) \cdot SO_2)_2$ may be prepared, and whence PCl_5 produces $C_6H_4Me(NO_2) \cdot SO_2N \cdot CClPh$ [125°] from which ammonium carbonate forms $C_6H_4Me(NO_2) \cdot SO_2$ [125°] (Anna Wolkoff, Z. 1871, 422; B. 5, 141).

p-Toluide. [131°]. Crystals.

o-Nitro-toluene sulphonic acid

$C_6H_4Me(NO_2)(SO_2H)$ [1:2:3,5 or 6]. Formed from (2,1,4)-nitro-toluidine by sulphonating and eliminating NH_2 (Foth). Its salts are v. e. sol. water.

Chloride [50°]. Thick prisms.

Amide [133°]. Needles.

o-Nitro-toluene sulphonic acid

$C_6H_4Me(NO_2)(SO_2H)$ [1:2 or 6:8]. Formed from *p*-toluidine sulphonic acid by nitration and elimination of NH_2 (Pechmann, A. 173, 214; Foth,

A. 230, 303). —BaA', 2aq: plates, sl. sol. cold water.

Chloride $C_6H_4Me(NO_2)SO_2Cl$. [58-5°].

Amide $C_6H_4Me(NO_2)SO_2NH_2$. [163-5°].

m-Nitro-toluene sulphonic acid. Formed by sulphonating *m*-nitro-toluene (B. a. K.). —BaA', 2aq. S. (of BaA') 1-145 at 17-5°. —PbA', 2aq. S. (of PbA') 3-62 at 18°.

p-Nitro-toluene sulphonic acid

$C_6H_4Me(NO_2)(SO_2H)$ [1:4:2]. [134°]. S. 210 at 23°; 250 at 28°. Formed by sulphonating *p*-nitro-toluene (Javorsky, Z. 1865, 222; B. a. K.; Jenssen, A. 172, 230; Hart a. Remsen, B. 10, 1046; Am. 1, 349; Schwanert, A. 186, 351; Noyes, Am. 8, 168; Haussner, Bl. [3] 3, 797). Trimetric crystals (containing 2aq). NaOHAq yields an azoxy-compound reduced by zinc-dust to di-amido-stilbene disulphonic acid.

Salts. —NH₄A': long prisms, not decomposed by H_2SO_4 at 100°.—NaA' 2aq.—KA'. S. 2-62 at 16°.—BaA', 3aq. S. 3-34 at 18-5°. —CaA', 4aq.—CaA', 3aq.—CaA', 6aq.—PbA', 3aq. S. (of PbA') 15-3 at 19°.—PbA', 2aq.

Chloride [44°]. Tablets (from ether).

Amide [187°]. Needles.

Nitro-toluene exo-sulphonic acid

[1:4] $C_6H_3(NO_2)_2 \cdot CH_2 \cdot SO_2H$. Formed by nitration of $C_6H_4 \cdot CH_2 \cdot SO_2H$ (Mohr, A. 221, 217).

Chloride. Oil. When gently distilled it gives SO_2 and $C_6H_3(NO_2)_2 \cdot CH_2Cl$ [1:4] [71-5°].

Amide [204°]. Prisms. Accompanied by an isomeride [140°-160°].

Nitro-toluene disulphonic acid

$C_6H_4Me(NO_2)(SO_3H)_2$. Formed by boiling *p*-bromo-toluene disulphonic acid with fuming HNO_3 (Kornatzki, A. 221, 198). —KA'. The same, or an isomeric acid, is obtained by displacing Br by H_2 and nitrating the product; it gives the salts K_2A'' and BaA'' 3aq.

Di-nitro-toluene exo-sulphonic acid

$C_6H_3(NO_2)_2 \cdot CH_2 \cdot SO_2H$. Formed from the acid $C_6H_4(NO_2)_2 \cdot CH_2 \cdot SO_2H$ and a mixture of H_2SO_4 (2 pts.) and fuming HNO_3 (1 pt.) (Mohr, A. 221, 225). —KA'. —BaA', 4aq.—PbA', 4aq.

Di-nitro-toluene sulphonic acid

$C_6H_4Me(NO_2)_2 \cdot SO_2H$ [1:2:6:4]. [165°]. Formed by nitrating toluene *p*-sulphonic acid (Schwanert, B. 10, 28; A. 186, 342). Trimetric prisms (containing 2aq). —KA'. S. 52 at 14-5°. S. (94 p.c. alcohol). 09 at 22°.—NH₄A'. S. 4-2 at 18°.—BaA', 4aq. S. 3 at 17°.—CaA', 2aq.—PbA', 2aq.—PbA', 3aq. S. (of PbA') 2-64 at 14-5° (B. a. K., Z. [2] 6, 796).

Chloride. [125°]. Crystals (from ether).

Amide. [203°]. Laminae.

(a)-NITRO-O-TOLUIC ACID $C_6H_4NO_2$, i.e.

$C_6H_4Me(NO_2)(CO_2H)$ [2:5:1]. [179°]. Formed, together with the (β)-acid, by nitration of *o*-toluic acid; and, together with the (γ)-acid by oxidation of nitro-*o*-xylene with dilute HNO_3 (Jacobsen, B. 16, 1957; 17, 162). Small crystals, v. sl. sol. water. Yields amido-toluic acid [196°] and oxy-toluic acid [172°]. —KA' aq.—CaA', 2aq.—BaA', 2aq: slender needles.

(8)-Nitro-*o*-toluic acid

$C_6H_4Me(NO_2) \cdot CO_2H$ [2:3:1]. [145°]. Formed as above. Long needles. Yields oxy-toluic acid [188°]. —BaA', 2aq.—CaA', 2aq.

(γ)-Nitro-*o*-toluic acid

$C_6H_4Me(NO_2) \cdot CO_2H$ [2:4:1]. [152°]. Formed as

above. Long needles. Yields oxy-toluic acid [179°].—BaA', 5aq; easily soluble prisms.

(a) Nitro-*m*-toluic acid

$C_6H_4Me(NO_2)CO_2H$ [8:6:1]. [219°]. Formed, together with a small quantity of its (8, 2, 1)-isomeride [182°], by nitration of *m*-toluic acid (Jacobsen, *B.* 14, 2353; Ahrens, *Z.* 1869, 188; Krausler, *Z.* 1866, 370; Panatovic, *J. pr.* [2] 33, 64). Monoclinic prisms.—BaA', 2aq.—CaA', 4aq; m. sol. water.

(8) Nitro-*m*-toluic acid $C_6H_4Me(NO_2)CO_2H$ [3:2:1]. [182°]. Formed as above (Jacobsen).

s-Nitro-*m*-toluic acid

$C_6H_4Me(NO_2)CO_2H$ [3:5:1]. [167°]. Formed by oxidation of s-nitro-*m*-xylene with $KMnO_4$ and acetic acid (Thöl, *B.* 18, 360). Silky needles, v. sol. water.—BaA', 4aq. S. 308 at 15°. Needles.

Nitro-*m*-toluic acid

$C_6H_4Me(NO_2)CO_2H$ [3:4:1]. [214°]. Formed by oxidation of crude nitro-xylene (Beilstein a. Kreusler, *A.* 144, 168; Remsen a. Kuhara, *Am.* 8, 426) and of nitro-isocymene (Kelbe, *A.* 221, 161).— NH_4A' 2aq.— MgA' 7aq.— CaA' 2aq.— BaA' 4aq; very soluble needles.

Ethyl ether EtA'. [55°] (B. a. K.).

Amide. [151°] (B. a. K.).

Nitrile $C_6H_4Me(NO_2)CN$. [80°].

Nitro-*p*-toluic acid

$C_6H_4Me(NO_2)(CO_2H)$ [4:3:1]. [190°]. Formed by boiling cymene or *p*-toluic acid with fuming HNO_3 (Noad, *A.* 63, 297; Fitticov, *A.* 172, 309; Fittig, *A.* 168, 251; Ahrens, *Z.* [2] 5, 102). Monoclinic prisms, sl. sol. cold water.— BaA' 4aq.— CaA' 3aq.— CuA' 4aq.— Cu_2A' (OH)₂.— Cu_2A' (OH) aq (Noyes, *Am.* 10, 472).— $Pb(OH)A'$.— AgA' . The ethers MeA' and EtA' are crystalline.

Nitro-*p*-toluic acid

$C_6H_4Me(NO_2)(CO_2H)$ [4:2:1]. [181°]. Obtained by heating its nitrile with $HClAq$ at 195°. Long needles.— BaA' 4aq.— BaA' 5aq (Noyes, *Am.* 10, 472).— CaA' 2aq.— CuA' aq.— AgA' ; needles.

Amide. [153°]. Slender needles.

Nitrile $C_6H_4Me(NO_2)CN$. [99°] (G.; W.); [101°] (N.). Formed from (3, 1, 4)-nitro-*p*-toluidine by Sandmeyer's reaction (Glock, *B.* 21, 2662; Weise, *B.* 22, 2429; Von Niementowski, *J. pr.* [2] 40, 4; 21, 1535, 1992). Needles (from alcohol). Yields on reduction with tin and HCl the compounds $C_6H_4Me(Cy)_2N_2O$ [182°] and $C_6H_4Me(NH_2)CN$ [94°]. Does not form an imido-ether when treated with alcoholic HCl (Pinner, *B.* 23, 2919).

A nitro-toluic acid [218°] was obtained by Ahrens together with the acids [219°] and [190°] by the action of HNO_3 on crude xylene.

Di-nitro-*o*-toluic acid

$C_6H_3Me(NO_2)_2CO_2H$ [2:5:3:1]. [206°]. Formed by nitrating *o*-toluic acid (Jacobsen a. Wierss, *B.* 16, 1957; Racine, *A.* 239, 77). Needles. Yields di-nitro-phthalic acid [226°] on oxidation.— BaA' 2aq; v. s. sol. water.

Methyl ether MeA'. [74°]. Needles.

Di-nitro-*p*-toluic acid

$C_6H_3Me(NO_2)_2CO_2H$ [4:3:5:1]. [158°]. Formed by nitrating *p*-toluic acid (Brückner, *B.* 8, 1678). Plates (from hot water).— KA' 2aq.— CaA' 2aq.— BaA' 2aq.— AgA' .

Di-nitro-*p*-toluic acid

$C_6H_3Me(NO_2)_2CO_2H$ [4:2:5:1]. [188°]. Formed, together with the isomeride [249°], by nitrating

(2, 4, 1)-nitro-toluic acid (Bozansky, *B.* 22, 2676). Radiating needles. Yields (1, 4, 8)-di-nitro-toluene on heating with dilute HCl at 250°.— NaA' 8aq.— BaA' 2aq.— CaA' 2aq.

Di-nitro-*p*-toluic acid

$C_6H_3Me(NO_2)_2CO_2H$ [4:2:3:1]. [249°]. Formed as above (R.). Trimetric prisms.— CaA' aq.— BaA' 4aq; long needles.

NITRO-*m*-TOLUIC ALDEHYDE $C_6H_4Me(NO_2)CHO$, i.e. $C_6H_3Me(NO_2)_2CHO$. An oil, formed as well as di-nitro-*m*-toluic aldehyde [112°], by nitrating *m*-toluic aldehyde (Bornemann, *B.* 17, 1478).

NITRO-*o*-TOLUIDINE

$C_6H_4Me(NH_2)(NO_2)$ [1:2:3]. [97°]. Obtained from acetyl-*o*-toluidine by nitration and saponification (Lellmann a. Würthner, *A.* 228, 240), and also by heating its sulphonic acid with dilute H_2SO_4 at 180° (Nietzki a. Pollini, *B.* 23, 138). Prisms (from dilute alcohol).

Acetyl derivative. [158°]. Plates.

Nitro-*o*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1:2:4]. [107°]. Obtained by nitrating *o*-toluidine (1 pt.) dissolved in H_2SO_4 (10 pts.) (Nölting a. Collin, *B.* 17, 238) and by reduction of (4, 2, 1)-di-nitro-toluene [70-5°] (Graeff, *A.* 229, 343; Limpriht, *B.* 18, 1400; Anschütz, *B.* 19, 2161). Orange monoclinic prisms. Sweet taste.— $B'H_2SO_4$; plates, decomposed by water.

Acetyl derivative [151°]. Needles.

Nitro-*o*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1:2:5]. [128°]. Obtained from its acetyl derivative which is got by nitrating acetyl-*o*-toluidine (Beilstein a. Kuhlberg, *A.* 158, 345). Small lemon-yellow needles (from water).

Acetyl derivative [197°]. Needles.

Nitro-*o*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1:2:6]. [92°]. Formed by reduction of (6, 2, 1)-di-nitro-toluene (Cunerth, *A.* 172, 223; Ullmann, *B.* 17, 1957). Formed also, together with the (1, 2, 4)-isomeride, by nitrating *o*-toluidine in presence of a large excess of H_2SO_4 (Green a. Lawson, *priv. com.*). Bright yellow slender needles.— $B'HCl$.

Acetyl derivative [158°]. Needles.

Benzoyl derivative [167°].

Nitro-*m*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1:3:6]. [184°]. Formed from its acetyl derivative, which is got by nitrating acetyl-*m*-toluidine (Beilstein a. Kuhlberg, *A.* 158, 348). Obtained also by heating the ethyl ether [54°] of nitro-cresol [129°] with NH_4Aq at 150° (Staedel, *A.* 259, 214). Needles, v. sol. alcohol. Yields tolylene-*p*-diamine [64°] on reduction (Filici a. Crosa, *G.* 18, 298).

Acetyl derivative [102°]. Cubes.

Nitro-*m*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1:3:4]. [109°]. Formed by heating the ethyl ether [51°] of nitro-cresol [56°] with NH_4Aq for 8 hours at 150° (Staedel, *A.* 259, 225). Golden plates, m. sol. alcohol.

s-Nitro-*m*-toluidine

$C_6H_4Me(NH_2)(NO_2)$ [1:3:5]. [98°]. Formed from s-di-nitro-toluene (Becker, *B.* 15, 1138; Neville a. Winther, *C.* 41, 416; Staedel, *A.* 217, 199). Needles.— $B'HCl$. [56°]. Prisms.

Benzoyl derivative. [177°].

Nitro-*m*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1:3:2]. [53°]. Formed by reducing (2, 8, 1)-di-nitro-toluene (Limpriht, *B.* 18, 1401).— $B'HCl$.— $B'H_2SO_4$; tables, v. sol. hot water.

Acetyl derivative [186°]. Needles.

Nitro-*p*-toluidine $C_6H_4Me(NH_2)(NO_2)$ [1:4:3].

[118°]. Formed from acetyl-*p*-toluidine by nitration and hydrolysis (Beilstein, A. Kuhlberg, A. 155, 28; Lorenz, A. 172, 177; Hübner, A. 208, 818; Cosack, B. 18, 1088; Ehrlich, B. 15, 2009; Gattermann, B. 18, 1483; Lellmann, A. 221, 7; Nölting, B. 17, 268). Formed also by heating nitro-*p*-cresol with NH_4Aq at 180° (Barr, B. 21, 1543). Red monoclinic prisms, $a:b:c = 1.358:1.1755$; $\beta = 54^\circ 51'$ (Panbianco, G. 9, 358).— B'HCl .— B'HNO_3 : crystals, decomposed by water.

Acetyl derivative [95°]. Needles. Reduced by means of ammonium sulphide at b° to $\{\text{C}_6\text{H}_4\text{Me}(\text{NHAc})\}_2\text{N}_2\text{O}$ [196°] and the compound $\text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{N} \\ \text{NH.CMe} \end{smallmatrix} \text{O}$ [234°], whence B'HCl , $\text{B'H}_2\text{SO}_4$, and B'HNO_3 (Bankievitch, B. 22, 1396).

Trichloroacetyl derivative [55°].

Valeryl derivative [88°]. Yields on reduction $\text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \text{C}_4\text{H}_9\text{O}$ [145°].

Benzoyl derivative [43°]. Needles.

Nitro-*p*-toluidine $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)$ [1:4:2]. [77-5°]. Formed by reduction of (4, 2, 2)-di-nitro-toluene (B. a. K.) and, together with a small quantity of the preceding isomeride, by the action of nitric acid on a solution of *p*-toluidine in H_2SO_4 (Hübner, B. 10, 1716; Nölting, A. Collin, B. 17, 263; Foth, A. 239, 299). Monoclinic needles.— B'HCl . [220°].— B'HNO_3 .— $\text{B'H}_2\text{SO}_4$ 2aq: stellate needles.— B'AgNO_3 . [132°]. Greenish-yellow crystals (Mixer, Am. 1, 241).

Acetyl derivative. [144-5°]. Needles (Wallach, A. 234, 353).

Benzoyl derivative [172°]. Pale-yellow prisms (Bell, C. N. 30, 202).

Di-nitro-*o*-toluidine

$\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1:2:3:5]. [208°]. Formed from di-nitro-*o*-cresol and its ethers by the action of NH_3 (Staedel, B. 14, 900; A. 217, 185, 203; Van Romburgh, R. T. C. 8, 398; Barr, B. 21, 1543). Yellow prisms (from xylene).

Di-nitro-*m*-toluidine

$\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1:3:4:6]. [193°]. Formed from the ethyl ether of di-nitro-*m*-cresol and NH_4Aq at 100° (Staedel, A. 259, 220), and from $\text{C}_6\text{H}_3\text{MeBr}(\text{NO}_2)_2$ and NH_3 (Jackson, B. 22, 1232). Formed also by reducing (7)-tri-nitro-toluene (Hepp, A. 215, 368). Yellow crystals, yielding di-nitro-toluene [71°] on elimination of NH_3 .

Di-nitro-*p*-toluidine $\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1:4:3:5]. [168°]. S. (CS₂) 32 at 18°. Formed by nitration of acetyl- or benzoyl-*p*-toluidine and hydrolysis of the product (Beilstein, B. 13, 242; Hübner, A. 222, 73). Formed also by the action of ammonia on the ethers of di-nitro-*p*-cresol (Staedel, A. 217, 183). Needles, sl. sol. alcohol. Yields chrysianic acid on oxidation.

Acetyl derivative [195°]. Needles. Yields on reduction an azoxy-compound [236°], an azo-compound [244°], and $\text{C}_6\text{H}_3\text{N}_2\text{O}$ [256°]. The compounds $\text{C}_6\text{H}_3\text{Me}(\text{NO}_2) \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \text{CMe}$ [246°] and

$\text{C}_6\text{H}_3\text{Me}(\text{NH}_2) \begin{smallmatrix} \text{N} \\ \text{NH.CMe} \end{smallmatrix} \text{O}$ [266°] may also be got by reduction (Bankievitch, B. 21, 2404).

Trichloroacetyl derivative [142°]. Prisms or needles (Friedrich, B. 11, 1975).

Benzoyl derivative [188°]. Needles.

Vol. III.

An isomeric body [208°] is got by nitrating benzoyl-(2,1,4)-nitro-toluidine (Ounert, A. 173, 229).

Di-nitro-*p*-toluidine $\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [1:4:2:6]. [168°]. Formed from tri-nitro-toluene [82°] and ammonium sulphide (Tiemann, B. 3, 218; Beilstein, B. 13, 242; Staedel, A. 225, 884). Needles, v. sol. alcohol.

Di-nitro-*p*-toluidine $\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{NO}_2)_2$ [94°]. Formed by heating (β)-tri-nitro-toluene with alcoholic NH_3 at 100° (Hepp). Golden needles (from HOAc).

Tri-nitro-*m*-toluidine $\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{NO}_2)_3$ [1:3:2:4:6]. [136°]. Formed by the action of NH_3 on the ethyl ether of tri-nitro-*m*-cresol (Nölting, A. Salis, B. 15, 1864; A. Ch. [6] 4, 128; Staedel, A. 259, 222). Small cubes, sol. alkalis, forming a red solution.

NITRO-*p*-TOLUIDINE SULPHONIC ACID $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{NO}_2)(\text{SO}_3\text{H})$ [1:4:2:5]. S. 1603 at 15°. Formed by sulphonating nitro-*p*-toluidine (Limpricht, B. 18, 2183; Foth, A. 230, 298).— KA' aq .— BaA' 2aq .— PbA' 3aq ?

DI-NITRO-TOLYL-ACETIC ACID

$\text{C}_6\text{H}_3\text{Me}(\text{NO}_2)_2\text{CH}_2\text{CO}_2\text{H}$. [173°]. Formed by nitration (Senkowsky, M. 9, 856). Yields the ether MeA' [41°] and EtA' [68°] crystallising in needles.

NITRO-*p*-TOLYL-AMIDO-ACETIC ACID

[1:3:4] $\text{C}_6\text{H}_3\text{Me}(\text{NO}_2)\text{NHCH}_2\text{CO}_2\text{H}$. [190°]. Formed from nitro-*p*-toluidine and bromo-acetic acid (Plöchl, B. 19, 9; Leuckhart, B. 20, 24). Prisms.— $\text{NH}_4\text{A'}$.— BaA' 2aq .— PbA' 3aq : purple-red needles.

Ethyl ether EtA'. [65°]. Needles.

NITRO-*o*-TOLYLAMIDO-BENZOIC ACID [3:4:1] $\text{C}_6\text{H}_3(\text{NO}_2)(\text{NHCH}_2\text{CO}_2\text{H})\text{CO}_2\text{H}$. [211°]. Formed by heating *o*-toluidine with bromo-nitro-benzoic acid (Heidenleben, B. 23, 3451). Brown needles.— NaA' 2aq : red needles.

Ethyl ether EtA'. [106°]. Leaflets.

***m*-Nitro-*p*-tolyl-amido-benzoic acid**

$\text{C}_6\text{H}_3\text{Me}(\text{NHCH}_2\text{CO}_2\text{H})(\text{NO}_2)\text{CO}_2\text{H}$. [257°]. Formed from *p*-toluidine and bromo-nitro-benzoic acid (Schöpf, B. 22, 3288; H.).— NaA' : dark-red needles.

Ethyl ether EtA'. [115°]. Leaflets.

NITRO-DI-*p*-TOLYL-AMINE

$\text{NH}(\text{C}_6\text{H}_4)(\text{C}_6\text{H}_4\text{NO}_2)$. [85°]. The **benzoyl derivative** [167°] is formed, together with that of di-nitro-di-tolyl-amine [191°], by nitrating benzoyl-di-*p*-tolyl-amine (Lellmann, B. 15, 831).

Hexa-nitro-di-*p*-tolyl-amine

$\text{NH}(\text{C}_6\text{HMe}(\text{NO}_2)_3)_2$. [258°]. Formed from di-tolyl-nitrosamine and fuming HNO_3 (Lehne, B. 13, 1545). Trimetric crystals.

NITRO-TOLYL-ISOBUTYRIC ACID

[1:3:6] $\text{C}_6\text{H}_3\text{Me}(\text{NO}_2)\text{CH}_2\text{CHMeCO}_2\text{H}$. [189°]. Formed from iodo-isobutyl-toluene and dilute HNO_3 (S.G. 1.12) at 200° (Effront, B. 17, 2326).— AgA' : colourless plates.

NITRO-TOLYLENE-DIAMINE $\text{C}_6\text{H}_3\text{N}_2\text{O}$ &c. $\text{C}_6\text{H}_3\text{Me}(\text{NO}_2)(\text{NH}_2)$ [1:2:3:6]. [154°]. Obtained from its **acetyl derivative** [258°], which is got by nitrating di-acetyl-tolylene-diamine (Tiemann, B. 3, 9; Ladenburg, B. 8, 1211). Needles, with violet reflex. Yields a **di-benzoyl derivative** [245°] (Ruhemann, B. 14, 2656).

Nitro-tolylene-diamine. Benzoyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{NO}_2)(\text{NH}_2)(\text{NHBS})$ [1:2:5:6]. [189°].

S S

Formed by reducing benzoyl-di-nitro-toluidine (Hübner, A. 208, 817). Red needles (from water).

NITRO-TOLYLENE-DIAMINE $C_7H_7Me(NO_2)(NH_2)_2$, [1:6:4:2] ? [132°]. Formed by reducing (3,4,2,1)-tri-nitro-toluene (Tiemann, B. 9, 218). Red prisms (from water).

Tri-nitro-tolylene-diamine $C_7Me(NO_2)_3(NH_2)_2$, [1:2:4:6:3:5]. [222°]. Formed from $C_7Me(NO_2)_3Br_2$ and alcoholic NH_3 (Palmer, B. 21, 8501). Small yellow prisms.

NITRO-TOLYLENE-TETRA-METHYL-DIAMINE $C_7H_7Me(NO_2)(NMe)_2$, [63°]. Formed by nitration (Niementowski, B. 20, 1888). Prisms.

DI-NITRO-DI-TOLYL-ETHYLENE-DIAMINE $C_7H_7(NH.C_7H_7Me.NO_2)_2$, [195°]. Formed from (3,1,4)-nitro-toluidine and ethylene bromide. (Gattermann & Hager, B. 17, 779). Red plates.

NITRO-TOLYL-HYDRAZINE SULPHONIC ACID $C_7H_7Me(NO_2)(N_2H_3)(SO_3H)$ [1:2:4:5]. Formed from nitro-*p*-diazotoluene sulphonic acid and a cooled solution of $SnCl_4$ (Limpricht, B. 18, 2194). Tables.— BaA' , 3aq; yellow prisms.

NITRO-TOLYL-METHYLENE-PHTHALIDE
 $C_7H_7 \begin{array}{c} \diagup C=O \\ \diagdown C=O \end{array} (NO_2).C_7H_7$, [144°]. Formed from tolyl-methylene-phthalide by the action of nitrous acid, the resulting $C_7H_7 \begin{array}{c} \diagup C=O \\ \diagdown C=O \end{array} (NO_2).CH(NO_2)C_7H_7$, [133°] being boiled with dilute alcohol. (Heilmann, B. 23, 8163). Needles.

NITRO-TOLYL-METHYLENE-PHTHALIMIDINE $C_7H_7 \begin{array}{c} \diagup C=O \\ \diagdown C=O \end{array} NH$, [159°]. Formed from tolyl-methylene-phthalimidine and nitrous acid (Heilmann, B. 23, 3161). Needles (from alcohol).

NITRO-*m*-TOLYL-PROPIONIC ACID $C_7H_7Me(NO_2)C_2H_4CO_2H$, [130°–136°]. Formed from (2,5,1)-iodo-isobutyl-toluene and HNO_3 (S.G. 1:25) at 200° Effront, B. 17, 2327). Needles (from water).

DI-NITRO-DI-TOLYL-PROPIONIC ACID $(C_7H_7MeNO_2)_2CMe.CO_2H$, [129°]. Formed, together with the tetra-nitro-acid [226°] by nitrating di-tolyl-propionic acid (Haiss, B. 15, 1476). Yellowish crystals.

DI-NITRO-DI-*o*-TOLYL-SULPHAZIDE $C_7H_7N_2O_2S$ *is.* [2:4:1] $C_7H_7Me(NO_2)_2.NH.NF.SO_2.C_7H_7(NO_2)Me$ [1:4:2] ? [142°]. Obtained by the action of alcoholic SO_2 upon nitro-*o*-diazotoluene (Limpricht, B. 20, 1241). Small yellow prisms.

NITRO-TOLYL-THIOCARBAMIC ETHER [1:2:4] $C_7H_7Me(NO_2).NH.CS.OEt$, [96°]. Formed by boiling with alcohol nitro-tolyl-thiocarbimide, which is produced by the action of Ac_2O on phenyl-nitro-tolyl-thio-urea (Staudemann, Z. 16, 2337). Needles, v. sol. alcohol.

NITRO-TOLYL-THIO-UREAS. The following compounds have been prepared by Staudemann (B. 16, 2337) from $C_7H_7Me(NO_2)(NH_2)$ [1:2:4]: $NH_2.CS.NH.C_7H_7Me(NO_2)$, [176°]. [4:1] $C_7H_7Me.NH.CS.NH.C_7H_7Me(NO_2)$, [169°]. $CS(NH.C_7H_7Me(NO_2))_2$, [207°].

DI-NITRO-DI-*p*-TOLYL-UREA $CO(NH.C_7H_7Me.NO_2)_2$, *is.* [233°]. Formed from di-*p*-tolyl-guanidine, alcohol, and HNO_3 (S.G.

1:4) (A. G. Perkin, C. J. 37, 699). Needles (from xylene).

NITRO-URACIL v. NITRO-DI-OXY-PYRIMIDINE.

NITRO-URAMIDO-BENZOIC ACIDS. The three following acids are obtained by boiling the three di-nitro-uramido-benzoic acids with aqueous NH_3 (Griess, B. 5, 193):—
 $C_6H_4(NO_2)(NH.CO.NH).CO_2H$ [6:3:1]. Crystals.
 $C_6H_3(NO_2)(NH.CO.NH).CO_2H$ [4:3:1]. Needles.
 $C_6H_2(NO_2)(NH.CO.NH).CO_2H$ [2:3:1]. Plates.
 The isomeric $C_6H_3(NO_2)(NH.CO.NH).CO_2H$ [5:3:1] is formed, together with nitro-di-uramido-benzoic acid, by the action of potassium cyanate on nitro-amido-benzoic acid (Griess, B. 17, 2184). It yields the salt BaA' , 5aq.

Nitro-diuramido-benzoic acid $(NH_2.CO).N.C_6H_3(NO_2)CO_2H$ forms crystals (containing 2aq), and yields the salt BaA' , 7½aq. Three crystalline di-nitro-*m*-uramido-benzoic acids are got by nitrating *m*-uramido-benzoic acid. A di-nitro-*p*-uramido-benzoic acid is formed by nitrating *p*-uramido-benzoic acid.

NITROUS ACID v. NITROGEN, p. 567.

NITROUS ETHER v. ETHYL NITRITE.

NITRO-UVITIC ACID

$C_7H_7Me(NO_2)(CO_2H)$, [1:2:3:5]. [227°]. Formed, together with an isomeric $C_7H_7NO_6$, ½aq [250°] by nitrating uvitic acid (Böttiger, B. 9, 804; A. 189, 171). Prisms (containing 2aq).— K_2A' aq.— BaA' aq.— CaA' 3aq; needles, m. sol. hot water.

NITRO-VALERIC ACID $C_7H_7(NO_2).CO_2H$. Formed by the action of nitric acid on isovaleric acid and on di-isomyl ketone (Dessaignes, A. 79, 374; Bredt, B. 15, 2319; Brazier & Gosselo, A. 75, 262; Schmidt, B. 5, 602). Monoclinic tables.— AgA' : prisms (from hot water).

DI-NITRO-VINYL-FURFURANE

$C_7H_7(NO_2)O.CH:CH.NO_2$, [144°]. Formed by nitrating vinyl-furfurane (Prieb, B. 18, 1362). Yellow needles. Yields a dibromide [111°].

NITRO-VINYL-PHENOL. *Methyl derivative* $C_6H_4(NO_2)(CH:CH.NO_2)OMe$ [3:1:4]. [163°]. Formed from the methyl derivative of *p*-coumaric acid and HNO_3 (Einhorn & Grabfield, A. 243, 369). Yellow needles (from alcohol).

***o*-NITRO-*o*-XYLENE** $C_6H_4Me(NO_2)$, [1:2:4]. Mol. w. 151. [29°]. (258°). S.G. 1:139. Formed by nitration of *o*-xylene (Jacobsen, B. 17, 160). Long yellow prisms.

***c*-Nitro-*o*-xylene** $C_6H_4Me(NO_2)$, [1:2:3]. (250° i.V. at 739 mm.). S.G. 1:147. Formed, together with the preceding isomeride, by the action of H_2SO_4 and HNO_3 on *o*-xylene (Nölting & Foral, B. 18, 2669). Liquid.

***c*-Nitro-*m*-xylene** $C_6H_4Me(NO_2)$, [1:3:2]. (225°) at 745 mm. S.G. 1:112. Formed from nitro-xylidine [78°] by eliminating NH_3 (Grevink, B. 17, 2430), and, together with the (1,3,4)-isomeride, by nitration of *m*-xylene with HNO_3 and H_2SO_4 at 0° (N. & F.). Liquid.

***i*-Nitro-*m*-xylene** $C_6H_4Me(NO_2)$, [1:3:4]. (244° cor.). S.V. 184.5. Formed by nitrating *m*-xylene (Harmsen, B. 13, 1558) or its dihydride (Wallach, A. 258, 330), and by eliminating NH_3 from nitro-xylidine [123°] (G.). Liquid.

***s*-Nitro-*m*-xylene** $C_6H_4Me(NO_2)$, [1:3:5]. [75°]. (263° i.V.) at 739 mm. Formed by eliminating NH_3 from nitro-xylidine [70°] (Wroblewski, A. 207, 94; B. [2] 84, 832; Thol,

B. 18, 860; Nörling a. Forel, *B.* 18, 2678). Needles, volatile with steam.

Nitro-*p*-xylene $C_6H_4Me_2(NO_2)$ [1:4:2]. (289° i.v.) at 739 mm. S.G. 1.132. Formed by nitration of *p*-xylene (Jannasch, *A.* 176, 55; N. a. F.). Liquid.

***o*-Nitro-*m*-xylene** $C_6H_4Me_2(CH_2NO_2)$. Formed by the action of alkalis followed by HCl, on $O_2H \begin{matrix} \diagup C=C(NO_2)C_6H_4Me \\ \diagdown CO.O \end{matrix}$ (Heilmann, *B.* 23,

3164). Oil, with irritating odour.

Di-nitro-*m*-xylene $C_6H_4Me_2(NO_2)_2$ [1:3:4:2]. Mol. w. 196. [82°]. Formed, together with the isomeride [93°], by nitrating *m*-xylene with HNO_3 and H_2SO_4 at 5° (Grevingk, *B.* 17, 2422). Plates, v. sol. alcohol.

Di-nitro-*m*-xylene $C_6H_4Me_2(NO_2)_2$ [1:3:4:6]. [93°]. Formed by nitrating *m*-xylene or its dihydride (Luhmann, *A.* 144, 274; Fittig, *A.* 148, 5; Wallach, *A.* 258, 332). Crystals (from alcohol).

Di-nitro-*p*-xylene $C_6H_4Me_2(NO_2)_2$ [1:4:2:3]. [93°]. Formed, together with the isomeride [124°], by nitrating *p*-xylene (Rammer, *Zl.* [2] 9, 434; Fittig, *A.* 136, 307; 147, 17; Jannasch, *A.* 171, 79; Nörling, *B.* 19, 144; Lellmann, *A.* 228, 252). Monoclinic crystals. Yields xylylene-diamine [75°].

Di-nitro-*p*-xylene $C_6H_4Me_2(NO_2)_2$ [1:4:2:6]. [124°]. Needles.

Di-nitro-*p*-xylene $C_6H_4Me_2(NO_2)_2$ [1:4:2:5]. Formed in small quantity by nitrating *p*-xylene (L.). Long yellow needles (from alcohol).

Tri-nitro-*m*-xylene $C_6H_3Me_3(NO_2)_3$ [1:3:2:4:6]. Mol. w. 241. [a. 182°]. Formed by nitration of *m*-xylene or its dihydride (Luhmann; Grevingk; Tilden, *C. J.* 45, 416; Wallach, *A.* 258, 333). Crystals, insol. hot alcohol.

Tri-nitro-*p*-xylene $C_6H_3Me_3(NO_2)_3$ [1:4:2:3:5]. [140°]. Formed by nitration of *p*-xylene (Fittig; Nörling, *B.* 19, 145). Crystals (from benzene).

NITRO-*m*-XYLENE PHOSPHONIC ACID
 $C_6H_4Me_2(NO_2)PO(OH)_2$. Two acids of this formula, [100°] and [182°], are formed by nitrating *m*-xylene (a)-phosphonic acid (Weller, *B.* 20, 1722; 21, 1492). From *n*-xylene (b)-phosphonic acid an isomeric acid [107°] is obtained, and another isomeride [224°] may be obtained from *p*-xylene phosphonic acid.

NITRO-*m*-XYLENE SULPHONIC ACID
 $C_6H_4Me_2(NO_2)(SO_3H)$ [1:3:6:4]. [132°]. Formed by sulphonating nitro-*m*-xylene and by nitrating *m*-xylene (a)-sulphonic acid (Harmsen, *B.* 13, 1558; Limpriht, *B.* 18, 2191; Claus a. Schmidt, *B.* 19, 1418). Crystals. NaA' aq.—NaA' 2aq.—KA'—NH₄A'—BaA' 3aq.—CaA' 6aq. *s.* 6:35 at 18°.—MgA' 9aq.—CuA' 6aq.—PbA' 4aq.—AgA' aq.

Amide [179°] (L.); [187°] (C. a. S.).

Chloride [98°] (L.).

Nitro-*m*-xylene sulphonic acid
 $C_6H_4Me_2(NO_2)(SO_3H)$ [1:3:5:4]. [100°]. Formed, with the preceding and succeeding acid, by nitrating (1,3,4)-xylene sulphonic acid (C. a. S.). Plates.—KA'—NaA' aq.—BaA' 14aq.—CaA' 6aq.—PbA' aq.—CuA' 6aq.—AgA' aq.: needles, v. sol. water.

Amide [108°]. Needles.

Chloride [97°].

Nitro-*m*-xylene sulphonic acid

$C_6H_4Me_2(NO_2)SO_3H$ [1:3:2:4]. [144°]. Formed as above (C. a. S.). Plates (containing aq.).—KA' aq.—NaA' aq.—BaA' aq.—CaA' aq.—PbA' aq.—CuA' 2aq.—AgA' aq.

Chloride [96°]. Needles.

Amide [172°]. Needles.

Di-nitro-*xylene* sulphonie acid

$C_6H_4Me_2(NO_2)_2SO_3H$ [1:3:6:3:4]. [70°]. Formed, as well as the following isomeride, by nitrating *m*-xylene sulphonic acid (Claus a. Schmidt, *B.* 19, 1425). Plates.—KA'—NaA' aq.—BaA' 3aq.—CaA' 2aq.—PbA' 4aq.—CuA' 4aq.: pale-green plates.

Chloride [118°]. Crystals.

Amide [158°]. Needles.

Di-nitro-*xylene* sulphonic acid

$C_6H_4Me_2(NO_2)_2SO_3H$ [1:3:6:3:4]. Needles (containing 2aq) (Limpriht, *B.* 18, 2192; C. a. S.).—NaA' aq.—KA'—BaA' 3aq.—CaA' 3aq.—CuA' 2aq.—PbA' 3aq.: prisms.

Chloride [123°]. Prisms.

Amide [193°]. Prisms.

NITRO-*m*-XYLENOL $C_6H_3Me_2NO_2$ *is.*

$C_6H_3Me_2(NO_2)(OH)$ [1:3:2:4]. [68:5°]. Formed by nitrating *m*-xynol (Lako, *A.* 182, 32). Needles.—KA' 3aq.: dark-red plates.

Nitro-*m*-xynol $C_6H_3Me_2(NO_2)(OH)$. [95°]. Formed by the action of nitrous acid on the nitro-xylydine obtained by partial reduction of di-nitro-*m*-xylene (Pfaff, *B.* 16, 616, 1186). Needles.—KA' 2aq.: red crystals.

Methyl ether MeA'. [57°]. Needles.

(a)-Nitro-*p*-xynol

$C_6H_3Me_2(NO_2)(OH)$ [1:4:6:3]. [115°] (O.); [122°] (C. a. S.). Formed by oxidising nitroso-*p*-xynol (the oxim of phlorone) with alkaline K_2FeO_4 (Olivieri, *G.* 12, 162; Goldschmidt a. Schmid, *B.* 18, 569). Needles, sol. hot water.

(b)-Nitro-*p*-xynol $C_6H_3Me_2(NO_2)(OH)$. [236°]. Formed by nitrating *p*-xynol (O.). Oil.—BaA': purple scales.

(γ)-Nitro-*p*-xynol. [89°]. Formed by heating *p*-xynol sulphonic acid with fuming HNO_3 (O.). Light-yellow scales.—KA' aq.—BaA' aq.: light-yellow scales.

Nitro-*p*-xynol $C_6H_3Me_2(NO_2)(OH)$ [1:4:3:5]. [91°]. Formed by the action of nitrous acid on the corresponding nitro-xylydine (Von Kostanecki, *B.* 19, 2320). Buff-coloured plates; perhaps identical with the preceding isomeride.

*Nitro-*p*-xynol*. *Ethyl ether*

$C_6H_3Me_2(NO_2)(OEt)$. [85°]. Formed from *p*-xylydine by nitration and treatment with nitrous acid (Nörling, Witt, a. Forel, *B.* 18, 2667).

Di-nitro-*o*-xynol

$C_6H_3Me_2(NO_2)_2(OH)$ [1:2:3:5:4]. [128°]. Formed as a by-product by nitrating *o*-xylene (Nörling a. Pick, *B.* 21, 8158). Obtained also from (1, 2, 4)-xylydine. Needles, sl. sol. cold water.

Di-nitro-*o*-xynol

$C_6H_3Me_2(NO_2)_2(OH)$ [1:2:3:4:6]. [82°]. Obtained by nitrating and diazotising (1, 2, 3)-xylydine (N. a. P.). Orange-yellow needles, m. sol. water.

Di-nitro-*p*-xynol [121°]. Formed from *p*-xynol, H_2SO_4 , and HNO_3 (Kostanecki, *B.* 19, 2321). Yellow plates (from water).

NITRO-*m*-XYLENOL SULPHONIC ACID

$C_6H_3Me_2(NO_2)(OH)(SO_3H)$ [1:3:2:4:6]. Formed from nitro-xylydine sulphonic acid by the diazo reaction (Limpriht a. Sartig, *B.* 18, 2190; A.

230, 840).—BaA', 8aq.—PbA', 8aq. The *ethyl derivative* forms $C_6H_5Me_2(NO_2)(OEh)(SO_3K)aq$, crystallising in plates.

NITRO-*m*-XYLIDINE $C_6H_4Me_2(NO_2)$, *i.e.* $C_6H_4Me_2(NO_2)(NH_2)$ [1:3:5:4]. [76°]. Formed from acetyl-*m*-xylidine by nitration and saponification (Wroblewsky, A. 207, 91; Nölting a. Foral, B. 18, 2677). Orange needles.

Acetyl derivative. [178°]. Needles.

Nitro-*m*-xylidine

$C_6H_4Me_2(NO_2)(NH_2)$ [1:3:6:4]. [123°]. Formed by reduction of di-nitro-*m*-xylene (Fittig, A. 147, 18; Wallach, A. 258, 332) and by nitration of (1,3,4)-*m*-xylidine (1 pt.) dissolved in H_2SO_4 (10 pts.) (Nölting a. Collin, B. 17, 265). Orange needles.—B'HCl.—B'H₂SO₄.—B'H₂C₂O₄.

Acetyl derivative. [160°].

Diacetyl derivative. [116°].

Nitro-*s-m*-xylidine

$C_6H_4Me_2(NO_2)(NH_2)$ [1:3:4:5]. [54°]. Formed by nitration of *s-m*-xylidinol dissolved in 10 pts. of conc. H_2SO_4 (Nölting a. Foral, B. 18, 2679). Yellow needles. Volatile with steam.

Nitro-*m*-xylidine

$C_6H_4(GH_2)_2(NO_2)(NH_2)$ [1:3:2:4] or [1:3:4:2]. [78°]. Formed by reduction of di-nitro-*m*-xylene [82°] with alcoholic ammonium sulphide (Grevingk, B. 17, 2425). Yellow needles, sol. hot water.

Acetyl derivative. [149°]. White needles.

Nitro-*p*-xylidine $C_6H_4Me_2(NO_2)(NH_2)$ [1:4:5:2]. [142°]. Formed by nitration of acetyl-*p*-xylidine and saponification, or by nitration of *p*-xylidine dissolved in conc. H_2SO_4 (Nölting, Witt, a. Foral, B. 18, 2666). Formed also by reducing di-nitro-*p*-xylene (Kostanecki, B. 19, 2318). Brownish-yellow crystals. On reduction it gives the *para*-diamine [147°].

Acetyl derivative. [166°]. Needles.

Nitro-*p*-xylidine $C_6H_4Me_2(NO_2)(NH_2)$ [1:4:3:5]. [96°]. Formed by reduction of di-nitro-*p*-xylene [123°] (Fittig, A. 147, 22; Kostanecki, B. 19, 2320). Needles (from alcohol).

Acetyl derivative. [180°]. Needles.

Di-nitro-*p*-xylidine

$C_6H_4Me_2(NO_2)_2(NH_2)$ [1:4:3:5:2]. [203°]. Formed from tri-nitro-*p*-xylene and alcoholic NH_3 (Nölting, B. 19, 145). Needles (from HOAc).

Di-nitro-*p*-xylidine [192°]. Formed by reduction of tri-nitro-*p*-xylene (Bussenius a. Eisenstuck, A. 118, 165; Beilstein, A. 133, 45). Yellow needles.

NITRO-XYLIDINE SULPHONIC ACID

$C_6H_4Me_2(NO_2)(NH_2)SO_3H$ [1:3:2:6:4]. S. 0818 at 8°. Formed by nitrating xylidine sulphonic acid (Limpriecht a. Sartig, B. 18, 1289; A. 230, 338). Needles.—KA' 1½aq.—BaA', 1½aq.—PbA', aq.: yellow silky needles.

NITRO-XYLYLENE-DIAMINE $C_6H_4Me_2$, *i.e.* $C_6H_4Me_2(NO_2)(NH_2)_2$ [215°]. Formed by reducing tri-nitro-*m*-xylene (Bussenius a. Eisenstuck, A. 118, 159; Fittig, A. 143, 6; Wallach, A. 258, 333). Red prisms. With EtH at 105° it yields

crystalline $C_6H_4Me_2(NO_2)(NEt_2)(NHEt)$.—B'HCl.—B'H₂Cl.—B'H₂PtCl₂ 8aq.—B'H₂SO₄ 2aq.—B'(H₂SO₄) 2aq.—B''H₂SO₄.

NITRIL CHLORIDE *v.* Nitrogen oxychlorides, under NITROGEN, p. 670.

NOBLE METALS. The elements Gold, Ruthenium, Rhodium, Palladium, Iridium, Osmium, and Platinum are sometimes classed

together as the *noble metals*. The application of the term *noble* to metals is a survival of the alchemical notion of a close connexion between physical and moral properties. Gold was regarded by the alchemists as the purest metal, as that which most nearly approached their ideal element. As gold did not change when heated in air, and did not dissolve in any single acid, these two properties came to be looked on as characteristic; and when these properties were found to belong also to certain other metals these other metals were placed in the same class as gold. Silver dissolves in nitric acid, but it does not change by heating in air; hence Ag was often classed with Au as a noble metal. The term *noble* is applied in this article to the seven metals named above, as a convenient form of expressing the fact that these metals have many properties in common. The seven metals are all found uncombined in nature; they are all very lustrous, heavy, generally ductile and malleable, hard (except Au); some are not oxidised by heating in air, others combine with O at high temperatures.

Au has been known from prehistoric times. Pt was discovered about 1750; and the other Pt metals from 1803 to 1845. The name platinum is said to be derived from *platina del Pinto* (*platina* = diminutive of *plata* = silver), a name by which the natural alloy of the metal was known in New Granada, from whence it was first obtained. The names palladium and rhodium were given by Wollaston, who separated these metals from Pt ore, in 1803, the first suggested by the planet Pallas discovered about that time, and the second from *ρόδον* = a rose, in allusion to the colour of solutions of the salts of the metal. Tennant discovered two other metals in Pt ore, in 1803; he called one iridium, because of its many-coloured salts (*iris* = the rainbow), and the other osmium, because of the peculiar smell of its volatile oxide (*ὀσμη* = a smell). In 1845, Claus separated a sixth metal from Pt ore from the Ural, and called it ruthenium, in allusion to Russia.

Ru, Rh, Pd; and Ir, Os, Pt, form the second and third sections or families of Group VIII. in the periodic classification of the elements; the first family of this group is composed of Fe, Ni, and Co. Au belongs to Group I.; it is a member of the family Cu, Ag, Au. As Cu follows immediately after Fe, Ni, Co in the *long period* beginning with K and ending with Br, and as Ag follows Ru, Rh, Pd, in the *long period* Rb to I, so Au is placed in immediate succession to Os, Ir, Pt in the *long period* which, when it is complete, will begin with an alkali metal resembling Cs and end with a halogen more or less like I. Looking at the position of Au in the periodic scheme of classification (*v.* Table, p. 204, vol. II.) one may say that the relations of this element to Os, Ir, and Pt will be found very similar to the relations of Ag to Ru, Rh, and Pd, and also to the relations of Cu to Fe, Ni, and Co.

The table on page 629 presents some of the important properties of the metals Ru, Rh, and Pd.

These three metals form *oxides* MO and MO₂; Ru and Rh also form MO₃; Ru forms a volatile oxide RuO₃; Rh forms RhO₃; and PdO is known. The oxides MO are basic, forming salts

Spec. heats	.061	.053	.06
Occurrence and preparation	The metals Rh, Ru, and Pd, occur in small quantities in many Pt ores; they are usually separated in the form $2\text{NH}_4\text{ClMCl}_2$; on strongly heating these double chlorides, the metals remain.		
Physical properties	White, lustrous, hard, brittle, crystalline; less ductile and malleable than Pd; fuses in O-H flame.	Greyish-white, very hard, malleable, not very ductile; may be fused in O-H flame, and is thus obtained in crystals.	White, hard, lustrous, ductile and malleable; most fusible of the 3 metals. Crystallises in octahedral and also in hexagonal forms.
Chemical properties	Oxidised by heating powdered metal in air; also by heating with KOH or K_2CO_3 , forming K_2RuO_4 , which is sol. water. Combines with Cl at red heat; dissolves very slowly in <i>aqua regia</i> .	Oxidised at red heat, when in powder; combines with Cl at red heat; unacted on by any acid; but when alloyed with Pb, Cu, &c., dissolves in <i>aqua regia</i> . Fused with KHSO_4 , forms a soluble Rh-K sulphate. Absorbs H rapidly. When in very fine powder, decomposes H_2CO_3 to H and CO_2 , and $\text{C}_2\text{H}_6\text{O}$ to H and $\text{C}_2\text{H}_4\text{O}$.	Oxidises superficially at moderate temp.; at higher temps. the oxide is reduced. Absorbs H rapidly, probably forming a definite compound. Dissolves in hot conc. HClAq or H_2SO_4 ; also sol. HNO_3 and <i>aqua regia</i> .

$\text{MX}(\text{X} = \text{SO}_4, \&c.)$. Ru_2O_3 and Rh_2O_3 are also basic; the corresponding salts are M_3X . A few salts corresponding with RuO_4 have been isolated, but none derivable from RhO_4 or PdO_4 has been prepared. RhO_4 has not yet been proved to be basic. RuO_4 is not known, but a few salts (*ruthenates*) have been isolated in which RuO_4 forms the negative radicle, e.g. K_2RuO_4 . An acid HRuO_4 is known; the K salt (KRuO_4) is said to be isomorphous with KClO_4 and KMnO_4 . RuO_4 is a solid melting at c. 26°; it is very volatile; easily reduced to lower oxides; explodes at c. 108° giving RuO_3 and O; with KOH Aq it forms K_2RuO_4 . The chlorides generally correspond with the oxides MO , M_2O_3 , and MO_2 ; the chlorides form double chlorides with more positive chlorides; the salts $\text{MCl}_2 \cdot 2\text{XCl}$ are best regarded as salts of the acids H_2MCl_2 (e.g. K_2PdCl_4 and $(\text{NH}_4)_2\text{RuCl}_6$). The cyanides MCy form double salts; an acid H_2RuCy_2 is known. The sulphides generally correspond with the oxides MO , M_2O_3 , and MO_2 ; PdS forms thio-salts, Na_2PdS_2 , &c.; Rh_2S_3 dissolves in alkali sulphides: the sulphides M_2S_3 and MS_2 are therefore more or less acidic. The three metals form many ammoniacal compounds, which are best regarded as salts of various radicles obtained by replacing H in two or more NH_3 molecules by Ru, Rh, or Pd.

In the table on page 680 are presented some of the more important properties of the metals Os, Ir, Pt, and Au.

Au differs considerably in its chemical properties from Os, Ir, and Pt. The oxides of Os, Ir, and Pt are MO and MO_2 ; M_2O_3 , represented by Os_2O_3 and Ir_2O_3 ; OsO_4 . Very few salts of Os have been prepared as yet; OsO and Os_2O_3 are probably basic. OsO_4 is not known, but osmates, e.g. K_2OsO_4 , have been isolated. OsO_4 is solid, with low melting and boiling points; it is slowly soluble in water, seems to form very unstable salts with alkalis, but does not decompose carbonates. Os forms a peculiar acid $\text{H}_2\text{N}_2\text{Os}_2\text{O}_8$; perhaps $\text{HO.OsO}_4 \cdot \text{N.N.OsO}_4 \cdot \text{OH}$; it also forms ammoniacal bases, in which OsO seems to replace H, in N_2H_4 , and OsO_2 to replace H, in N_2H_5 . The acid H_2OsCy_2 is known. Very few salts of Ir are known; Ir_2O_3 is basic. The chloride IrCl_3 , corresponding to IrO_3 , is known; and also such salts as $\text{IrO}_3 \cdot \text{SO}_3$, in which an acid radicle seems to replace O in IrO_3 . Some iridates have been obtained, e.g. $\text{K}_2\text{O} \cdot 2\text{IrO}_3$. The acid H_2IrCy_2 , and salts of this acid, exist. Some ammoniacal bases are known, in which Ir seems to replace H, of N_2H_5 . A few salts corresponding with PtO are known, but they have been but little studied; PtO forms salts such as $\text{Pt}(\text{SO}_4)_2$. PtO also combines with some positive oxides to form salts $2\text{PtO} \cdot \text{RO}$, e.g. $2\text{PtO} \cdot \text{Na}_2\text{O}$. PtO also combines with acidic and basic oxides to form complex salts, e.g. $\text{PtO} \cdot 10\text{MoO}_3$ (or 10WO_3), $4\text{Na}_2\text{O} \cdot 2\text{H}_2\text{O}$. A very large number of salts of complex ammoniacal

<i>Spec. heats</i>	.0311	.0326	.0324	.0324
<i>Occurrence and preparation</i>	The three metals Os, Ir, and Pt, occur in small quantities, associated (? alloyed) with each other, and frequently with Ru, Rh, and Pd. They are usually separated as 2NH ₄ Cl.MOCl ₄ , and are obtained by strongly heating these compounds.			Occurs native, generally alloyed with Ag. Prepared by removing earthy impurities; or by crushing auriferous quartz, forming an amalgam of Au and Hg, and removing Hg by heat; sometimes by smelting, or by treatment with Cl &c.
<i>Physical properties</i>	White, with tinge of blue; very hard; crystalline; brittle; also a black, amorphous, powder. Os does not melt at the highest temp. of the O-H flame; it is the heaviest substance known.	White; lustrous; hard; crystalline; brittle, but fairly malleable at red heat; also a hard black powder. Melts in O-H flame.	Silver-white; very lustrous; fairly hard; very malleable and ductile; expands by heat less than any other metal. Melts in O-H flame.	Very lustrous, yellow metal; crystallises in octahedra; good conductor of heat and electricity; most malleable of all metals; very ductile. Also obtained as a lustreless, brown-yellow, powder.
<i>Chemical properties</i>	Oxidised readily, to OsO ₄ , by heating finely powdered metal in air; also oxidised by HNO ₃ , when in fine powder. Oxidised by fusion with KOH or KNO ₃ . Combines directly with Cl.	When finely divided, oxidises slowly when heated in air, and dissolves in <i>aqua regia</i> ; in compact form is insol. in all acids. Oxidised by fusion with KOH and KNO ₃ . Combines directly with Cl.	Not oxidised by heating in air or O, but by fusion with KOH. Dissolves in <i>aqua regia</i> . Combines directly with Cl. Absorbs H rapidly, and gives it off again at red heat.	Not oxidised by heating in air. Dissolves in <i>aqua regia</i> . Combines directly with Cl, Br, and I. Compounds are easily decomposed, yielding Au.

bases, containing Pt, are known. Pt is rather remarkable for the number of compounds which it forms with H and acidic radicles; these compounds are acids, and corresponding with each is a series of salts; the acids in question, are H₂PtCl₆, H₂PtCl₄, H₂PtBr₆, H₂PtI₆; H₂Pt(NO₃)₂Cl₂, H₂Pt(NO₃)₂, H₂PtO(NO₃)₂; H₂PtCy₂, H₂PtCyCl₂, H₂Pt(SCN)₂; H₂Pt₂S₄ (salts of H₂Pt₂S₄ exist).

Au forms three oxides, Au₂O, AuO, and Au₂O₃; Au₂O is slightly sol. cold water; a few salts corresponding with Au₂O₃ are known, e.g. Au(NO₃)₃; AuSO₄ corresponds with AuO. Au₂O₃ forms aurates, e.g. KAuO₄, by reacting with alkalis. The sulphides, Au₂S and AuS, form thio-salts with the alkali sulphides, e.g. NaAuS₂;

but these thio-salts have been examined very slightly. The chlorides are AuCl and AuCl₃; the acids HAuCl₄, HAuBr₄, and HAuCy₄, and salts of the form M'AuI₄, are known. The compounds of Au are easily decomposed with separation of Au.

The Pt metals fall into two families: (1) Ru, Rh, Pd, and (2) Os, Ir, Pt. The elements, as a group, possess the physical characters of metals very distinctly marked; but the existence of acidic oxides and sulphides points to the non-metallic nature of these elements. Au is physically more metallic, and chemically more non-metallic, than any of the other noble metals. For the relations of Au to Cu and Ag, and

the relations of this family to the members of Group VIII. (Fe, Ni, Co, Ru, Rh, Pd, Os, Ir, Pt), and also to the other members of Group I. (Li, Na, K, Rb, Cs), v. COPPER GROUP OF ELEMENTS, vol. ii. p. 250; v. also IRON GROUP OF ELEMENTS, this vol. p. 65. For details about the individual noble metals, v. GOLD, vol. ii. p. 647; Iridium, this vol. p. 46; OSMIUM, PALLADIUM, in this vol.; PLATINUM, RHODIUM, and RUTHENIUM in vol. iv.

M. M. P. M.

NOMENCLATURE. The nomenclature of chemistry is based on the system introduced by Lavoisier, De Morveau, Berthollet, and De Fourcroy in 1787. The leading principles laid down by the French chemists were (1) that every substance is to be regarded as an element until it is proved to be otherwise; (2) that the name of a compound is to exhibit the elements, and as far as possible the relative proportions of the elements, of which it is composed. The names given to elements are not based on any uniform principle; some are known by the names given them for centuries; more recently discovered elements are named, sometimes from the names of compounds of them well known before the elements were discovered, sometimes from the localities where the material was found from which the element was prepared for the first time, sometimes from a characteristic property of the element, sometimes from fanciful considerations, and sometimes to express the pride of the discoverer in his own nationality. To all more recently discovered metals have been given names ending in *um*. Binary compounds are designated by names ending in *ide*, this termination being applied to the name of the more negative element; thus all binary compounds of O are called oxides. As Cl is more negative than S, it is better to call S_2Cl_2 sulphur chloride than chlorine sulphide. When two oxides, chlorides, &c., of an element exist, they are generally distinguished by throwing the name of the more positive element into adjectival form, and using the termination *ic* to indicate more of the negative element, and *ous* to denote less of the negative element, relatively to a fixed quantity of the more positive element; thus the compounds $FeCl_2$ and $FeCl_3$ are known as ferrous chloride and ferric chloride respectively. When more than two oxides, chlorides, &c., of an element are known, it is customary either to use prefixes *di-* (or *bi-*), *tri-* (or *ter-*), &c., or to indicate the relative proportions of the elements by such prefixes as *hypo-* and *per-*. It is also customary to give names to certain oxides for the purpose of indicating their acidic character. Thus the five oxides of N have been named as follows at different times:

N_2O . Nitrous oxide; nitrogen monoxide (might also be called hyponitrous anhydride).

NO . Nitric oxide; nitrogen dioxide.

N_2O_3 . Nitrogen trioxide; nitrogen sesquioxide; nitrous anhydride.

N_2O_4 . Nitrogen dioxide; nitrogen tetroxide; nitroso-nitric anhydride; nitrogen peroxide.

N_2O_5 . Nitrogen pentoxide; nitric anhydride; nitrogen peroxide.

The same name—nitrogen dioxide—has been given to two different compounds, NO and NO_2 ;

and the name peroxide has been used for NO_2 and N_2O_5 . This illustrates a difficulty. The prefixes *mono-*, *di-*, &c. are sometimes employed to designate the first, second, third, &c., members of a series of oxides, chlorides, &c. of the same element, without implying anything as to the number of O, Cl, &c. atoms in the molecules of the various compounds; but the same prefixes are employed sometimes to imply one, two, &c. atoms of O, Cl, &c. On both systems of naming N_2O is called monoxide; on the first system NO is called dioxide, but on the second system it must be called monoxide; hence the second system of naming gives the same name to two different compounds. To get over this difficulty N_2O may be called dinitrogen monoxide, and NO mononitrogen monoxide; but such names are cumbersome. The prefix *per-* is generally employed to designate the highest compound of a series, i.e. the one with relatively most negative element; but a higher compound may be discovered; in such a case the prefix, if used at all, must be moved from the older to the more recently discovered substance. Salts are named from the acids of which they are metallic derivatives. If there are two acids containing the same elements, to that with relatively more of the negative radicle is given a name ending in *-ic*, and its salts are called *-ates*; to the other acid is given a name ending in *-ous*, and its salts are called *-ites*. By the use of prefixes *per-*, *hypo-*, &c., four or five acids and their salts may be named, e.g.

$HClO$. Hypochlorous acid.

$HClO_2$. Chlorous acid.

$HClO_3$. Chloric acid.

$HClO_4$. Perchloric acid.

Compounds which probably contain the OH group are generally called hydroxides, and those containing the SH group are called hydro-sulphides or sulphhydrates. These names more or less imply a special view of the structure of the compounds; as the same view is not always held by all chemists, it seems preferable to call a commonly occurring compound, such as KOH, potash, rather than potassium hydroxide. The nomenclature of organic chemistry must be based on certain conceptions regarding the structure of carbon compounds. These compounds are so numerous, and many of them show such small differences in empirical composition, while not a few are identical in composition, that it would be impossible to frame a systematic nomenclature without the help of the conceptions of molecular structure which lie at the root of organic chemistry. In other words, names cannot be found for the vast variety of carbon compounds without considering the properties and functions of these compounds as well as their composition; but the only way we have of expressing, at present, the chemical properties of carbon compounds is in terms of the molecular and atomic theory. For complicated examples v. AZO-COMPOUNDS, vol. i. p. 369; for some simpler cases v. HYDROCARBONS, vol. ii. p. 715.

No attempt is made in this article to trace the historical development of chemical nomenclature, nor to discuss fully the present systems of naming used in the science. Chemical nomenclature is a subject the details of which must be

learned gradually by studying chemical substances and their reactions. The article NOMENCLATURE in the first edition of this Dictionary contains references to the more important older memoirs on the subject. In addition to these should be added a report on chemical nomenclature by a committee of the British Association (B. A. 1884. 89). Reference should also be made to the suggestions of the Council of the Chemical Society (C. J. 35, 277). M. M. P. M.

NONADECANE v. ENNDECANE.

NONANE v. ENNANE.

NONAPHTHENE C_9H_8 . (136° cor.). S.G. $\frac{23}{20}$. 763. H.C.v. 1,880,900. H.C.p. 1,383,400. Occurs in Russian petroleum (Markownikoff, J. R. 15, 831; Ossipoff, J. R. 20, 645). It is ψ -Cumene hexahydride as it yields ψ -Cumene sulphonic acid on treatment with H_2SO_4 (Konovaloff, C. C. 1887, 1133; J. R. 22, 4, 118). Br and AlBr₃ yield tri-bromo- ψ -Cumene. Nitric acid (S.G. 1.4) yields $C_9H_7NO_2$ (219°), which on reduction yields $C_9H_7NH_2$ (172°-177°), S.G. $\frac{2}{2}$.873, smelling like coniine. Chlorine yields C_9H_7Cl (186°), whence C_9H_7I (110° at 200 mm.), C_9H_7OAc (209°), and C_9H_7OH (191°), S.G. $\frac{23}{20}$.8972 may be successively derived. Nonaphthyl iodide is converted by Ag_2O into $(C_9H_7)_2O$ (301°), S.G. $\frac{23}{20}$.866. Nonaphthylene C_9H_8 . (136°), S.G. $\frac{2}{2}$.807 may be obtained from nonaphthyl chloride.

Isnonaphthene C_9H_{10} . (15°). H.C.v. 1,881,700. H.C.p. 1,384,200. Occurs also in Russian petroleum.

NONIC ACID $C_9H_8O_2$. [187°]. Formed by the action of bromine and alcoholic potash on isopropyl-isovaleric acid (Wohlbrück, B. 20, 2336). Plates.

NONOIC ACID v. ENNOIC ACID.

NONYL. The radicle C_9H_{19} , called ENNYL in this Dictionary.

Di-nonyl is OCTODECANE.

NONYL ALCOHOL v. ENNYL ALCOHOL.

NONYLENE v. ENNYLENE.

NONYLENIC ACID v. ENNENIC ACID.

NONYLIC ACID v. ENNOIC ACID.

NORMETHYLHEMIPIC ACID v. Methyl derivative of DI-OXY-PHTHALIC ACID.

NORMETHYLNITROHEMIPIC ACID v.

Methyl derivative of NITRO-DI-OXY-PHTHALIC ACID.

NORNARCOTINE v. NARCOTINE.

NOROPIANIC ACID v. OPIANIC ACID.

NORWEGIUM Ng. (?) At. w. c. 219. This name was given by Dahl to a substance separated by him from *nickel-glance* from the Norwegian island of Osterö and ranked by him among the elements (B. 12, 1731; 13, 250). According to Prochazka (A. C. J. 2, 218) the element exists in some specimens of unrefined Pb (along with Bi, Cu, and Ni). The claim of Ng to rank as an element cannot be regarded as yet satisfactorily established. Ng is said to show great resemblances to Bi; to melt at c. 254°; to form a fusible oxide resembling Bi_2O_3 . The hydroxide is soluble in KOHq, also in a large excess of NH_3 or Na carbonate solution. If the oxide is Ng_2O_3 , the at. w. is approximately 219; if the oxide is NgO , the at. w. is approximately 146. M. M. P. M.

NOTATION. The expression of the composition, and, as far as possible, the properties, of compounds by the use of symbols and formulae. The subject is discussed sufficiently in the articles EQUATIONS, CHEMICAL (q. v. vol. ii. p. 433), FORMULÆ (q. v. vol. ii. p. 572), and ISOMERISM (q. v. this vol. p. 79). M. M. P. M.

NUCIN v. JUGLONE.

NUCITANNIN. Occurs in walnuts (Phipson, C. N. 20, 116). Decomposed by dilute acid into sugar and red amorphous rufic acid $C_{10}H_{10}O_2$, which yields the salts $CaC_{10}H_{10}O_2$ and $PbC_{10}H_{10}O_2$.

NUCLEIN v. PROTEIDS, Appendix C.

NUCLEO-ALBUMIN v. PROTEIDS, Appendix C.

NUCLEO-PROTEIDS v. PROTEIDS, Appendix C.

NUMBERS, LAW OF EVEN. Laurent (A. Ch. [3] 18, 266) said that the sum of the monovalent, trivalent, and pentavalent elements contained in any well-defined and stable compound is always an even number. This law of even numbers was long an article of belief among orthodox chemists. If by an n -valent element is meant one the atom of which combines directly with n other atoms to form a molecule, then there are several exceptions to the so-called law; e.g. the molecules $InCl_2$, $InCl_3$, and probably $InCl_4$ exist as gases; so do the molecules $FeCl_2$ and $FeCl_3$, the molecules WCl_4 and WCl_5 , &c. M. M. P. M.

NUPHARIN $C_{18}H_{24}N_2O_2$. An amorphous substance in the rhizome of *Nuphar luteum* (Grüning, J. 1882, 1156).

NUX VOMICA v. STRYCHNINE.

O

α -OCTADECANE $C_{18}H_{38}$. [28°] (517°). S.G. $\frac{2}{2}$.775; $\frac{2}{2}$.768. Occurs in paraffin from brown coal. Formed by reduction of stearic acid with HI and P and by the action of Na on ennyl iodide (Krafft, B. 15, 1703; 16, 1723; 19, 2221; 21, 2261). Hexagonal tables.

OCTADECINENE $C_{18}H_{34}$. [80°]. (184° at 15 mm.). S.G. $\frac{2}{2}$.8016. Formed by heating $C_{18}H_{36}Br_2$ with alcoholic potash (Krafft, B. 17, 1874). Plates.

OCTADECIC ACID $(C_8H_{17})_2CH.CO_2H$. [39°]. (above 300°). Prepared by heating di-octyl-malonic acid (Conrad & Bischoff, B. 13, 597). White crystals.

OCTADECYL ALCOHOL $C_{18}H_{37}OH$. [59°]. (210° at 15 mm.). S.G. $\frac{2}{2}$.8048; $\frac{2}{2}$.7849. Occurs in crude cetyl alcohol, and is prepared by reducing stearic aldehyde with zinc dust and acetic acid (Krafft, B. 16, 1723; 17, 1827).

Acetyl derivative [a. 81°]. (238° at 15 mm.).

OCTADECYL-BENZENE $C_{18}H_{38}$, $C_{18}H_{36}$. [86°]. (249° at 15 mm.). Formed from octadecyl iodide, iodo-benzene, and sodium (Krafft, B. 19, 2984). Yields a solid sulphonic acid.

OCTADECYLENE $C_{18}H_{34}$. [18°]. (179° at 15 mm.). S.G. $\frac{1}{4}$ 7910; $\frac{2}{4}$ 7881. Formed by distilling octadecyl palmitate (Krafft, B. 16, 8024).

Octadecylene $C_{18}H_{34}$. *Anthemens*. [64°]. S.G. 1.842. V.D. 127 (H=1). Obtained from *Anthemis nobilis* by extracting the blossoms with ligroin (Naudin, Bl. [2] 41, 483). Minute needles.

OCTADECYLENE BROMIDE v. DI-BROMO-OCTADECANE.

OCTADECYL IODIDE $C_{18}H_{37}I$. $\leq 33.5^\circ$ (K.). [48°] (S.). From the alcohol, I, and P (Krafft, B. 19, 2984; Schweizer, Ar. P. [3] 22, 763).

OCTADECYL-PHENOL $C_{18}H_{37}O$, $C_{18}H_{35}OH$. [84°]. (277° at 15 mm.). Formed by fusing octadecyl-benzene sulphonic acid with potash (Krafft, B. 19, 2985). Plates (from alcohol).

n-OCTANE C_8H_{18} . Mol. w. 114. (125°). S.G. $\frac{1}{4}$ 7188. V.D. 4.03 (Lemoine, Bl. [2] 41, 163). C.E. (0°-10°) 001186; (0°-100°) 001331 (Thorpe, C. J. 87, 217). S.V. 186.8. Occurs in American petroleum (Pelouze a. Cahours, A. 127, 197; Schorlemmer, C. J. 15, 419). Formed by the action of zinc and HClAq on sec-octyl iodide (Schorlemmer, C. J. 27, 1029), by the action of sodium-amalgam on n-octyl iodide (Zincke, A. 152, 15), and by the action of sodium on n-butyl iodide (Schorlemmer, A. 161, 280). Obtained also by distilling whale oil under pressure (Engler, B. 22, 595). Oil.

Iso-octane $Pr.CH_2.CH_2.Pr$. *Di-isobutyl*. (108°). S.G. $\frac{1}{4}$ 709; $\frac{2}{4}$ 698 (W.); $\frac{3}{4}$ 711 (Thorpe). C.E. (0°-10°) 001205; (0°-100°) 001401. $\mu_n = 1.3943$ at 16° (W.). $R_D = 64.47$. S.V. 184.5 (Schiff, A. 220, 88). V.D. 3.94. Formed by electrolysis of potassium isovalerate (Kolbe, A. 69, 261; C. S. Mem., 8, 378; C. J. 2, 157). Formed also by the action of sodium on isobutyl iodide and on a mixture of isoamyl and isopropyl iodides (Wurtz, A. 93, 112; 96, 364; Schorlemmer, Pr. 16, 37; A. 144, 188; W. O. Williams, C. J. 31, 541; 35, 125). Occurs also among the products of the distillation of whale oil under pressure (Engler, B. 22, 595). Oil.

Octane C_8Me_8 . *Hexa-methyl-ethane*. [97°]. (108°). Formed from tert-butyl iodide and sodium (Lwow, Bl. [2] 35, 169).

Octane C_8H_{18} . [13°]. V.D. 3.97 (obs.). S.G. 1.712. Formed by reduction of couline, coniceline, or conhydrine by prolonged heating with HI and P (Hofmann, B. 18, 12).

OCTANE DICARBOXYLIC ACID $C_8H_{14}O_4$. [184°-194°]. A product of the action of sodium on bromo-methyl-ethyl-acetic ether (Pagenstecher, A. 195, 121). Crystals (from water).

Octane dicarboxylic acid
OO.H.CH₂.CHMe.(CH₂)₄.CO₂H. [44°]. *Methyl-aselato acid*. Formed by heating the tetracarboxylic acid (Perkin, jun., C. J. 51, 218). Crystals.—Ag.A". *Ethyl ether Et.A"*. Oil.

Octane tetracarboxylic ether
(CO₂Et).CH.CHMe.(CH₂)₄.CH(CO₂Et). [275° at 60 mm.]. A product of the action of di-bromo-

methyl-pentamethylene on malonic ether (Perkin, C. J. 53, 217). Syrup.

Octane tetradeca-carboxylic ether
CO₂Et.CH₂.[C(CO₂Et)]₄.CH₂.CO₂Et. Formed from chloro-butane heptacarboxylic ether and sodium butane heptacarboxylic ether (Bischoff, B. 21, 2116). Viscid oil.

OCTENE v. OCTYLENE.
OCTENOIC ACID $C_8H_{14}O_2$, i.e.
Pr.CH₂.CH:CH.CH₂.CO₂H. (231°). Formed by distilling isobutyl-paraconic acid (Fittig, B. 21, 920; A. 255, 103). Oil.

Octenoic acids are also formed by oxidation of octenoic aldehyde (Fossek, M. 2, 622), and by reduction of suberene-carboxylic acid $C_{10}H_{16}O_2$ (Spiegel, A. 211, 119). They are volatile with steam.

OCTENOIC ALDEHYDE $C_8H_{14}O$. (150° at 18 mm.). Formed by heating isobutyric aldehyde with conc. NaOAcAq at 150° (Fossek, M. 2, 614). Liquid, volatile with steam. Forms a mirror with ammoniacal AgNO₃ and a crystalline compound with NaHSO₄. Yields acetic and isobutyric acids on oxidation.

Octenoic aldehyde $Pr.CH:CH.CHO$. (173°). Formed from butyric aldehyde and aqueous NaOH or NaOAc (Raupenstrauch, M. 8, 108). Oil. Reacts with phenyl-hydrazine. Yields $C_8H_{14}O$ (151°) on reduction with iron and HOAc.

Octenoic aldehyde $C_8H_{14}O$. (230° i.v.). S.G. $\frac{1}{4}$ 958. Formed by passing dry HCl into isobutyric aldehyde (Oeconomides, Bl. [2] 86, 209). Oil, resinified by potash. Reduces ammoniacal AgNO₃ forming a mirror.

OCTENYL ALCOHOL $C_8H_{17}O$ i.e.
CH₃.CH.CH₂.CH₂.OH. *Di-ethyl-allyl-carbinol*. (156°). S.G. $\frac{1}{4}$ 889. C.E. (0°-33°) 00104. Formed from di-ethyl ketone, allyl iodide, and zinc (Schirokoff a. Saytzeff, A. 196, 113). Oil. Yields di-ethyl-ketone and propionic acid on oxidation. With HCl it forms a compound converted by caustic potash into tri-oxy-octane. KMnO₄ yields $CH_3(CH_2)(OH).CH_2.CO_2H$. Dilute H₂SO₄ at 100° yields octenene (a. 128°) (Reformatsky, J. pr. [2] 80, 217).

Octenyl alcohol $OMePr(C_2H_5)(OH)$. (160°). S.G. $\frac{1}{4}$ 8486; $\frac{2}{4}$ 8345. Formed from methyl propyl ketone, allyl iodide, and zinc (Semljanitzin, J. pr. [2] 23, 263; Reformatsky, J. pr. [2] 40, 412). Yields $CMePr(OH).CH_2.CO_2H$ on oxidation.

OCTENYL CHLORIDE $C_8H_{17}.CH.CHCl$. (168°). S.G. $\frac{1}{4}$ 927. Formed from $C_8H_{17}Cl_2$ and alcoholic potash (Béhal, A. Ch. [6] 15, 278). Liquid, smelling like carrots.

OCTINENE C_8H_{14} , i.e. $CH_3C(C_2H_5)C_2H_3$. *Methyl-amyl-acetylene*. (133°). S.G. $\frac{1}{4}$ 771. Formed by the action of alcoholic potash on octylene bromide (derived from octylene got by dehydrating octyl alcohol) (Rubien, A. 142, 299; Béhal, Bl. [2] 47, 33; 48, 704; 50, 359, 629; A. Ch. [6] 15, 274, 428). Mobile liquid. Does not react with ammoniacal Cu_2Cl_2 . On dissolving in cold H₂SO₄ and pouring into ice-cold water it yields the ketone $C_8H_{14}O$ (171°). S.G. $\frac{1}{4}$ 835 which forms hexoic and acetic acids on oxidation.

Octinene C_8H_{14} , i.e. $CH_3C(C_2H_5)C_2H_3$. (125°-133°). Obtained by heating the preceding isomeride with sodium at 110° (Béhal). Liquid. Forms a yellow pp. with ammoniacal cuprous chloride.

Octinene C_8H_{14} . *Conylene*. (125°). V.D. 55.6 ($H=1$). Obtained by dry distillation of dimethyl-conine methoxy-hydroxide and by heating 'azooconhydrin' with P_2O_5 (Wertheim, A. 123, 170; Hofmann, B. 14, 710). Oil. Forms a di-bromide (v. Di-BROMO-OCTYLENE).

Octinene C_8H_{14} . *Diisocrotyl*. [5°]. (125°-180°). Formed from CH_3CHBr and sodium (Pribytek, J. R. 20, 506). Oil, rapidly absorbing oxygen.

Octinene $CH_3.CMe.CH_2.CH_2.CMe.CH_3$ (114°). Formed from $CH_3.CMe.CH_2Cl$ and sodium (Przybytek, B. 20, 3240).

Octinene C_8H_{14} . (c. 123°). S.G. $\frac{2}{4}$ 7734; $\frac{25}{4}$ 7588. R.p. 62.12. Formed by heating octenyl alcohol $CH_2=CH.CH_2.CEt.OH$ with dilute H_2SO_4 at 100° (Reformatsky, J. pr. [2] 30, 217). Mobile liquid, absorbing oxygen from the air. Combines with bromine. Oxidised to acetic and propionic acids by chromic acid mixture. Yields $C_8H_{14}Br_2$.

Isomerids: Xylene tetrahydride.

OCTINOYL ACID v. DI-ALLYL-ACETIC ACID.

OCTINOYL ALCOHOL $C_8H_{17}O$ i.e.

$(CH_3.CE.CH_2)_2CMe(OH)$. *Methyl-di-allyl-carbinol*. (158° cor.). S.G. $\frac{2}{4}$ 864; $\frac{15}{4}$ 852. H.C. 1,201,400 (Longuinine, A. Ch. [5] 23, 388). Formed from allyl iodide, acetic ether, and zinc (Saytzeff, A. Sorokin, B. 9, 33, 277; A. 185, 169). Yields oxy-methyl-glutaric acid on oxidation.

Acetyl derivative (177° cor.).

OCTODECANE v. OCTADECANE.

n-OCTOIC ACID $C_8H_{16}O_2$ i.e. $CH_3(CH_2)_6CO_2H$. *Caprylic acid*. Mol. w. 144. [17°]. (237° i.v.). S.G. $\frac{2}{4}$ 927 (Zander, A. 224, 71); $\frac{15}{4}$ 913; $\frac{25}{4}$ 908. M.M. 8.565 at 18.5°. S. 25 at 100°. H.C. 1,138,694 (Longuinine, A. Ch. [6] 11, 221); 1,145,600 (Stohmann, J. pr. [2] 43, 18). C.E. (0°-10°) 00092. S.V. 197.8. Occurs as glyceryl ether in butter (Lerch, A. 49, 214) in cocoa-nut oil (Fehling, A. 53, 399; Renesse, A. 171, 380), and in Limburg cheese (Iljenko, A. 55, 85). It occurs also in fusel oil from various sources. Formed by oxidation of n-octyl alcohol (Zincke, A. 152, 9) and by saponifying its nitrile which is formed by the action of bromine and NaOH on the amide of ennoic acid (Hofmann, B. 17, 1408). Formed also by oxidising di-oxy-stearic acid with alkaline $KMnO_4$ (Spiridonoff, J. pr. [2] 40, 248). White crystals, insol. cold water.

Salts.— BaA' . $\frac{2}{4}$ 62° at 20°.— CaA' . aq.— ZnA' . [186°].— PbA' . [84°].— CuA' . [266°].— AgA' : white curdy pp.

Methyl ether MeA' . (193°). S.G. $\frac{2}{4}$ 8942. S.V. 220.1. C.E. (0°-10°) 00094 (Gartenmeister, A. 233, 286).

Ethyl ether EtA' . Mol. w. 172. (206°). S.G. $\frac{2}{4}$ 8842. S.V. 245.9. C.E. (0°-10°) 00093.

Propyl ether PrA' . (225°). S.G. $\frac{2}{4}$ 8805. S.V. 270.3. C.E. (0°-10°) 00092.

Butyl ether C_4H_9A' . (240.5°). S.G. $\frac{2}{4}$ 8797. S.V. 295.9. C.E. (0°-10°) 00094.

Heptyl ether $C_7H_{15}A'$. (290°). S.G. $\frac{2}{4}$ 8754. S.V. 377.0. C.E. (0°-10°) 00086.

n-Octyl ether $C_8H_{17}A'$. (306°). S.G. $\frac{2}{4}$ 8755. S.V. 404.3. C.E. (0°-10°) 00084.

Phenyl ether PhA' . (300°).

Amide $C_8H_{15}ONH_2$. [106°]. S. 454 at 100°. Plates.

Anhydride $(C_8H_{15}O)_2O$. (c. 285°). (Chiozza, A. 85, 229).

Nitrile $C_8H_{13}CN$. (195°) (F.); (199°) (Hofmann, B. 17, 1410). S.G. $\frac{12}{4}$ 82 (Fellertar, Z. [2] 4, 665).

Iso-octoic acid $C_8H_{16}O_2$. (219°). S.G. $\frac{2}{4}$ 926; $\frac{10}{4}$ 911. S. 15 at 15°. Formed by oxidising iso-octyl alcohol (W. C. Williams, C. J. 31, 542; 35, 129). Liquid. — NaA' . — KA' . — MgA' . 2aq. — AgA' . Crystallises from hot water.

Ethyl ether EtA' . (175°).

Iso-octyl ether $C_8H_{17}A'$. (c. 280°).

Octoic acid $CH_3.Pr.CH_2.CHMe.CO_2H$. (c. 215°). Formed by oxidation of isodibutyl $C_8H_{17}O$ (Butlerow, A. 189, 70). Liquid. Probably identical with the preceding acid.

Octoic acid $CMe_2.CMe_2.CO_2H$? (210°-230°). Formed, in small quantity, by passing CO over a mixture of $NaOMe$ and $NaOAc$ at 200° (Geuther, A. Fröhlich, A. 202, 813).

Octoic acid $Pr_2CH.CO_2H$.

Di-n-propyl-acetic acid. (220°). S.G. $\frac{2}{4}$ 9215. Obtained by boiling di-propyl-acetoacetic ether with alcoholic potash or by heating di-propyl-malonic acid (Burton, Am. 8, 389; Fürth, M. 9, 317). — CaA' . 2aq. S. 9.57 at 0°; 1.65 at 80°. — BaA' . — AgA' . S. 123.

Ethyl ether EtA' . (183°).

Octoic acid $CH_3.Pr.CMe_2.CO_2H$. [18°]. (215°). Obtained from its ether, which is formed by the action of sodium on isobutyric ether (Brüggemann, A. 246, 149). Large hexagonal plates.

OCTOIC ALDEHYDE $C_8H_{16}O$. (171°). Occurs among the products of the distillation of castor oil soap (Limpricht, A. 93, 242; Bouis, A. Ch. [3] 48, 99; Städeler, J. pr. 72, 241; Dachauer, A. 106, 270; Béhal, B. [2] 47, 33, 163). Formed also by distilling a mixture of calcium octoate and calcium formate. Liquid. Combines with $NaHSO_4$. Yields a mirror with ammoniacal $AgNO_3$.

Oxim (222°).

Octoic aldehyde $C_8H_{15}CH=O$. (161°). Formed by reduction of octoic aldehyde (Rampenstrauch, M. 8, 108). Oil. Volatile with steam. Reduces ammoniacal $AgNO_3$.

OCTOICOSONOIC ALDEHYDE $C_{10}H_{18}O$ i.e. $C_8H_{15}CH(C_2H_5)CH_2(C_2H_5)CH_2(C_2H_5)CHO$. (c. 335°). A product of the action of alcoholic potash or of Ac_2O on heptoic aldehyde (enanthal) (Perkin, C. J. 43, 66). Oil. Yields a mixture of heptoic and hexoic acids on fusion with potash.

OCTONAPHTHENE $C_{18}H_{14}$. (113°). Occurs in Russian petroleum (Markownikoff, B. 20, 1851). Yields a very little tri-nitro-m-xylene on treatment with H_2SO_4 and HNO_3 . H_2SO_4 yields a sulphonic acid, the amide of which crystallises in needles [220°].

OCTYL. The radicle C_8H_{17} , which is also called CAPRYL.

Di-octyl v. HEXADECANE.

OCTYL ACETATE v. *Acetyl derivative of* OCTYL ALCOHOL.

DI-OCTYL-ACETONE v. METHYL HEPTADECYL KETONE.

n-OCTYL ALCOHOL $C_8H_{17}O$. Mol. w. 130. (135.5° i.v.). S.G. $\frac{2}{4}$ 8375 (Z.); $\frac{15}{4}$ 8301; $\frac{25}{4}$ 8249 (P.). C.E. (0°-10°) 00080. M.M. 8.880 at 20° (Perkin). S.V. 190.6 (Zander, A. 224, 84); 197.8 (Ramsay). Obtained from its acetyl derivative which occurs in the volatile oil of cow.

paramep (*Heracleum Sphondylium*), and in the oil of *H. giganteum* (Zincke, A. 152, 1; B. 4, 822; Möslinger, A. 185, 26). The butynyl derivative occurs in the ripe fruits of *Pastitaca sativa* (Renesse, A. 166, 80). Heated with ammoniacal ZnCl_2 at 280° it yields a mixture of mono- di- and tri- octyl-amines, the yield of mixed bases amounting to 70 per cent. of the alcohol used (Merz a. Gasiorowski, B. 17, 626).

Acetyl derivative $\text{C}_8\text{H}_{17}\text{OAc}$. (212° cor.). S.G. $\frac{4}{4}$ 8847 (G.); $\frac{15}{15}$ 8724; $\frac{25}{25}$ 8678 (P.). C.E. (0°-10°) 00094. S.V. 245-8 (Gartenmeister). M.M. 10-601 at 16.1° (Perkin, C. J. 45, 421).

Benzoyl derivative $\text{C}_8\text{H}_{17}\text{OBz}$. (306°).

Ethyl ether $\text{C}_8\text{H}_{17}\text{OEt}$. (183°). S.G. 11-79.

Sec-Octyl alcohol $\text{C}_8\text{H}_{17}\text{CH}(\text{OH})\text{CH}_3$. **Capryl alcohol. Methyl-hexyl-carbinol.** (179-5° cor.). S.G. $\frac{15}{15}$ 8236; $\frac{25}{25}$ 8178. M.M. 9-404 at 12.4° (Perkin). S.V. 191-3 (Schiff, A. 220, 103). $\mu_D = 1.4297$. $n_D = 65.67$ (Brühl, A. 203, 28). Formed by distilling sodium ricinoleate with NaOH (Bouis, A. 97, 34; Möschlin, A. 87, 111; A. Ch. [3] 44, 140; Limpricht, A. 93, 242; Neison, C. J. 27, 837; Schorlemmer, Pr. 16, 396; O. J. 27, 1029). Obtained also from *n*-octane with octyl chloride and octyl acetate (Schorlemmer, A. 152, 152). Yields methyl hexyl ketone on oxidation.

Acetyl derivative $\text{C}_8\text{H}_{17}\text{OAc}$. (193°).

Octyl alcohol $\text{C}_8\text{H}_{17}\text{O}$. **Di-isobutyl hydrate.** (180°). S.G. $\frac{4}{4}$ 841. Formed by chlorinating $\text{CH}_3\text{Pr.CH}_2\text{Pr}$, converting the resulting octyl chloride into octyl acetate, and boiling this with KOH aq (W. C. Williams, C. J. 35, 127). Yields an octoic acid on oxidation.

Octyl alcohol $\text{C}_8\text{H}_{17}\text{O}$. (c. 162°). S.G. $\frac{15}{15}$ 820. Formed at the same time as the preceding (W.). Yields on oxidation a ketone $\text{C}_8\text{H}_{15}\text{CO.C}_8\text{H}_{17}$ (160°).

Octyl alcohol $\text{CHET.CH}(\text{OH})\text{C}_6\text{H}_5$. (164°-168°). Formed from $\text{CH}_2\text{Br.COBr}$ and ZnEt_2 followed by water (Winogradoff, A. 191, 125). Sl. sol. water.

Octyl alcohol $\text{C}_8\text{H}_{17}\text{O}$. (174°-178°). S.G. $\frac{2}{2}$ 811. Obtained from octylene, by treatment with HI , the resulting octyl iodide being converted into octyl acetate by AgOAc (De Clermont, C. R. 66, 1211; A. 149, 38; Bl. [2] 12, 212). Yields a ketone $\text{C}_8\text{H}_{15}\text{O}$ on oxidation, and, on further oxidation, acetic and hexoic acids. Is probably identical with methyl-hexyl-carbinol.

Acetyl derivative. (c. 176°).

Tert-Octyl alcohol $\text{Pr}_2\text{CMe}(\text{OH})$. (161-5° cor.). S.G. $\frac{20}{20}$ 8236; $\frac{30}{30}$ 8151. Formed from di-propyl ketone, MeI , and zinc, followed by water (Saytzeff, J. pr. [2] 31, 320; Bl. [2] 45, 257). Yields acetic, propionic, and butyric acids on oxidation.

Acetyl derivative. (c. 175°). S.G. $\frac{20}{20}$ 8554. (160-5°). S.G. 28-838.

Tert-Octyl alcohol $\text{CET.Pr}(\text{OH})$. Formed from butyryl chloride or EtCOPr and ZnEt_2 followed by water (Butlerow, Bl. [2] 5, 17; Sokoloff, J. R. 1887, 595). Yields butyric, propionic, and acetic acids on oxidation.

Acetyl derivative. (177°).

Octyl alcohol $\text{CMe}_2\text{CH}_2\text{CMe}_2(\text{OH})$. **Isodibutol.** [c. -20°] (147°). S.G. $\frac{2}{2}$ 842. Formed from 'di-isobutylene' hydriodide and Ag_2O (Butlerow, A. 189, 58). Yields $\text{CMe}_2\text{CO}_2\text{H}$ and acetone on oxidation.

Sec-Octyl alcohol. (182°-186°). Obtained from *n*-octane by chlorination and conversion of the mixed octyl chlorides into acetates (Schorlemmer). Yields propionic and valeric acids on oxidation.

Acetyl derivative. (200°).

OCTYL ALLOPHANATE $\text{C}_8\text{H}_{17}\text{N}_2\text{O}_2$, i.e. $\text{C}_8\text{H}_{17}\text{O.CO.NH.CO.NH}_2$. (186°). Formed from octyl alcohol and Cl.CO.NH_2 (Gattermann, A. 244, 40). Silky needles, v. sol. hot alcohol.

n-OCTYLAMINE $\text{C}_8\text{H}_{17}\text{NH}_2$. (186°) (E.); (180°) (H. a. D.). Formed, together with di- and tri-octyl-amine, by heating octyl iodide with alcoholic NH_3 at 100° , or octyl alcohol with ammoniacal ZnCl_2 at 280° (Renesse, A. 168, 85; Merz a. Gasiorowski, B. 17, 629). Formed also by reducing nitro-octane (Eichler, B. 12, 1885), and produced by decomposition of the urea $\text{C}_8\text{H}_{17}\text{NH.CO.NH.CO.C}_6\text{H}_5$, [100°], which is produced by the action of KQBr on ennoic amide $\text{C}_8\text{H}_{17}\text{CO.NH}_2$ (Hofmann, B. 15, 773; Hoggewerff a. van Dorp, R. T. C. 6, 387). Oil. B^+HCl .— $\text{B}^+\text{H}_2\text{PtCl}_6$.—Picrate [113°]. Plates (H. a. D.).

Sec-Octylamine $\text{C}_8\text{H}_{17}\text{CH}(\text{NH}_2)\text{CH}_3$. **Caprylamine.** (175°) (B.); (163°) (Jahn, M. 8, 172). Formed, together with the di- and tri-octyl-amines, by heating iso-octyl chloride with aqueous NH_3 (Malbot, C. R. 105, 575; A. Ch. [6] 13, 507; cf. Squire, C. J. 7, 108; Cahours, A. 92, 339; C. R. 39, 254; Bouis, A. Ch. [8] 44, 139). Formed also by heating the alcohol with ammoniacal ZnCl_2 at 260° (Merz a. Gasiorowski, B. 17, 634). B^+HCl .— B^+HI .— B^+HAuCl_4 .— $\text{B}^+\text{H}_2\text{PtCl}_6$.— B^+HNO_3 .— $\text{B}^+\text{H}_2\text{SO}_4$: crystalline, v. sol. water.

Di-n-octyl-amine $(\text{C}_8\text{H}_{17})_2\text{NH}$. (37°). (298°). V.D. 8-27 (obs.).— B^+HCl .— $\text{B}^+\text{H}_2\text{PtCl}_6$: nearly insoluble yellow plates (M. a. G.).

Di-iso-octyl-amine. (260°-270°). V.D. 8-49 (obs.).— B^+HCl .— B^+HAuCl_4 .— $\text{B}^+\text{H}_2\text{PtCl}_6$.

Tri-n-octylamine $(\text{C}_8\text{H}_{17})_3\text{N}$. (367°). Solid, sl. sol. 90 p.c. alcohol.— $\text{B}^+\text{H}_2\text{PtCl}_6$.

Tri-iso-octyl-amine $(\text{C}_8\text{H}_{17})_3\text{N}$. (c. 370°). Oil.— $\text{B}^+\text{H}_2\text{PtCl}_6$: reddish-brown mass.

n-OCTYL-BENZENE $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_5$. [-7°]. (263°). S.G. $\frac{4}{4}$ 849. Formed from bromobenzene, *n*-octyl bromide, and sodium (Schweinitz, B. 19, 641; Ahrens, B. 19, 2718).

Octyl-benzene $\text{Pr.CH}_2(\text{CH}_2)_6\text{C}_6\text{H}_5$. (245°-255°). Formed by heating phenacyl-isoamyl-malonic acid with zinc-dust, (Paal a. Th. Hoffmann, B. 28, 1502). Oil, with blue fluorescence.

References.—Bromo-, Chloro-, and Iodo-OCTYL-BENZENE and OCTYL-PHENYL-AMINE.

n-OCTYL-BENZENE SULFONIC ACID $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{SO}_3\text{H}$. Formed by sulphonation of *n*-octyl-benzene (Schweinitz, B. 19, 642).— BaA'_2 , aq .— PbA'_2 , aq .— AgA'_2 , aq : minute soluble prisms.

n-OCTYL-BENZOIC ACID $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{O}_2$, i.e. $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{CO}_2\text{H}$ [14]. [139°]. Formed by saponifying its nitrile which is obtained by distilling the formyl derivative of *p*-octyl-phenylamine with zinc-dust, (Beran, B. 18, 138). Plates or needles.— AgA' .

Nitrile $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{ON}$. (c. 312° uncor.).

OCTYL BROMIDES. Formed from the corresponding alcohols, Br, and P (Zincke, A. 151, 5; Lachovitch, A. 220, 181).

$\text{CH}_3(\text{CH}_2)_7\text{CH}_2\text{Br}$. (199°) (Z.); (204° cor.) (Perkin). S.G. $\frac{1}{4}$ 1.1180; $\frac{1}{2}$ 1.1099.

$\text{C}_8\text{H}_{17}\text{CHBrCH}_2$. (188°). S.G. $\frac{1}{4}$ 1.099.

OCTYL CARBAMATE $\text{NH}_2\cdot\text{CO}_2\text{C}_8\text{H}_{17}$. (55°). (281°). Formed from *sec*-octyl (capryl) alcohol and ONCl at 100° (Arth, *Bz.* [2] 45, 703; *A. Ch.* [6] 8, 480). Crystals, v. sol. alcohol.

***n*-OCTYL CHLORIDE** $\text{CH}_3(\text{CH}_2)_7\text{CH}_2\text{Cl}$. Mol. w. 148.5. (180°) (Zincke, *A.* 152, 4); (183° cor.) (Perkin). S.G. $\frac{1}{4}$.8786; $\frac{1}{2}$.8719. M.M. 10.128 at 18°. Formed from *n*-octyl alcohol.

Sec-Octyl chloride $\text{C}_8\text{H}_{17}\text{CHClCH}_3$. (172° cor.). S.G. $\frac{1}{4}$.8708; $\frac{1}{2}$.8639. M.M. 10.248 at 18° (Perkin). Formed from *sec*-octyl alcohol and HCl (Bonis, *A.* 92, 398; Malbot, *Bz.* [3] 3, 68). Obtained also, together with the preceding isomeride, by chlorinating *n*-octane (Schorlemmer, *A.* 152, 152).

Octyl chloride $\text{Pr}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CHMe}\cdot\text{CH}_2\text{Cl}$. A mixture of this chloride with $\text{Pr}\cdot\text{CH}_2\cdot\text{CHCl}\cdot\text{Pr}$ is formed by chlorinating $\text{Pr}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{Pr}$ (Williams, *C. J.* 85, 127; cf. Schorlemmer, *A.* 144, 190).

Octyl chloride $\text{CMe}_2\cdot\text{CH}_2\cdot\text{CClMe}_2$. (145°-150°). S.G. $\frac{1}{4}$.890. Formed from 'diisobutylene' and HCl at 100° (Butlerow, *A.* 189, 51).

Octyl chloride $\text{CET}\cdot\text{PrCl}$. (155°). (Butlerow, *Bz.* 5, 24).

***n*-OCTYLENE** C_8H_{16} . *Octene*. (123°). S.G. $\frac{1}{4}$.722. Formed from *n*-octyl alcohol, I, and P (Möslinger, *A.* 185, 52).

Octylene C_8H_{16} . (123°) at 750 mm. S.G. $\frac{1}{4}$.7294 (S.); $\frac{1}{2}$.7197 (Brühl, *A.* 235, 11). C.E. (9.9-123.4) .00188. μ_D 1.418. S.V. 177.2 (Schiff, *A.* 220, 90). Formed by heating *sec*-octyl alcohol with H_2SO_4 or fused ZnCl_2 (Bonis, *A.* 92, 396). Formed also, together with octyl bromide, by the action of P and Br on *sec*-octyl alcohol (Lachovitch, *A.* 220, 185). It is also a product of the action of NH_3Aq on *sec*-octyl iodide at 150° (Malbot, *A. Ch.* [6] 13, 514). Oil, with unpleasant odour. Not affected by cold alcoholic KOH. Is perhaps identical with the preceding octylene.

Octylene $\text{CMe}_2\cdot\text{CH}\cdot\text{CMe}_2$. *Diisobutylene*. (108° i.v.) (B.); (112°) (Malbot, *A. Ch.* [6] 19, 870; *C. R.* 108, 957). S.G. $\frac{1}{4}$.734. H.O. 1,252,500. H.F. 51,500. Formed by polymerisation of isobutylene by heating with H_2SO_4 (1 pt.) and water (1 pt.) at 100° (Butlerow, *B.* 8, 1683; 9, 1687; *A.* 180, 245; 189, 44; *J. R.* 1892, 190; Kononoff, *Bz.* [2] 34, 534). Yields acetone, $\text{CMe}_2\cdot\text{CO}\cdot\text{H}$, and ox., octoic acid on oxidation.

Octylene $\text{CMePr}\cdot\text{CHET}$. (120.4° cor.). S.G. $\frac{1}{4}$.7314. Formed in the action of MeI and Zn on di-propyl ketone (Sokoloff, *J. pr.* [2] 39, 444).

Octylene $\text{CETPr}\cdot\text{CHMe}$ or $\text{CET}\cdot\text{CHET}$. (119°). S.G. $\frac{1}{4}$.7365. A product of the action of EtI and zinc on ethyl propyl ketone (Sokoloff, *J. pr.* [2] 39, 440). Oil. Yields acetic, propionic, and butyric acids on oxidation.

Octylene $\text{PrCH}\cdot\text{CHPr}$. (116°-120°). Formed from $\text{PrCH}(\text{OH})\cdot\text{CH}(\text{OH})\text{Pr}$ and HI at 140°, followed by alcoholic potash (Fossek, *M.* 4, 673).

Octylenes of undetermined composition have been prepared by Schorlemmer (*A.* 125, 118), Cahours (*J.* 1850, 402; 1863, 529); Ranard (*Bz.* [2] 39, 541), Wurtz (*A.* 128, 280), Cléoz (*B.* 7, 823), Williams (*B.* 10, 908), Thorpe & Young (*A.* 165, 14), and Fittig (*A.* 117, 77).

OCTYLENE BROMIDE v. DI-BROMO-OCTANE.

OCTYLENE GLYCOL v. DI-OXY-OCTANE.

OCTYLENE OXIDE $\text{C}_8\text{H}_{16}\text{O}$. (145°). S.G. $\frac{1}{4}$.831. Formed by the action of KOH at 180° on the chloro-octyl alcohol formed by union of octylene with HOCl (Clermont, *C. R.* 63, 1328).

***n*-OCTYL IODIDE** $\text{C}_8\text{H}_{17}\text{I}$. (220°) (Möslinger, *B.* 9, 998); (225.5°) (Dobriner, *A.* 243, 29). S.G. $\frac{1}{4}$ 1.5533 (D.); $\frac{1}{2}$ 1.8407; $\frac{3}{4}$ 1.8316 (Perkin). C.E. (0°-10°) .00089 (D.). M.M. 16.197 at 20.7°. S.V. 222.6. Formed from the alcohol and HI.

Sec-Octyl iodide $\text{C}_8\text{H}_{17}\text{CHMeI}$. (211°). S.G. $\frac{1}{4}$ 1.81 (B.); $\frac{1}{2}$ 1.865 (Krafft, *B.* 19, 2222). Formed from the alcohol (Bonis, *A. Ch.* [3] 44, 131; Squire, *C. J.* 7, 108).

Octyl iodide $\text{C}_8\text{H}_{17}\text{I}$. (120° *in vacuo*). S.G. $\frac{1}{4}$ 1.314. Formed from octylene and HI (De Clermont, *Bz.* [2] 12, 212).

DI-OCTYL-MALONIC ACID $\text{C}_8\text{H}_{17}\text{O}_4$. *t.e.* (C_8H_{17}), $\text{C}(\text{CO}_2\text{H})_2$. [75°]. Crystals, insol. water (Conrad & Bischoff, *B.* 18, 597; *A.* 204, 163).

Ethyl ether Et.A. (338°). S.G. $\frac{1}{4}$.896.

OCTYL NITRITE $\text{C}_8\text{H}_{17}\text{ONO}$. (176°). S.G. $\frac{1}{4}$.882. Formed from octyl alcohol and HNO_3 (Eichler, *B.* 12, 1887).

Sec-Octyl nitrite $\text{C}_8\text{H}_{17}\text{CHMeONO}$. (165°). S.G. $\frac{1}{4}$.881. Formed by the action of glyceryl trinitrate on *sec*-octyl alcohol (Bertoni, *G.* 16, 520). Oil, v. sol. ether.

OCTYL OXIDE (C_8H_{16}), O . (292°). S.G. $\frac{1}{4}$.8204. C.E. (0°-10°) .00088. S.V. 403.6. Formed from $\text{C}_8\text{H}_{17}\text{ONa}$ and $\text{C}_8\text{H}_{17}\text{I}$ (Möslinger, *A.* 185, 56; Dobriner, *A.* 243, 10).

***n*-OCTYL-PHENYL-AMINE** $\text{C}_8\text{H}_{17}\cdot\text{C}_6\text{H}_5\cdot\text{NH}_2$. —B'HCl.—B' $\frac{1}{2}$ H_2SnCl_4 (Ahrens, *B.* 19, 2725).

p-Octyl-phenyl-amine [20°]. (310° cor.). Formed by heating octyl alcohol with aniline and ZnCl_2 at 280° (Beran, *B.* 18, 132).—B'HCl.—B' $\frac{1}{2}$ H_2SO_4 .—B' $\frac{1}{2}$ $\text{H}_2\text{C}_2\text{O}_4$: white plates.

Formyl derivative [56°]. Plates.

Acetyl derivative $\text{C}_8\text{H}_{17}\text{NHAc}$. [98°].

Benzoyl derivative. [117°]. Plates.

The corresponding derivative of *sec*-octyl-phenyl-amine melts at 109°.

***n*-OCTYL-PHOSPHINE** $\text{C}_8\text{H}_{17}\cdot\text{PH}_2$. (c. 186°). S.G. $\frac{1}{4}$.821. Formed by heating octyl iodide with PH_3 and ZnO (Möslinger, *A.* 185, 65).—B'HI: crystalline.

OCTYL SULPHATES.
n-Octyl-sulphuric acid $\text{C}_8\text{H}_{17}\cdot\text{O}\cdot\text{SO}_3\text{H}$ (Möslinger, *A.* 185, 62). Forms a sparingly soluble Ba salt, and an easily soluble K salt.

Sec-Octyl-sulphuric acid $\text{C}_8\text{H}_{17}\cdot\text{O}\cdot\text{SO}_3\text{H}$ (Bonis, *C. R.* 83, 144; 88, 935).—BaA, 8aq.—KA' aq.: pearly crystals.

***n*-OCTYL SULPHIDE** (C_8H_{17}), S . (above 810°). S.G. $\frac{1}{4}$.842. From the chloride and K_2S (Möslinger, *A.* 185, 59).

Sec-OCTYL SULPHOCYANIDE $\text{C}_8\text{H}_{17}\cdot\text{NS}$. *t.e.* $\text{C}_8\text{H}_{17}\cdot\text{CHMe}\cdot\text{SCy}$. (142°). From the iodide and potassium sulphocyanide (Jahn, *B.* 8, 805).

OCTYL-THIENYL METHYL KETONE $\text{C}_8\text{H}_8\text{S}(\text{C}_6\text{H}_5)\cdot\text{CO}\cdot\text{CH}_3$. (c. 352°). Formed, together with oily $\text{C}_8\text{H}_8\text{S}(\text{C}_6\text{H}_5)(\text{CO}\cdot\text{CH}_3)_2$ (which yields an oxim [58°]), by the action of AcCl on octyl-thiophene in presence of AlCl_3 (Schweinitz, *B.* 19, 646). Oil, volatile with steam.

***n*-OCTYL-THIOCARBIMIDE** $\text{C}_8\text{H}_{17}\cdot\text{N}\cdot\text{CS}$. (282°). Formed from *n*-octylamide (Jahn, *B.* 8, 804; *M.* 3, 178).

(α)-OCTYL-THIOPHENE $\text{C}_8\text{H}_{17}\cdot\text{C}_6\text{H}_4\text{S}$. (258°). S.G. $\frac{1}{4}$.8118. Formed from octyl

bromide, (α)-iodo-thiophene and Na in ether (Schweinitz, B. 19, 644). Oil.

References.—Bromo- and Iodo-octyl-thio-phenes.

OCTYL-THIOPHENY DICARBOXYLIC ACID $C_8H_{17}O_4S(CO_2H)_2$. [185°]. Formed by oxidising $C_8H_8(C_2H_5)_2(CO_2CH_3)_2$ with alkaline $KMnO_4$ (Schweinitz, B. 19, 648). Needles.— BaA'' 14aq.— CuA'' 24aq.— AgA'' 8aq: yellow, pp.

Sec-OCTYL-THIO-UREA $C_8H_{17}NH_2CS.NH_2$. [114°]. Formed from sec-octyl-thio-carbimide and NH_3 (Jahn, B. 8, 804; M. 8, 173). Plates.

OCTYL-TOLYL-AMINE $C_8H_{17}Me(C_6H_5)_2NH_2$. (325°). Formed by heating o-toluidine with octyl alcohol and $ZnCl_2$ at 280° (Beran, B. 18, 145). Oil.— $B'HCl$ — $B_2H_2SO_4$ — $B_2H_2C_2O_4$.

Acetyl derivative. [81°]. Needles.

Benzoyl derivative. [117°]. Plates.

OCTYL-UREA. Ennoyl derivative $C_8H_{17}NH_2CO.NH.CO.C_6H_5$. [97°]. From ennoic amide, Br, and $NaOH$ aq (Hofmann, B. 15, 760).

ENANTH-DIACETONAMINE. v. ACETON-AMINE.

ENANTHIC ACID v. HEPTOIC ACID.

ENANTHOL v. HEPTOIC ALDEHYDE.

ENANTHYLAMINE v. HEPTYLAMINE.

ENANTHYLIC ACID v. HEPTOIC ACID.

ENANTHYLIDENE v. HEPTINENE.

ENOGLUCIN $C_8H_{16}O_2$. [208.5°]. A substance resembling phloroglucin prepared from enolin, the red colouring matter of wine, by potash-fusion (Gautier, *Bl.* [2] 33, 583). Tables (containing 2aq), m. sol. water. Gives no colour with $FeCl_3$.

ENOLIN $C_8H_{16}O_2$? A colouring matter ppd. by adding lead subacetate to red wine (Glénard, C. R. 47, 268; Gautier, *Bl.* [2] 32, 103) or by adding lime (Varenne, *Bl.* [2] 29, 109). Its composition is variable.

OIAZTHIOLES. Derivatives of $\begin{smallmatrix} <N:CH> \\ <N:CH> \end{smallmatrix}$ S.

OILS. Liquids nearly or quite insol. water. In a more restricted sense, the term oil is applied to neutral liquids derived from plants or animals. Oils are said to be 'fixed' when they cannot be distilled either alone or with steam without undergoing decomposition; oils that can be so distilled being termed volatile or essential oils. Most of the fixed oils are glycerides of stearic, palmitic, and oleic acids (v. GLYCERIN). Fatty oils that absorb oxygen from the air and thus become slowly converted into varnishes are termed drying oils, e.g. linseed, hazel-nut, hemp, and poppy oils. Drying oils contain glycerides of linoleic and similar unsaturated acids (v. LINOLEIC ACID and FATS). Essential oils consist either wholly of hydrocarbons or of mixtures of hydrocarbons with compounds of carbon, hydrogen, and oxygen. These oxygenated compounds may be compound ethers (oil of chamomile), phenols (oil of thyme; oil of caraway), ketones (oil of rue), aldehydes (oil of cinnamon), or acids (oil of valerian). Many essential oils deposit a solid (stearoptene) on cooling strongly, leaving a liquid portion (elaoptene). Most of the essential oils contain terpenes or at any rate hydrocarbons of the formula $(C_5H_8)_n$ (v. TERPENES). The individual oils are described in their alphabetical places. See also FATS.

OLEANDRINE. A poisonous alkaloid [70°-75°], in the leaves of the oleander (Lukomski, J.

1861, 546; Betelli, J. 1875, 783). Minute crystals (by sublimation).

OLEFINES. Hydrocarbons, C_nH_{2n} , homologous with ethylene, so called from their property of combining with chlorine and bromine, even in the dark, forming oily dichlorides and dibromides (v. vol. ii. p. 716).

OLEIC ACID $C_{18}H_{34}O_2$. Mol. w. 282. [8°] (Schön, A. 243, 262; [14°] (Gottlieb). (223° at 10 mm.); (236° at 100 mm.) (Kraft a. Noerdlinger, B. 22, 819). S.G. 1.808. Occurs as glyceryl ether (triolein, vol. ii. p. 622) in most fixed oils and fats (Chevreul, *Recherches sur les corps gras*, p. 205; Varrentrapp, A. 35, 196; Laurent, A. Ch. [2] 65, 149; Gottlieb, A. 57, 40; Heintz, P. 83, 555; 89, 583; 90, 143; Berthelot, A. Ch. [3] 41, 243). Prepared by saponifying olive or almond oil with potash, decomposing the soap with tartaric acid, heating the separated fatty acids with PbO , extracting lead oleate with ether, shaking the extract with HCl aq, decanting and evaporating the ethereal solution.

Properties.—White needles or (above 14°) oil. Insol. water, v. sol. alcohol, miscible with ether. May be distilled by superheated steam at 250°. Neutral to litmus, but when impure it absorbs oxygen, becoming acid and rancid. Gives a crimson colour (Pettenkofer's reaction) when heated with sugar or furfuraldehyde and H_2SO_4 (Mylus, H. 11, 492).

Reactions.—1. Yields, on distillation, sebacic, acetic, and hexoic acids, CO_2 , CH_4 , C_2H_4 , and CO (Engler, B. 22, 593).—2. *Potash-fusion* gives acetate, palmitate, and hydrogen.—3. *Nitrous acid* converts it into the isomeric elaidic acid, which is solid.—4. *Nitric acid* oxidises it to acetic, propionic, butyric, valeric, hexoic, heptioic, octoic, ennoic, decoic, suberic, pimelic, adipic, and azelaic acids.—5. *Glycerin* yields on heating mono- and tri-olein.—6. *Bromine* combines, forming di-bromo-stearic acid (Overbeck, J. pr. 97, 159).—7. $HIAg$ and red P at 205° in sealed tubes yield stearic acid (Goldschmidt, *Sitz. W.* 72, 366; Muter, An. 2, 63).—8. Alkaline $KMnO_4$ gives azelaic acid and di-oxy-stearic acids [137°] (A. Saytzeff, J. pr. [2] 31, 541; *Bl.* [2] 45, 255).—9. *Iodine* (1 pb.) in sealed tubes at 270° forms stearic acid (Wilde a. Reychler, *Bl.* [3] 1, 295).—10. Conc. H_2SO_4 , followed by water, yields oxy-stearic acid [79°], oxy-stearic lactone [48°], and oily $C_{18}H_{32}O_2(CO_2SO_3H).CO_2H$ (Babaneff, *Bl.* [2] 46, 819; Geitel, J. pr. [2] 87, 74).

Salts.— KA' . S. 25 in the cold. Deliquescent. Its solution deposits a gelatinous acid salt when greatly diluted.— NaA' . S. 10 at 12°. S. (alcohol of S.G. .82) 5 at 18°. S. (boiling ether) 1.— LiA' .— CaA' .: granular pp.— $StrA'$.— BaA' .: crystalline.— BaH_2A' .: flocculent (Gösmann, A. 86, 822).— MgA' .— PbA' .: [c. 80°]. White powder, sol. boiling ether, turpentine oil, and ligroin.— PbA'_2O . [100°].— PbA'_2O_2 (Schön).— MnA' .: sl. sol. alcohol, v. sol. ether.— FeA' .: insol. alcohol; v. sol. ether.— AlA' .: sl. sol. ether.— $Hg_2A'_2$.: grey flocks, insol. water, sol. alcohol and ether.— ZnA'_2 .— CuA'_2 .— AgA' .

Methyl ether MeA' . S.G. 1.88. Oil.

Ethyl ether EtA' . (307°) at 807 mm. S.G. 1.875; 1.870. MM. 21.9 at 15° (Perkin).

Glyceryl derivatives v. vol. ii. p. 622.

Amide $C_{18}H_{35}O(NH_2)$. [78°] (R.); [75°]

(C.). Formed by the action of alcoholic ammonia on oil of almonds or oil of hazel-nuts (Rowney, *C. J.* 7, 200; Carlet, *Bl.* 1859, 73).

Elaïdic acid, [47°]. A polymeride of oleic acid produced by the action of nitrous acid on oleic acid. It may also be got by saponifying its glyceryl derivative, elaïdin, which is formed when olive oil is solidified by nitrous acid gas or by mercurous nitrate (Boudet, *A. Ch.* [2] 50, 391; Laurent, *A. Ch.* [2] 65, 149; Meyer, *A.* 85, 174; Gottlieb, *A.* 57, 54). Laminas (from alcohol), m. sol. ether. May be distilled. Acid to litmus. On fusion with potash it yields acetate and palmitate. Alkaline KMnO_4 forms di-oxy-stearic acid. Combines with bromine forming di-bromo-stearic acid [27°] (Burg, *Bl.* [2] 8, 191).

Salts.— NaA' : plates.— NaHA' .— AgA' .

Methyl ether MeA' . S.G. 15°-872. Oil.

Ethyl ether EtA' . S.G. 15°-869.

Glyceryl ether $\text{C}_3\text{H}_7\text{A'}$. *Flaïdin*. [32°].

Nodules, almost insol. alcohol.

Amide. [94°]. Formed from elaïdin and alcoholic NH_3 . Needles.

Iso-oleic acid $\text{C}_{18}\text{H}_{34}\text{O}_2$. [45°]. Formed by the action of alcoholic potash at 120° on iodostearic acid obtained from oleic acid* and HI (Michael a. Saytzeff, *J. pr.* [2] 35, 386; 37, 277; Benedikt, *M.* 9, 520). G. also by distilling, at 100 mm. pressure, oxy-stearic acid (v. **OLEIC ACID**, Reaction 10). Trimetric plates (from ether), insol. water, v. e. sol. alcohol, m. sol. ether.

Reactions.—1. Yields acetate and palmitate by potash-fusion.—2. KMnO_4 forms di-oxy-stearic acid [78°].—3. Bromine forms a liquid dibromide.—4. HI yields an oily iodostearic acid.

Salts.— NaA' .— ZnA' .

OLEIN v. GLYCERIN, *Oleyl derivative*.

OLIBANUM, *Incense*. A gum resin exuding from *Boswellia papyrifera*. It contains 7 p.c. essential oil, 72 p.c. of resin soluble in alcohol, and 20 p.c. of gum (arabin) (Stenhouse, *A.* 85, 306; Kurbatoff, *Z.* [2] 7, 201; *A.* 173, 1; cf. Braconnot, *A. Ch.* [2] 58, 60). The essential oil contains a terpene, olibene $\text{C}_{10}\text{H}_{16}$ (157°), S.G. 12°-863, and an oxidised substance. Olibene forms a hydrochloride $\text{C}_{10}\text{H}_{15}\text{HCl}$ [127°].

OLIVE OIL. S.G. 15°-913 (Long, *Am.* 10, 892). An oil expressed from olives (*Olea europaea*). It contains the glyceryl ethers of oleic and palmitic acids. The glycerides of unsaturated acids are present in greater quantity (87 p.c.) than those of saturated fatty acids (13 p.c.) (Hazura a. Grüssner, *M.* 10, 248).

OLIVIL $\text{C}_{18}\text{H}_{34}\text{O}_2$. [120°]. A neutral substance occurring, together with resin and a little benzoic acid, in the gum of the olive-trees. The resin is removed by ether, and the residue crystallised from alcohol (Pelletier, *A. Ch.* [2] 2, 105; 51, 196; Sobrero, *A.* 54, 67; Amato, *G.* 8, 88). Anhydrous crystals (from alcohol) of prisms containing Aq (from water). Reduces silver salts. Alkaline KMnO_4 yields vanillin. Conc. HIAq yields MeI and EtI.

OMICHOLIN $\text{C}_{18}\text{H}_{33}\text{NO}$? A red resin obtained, together with the similar omicholic acid from urine (Thudichum, *C. R.* 106, 1803).

OMPHALOCARPIN. A neutral substance in the fruit of *Omphalocarpum Procera* (Naylor, *Ph.* [8] 12, 478). Needles (from alcohol).

ONONERIN $\text{C}_{18}\text{H}_{34}\text{O}_2$. Occurs, together with ononin, in the root of *Ononis spinosa* (Hlasiwetz, *J. pr.* 65, 142). Hair-like crystals (from alcohol). Chlorine forms resinous $\text{C}_{18}\text{H}_{33}\text{Cl}_2\text{O}$.

ONONIN $\text{C}_{18}\text{H}_{34}\text{O}_{12}$. [35°]. A glucoside occurring in the root of the spinous rest-harrow (*Ononis spinosa*) (Reinsch, *Rep. Pharm.* [2] 26, 12; Hlasiwetz, *Sitzb.* W. 15, 142). Tasteless needles (from alcohol), sl. sol. boiling water, nearly insol. ethers. Its alcoholic solution is ppd. by lead subacetate.

Reactions.—1. Boiling baryta-water splits it up into formic acid and crystalline onospin $\text{C}_{18}\text{H}_{34}\text{O}_{12}$ [162°].—2. Dilute H_2SO_4 yields glucose and formonetin $\text{C}_{18}\text{H}_{34}\text{O}_8$, which is further split up by baryta-water into formic acid and ononetin $\text{C}_{18}\text{H}_{34}\text{O}_2$ [120°]. Formonetin and ononetin crystallise from alcohol. Ononetin and onospin are coloured red by FeCl_3 .

OPHIOXYLIN $\text{C}_{18}\text{H}_{34}\text{O}_2$? [72°]. S. 15 at 100°; S. (alcohol) 33 at 78°. Occurs in the root of *Ophiozylon serpentinum* (Bettink, *R. T. C.* 8, 319). Dimetric needles. Conc. H_2SO_4 colours it blood-red and, on warming, indigo-blue. Its alkaline solution is violet.

OPIANIC ACID $\text{C}_{18}\text{H}_{34}\text{O}_4$, *etc.*

$\text{C}_8\text{H}_7(\text{OMe})_2(\text{CH})_2\text{CO}_2\text{H}$. Mol. w. 210. [146°]. An acid obtained by the oxidation of narcotine (q. v.) (Liebig a. Wöhler, *A.* 44, 126; 50, 1; Blyth, *A.* 50, 29; Anderson, *Tr. E.* 20 [2] 347; Matthiessen a. Foster, *C. J.* 16, 345; 21, 357). It is also formed by the action of KMnO_4 and dilute HNO_3 on hydrastin (Freund a. Will, *B.* 19, 2799). Purified by passing a rapid current of nitrous acid gas (which does not affect it) through its boiling aqueous solution (Prinz, *J. pr.* [2] 24, 355). It may also be purified by etherification, the ether being subsequently decomposed by boiling with water (Liebermann a. Kleemann, *B.* 20, 881).

Properties.—Needles or prisms, v. sol. alcohol, ether, and hot water. Tastes bitter.

Reactions.—1. Readily oxidised to hemipic acid.—2. Reduced by sodium-amalgam to meconin.—3. Boiling conc. KOH aq yields hemipic acid and meconin.—4. Conc. HCl aq at 100° yields MeCl and $\text{C}_8\text{H}_7(\text{OMe})(\text{OH})(\text{CHO})\text{CO}_2\text{H}$. HIAq acts in like manner. Dilute HCl aq at 170° forms isovanillin $\text{C}_8\text{H}_7(\text{OMe})(\text{OH})\text{CHO}$ and protocatechuic aldehyde.—5. HNO_3 forms nitro-opianic acid, nitro-hemipic acid, and a compound $\text{C}_{20}\text{H}_{20}\text{N}_2\text{O}_{12}$.—6. PCl_5 yields a chloride reduced by zinc and HCl to meconin.—7. Heating with malonic acid, HOAc , and NaOAc forms $\text{C}_8\text{H}_7(\text{OMe})_2\text{CH}(\text{CH}_2\text{CO}_2\text{H})$ (Liebermann, *B.* 19, 2284).—8. H_2SO_4 (30 pts.) at 180° forms rufopir, a red colouring matter (Anderson, *C. J.* 9, 277; Liebermann a. Chojnacki, *B.* 4, 194).—9. Distillation with soda-lime yields methyl-vanillin.—10. Toluene-*o*-diamine forms a crystalline compound [243°] (Bistrzycki, *B.* 21, 2523).—11. Benzidine yields $\text{C}_{18}\text{H}_{19}\text{N}_2\text{O}_8$ (above 320°).—12. Urea forms $\text{C}_{11}\text{H}_{11}\text{N}_2\text{O}$ [259°].—13. Hydrazobenzene produces $\text{C}_8\text{H}_7(\text{OMe})_2\text{CH}(\text{CH}(\text{NPh})\text{NPh})$ [183°].

14. An alcoholic solution of hydroxylamine hydrochloride forms, on boiling, hemipimide, but in the cold it yields the isomeric oxim-anhydride $\text{C}_8\text{H}_7(\text{OMe})_2\text{CH}(\text{N}=\text{O})$ [115°] (Liebermann, *B.* 19,

2928). This body suddenly changes, at its melting-point, to hemipimide, with great rise of temperature.—15. *Aniline* in HOAc forms, on boiling, $C_6H_5(OMe)_2(CO_2H)CH:NPh$ [187°].—16. *Ammonia* forms opiammon $C_{22}H_{19}NO_4$, a yellowish powder, decomposed by water at 150° into NH_3 and opianic acid.—17. Aqueous *sulphurous acid* forms crystalline $C_{10}H_9O_4H_2SO_3$, whence the salts BaA' , 3aq and PbA' , 6aq may be obtained.—18. H_2S forms yellow amorphous $C_{10}H_9SO_3$.—19. *Phenol* and H_2SO_4 in the cold form amorphous opiaurin $C_{20}H_{15}O_6$, which forms a purple solution with potash.—20. *Phenylhydrazine acetate* forms $C_{10}H_9N_3O_4$ crystallising in needles [175°] (Liebermann, B. 19, 763).—21. *Salicylic acid* and $ZnCl_2$ form $C_{11}H_9O_4$ [140°], whence $C_{11}H_9AcO_4$ [152°] (Michael, Am. 5, 95).

Salts.— KA' , 2aq (Wegscheider, M. 3, 348).— KA' aq: triclinic plates.— BaA' , 2aq: efflorescent prisms.— PbA' , 2aq: sparingly soluble crystals. [150°].— PbA' , 2; tufts of silky prisms.— AgA' .

Methyl ether MeA' . [85°] (W.); [102°] (L.). Formed from the silver salt and MeI , or by boiling the acid with $MeOH$. Monoclinic.

Ethyl ether EtA' . [92°].

Propyl ether PrA' . [103°].

Acetyl derivative $C_{10}H_9AcO_4$. [121°].

Propionyl derivative. [111°]. Needles.

Anhydride $\{C_6H_5(OMe)_2(CHO)CO\}_2O$.

Triopianide. [234°]. Formed by heating the acid for two hours in a current of dry air. Needles (from acetone).

Oxim $C_6H_5(OMe)_2(CO_2H)CH:NOH$. [83°]. Formed from the acid (1 mol.), dilute KOH (4 mols.), and hydroxylamine hydrochloride (1½ mols.) in the cold (Perkin, jun., C. J. 57, 1071). Long slender needles, v. sol. alcohol. At 130° it suddenly becomes solid owing to the formation of hemipimide.

Di-phenyl-hydrazide

$C_6H_5(OMe)_2(CO_2H)CH:N.NPh_2$. [172°]. CaA' , 2aq.

Chloro-opianic acid

$C_6HCl(OMe)_2(CHO)CO_2H$. [211°]. Needles (Prinz, J. pr. [2] 24, 366).

Bromo-opianic acid. [192°]. (P.); [204°]

(Wegscheider, M. 4, 267). Needles.— BaA' , aq.

Nitro-opianic acid

$C_6H(NO_2)(OMe)_2(CHO)CO_2H$. [166°]. Formed by nitration of opianic acid (Prinz). Yellow prisms (from water). With acetone and dilute $NaOH$ aq it yields the tetra-methyl derivative of tetra-oxy-indigo dicarboxylic acid (Liebermann, B. 19, 352). *Aniline* in HOAc reacts, forming $C_6H(NO_2)(OMe)_2(CO_2H)CH:NPh$ [184°].— KA' , 3aq: prisms.— BaA' , 3aq: yellow needles.

Ethyl ether EtA' . [96°].

Acetyl derivative $C_{10}H_9AcNO_4$. Crystals.

Phenyl-hydrazide

$C_6H(OMe)_2(NO_2)(CO_2H)CH:N_2HPh$. [184°]. Red needles (Liebermann, B. 19, 764). By boiling with HOAc it is converted into 'nitro-opianyl-phenyl-hydrazine' $C_{11}H_{13}N_3O_4$ [173°].

Di-phenyl-hydrazide $C_{22}H_{19}N_3O_4$. [217°]. Prisms, sl. sol. ether (Bistrzycki, B. 21, 2520).

Nitroso-opianic acid?

$C_6H(OMe)_2(NO)(CHO)CO_2H$ [6:5:3:4:1]. [176°]. Formed by reducing nitro-opianic acid with $NaOMe$ (Kleemann, B. 20, 875). Long yellowish-green needles.— AgA' : felted needles.

Amido-opianic acid

$C_6H(NH_2)(OMe)_2(CHO)CO_2H$. Formed by reduction of nitroso-opianic acid (K).— HA' , HCl .

Acetyl derivative $C_{10}H_9N_2O_4$. [233°].

Phenyl-hydrazide

$C_6H(NH_2)(OMe)_2(CHO)CO_2H$. [143°]. Needles (Liebermann, B. 19, 227°).

Noropianic acid $C_6H_4(OH)(CHO)CO_2H$. [171° cor.]. Formed by heating opianic acid with $HIAc$. Crystals (containing 1½ aq).

Methyl derivative

$C_6H_4(OMe)(OH)(CHO)CO_2H$. [154°] (P.); [142°] (Wegscheider, M. 3, 790). Formed by heating opianic acid with $HClAq$ at 100°. Prisms (containing 2aq). Chlorine forms the chloro-derivative $C_6H_4ClO_2$. [206°]. On nitration it yields $C_6H(NO_2)(OMe)(OH)(CHO)CO_2H$ [203°], which crystallises in needles (containing aq), and yields an oxim decomposing at 252°, and converted by $HIOAc$ into the anhydride $C_6H_4N_2O_4$ [252°]; the nitro-acid also yields a phenyl-hydrazide [179°] converted by $HIOAc$ into an anhydride [191°] (Elbel, B. 19, 2706).— KA' , 2aq.— $BaC_6H_5O_4$ aq.

Iso-opianic acid v. Methyl derivative of Aldehyde-vanillic acid.

Iso-noropianic acid $C_6H_4(OH)(CHO)CO_2H$ [4:3:5:1]. [above 240°]. Formed by heating aldehyde-vanillic acid with $HClAq$ at 175° (Tiemann a. Mendelsohn, B. 10, 400). Needles.

Pseudopianic acid

$C_6H_4(OMe)_2(CHO)CO_2H$ [1:2:3:4]. [122°]. A product of the action of boiling dilute H_2SO_4 on berberol (Perkin, jun., C. J. 57, 1065). Slender needles (from hot water). When warmed with phenol and H_2SO_4 it gives a green colour, changing to violet-brown.— KA' .— AgA' : needles.

Oxim $C_6H_4(OH)(CHO)CH:NOH$. [124°]. Needles.

OPIANYL-ACETIC ACID $C_{12}H_{11}O_4$, i.e.

$C_6H_5(OMe)_2(CO_2H)CH(OH)CH_2CO_2H$. Formed, as barium salt, by boiling meconin-acetic acid (p. 198) with baryta water (Liebermann a. Kleemann, B. 19, 2292). The acid when liberated from its salts at once loses H_2O and is reconverted into its lactone: meconin-acetic acid.— $A'Ag$: crystalline pp.— A' , $BaAq$: prisms.

OPINIC ACID $C_6H_5O_3$. [148°]. Formed by the action of HI on hemipic acid (Liechti, Z. [2] 6, 196; A. Suppl. 7, 151; Bockett a. Wright, J. 1876, 809). Prisms (containing 2aq). Coloured violet by $FeCl_3$.

OPIONIN. [227°]. A substance present in small quantity in *Strychna Opium* (Hesse, A. 223, 299). Small needles, v. sl. alcohol, ether, and alkalis, v. sl. sol. water. Neutral to litmus. When fused with potash it yields opionic acid [126°].

OPIUM. The dried juice obtained from the unripe capsules of *Papaver somniferum*. It contains morphine, codeine, narcotine, narceine, thebaine, papaverine, meconic acid, and meconin. The quantity of morphine varies from 8 to 15 p.c. Hesse (A. 153, 47; Suppl. 8, 299) obtained also codamine, lantopine, laudanine, meconidine, cryptopine, protopine, laudanoline, and hydrocotarnine. Kauder describes tritopine (A. Ph. 223, 419). The three alkaloids morphine, codeine, and thebaine are strong bases, while papaverine, narcotine, and narceine are feeble bases. The various constituents of opium are described in their alphabetical position.

OPOPANAX. The dried juice obtained from the roots of the *Pastinaca Opopanax*. It contains 35 p.c. of gum, 2.8 p.c. of malic acid, and 42 p.c. of a resin which yields pyrocatechuic acid on fusion with potash (Pelletier; Hlasiwetz a. Barth, *J.* 1866, 630; Hirschsohn, *C. O.* 1877, 183).

ORANGE PEEL OIL. S.G. $\frac{30}{4}$ 8435. The essential oil of orange peel consists mainly of a terpene (174°), but contains also an aldehyde $C_{10}H_{16}O$ (224°–228°) (Wright, *C. J.* 18, 1186; 20, 552; Semmler, *B.* 24, 202). It contains no cymene (Hartley, *C. J.* 37, 677). Tanret (*Bl.* [2] 46, 501) got from orange peel resinous 'aurantiamaric acid' $C_{10}H_{12}O_4$, $[\alpha]_D^{25} = -28^\circ$, and uncrySTALLISABLE 'aurantiamarine' $C_{22}H_{32}O_{12}$? $[\alpha]_D^{25} = -60^\circ$, a very bitter substance.

ORCEIN $C_{12}H_8N_2O_4$. A colouring matter obtained from orcin by the action of aqueous ammonia and air. Purified by exhausting with ether, and crystallising from dilute alcohol (Zulkowsky a. Peters, *M.* 11, 227; cf. Robiquet, *A. Ch.* [2] 42, 245; 58, 320; Dumas, *A.* 27, 145; Laurent a. Gerhardt, *A. Ch.* [3] 24, 315; Liebermann, *B.* 7, 247; 8, 1649). Micro-crystalline mass, with metallic lustre; insol. water, ether, and CS_2 . Its solutions are crimson, but are turned bluish-violet by ammonia or potash.

ORCENE DIALDEHYDE. This name is given by Tiemann and Helkenberg (*B.* 12, 1003) to two isomeric $C_8H_6O_2$, $(CH_3)_2(C_6H_4)$, (α) [118°] and (β) [168°] formed, together with orceyl aldehyde $C_8H_6O_2$, by the action of chloroform and KOH upon orcin. The (α)-isomeride forms a di-anilide $C_8H_6O_2(OH)(CH_3NPh)_2$ [281°].

ORCIN $C_8H_6O_2$, i.e. $C_8H_6Me(OH)_2$ [1:3:5]. *Di-oxy-toluene*. *Methyl-resorcin*. Mol. w. 124. [108°] (Neville a. Winther, *C. J.* 41, 417); [57°] (when containing aq.). (c. 288). H.F.p. 109, 276 (Stohmann, *J. pr.* [2] 34, 315). Obtained by boiling orsellic acid with water or by action of alkalis on lecanoric, erythric, and evernic acids and picroerythrin, and also by dry distillation of the same bodies (Robiquet, *A. Ch.* [2] 42, 245; 58, 820; Liebig a. Will, *A.* 27, 147; Dumas, *A.* 27, 140; Schunck, *A.* 41, 159; 54, 269; Stenhouse, *Tr.* 1848, 85; *A.* 68, 93, 99; *Pr.* 12, 263; *C. J.* 18, 327; 20, 223; De Luynes, *A.* 128, 330; 130, 81; Lamparter, *A.* 134, 256). Formed also by potash-fusion from aloes (Hlasiwetz a. Barth, *A.* 134, 287); *p*-chloro-toluene sulphonic acid (Vogt a. Henniger, *C. R.* 74, 1107); toluene *m*-disulphonic acid; *s*-bromo-resorcin; *s*-di-bromo-toluene; and *s*-bromo-toluene sulphonic acid (Neville a. Winther, *C. J.* 41, 417). Formed also from nitro-*m*-cresol by reduction and application of the diazo-reaction.

Synthesis.—Acetone-di-carboxylic ether $OC(CH_3)_2CO_2Et$, when treated with sodium condenses to di-oxy-phenyl-acetic-di-carboxylic ether $C_6H_4(OH)_2(CO_2Et)_2$, CH_3CO_2Et , the latter by the energetic action of alkalis is converted into di-oxy-phenyl-acetic acid $C_6H_4(OH)_2CH_2CO_2H$, whose silver-salt on dry distillation yields orcinol (Cornelius a. Pechmann, *B.* 19, 1446).

Properties.—Monoclinic prisms (containing aq.), v. sol. water, alcohol, and ether. Sweet taste. Turns red in air. Its aqueous solution gives a white pp. with lead subacetate and a dark red pp. with $FeCl_3$. It reduces ammoniacal $AgNO_3$. Dry bromine forms tri-bromo-orcin.

Bromine water yields penta-bromo-orcin (Stenhouse a. Groves, *C. J.* 37, 408). Its solution is not rendered acid by borax. Nitrous acid gives an orange-pink colour in dilute solutions (Linda, *O. N.* 58, 1, 15). It forms a deliquescent compound with picric acid.

Reactions.—1. Air and ammonia yield orcein together with yellow $C_{12}H_8N_2O_4$, soluble in ether and an amorphous body, resembling litmus, in soluble in ether and alcohol (Zulkowsky a. Peters, *M.* 11, 227). Dry ammonia forms colourless crystals of $C_{12}H_8N_2O_4$.—2. Ammonium carbonate yields 'para-orcellin' acid $C_{12}H_8O_4$, aq. [151°] (Seahofer a. Brünner, *C. J.* 40, 265).—3. KOH and CO_2 form pseudo-orcellin acid (Schwarz, *B.* 13, 1643).—4. Heating with $HOAc$ (1½ pts.) and $ZnCl_2$ (2 pts.) forms crystalline $C_{12}H_8O_4$, as well as 'oraceticin' $C_{12}H_8O_4$, a yellow powder (Rasinski, *J. pr.* [2] 26, 56). On boiling orcin (9 g.) with $HOAc$ (18.5 g.) and phosphorus oxychloride (18 g.) there is formed $C_{12}H_8Me(OH)_2CO_2CH_3$ [146°] crystallising in needles.—5. Orcin (3 pts.) heated with acetoacetic ether (2 pts.) and a little H_2SO_4 at 100° forms insoluble $C_{12}H_8O_4$ [249°] which yields $C_{12}H_8AcO_4$ [200°] and $C_{12}H_8BrO_4$, crystallising in plates.—6. HNO_3 saturated with HNO_2 acting upon an ethereal solution of orcin forms a scarlet dye 'azo-orcin' $C_{12}H_8N_2O_4$, which forms an alkaline solution with orange-red fluorescence (Krämer, *B.* 17, 1832).—7. H_2SO_4 saturated with nitrous acid forms a dye $C_{12}H_8N_2O_4$, which yields alkaline solutions with red fluorescence and $C_{12}H_8N_2O_4$, which does not yield fluorescent solutions (K. Brunner, *B.* 21, 251).—8. A mixture of HNO_3 and HBr yields $C_{12}H_8BrNO_4$ and $C_{12}H_8MeBrNO_4$; the alkaline solutions of these bodies exhibit brown and red fluorescence respectively (Brunner, *B.* 21, 2484).—9. A mixture of HNO_3 (10 c.c. of S.G. 1.39) and HCl (30 c.c. of S.G. 1.2) on the water-bath yields $C_{12}H_8ClNO_4$, a greenish mass which yields $C_{12}H_8AcClNO_4$.—10. Chloral hydrate and water on boiling form crystalline $C_{12}H_8O_4$, whence $C_{12}H_8AcO_4$ [185°] (Michael a. Ryder, *Am. J.* 9, 135).—11. Fusion with NaOH yields resorcin, tetra-oxy-di-phenyl-methane, and finally phloroglucin (Barth, *M.* 3, 115).—12. Benzoic aldehyde and a little HCl give a white resin $C_{12}H_8O_4$ (M. a. R.).—13. Chloroform and dilute potash form, on boiling, two isomeric 'orcene dialdehydes' $C_8H_6Me(OH)_2(CHO)_2$ and 'orceylaldehyde' $C_8H_6Me(OH)_2CHO$ [177°] (Tiemann, *B.* 12, 999). Another product of the action of potash and chloroform on orcin is homofluorescein (vol. ii. p. 558) which is probably orcin-aurin $C_{12}H_8O_4$, a body which is formed by heating orcin with formic acid and $ZnCl_2$ at 100° (Nencki, *J. pr.* [2] 25, 277; Grimaux, *Bl.* [3] 8, 850).—14. Phthalic anhydride (8 pts.) heated with orcin (5 pts.) and sulphuric acid (5 pts.) yields 'orcine-phthalein' $C_{12}H_8$  O , which crystallises from acetone in colourless needles, dissolving in alkalis with red colour, and yielding the acetyl derivatives $C_{12}H_8AcO_4$ [150°] and $C_{12}H_8AcO_4$ [220°]. Orcine-phthalein is reduced by zinc-dust and $NaOH$ aq. to orcin-phthalin $C_{12}H_8O_4$, which yields $C_{12}H_8AcO_4$ [211°] (B. Fischer, *A.* 183, 72).—15. Concentrated sulphuric

acid at 70° produces orcin disulphonic acid $C_6H_4Me(OH)(SO_3H)_2$, which yields the crystalline salts $Pb_2C_6H_2S_2O_6 \cdot 6H_2O$ and $Pb_2(C_6H_2S_2O_6)_2 \cdot 8H_2O$ (Hesse, A. 117, 824).—16. Fuming HNO_3 , acting on orcin dissolved in ether forms orcirufin $C_{12}H_{11}NO_3$, crystallising in needles [225°] which are blue by reflected light and form a crimson solution in alkalis exhibiting yellow fluorescence. Orcirufin yields an acetyl derivative [204°] and an ethyl ether [269°] (Nietzki a. Maackler, B. 23, 720).—17. Aldehyde dissolved in alcohol forms on addition of a few drops of $HClAq$, a compound $C_{12}H_{12}O_4$, crystallising in tables (Michael a. Comey, Am. 5, 849).—18. Chloro-acetic acid and caustic soda forms $C_6H_4Me(OCH_2CO_2H)_2$ [217°] crystallising in needles. This acid forms the salts Na_2A'' 8aq, K_2A'' 8aq, and CaA'' 2aq; the ether Et_2A'' [107°]; and two nitro-derivatives one of which melts at 140° (Saarbach, J. pr. [2] 21, 162).—19. Di-chloro-quinonimide in alcoholic solution forms brown needles of 'orcirufamine' $C_{12}H_9N_2O_3$, which dissolves in acids with reddish-violet colour and orange fluorescence. It dyes silk, and yields a crystalline mono-acetyl derivative (N. a. M.).

Acetyl derivative $C_6H_4Me(OAc)_2$. [25°]. Needles, nearly insol. water.

Benzoyl derivative $C_6H_4Me(OBz)_2$. [88°]. Needles (Rasinski, J. pr. [7] 26, 65).

Orthocarbonyl derivative $(C_6H_4MeO)_2C$. [195°]. Formed by distilling $C_6H_4Me(O.CO.Et)_2$, which is produced by the action of $ClCO_2Et$ on sodium-orcin (Wallach, A. 228, 86; Bender, B. 13, 700).

Methyl ether $C_6H_4Me(OMe)(OH)$. (c. 278°). Liquid, sl. sol. water (Tiemann a. Strang, B. 14, 2001).

Di-methyl ether $C_6H_4Me(OMe)_2$. (244°). V.D. 76.2 (H = 1) (obs.). Mobile liquid.

Di-ethyl ether $C_6H_4Me(OEt)_2$. [16-5°]. (252° cor.). Needles. Yields $C_6H_4Br_2Me(OEt)_2$ [144°] (Herzig a. Zeisel, M. 11, 315; cf. De Luynes a. Lionet, C. R. 65, 213).

Nitroso-derivative $C_6H_4(NO)O_2$. [157°]. Yellow needles, detonating at its melting-point (Nietzki a. Maackler, B. 23, 723).

ORCYL ALDEHYDE v. DI-OXY-TOLUIC ALDEHYDE.

OREOSELIN $C_{12}H_{12}O_4$. Oreoselone. [170°]. Formed by the action of alcoholic potash or acids on peucedanin (Wagner, J. pr. 62, 275; Hlasiwetz, A. 174, 70; Heut, A. 176, 73). Needles (from alcohol), v. sl. sol. water. Its solution in H_2SO_4 exhibits bluish-green fluorescence. Potash-fusion yields resorcin and acetic acid. It yields an acetyl derivative [123°] and an isovaleryl derivative [97°].

OREOSELONE $C_{12}H_{12}O_4$. [190°]. Formed by passing HCl over dry athamantin (Schnedermann a. Winckler, A. 51, 820). Needles (from alcohol), insol. water.

ORGANIC ANALYSIS v. ANALYSIS, ORGANIC, vol. i. p. 259.

ORNITHINE $C_6H_{13}N_2O_3$. Obtained, together with benzoic acid, by boiling ornithuric acid VOL. III.

with hydrochloric acid (Jaffé, B. 10, 1925).— $B'_2H_2Cl_2$.— $B'HCl$.— $B'_2H_2O_2$.— $B'HNO_3$.

Benzoyl derivative $C_6H_4BaN_2O_3$. [225°-230°].

ORNITHURIC ACID $C_6H_9N_2O_3$. [182°]. Excreted by birds after a dose of benzoic acid (Jaffé, B. 10, 1925; 11, 406). Needles, v. sl. sol. hot water.— CaA'' .— BaA'' . powder v. a. sol. water.

OSMIRIDIUM v. IRIIDIUM, Alloys of, p. 47.

OSMIUM. Os. At. w. 190.3. Mol. w. unknown. Infusible at highest temperature attained by O-H flame. S.G. 22.477 at 17.5° (Deville a. Debray, P. M. [4] 50, 651). S.H. 19° to 98°-03113 (Regnault, P. M. [4] 23, 103). C.E. 00000657 (Fizeau, C. R. 68, 1125).

Occurrence.—As metal, alloyed with Ir, Pt, Rh, Ru, and Pd. The residues obtained by heating various Pt ores with aqua regia contain from 17 to 50 p.c. Os (v. Deville a. Debray, A. Ch. [3] 56, 431; Berzelius, P. 13, 435, 527; 15, 208). In 1804 Tennant showed that the metallic residue remaining after treating Pt ore with aqua regia contained two new metals (T. 1804. 411); to one of these metals he gave the name iridium, because of the colours of its oxides (*iris* = rainbow), and to the other, the name osmium, because of the peculiar smell of its volatile oxide (*osmū* = smell).

Formation.—1. By ppg. K_2OsO_4Aq by NH_4Cl , and heating the pp. in H_2 .—2. By heating $(NH_4)_2OsCl_4$ or $(NH_4)_4OsCl_6$.—3. By strongly heating any of the sulphides of Os in absence of air.—4. By warming K persmate in $HClAq$, with a formate; or by digesting the same salt with Hg, and heating the Os-Hg amalgam thus obtained.—5. By passing vapour of OsO_4 mixed with H or CO through a red-hot tube.—6. By passing OsO_4 vapour along with N through a hot tube lined with C (obtained by previously passing C_6H_6 vapour through the tube).

Preparation.—When Pt ores are treated with aqua regia, osm-iridium remains, partly as lustrous tablets, and partly as a black powder. Sand and gangue are removed by fusing the osm-iridium with Na_2CO_3 , boiling with water, then with $HClAq$, and again with water. Os is obtained from this residue by various methods, which are based on the ready oxidation of Os to OsO_4 , and the volatility of this compound. The lustrous tablets of osm-iridium yield much more Os than the black powder. OsO_4 may be obtained by the following methods.—1. The osm-iridium is heated to redness in a tube of porcelain, or Pt, while a current of air or O (previously passed through H_2SO_4) is sucked through the tube; the exit end of the tube is connected with a dry flask, or a series of dry Woulf's bottles, kept at a low temperature; the connecting tubes must be wide, else they may get choked with crystals of OsO_4 ; a vessel containing KOH is placed between the receiver and the aspirator, to absorb the last traces of OsO_4 .

T T

(Fremy, *J. pr.* 63, 342).—2. The osm-iridium is very well mixed with an equal weight of dry NaCl, and the mixture is heated to low redness in a rapid stream of moist Cl, in a glass or porcelain tube; the apparatus is connected with a wide-necked tubulated receiver, from which a tube passes into KOHAq. or NH₄Aq. OsCl₃ is formed, and decomposed by the H₂O present to OsO₃, HCl, and Os which again combines with Cl to form OsO₄, which OsCl₃ is again decomposed by H₂O, and so on (Wöhler, *P.* 31, 161; 104, 368; 107, 357). Schneider (*A. Suppl.* 5, 261) places the osm-iridium in a large Hessian crucible, the lid of which is cemented on, by CaSO₄, and carries a porcelain tube passing into a receiver.—3. The osm-iridium may be treated with molten KOH and KClO₄ (Fritzsche, *J. pr.* 37, 483); or with KOH and KNO₃ (Claus, *C. C.* 1862, 129; Gibbs, *A.* 120, 108); or with BaO₂ and Ba(NO₃)₂ (Deville & Debray, *A. Ch.* [3] 56, 431); in each case the K persulfate obtained is distilled with *aqua regia* and OsO₃ is obtained. The preparation of OsO₃ from osm-iridium is easily accomplished; but the process is extremely unpleasant, and also very dangerous, inasmuch as the vapour of OsO₃ rapidly attacks the eyes and lungs.

Os is obtained from OsO₃ by reducing the vapour by H or CO, or by C (Deville & Debray, *l.c.*; cf. *Formation*, Nos. 5 and 6), or a solution of OsO₃ in KOHAq may be reduced by warming with alcohol, the violet-red crystalline pp. of K₂OsO₄ may be dissolved in water, ppd. by NH₄Cl, and the pp. reduced to Os by heating in H (Fremy, *l.c.*). Or the OsO₃ may be dissolved in NH₄Aq, warmed for some hours till blackish-brown (N is evolved, and an ammoniacal solution of Os₂O₃ remains), and evaporated until a brown pp. of impure Os₂O₃ forms; the pp. may then be washed, dissolved in HClAq, NH₄Cl added, the solution evaporated to dryness, and the residue heated in a retort as long as HCl is evolved and NH₄Cl sublimates. Os remains as a compact porous mass (Berzelius).

Os may be obtained in crystals by dissolving the metal in Sn, by heating to redness in a carbon crucible with 8 parts Sn, and allowing the mass to cool (Deville & Debray, *C. R.* 82, 1076). The crystals are purified by dissolving out Sn, and heating the residue in a stream of HCl. Os is also obtained in crystals by passing the vapour of OsO₃, mixed with N₂, through a hot porcelain-tube lined with C. The lining of C is obtained by passing C₂H₄ vapour through the tube at a temperature high enough to decompose the C₂H₄. By alloying Os with Zn, and treating the alloy with HClAq, Os is obtained as a black powder which is easily ignited (D. & D., *A. Ch.* [3] 56, 899).

Properties and Reactions.—As obtained by reducing its compounds at high temperatures, Os is a lustrous, blue-white metal, resembling Pt or Sn. Prepared by reduction at lower temperatures, Os is a greyish-black powder, without metallic lustre. From solution in Sn, Os separates in hard, bluish crystals, probably belonging to the regular system; S.G. 22.477. Deville & Debray heated Os to the temperature at which Rh melts (c. 2000°) without fusing it. The Os was placed in a carbon-crucible placed in a cylinder of lime, resting on a block of

lime, and surrounded by three other similar blocks; a powerful O-H flame was caused to play over, and around, the lime cylinder (*A. Ch.* [3] 56, 885; 61, 5).

Os is easily oxidised to OsO₃. The finely divided metal obtained at low temperatures smells of OsO₃ at the ordinary temperature; when heated in air, it burns and is completely volatilised. A compact mass of Os ignites when strongly heated in air, but ceases to burn when the source of heat is removed; Os prepared at very high temperatures may be heated to c. 225° without change. Finely divided Os, which has not been strongly heated, is oxidised to OsO₃ by heating with conc. HNO₃ or *aqua regia*; if the metal has been exposed to a very high temperature, it cannot be oxidised in the wet way. Os is oxidised, to K₂OsO₄, by molten KOH; the oxidation is hastened by addition of KNO₃ or KClO₄. Heated in Cl, OsCl₃ is produced. Os forms a phosphide when heated in P vapour. The spectrum of Os has been examined by Huggins (*T.* 154, 139), and Thalén (*v. B. A.* 1882, 431).

The atomic weight of Os has been determined (1) by heating in O and weighing the OsO₃ produced (Berzelius, *P.* 13, 546; Fremy, *A. Ch.* [3] 12, 514); (2) by reducing K₂OsCl₆ in H, washing out KCl, and weighing Os (Berzelius, *P.* 13, 530; Seubert, *B.* 21, 1839; *A.* 261, 257); (3) by determining S.H. of Os (Regnault, *P. M.* [4] 23, 103). The older values were too high. Seubert's analyses of K₂OsCl₆ and (NH₄)₂OsCl₆, conducted in 1888, gave the mean value 191.12, but this number was regarded by S. as rather too high; in 1891 S. re-determined the at. w. very carefully and obtained the value 190.3.

Os is distinctly metallic in its physical characters, but some of its chemical properties are those of a non-metal, e.g. acidic character of OsO₃, and existence of salts the negative radicle of which is OsO₃. Os belongs to the group of Pt metals, to which group Cu, Ag, and Au are more or less closely related (*v. COPPER GROUP OF ELEMENTS*, ii. 250; and *NOBLE METALS*, this vol. p. 828). Os is more closely related to Ru than to the other Pt metals; the analogy is shown in the existence of volatile oxides MO, capable of existing as gases, in the salts K₂MO₇, and probably KMO₇, and in other respects. The existence of K₂OsO₇, the fact that this salt is oxidised probably to KO₂OsO₇, which salt is reduced to K₂OsO₄ by KOHAq, and also the existence of H₂OsO₇, and salts of this acid, emphasise the analogies between Os on the one hand, and Mn and Fe on the other hand.

Detection and Estimation.—Compounds of Os heated with a little Na₂CO₃ on Pt foil give the peculiar, chlorine-like, odour of OsO₃; at the same time the non-luminous flame becomes luminous from separation of Os. Salts of OsO₃ are easily oxidised; e.g. solution of OsCl₃, which is deep-blue, becomes violet in air, and then dark red (OsCl₂), and finally yellow (OsCl₄). Salts of OsO₃, e.g. K₂OsO₄, give a brown-red pp. (Os₂O₃.xH₂O) with KOHAq, a grey-brown pp. sol. in NH₄Aq, with AgNO₃Aq, and a blue colour (reduction to OsCl₂) on warming with tannic acid. Salts of OsO₃, e.g. K₂OsO₄, give no pp. with KOHAq in the cold, but on warming the liquid goes blue, and then black OsO₂.xH₂O

suddenly separates. Borax produces no change at ordinary temperatures, but a black pp. forms on warming; this distinguishes OsO_3 salts from salts of IrO_3 , which become blue on heating with borax, and after a little give a blue pp. Tannic acid does not react in the cold; on warming, the liquid becomes blue. Alkali salts of OsO_3 form violet solutions in water; HNO_3 oxidises to salts of OsO_4 ; NH_3 aq followed by NH_4Cl aq ppts. yellow $\text{OsO}_3(\text{NH}_4, \text{NH}_4\text{Cl})$, which gives Os on heating. OsO_3 or OsO_3Aq is recognised by its smell; addition of KOH aq to dilute solutions of OsO_3 removes the smell. A delicate test for Os consists in fusing with KOH and a little KNO_3 , dissolving K_2OsO_4 formed in water, adding NH_4Cl , washing the yellow pp. of $\text{OsO}_3(\text{NH}_4, \text{NH}_4\text{Cl})$ with very dilute HCl aq, dissolving it in slightly warm water, and adding KFeCy aq, when a splendid violet colour is produced (Gibbs, *Am. J.* 3, 233). Os is usually estimated as the metal. Os is separated from other metals by dissolving in *aqua regia*, adding HNO_3 , and distilling. The OsO_3 may be led into excess of NH_3 aq; the solution is saturated with H_2S and boiled, the pp. of OsS_3 is collected, washed, dried, and placed in a small carbon-crucible which is placed inside a Hessian crucible, the space between being filled with sand, and heated for some hours to c. 220° – 250° ; compact Os is thus obtained.

References.—Tennant, *T.* 1804 411; Berzelius, *P.* 13, 435, 527; 15, 208; Wöhler, *P.* 31, 161; Claus a. Jacobi, *J. pr.* 85, 142; 90, 65; A. 63, 355; Deville a. Debray, *A. Ch.* [3] 56, 393; Fremy, *A. Ch.* [3] 12, 523; 44, 391; Fritzsche a. Struve, *J. pr.* 41, 97.

Osmium, acids of. No oxyacid of Os has been isolated, but salts of the hypothetical acids H_2OsO_3 and HOsO_3 are known (v. *Osmium, salts of oxyacids of*, p. 646). A peculiar acid, $\text{H}_2\text{N}_2\text{OsO}_8$, generally known as *Osmiamic acid*, exists (v. *Osmium, nitrogen-containing acid of*, p. 644). *Osmocyanhydric acid*, H_2OsCy , and salts of this acid have been obtained (v. *CYANIDES*, vol. ii. p. 843). Salts of the hypothetical acids H_2OsCl_3 and HOsCl_3 are known (v. *Osmium, chlorides of*; p. 644).

Osmium, alloys of. Alloys with copper and gold were described by Tennant (*T.* 1804. 411) as very ductile, insoluble in *aqua regia*. An amalgam with mercury is obtained by the reaction of Hg with OsO_3 aq (v. Claus, *J. pr.* 90, 65). The alloy with iridium occurs native; composition varies between c. Os, Ir and Os, Ir; this alloy usually contains Ru, Rh, and Au, besides Os and Ir (v. *IRIDIUM, Alloys of*, this vol. p. 47). Alloys of Os and Ir were obtained by Deville by melting Os and Ir with Cu_2S , and treating the fused mass with HCl aq and then with HNO_3 aq (*M. S.* 1882. 1228).

Osmium, ammonio- salts of, or Osm-ammonium salts (Ammoniacal osmium bases). Not many of these compounds have been prepared. Those which are known seem best looked on as two or more NH_4 groups with H replaced by the radicle OsO or OsO_2 . The constitutional formulæ and the nomenclature of the osm-ammonium salts are not settled; in this article compounds supposed to contain the radicle OsO are called *Osmosyl-ammonium compounds*, and those supposed to contain the radicle OsO_2 are called

Osmyl-ammonium compounds (after the analogy of NO and NO_2 compounds).

OSMOSYL-DIAMMONIUM HYDROXIDE

$\text{OsO}(\text{NH}_4, \text{OH})_2$ (*Ammoniated osymous hydroxide*, *Oxyosmiumammonium hydroxide*). Simplest empirical formula = $\text{OsO}_2 \cdot 2\text{NH}_4 \cdot \text{H}_2\text{O}$. Obtained by dissolving OsO_3 in excess of conc. NH_3 aq, and warming the res. solution in a closed flask to 40° – 60° until a black pp. begins to form when the flask is opened (Claus a. Jacobi, *J. pr.* 79, 28). N escapes during the process ($28\text{OsO}_3 + 10\text{NH}_3$).

$28\text{OsO}(\text{NH}_4, \text{OH})_2 + 2\text{N}_2 + 3\text{H}_2\text{O}$). Forms a brown-black powder; decomposed by heat to Os with evolution of N and H_2O ; insol. water, sol. acids, and reppd. by KOH aq or NH_3 aq. Amorphous basic salts (not fully examined) are obtained by evaporating the acid solutions; these salts are decomposed by solution to neutral and more basic salts (Claus a. Jacobi, *J. pr.* 90, 65; cf. Berzelius, *P.* 13, 465, 527). The base dissolves in KOH aq; on boiling, NH_3 is evolved and a pp. $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ containing NH_3 separates.

OSMOSYL-TETRAMMONIUM HYDROXIDE

$\text{OsO}_2(\text{NH}_4, \text{NH}_4, \text{OH})_2$ aq (*Ammoniated osymic hydroxide*, *Osmidiammonium hydroxide*, *Oxyosmiumdiammonium hydroxide*, *Osmyl-ditetramine hydroxide*). Simplest empirical formula = $\text{OsO}_2 \cdot 4\text{NH}_4 \cdot \text{H}_2\text{O}$ aq. Known only in solution. A solution of this base is obtained by decomposing the chloride by Ag_2O and H_2O , or the sulphate by BaO aq (v. *infra*), and filtering; the solution is yellow, has an alkaline reaction, and is easily decomposed with formation of OsO_3 , NH_3 , and a black pp. (Claus, *J. pr.* 79, 28).

OSMOSYL-TETRAMMONIUM CHLORIDE

$\text{OsO}_2(\text{NH}_4, \text{NH}_4\text{Cl})_2$ (*Oxyosmiumdiammonium chloride*). The formulæ is sometimes written $\text{OsO}_2\text{Cl}_2 \cdot 4\text{NH}_4$, and the salt is called *ammoniated osmium oxychloride*; the formula is also written $\text{OsO}_2 \cdot 4\text{NH}_4 \cdot \text{Cl}_2$, and the salt is called *osmylet-tetramine chloride* (Gibbs, *Am. J.* 3, 233); Fremy (*A. Ch.* [3] 12, 522) wrote the formula $\text{OsO}_2(\text{NH}_4)_2 \cdot 2\text{NH}_4\text{Cl}$, calling the salt *osmiumdiammonium chloride*; Claus and Jacobi (*J. pr.* 79, 28; 85, 142; 90, 65) gave the formula $\text{Os}(\text{NH}_4)_2\text{Cl}_2 \cdot 2\text{H}_2\text{O}$, and the name *osmio-diammonio-chloride*. The investigations of Gibbs (*Am. J.* 3, 233) confirmed the empirical formula $\text{OsO}_2\text{Cl}_2 \cdot 4\text{NH}_4$. Obtained as a yellow crystalline pp. by adding NH_4Cl to K_2OsO_4 aq (Fremy, *A. Ch.* [3] 12, 522) ($2\text{K}_2\text{OsO}_4\text{Aq} + 4\text{NH}_4\text{Cl}$ = $\text{OsO}_2(\text{NH}_4)_2 \cdot 2\text{NH}_4\text{Cl}_2 + 2\text{KCl}$ aq + $2\text{H}_2\text{O}$). Slightly sol. cold water, more sol. hot water, insol. NH_4Cl aq. May be crystallised from water containing HCl ; ppd. from solution by conc. HCl aq. Aqueous solution quickly decomposes, giving off OsO_3 ; on evaporation a brown solid is obtained, which behaves like $\text{OsO}(\text{NH}_4, \text{OH})_2$; the solution gives a fine violet colour with KFeCy aq (Gibbs, *l.c.*). The compound is decomposed by heat, giving a residue of Os.

The *chloroplatinate* is obtained, as orange-yellow crystals, slightly sol. cold water, by boiling $\text{OsO}_2(\text{NH}_4)_2 \cdot 2\text{H}_2\text{O}$ with PtCl_4 aq (Gibbs, *l.c.*).

OSMOSYL TETRAMMONIUM SULPHATE, NITRATE, &c. The *sulphate* is obtained by pouring K_2OsO_4 aq into conc. cold $(\text{NH}_4)_2\text{SO}_4$ aq; small orange-yellow crystals, easily sol. hot water (Gibbs, *l.c.*). The *nitrate* is obtained by a similar reaction, and the *oxalate* also; using cold conc. NH_4NO_3 aq

and $(\text{NH}_4)_2\text{C}_2\text{O}_4$ instead of $(\text{NH}_4)_2\text{SO}_4$ (Gibbs, *l.c.*).

Osmium, chlorides of. Two chlorides of Os have been prepared, OsCl_2 and OsCl_3 ; OsCl_2 is known in solution; no chloride has yet been gasified; these are the only haloid compounds of Os known at present, except OsCy , be classed as a haloid compound. OsCl_2 and OsCl_3 combine with alkali chlorides to form $\text{OsCl}_2 \cdot 3\text{MCl}$ and $\text{OsCl}_2 \cdot 2\text{MCl}$ respectively; OsCl_2 also probably forms double salts, but they have not been isolated satisfactorily. OsCy forms an acid, H_2OsCy_2 , from which various salts (osmocyanide) are obtained. OsCl_2 and OsCl_3 are formed by direct union of Cl with Os.

OSMIUM CHLORIDE OsCl_2 (Osmium dichloride, Osmochloride). Obtained by heating finely divided Os in a long tube in a stream of dry Cl. Two sublimate are obtained; the less volatile (green) is OsCl_2 , the more volatile (red) is OsCl_3 . As thus prepared OsCl_2 forms dark-green deliquescent needles, which probably contain H_2O ; by heating again in perfectly dry Cl, OsCl_2 is obtained free from moisture as a nearly black sublimate (Claus a. Jacobi, *J. pr.* 90, 65). An indigo-blue solution of OsCl_2 may be prepared by dissolving $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ in HClAq ; the solution soon becomes violet, then dark red, and then yellow from formation of OsCl_2 and OsCl_3 ; the yellow solution again becomes blue by the action of reducers (C. a. J., *l.c.*). OsCl_2 dissolves in water, forming a green liquid, which is decolourised and decomposed on dilution with formation of Os, OsO_2 , and HClAq . Solutions of OsCl_2 in alkali chloride solutions are not decomposed by dilution; double salts are probably present (C. a. J.). Berzelius said that double salts of OsCl_2 are formed by the action of alcohol on the salts M_2OsCl_6 and M_2OsCl_4 (P. 13, 435, 527). OsCl_2 is sol. alcohol and ether. The aqueous solution conducts electricity, but the alcoholic and ethereal solutions do not (v. Hampe, *Z.* 11, 1549; 12, 23).

OSMIUM-OSMIUM CHLORIDE OsCl_3 (Osmium trichloride, Osmochloride, Osmium sesquichloride). This chloride is only known in solution, and in combination with alkali chlorides. The brown to purple solution obtained by the action of air on $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ in HClAq probably contains OsCl_3 (C. a. J.). By treating a solution of OsO_2 in HClAq with Hg, and evaporating *in vacuo* over conc. H_2SO_4 , Berzelius (P. 13, 435, 527) obtained a purple, varnish-like substance, which perhaps was OsCl_3 .

Double Salts.—**Ammonium-osmium trichloride (Ammonium chlorosmiate)**

$2(\text{OsCl}_3 \cdot 2\text{NH}_4\text{Cl}) \cdot 3\text{H}_2\text{O}$. Reddish-brown crystals; obtained by passing H_2S into OsO_2 in much HClAq till the solution is red, adding NH_4Cl , and evaporating (Claus, *J. pr.* 79, 28). The salt dissolves in water with a dark-purple colour, which is unchanged by addition of alkali, but reduction begins on warming. On heating, Os and NH_4Cl are formed (Berzelius, *l.c.*).

Potassium-osmium trichloride (Potassium chlorosmiate) $2(\text{OsCl}_3 \cdot 3\text{KCl}) \cdot 6\text{H}_2\text{O}$. Formed by strongly heating in Cl a mixture of equal parts KCl and powdered Os, dissolving in water, crystallising out K_2OsCl_6 , and evaporating the mother-liquor; also by dissolving KOH in conc. OsO_2 , adding NH_4Aq , and when the solution

is yellow and before K_2O separates, saturating with HClAq and evaporating to dryness on a water-bath, when the salt is obtained on the bottom of the basin, while KCl and NH_4Cl are deposited on the upper parts. Forms dark brownish-red crystals; easily sol. water, with deep cherry-red colour; easily sol. alcohol, insol. ether. The salt loses $3\text{H}_2\text{O}$ in air, and the rest at 160° – 180° . The aqueous solution easily decomposes with separation of $\text{Os}_2\text{O}_3\text{Cl}_2$.

OSMIUM CHLORIDE OsCl_3 (Osmium tetrachloride, Osmichloride). Obtained, as a dark-red powder, by heating finely-powdered Os in dry Cl; OsCl_3 is formed at the same time. OsCl_3 is the more volatile of the two chlorides. In presence of moisture, becomes cinnabar-red, and then forms yellow needles ($?\text{OsCl}_3 \cdot x\text{H}_2\text{O}$). Dissolves in a little water to form a yellow solution, which is decomposed and decolourised on dilution (Berzelius, *l.c.*). OsCl_3 is a non-conductor of electricity (Hampe, *Z.* 11, 1549; 12, 23). $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ dissolves in conc. HClAq , forming a dark greenish-brown solution, which probably contains OsCl_3 .

Double salts.—**Potassium-osmium tetrachloride (Potassium chlorosmate)** K_2OsCl_6 ($=\text{OsCl}_3 \cdot 3\text{KCl}$). Obtained by heating an intimate mixture of equal parts KCl and finely-powdered Os in dry Cl to low redness, removing excess of KCl by a little water, dissolving the residue in hot water, and allowing to crystallise (Berzelius, *l.c.*). Claus a. Jacobi (*l.c.*) obtained the salt by adding KCl to OsO_2 in HClAq , then adding alcohol and evaporating. Dark-brown lustrous octahedra; cinnabar-red when powdered. Sol. water, forming a yellow solution, from which alcohol ppts. the salt, incompletely, as a red crystalline powder. Not decomposed at low redness, but at a higher temperature Os and KCl are formed. OsO_2 is produced by distilling HNO_3 over K_2OsCl_6 (Berzelius, *l.c.*). Is not acted on by SO_2 at ordinary temperatures (K_2IrCl_6 is reduced). KOH does not decompose a cold solution of K_2OsCl_6 , but on warming the solution becomes blue, and then suddenly ppts. black $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ (Claus, *l.c.*; other reactions of K_2OsCl_6 are given).

Ammonium chlorosmate, silver chlorosmate, and sodium chlorosmate are described by Claus a. Jacobi (*J. pr.* 79, 28; 85, 142; 90, 65; *A.* 63, 855).

Supposed compound of Osmium hexachloride. Berzelius (P. 13, 435, 527; 15, 208) obtained a brown salt, which he supposed to be a compound of NH_4Cl and OsCl_3 , by saturating OsO_2 with NH_4Aq , after a time adding excess of HClAq , digesting for some days with Hg, filtering, and evaporating. According to Claus (*l.c.*), the salt is $2(\text{OsCl}_3 \cdot 2\text{NH}_4\text{Cl}) \cdot 3\text{H}_2\text{O}$ (v. *supra*; **Ammonium-osmium trichloride**).

Osmium, cyanide of, OsCy , and osmocyanhydric acid and its salts, H_2OsCy_2 , v. CYANIDES, vol. ii. p. 843.

Osmium, hydrated oxides or hydroxides of, v. Osmium, oxides and hydrated oxides of, p. 645.

Osmium, nitride of. The brass-yellow substance, obtained by passing H over the pp. produced by adding HNO_3 to K_2OsO_4 , is probably a nitride of Os (Claus, P. 65, 302).

Osmium, nitrogen-containing acid of, and

its salts. $\text{H}_2\text{N}_2\text{Os}_2\text{O}_4\text{Aq}$ or $\text{H}_2\text{N}_2\text{Os}_2\text{O}_4\text{Aq}$. This acid is generally known as *osmiamic acid*. An aqueous solution of this acid is obtained by decomposing the Ba salt by the equivalent quantity of $\text{H}_2\text{SO}_4\text{Aq}$, or by treating the moist Ag salt with HClAq , and filtering. The clear yellow solution remains unchanged for some days if dilute; but if it be concentrated, OsO_3 and a black pp. containing Os are formed, and gas is evolved. The aqueous solution of the acid evolves CO_2 from carbonates, and decomposes KCl ; Zn dissolves in it, with evolution of gas and partial decomposition of the acid. The solution is decomposed by acids on warming, with production of OsO_3 (Fritzsche & Struve, *J. pr.* 41, 97). F. a. S. gave the formula $\text{H}_2\text{N}_2\text{Os}_2\text{O}_4$; this was upheld by Claus (*J. pr.* 99, 65). Gerhardt (*J. Ph.* [3] 12, 304) gave the formula $\text{H}_2\text{N}_2\text{Os}_2\text{O}_4$. The K salt is obtained by the action of NH_3Aq on OsO_3 in excess of KOHAg ; the reaction is expressed thus by F. a. S.: $2\text{OsO}_3 + 2\text{NH}_3 + \text{Aq} = \text{H}_2\text{N}_2\text{Os}_2\text{O}_4\text{Aq} + \text{O} + 2\text{H}_2\text{O}$; Claus gives the equation $6\text{OsO}_3 + 8\text{NH}_3 + \text{Aq} = 8\text{H}_2\text{Os}_2\text{N}_2\text{O}_4\text{Aq} + \text{N}_2 + 9\text{H}_2\text{O}$. According to F. a. S. no gas is evolved during the reaction. If this is correct neither of the equations can express the change which occurs. The salts of osmiamic acid explode when heated; some explode when struck.

POTASSIUM OSMIATE $\text{K}_2\text{N}_2\text{Os}_2\text{O}_4$ or $\text{K}_2\text{N}_2\text{Os}_2\text{O}_4$. Prepared by dissolving solid OsO_3 in conc. KOHAg , to which conc. NH_3Aq has been added. The solution is clear yellow, and deposits yellow crystals of the salt. Claus & Jacobi (*l.c.*) dissolve KOH in very dilute OsO_3Aq , add $\frac{1}{2}$ vol. NH_3Aq , and evaporate rapidly until the salt begins to crystallise out, after which crystallisation is allowed to proceed. Citron yellow, tetragonal crystals. Sol. warm water, also in alcohol, sl. sol. cold water, insol. ether. Explodes at c. 180° . Decomposed by conc. HClAq , with evolution of Cl and formation of two kinds of red crystals (v. F. a. S., *l.c.*).

SILVER OSMIATE $\text{Ag}_2\text{N}_2\text{Os}_2\text{O}_4$ or $\text{Ag}_2\text{N}_2\text{Os}_2\text{O}_4$. A citron-yellow crystalline powder; sl. sol. water or dilute HNO_3Aq ; sol. NH_3Aq , forming therewith a crystalline compound; blackens in light; explodes at 80° , also when struck by a hammer. Prepared by dissolving OsO_3 in an ammoniacal solution of a salt of Ag, and adding excess of HNO_3Aq ; or by adding excess of HNO_3Aq , followed by solution of a salt of Ag, to OsO_3 dissolved in NH_3Aq .

Ammonium, barium, mercurous, sodium, and ammoniated zinc, osmiates have been prepared (F. a. S., *l.c.*).

Osmium, oxides and hydrated oxides of. Four oxides of Os are known; OsO , Os_2O_3 , OsO_2 , and OsO_3 . Salts in which OsO_3 acts as the negative radicle have been prepared (v. *infra*, *Osmium, salts of oxyacids of*). A hydrate of OsO has been obtained, but not pure; it rapidly absorbs O ; the hydrate $\text{OsO}_2 \cdot 3\text{H}_2\text{O}$ is known, as are also the hydrates $\text{OsO}_2 \cdot \text{H}_2\text{O}$ and $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$. No oxy-salts have been obtained directly from the oxides of Os; a few oxy-salts corresponding with OsO are known. OsO_3 acts as a weak acidic anhydride; this oxide is easily reduced to OsO_2 , or to Os . OsO_3 is the only oxide prepared by the direct union of Os with O . Chlorides corresponding with OsO and OsO_2 ,

have been obtained, and the chloride OsCl_2 , which corresponds with OsO_2 , probably exists in solution (v. *Osmium, chlorides of*, p. 644).

Osmous oxide OsO (*Osmium monoxide*). A greyish-black solid, insol. acids; obtained by heating in a stream of CO_2 , a mixture of Na_2CO_3 and OsSO_3 , or $\text{OsSO}_3 \cdot 2\text{K}_2\text{SO}_3 \cdot 2\text{KHSO}_4 \cdot 4\text{H}_2\text{O}$, and washing the residue with water (Claus & Jacobi, *J. pr.* 85, 142; 90, 65). The salt OsSO_3 is formed by evaporating OsO_3Aq with excess of SO_2 ; the salt $\text{OsSO}_3 \cdot 2\text{K}_2\text{SO}_3 \cdot 2\text{KHSO}_4 \cdot 4\text{H}_2\text{O}$ is formed by heating $\text{K}_2\text{OsCl}_6\text{Aq}$ with K_2SO_3 , and washing with water the powder which separates. *Hydrated osmous oxide*, $\text{OsO} \cdot \text{H}_2\text{O}$, was obtained by C. a. J. by the action of warm, very conc. KOHAg on OsSO_3 , in absence of air; it forms a blue-black pp. which very rapidly absorbs O from the air. Berzelius obtained a greenish-black pp. by boiling OsCl_2 in KClAq with KOHAg ; this pp. was supposed to be $\text{OsO} \cdot \text{H}_2\text{O}$, but C. a. J. say it cannot be washed free from alkali. A few salts are known corresponding with OsO , e.g. OsSO_3 , but none is obtained directly from the oxide.

Osmo-osmic oxide Os_2O_3 (*Osmium sesquioxide*). A black powder; insol. acids. Obtained by gently heating, in a stream of CO_2 , a mixture of $\text{K}_2\text{OsCl}_6 \cdot 3\text{H}_2\text{O}$ and Na_2CO_3 , and washing with water (C. a. J., *l.c.*). Deville & Debray (*C. R.* 82, 1076) say that this oxide is often formed, as copper-red crusts, in the preparation of Os, by passing OsO_3 vapour mixed with N through a hot tube lined with C , the lining of C being formed by passing C_2H_4 vapour through the tube heated to redness. Berzelius supposed that a compound of Os_2O_3 with NH_3 was formed by the action of NH_3Aq on OsO_3Aq ; but the pp. thus formed was shown by C. a. J. to be $\text{OsO}(\text{NH}_4\text{OH})_2$ (v. *Osmosyl-diammonium hydrosesquioxide*, p. 643). No oxy-salts are known corresponding with Os_2O_3 ; a solution of OsCl_2 has been prepared.

Hydrated osmo-osmic oxide $\text{Os}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$; a brown-red pp., somewhat sol. cold KOHAg , sol. acids even after drying; obtained by adding KOHAg to $\text{K}_2\text{OsCl}_6\text{Aq}$ (C. a. J., *l.c.*).

Osmic oxide OsO_2 (*Osmium dioxide*). Obtained by Berzelius (*P.* 13, 435, 527; 15, 208) by heating a mixture of K_2OsCl_6 and Na_2CO_3 in CO_2 , washing the residue with water, and then with HClAq ; as thus prepared OsO_2 forms a greyish-black powder. Claus & Jacobi (*l.c.*) obtained OsO_2 in the form of a copper-red, metallic-like solid, by strongly heating $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ in a covered crucible (OsO_2 , H_2 , and H_2O are also formed). $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ is obtained by the action of acids on $\text{K}_2\text{OsO}_4\text{Aq}$. OsO_2 may be heated to redness in absence of air (Berzelius); but Claus says that OsO_2 and Os are formed. Heated in air, or acted on by HNO_3 and HClAq , OsO_2 is produced. Reduced by H at ordinary temperatures. Detonates when heated with combustible bodies. A sulphate corresponding with OsO_2 is said to be prepared by the action of cold HNO_3Aq on OsS_2 , but little is known of its properties. The corresponding chloride, OsCl_2 , is known.

Hydrated osmic oxide $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$; a black pp. obtained by adding very dilute $\text{H}_2\text{SO}_4\text{Aq}$ to $\text{K}_2\text{OsO}_4\text{Aq}$, OsO_2 being formed at the same time (C. a. J., *l.c.*). The moist hydrate dissolves in HClAq , HNO_3Aq , or $\text{H}_2\text{SO}_4\text{Aq}$; oxidation begins

very quickly, with change of colour from purple to yellow-brown, green, and brownish-yellow on heating. From the solution in HClAq , Zn ppts. Os (Wöhler, *A.* 140, 256). By heating $\text{OsO}_3 \cdot 2\text{H}_2\text{O}$ to 200° in dry N, Fremy obtained the hydrate $\text{OsO}_3 \cdot \text{H}_2\text{O}$ (*A. Ch.* [3] 12, 515).

OSMIUM TETROXIDE OsO_4 (*Perosmic anhydride*). Often called *perosmic acid*, and formerly generally known as *osmic acid*. Mol. w. 254.84. V.D. 128.5 at c. 280° (Dewille & Debray, *C. R.* 62, 1076).

Formation.—1. By heating Os in air or O_2 .—2. By heating Os, or any of the lower oxides, with HNO_3 or *aqua regia*.—3. By the action of dilute acids on $\text{K}_2\text{OsO}_4\text{Aq}$; $\text{OsO}_3 \cdot 2\text{H}_2\text{O}$ being formed at the same time.—4. According to Claus (*J. pr.* 79, 28) by the action of Os on steam; H being evolved.

Preparation.—1. Finely powdered Os is gently warmed in a stream of dry O_2 ; the Os is placed in the bulb of a two-bulbed tube, and the OsO_4 condenses in the second bulb.—2. Three parts osmium are fused with 1 part KNO_3 , the cold mass is dissolved in water, the solution is neutralised by $\text{H}_2\text{SO}_4\text{Aq}$, and OsO_4 is distilled off into a cold receiver.

Properties.—Long, colourless, translucent, monoclinic, needles (Mallet, *Am. S.* [2] 29, 49). Melts considerably under 100° , and boils a few degrees above its melting-point. OsO_4 is very volatile; the vapour smells abominably, and is extremely poisonous, attacking the eyes and lungs; Deville nearly lost his eyesight while working with OsO_4 (*v. D. & D., A. Ch.* [3] 56, 400). Claus says the best antidote is H_2S gas. The V.D. was determined by D. & D. at 246° – 285° ; it agrees with the formula OsO_4 . OsO_4 may be vapourised in H; if the mixed vapours are passed through a hot tube, Os is deposited. OsO_4 is slowly dissolved by water, the solution does not react acid; sol. alcohol or ether, solutions are reduced with ppn. of Os.

Reactions.—1. Reduced to Os by heating with hydrogen; also by heating in a gas-flame; an aqueous solution of OsO_4 is readily reduced by most metals; the solution is also reduced by phosphorus, ferrous sulphate, stannous chloride, sulphurous acid (a blue liquid is produced by SO_2Aq , perhaps containing an oxide which has not been isolated), and by many carbon compounds (e.g. HCO_2H , tannin, sugar, alcohol, &c.) (*v. Tennant, T.* 1804. 411; Berzelius, *P.* 13, 435, 327; 15, 208; Döbereiner & Weiss, *A.* 14, 17, 251; Butlerow, *A.* 84, 278; Claus & Jacobi, *J. pr.* 90, 65).—2. A large excess of ammonia solution evolves N, and ppts. $\text{Os}(\text{NH}_4)_2\text{OH}$ (*v. Osmosyl-diammonium hydroxide*, p. 643).—3. OsO_4 dissolves in potash, forming a red-yellow liquid which probably contains K perosmate (*q. v.* under Osmium, salts of oxyacids of, *infra*).—4. Hydrogen sulphide ppts. an *oxysulphide* (*q. v.*) from OsO_4Aq ; on saturating OsO_4Aq with H_2S , and adding an acid, OsS is ppd. (*v. Osmium, sulphides of*, p. 647).—5. Hydrochloric acid does not react with OsO_4 ; but on addition of KOH , K_2OsCl_6 is produced. OsO_4 is a very weak acidic anhydride: an aqueous solution does not affect the colour of litmus, nor does it decompose carbonates; KOH probably forms K perosmate.

Osmium, oxyacids of. No oxyacid of Os has been isolated; salts of the hypothetical H_2OsO_5 (osmates) are known, and some of the reactions of OsO_4 indicate the existence of unstable salts derived from the oxide OsO_5 (*v. infra*, Osmium, salts of oxyacids of).

Osmium, oxychloride of. The black pp. obtained by boiling dilute $\text{K}_2\text{OsCl}_6\text{Aq}$ is probably an oxychloride (Claus & Jacobi, *J. pr.* 90, 65).

Osmium, oxysulphides of. The pp. obtained by passing H_2S into OsO_4Aq is said by von Meyer to have the composition $\text{Os}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$, and to be changed to $2\text{OsO}_3 \cdot 3\text{H}_2\text{O}$ by the action of air (*J. pr.* [2] 16, 77). Dried at 180° – 200° , OsO_3S is obtained (von M., *l.c.*).

Osmium, phosphide of. A phosphide of Os is said to be formed by heating Os in P vapour; it appears black if prepared at a moderate temperature, but white and metal-like if produced by heating strongly; it burns in air to OsO_4 , and osmious phosphate (Berzelius, *P.* 13, 435, 327; 15, 208).

Osmium, salts of. Very few salts have been obtained by replacing the H of oxyacids by Os. Osmium sulphite, OsSO_3 , is formed by evaporating OsO_4Aq with SO_2Aq ; a complex salt $\text{OsSO}_3 \cdot 2\text{K}_2\text{SO}_3 \cdot 2\text{KHSO}_4 \cdot 4\text{H}_2\text{O}$ is obtained by heating K_2OsCl_6 with $\text{K}_2\text{SO}_4\text{Aq}$; osmious phosphate and sulphate are also said to exist, but they have not been analysed (Berzelius). An osmic sulphate is stated to be produced by the action of cold HNO_3Aq on OsS_2 (Berzelius). No salt of Os has been formed by the direct reaction of Os or any of its oxides with an oxyacid (*v. SULPHITES, SULPHATES*).

Osmium, salts of oxyacids of. Some salts of the hypothetical *osmic acid*, H_2OsO_5 , have been isolated; and there are indications of the existence of alkali *perosmates*, i.e. salts derivable from OsO_5 .

OSMATES $\text{M}'\text{OsO}_5$ (formerly called *Osmites*). Neither the acid H_2OsO_5 , nor the anhydride OsO_5 , has been isolated (*cf.* Mallet, *Am. S.* [2] 29, 49). Alkali osmates are obtained by the reducing action of alcohol on OsO_4 in KOH or Ba salt is formed by the prolonged reaction of warm BaO on OsO_4 in a closed vessel; osmates of Ca, Pb, and Sr are obtained as insoluble pps. from the alkali salts.

Potassium osmate $\text{K}_2\text{OsO}_5 \cdot 2\text{H}_2\text{O}$. A violet-coloured, crystalline pp. of this composition is formed by adding alcohol to OsO_4 dissolved in KOH or KOH solution is red, then becomes colourless, and deposits the salt. Fremy obtained the salt in large octahedra by adding KNO_3Aq to OsO_4 in large excess of KOH (*J. pr.* 83, 411). According to Claus (*J. pr.* 84, 173, 424) $\text{K}_2\text{OsO}_5 \cdot 2\text{H}_2\text{O}$ is obtained by warming OsO_4 in an excess of KOH or KOH solution is similar to the reduction of KMnO_4Aq to $\text{K}_2\text{MnO}_4\text{Aq}$ by KOH . Violet-red octahedra. Sol. water, insol. alcohol or ether; slightly sol. conc. salt solutions (Gibbs, *Am. S.* [2] 81, 70). An aqueous solution decomposes rapidly on warming to K perosmate and $\text{OsO}_3 \cdot 2\text{H}_2\text{O}$. $\text{H}_2\text{SO}_4\text{Aq}$ forms OsO_4 from $\text{K}_2\text{OsO}_5\text{Aq}$, and separates $\text{OsO}_3 \cdot 2\text{H}_2\text{O}$ (Claus & Jacobi, *l.c.*). HNO_3Aq produces a similar change (Fremy, *l.c.*). SO_2Aq produces a blue solution. NH_4ClAq forms $\text{OsO}_4(\text{NH}_4)_2$ (NH_4Cl), and $(\text{NH}_4)_2\text{SO}_4\text{Aq}$ produces $\text{OsO}_4(\text{NH}_4)_2$ (NH_4SO_4) (*v. Osmosyl-tetrammonium*).

chloride and sulphate, p. 648). NH_4Aq is said to form $\text{OsO}_2(\text{NH}_4)_2$ (Fremy, l.c.).

Barium osmate $\text{BaOsO}_4 \cdot \text{H}_2\text{O}$ (Claus, *J. pr.* 34, 178, 224); **Calcium, lead, sodium, and strontium osmates** have been obtained (Fremy, *J. pr.* 33, 411).

PEROSMATES (formerly called *osmates*). These salts have not been prepared pure. Fremy (*J. pr.* 33, 409) says a perosmate of K is formed by dissolving OsO_4 in large excess of KOH Aq , and the salt is decomposed on dilution; the solution in excess of KOH Aq is colourless, but absorbs O and becomes brown; on boiling, K_2OsO_8 is formed, and an oxide of Os containing more O than OsO_4 is volatilised. On the other hand, Claus (*J. pr.* 36, 142; 90, 65) says that the greater part of the OsO_4 can be distilled off from a solution of this oxide in excess of KOH Aq , but that some decomposes to $\text{K}_2\text{OsO}_8 \text{ Aq}$ and O. Claus also says that OsO_4 distils off, at 60° , when Cl is passed into $\text{OsO}_4 \cdot x\text{H}_2\text{O}$ suspended in a large excess of KOH Aq . From a conc. solution of OsO_4 in KOH Aq , $\text{HNO}_3 \text{ Aq}$ ppt. OsO_4 mixed with $\text{OsO}_4 \cdot x\text{H}_2\text{O}$, according to Wöhler (A. 140, 256). Wöhler (l.c.) melted Os with KOH and KNO_3 , and obtained a black solid which formed a deep-red solution in water. This solution was supposed by Wöhler to contain K perosmate; only a very little OsO_4 was obtained by distilling, and the residual liquid deposited K_2OsO_8 on cooling. The mother-liquor from the K_2OsO_8 was yellow; on treatment with CO_2 it became colourless, and then violet, and deposited OsO_4 and a greyish-violet pp.

Osmium sulphides of Os with S (Berzelius, P. 13, 485, 527; 15, 208).

OSMIUM SULPHIDE OsS_2 (*Osmium disulphide*). A dark brownish-yellow solid; slightly soluble in water. Produced, according to Fremy (*J. pr.* 33, 409), by passing H_2S into $\text{K}_2\text{OsO}_4 \text{ Aq}$; according to Claus (*J. pr.* 79, 28), also by passing H_2S into $\text{K}_2\text{OsCl}_4 \text{ Aq}$.

OSMIUM TETRASULPHIDE $\text{OsS}_4 \cdot x\text{H}_2\text{O}$. Obtained by saturating OsO_4 in HCl Aq with H_2S ; on attempting to dry the pp. it is partly oxidised; above 100° , the pp. burns to OsO_4 and SO_2 ; easily oxidised by $\text{HNO}_3 \text{ Aq}$; heated in absence of air, $\text{OsS}_4 \cdot \text{OsS}_2$ is said to be produced (Berzelius; Claus). The pp. obtained by passing H_2S into $\text{OsO}_4 \text{ Aq}$ is an *oxysulphide* (q. v.).

M. M. P. M.

OSMOCYANIDES and Osmocyanhydric acid v. CYANIDES, vol. ii. p. 343.

OSMOSE. When two liquids are separated by the intervention of a porous diaphragm, a flow of liquid takes place from one side of the septum to the other or sometimes an unequal flow of the two liquids in opposite directions, so that the quantity of liquid increases on one side of the septum and diminishes on the other. This phenomenon was originally designated by the correlative terms *Endosmose* and *Exosmose*, but it is better expressed by the shorter word *Osmose* (from *ὀσμός*, impulsion), which includes the two former. For the application of osmotic methods to chemical questions v. MOLECULAR WEIGHTS, p. 417; also PHYSICAL METHODS; section *Electrical methods*. M. M. P. M.

OSOTRIAZOLE $\text{C}_4\text{H}_4\text{N}_2$, i.e. $\text{NH} \begin{smallmatrix} \text{N:CH} \\ \text{N:CH} \end{smallmatrix}$

[22-5°]. (204°) at 715 mm. Formed by heating its carboxylic acid. Sol. water and alcohol, insol. ligroin (Pechmann, A. 262, 320).—**BHCl**.—**BHgCl**: glittering needles.

Benzoyl derivative $\text{NBz} \begin{smallmatrix} \text{N:CH} \\ \text{N:CH} \end{smallmatrix}$ [100°].
OSOTRIAZOLE CARBOXYLIC ACID

$\text{NH} \begin{smallmatrix} \text{N:CH} \\ \text{N:O.CO}_2\text{H} \end{smallmatrix}$ [211°]. Formed by the action of KMnO_4 on amido-phenyl-osotriazole carboxylic acid, which is got by reducing the nitro-acid formed by nitrating the acid produced by the action of soda on the phenyl-hydrazide of di-nitroso-acetone (Pechmann, A. 262, 315). Crystalline powder, v. sol. boiling water.—**CaA**, 2aq.

OSOTRIAZONES and OSOTETRAZONES v. HYDRAZONES.

OSSEIN v. PROTEINS, Appendix G.

OSTRUTHIN $\text{C}_{11}\text{H}_{11}\text{O}_2$ (Görup-Besanes, A. 183, 321); $\text{C}_{11}\text{H}_{11}\text{O}_2$ (Jassoy, C. C. 1890 [i] 766). [115°]. Occurs in the roots of *Imperatoria Ostruthium*. Triclinic crystals, v. l. sol. boiling water, v. sol. alcohol and ether. Its alcoholic solution exhibits blue fluorescence. Forms a crystalline compound with dry HCl .

Acetyl derivative [78°]. Plates.

OTOBITE $\text{C}_{11}\text{H}_{11}\text{O}_2$ [133°]. Occurs in the fruit of *Myrsine otoba* (Uriceochea, A. 91, 370). Pearly prisms (from ether), insol. water.

OUABAIN $\text{C}_{11}\text{H}_{11}\text{O}_{12}$ [c. 185°]. S. 65 at 11° ; S. (alcohol) 3-75 at 11° . $[\alpha]_D = -33^\circ$. A poisonous glucoside present in *Onobabo root*, used as arrow-poison, and in the seeds of the glabrous *Strophantus* of Gabon (Arnaud, C. R. 106, 1011; 107, 348, 1162; *Bl.* [3] 1, 10). Rectangular plates (containing 7aq) v. sl. sol. water. Its solution is ppd. by tannin. It yields a sugar and a resin on boiling with acids.—**BaA**; deliquescent pp.

OSALACETIC ACID $\text{C}_4\text{H}_4\text{O}_4$. *Oxaloxyl-acetic acid*.

Oxim $\text{CO}_2\text{H.C}(\text{NOH}).\text{CH}_2.\text{CO}_2\text{H}$ [125°]. Formed by the action of alcoholic NaOH on the ether $\text{CO}_2\text{Et.C}(\text{NOH}).\text{CH}_2.\text{CO}_2\text{H}$ [107°], which is obtained by the action of water on the dihydride of di-nitroso-di-oxy-terephthalic ether (Cramer, B. 24, 1204). An isomeric oxim $\text{CO}_2\text{Et.C}(\text{NOH}).\text{CH}_2.\text{CO}_2\text{H}$ [54°] is formed from oxalacetic acid and hydroxylamine. It yields $\text{CO}_2\text{H.C}(\text{NOH}).\text{CH}_2.\text{CO}_2\text{H}$ [88°], whence AcCl forms an anhydride $\text{C}_4\text{H}_4\text{O}_4$ [105°] yielding $\text{C}_4\text{H}_4\text{AcO}_4$ [105°].

Phenylihydrazide of the methyl ether $\text{CO}_2\text{Me.CH}_2.\text{C}(\text{N}_2\text{HPh}).\text{CO}_2\text{Me}$ [118°]. Mol. w. 257.463; (calc. 250). Formed from di-methyl acetylene dicarboxylate and phenyl-hydrazine (Buchner, B. 22, 2930). Plates. Yields oxy-phenyl-pyrazole carboxylic acid on saponification.

Mono-ethyl ether $\text{CO}_2\text{Et.CH}_2.\text{CO}_2\text{H}$ [97°]. Obtained from the di-ethyl ether and cold dilute KOH (Wislicenus, B. 19, 3226; A. 246, 323). Needles, v. sol. water. Its aqueous solution is coloured deep red by FeCl_3 .

Anilide of the ethyl ether

$\text{CO}_2\text{Et.CO.CH}_2.\text{CO.NHPh}$ [88°]. Formed from oxalic ether, acetanilide, and NaOEt (Wislicenus a. Sattler, B. 24, 1250). Needles, v. sol. alcohol.

p-Toluide of the ethyl ether [135°].

Ethyl anilide of the ethyl ether $\text{CO}_2\text{Et.CO.CH}_2.\text{CO.NEtPh}$ [69°]. Formed from

NaOEt, oxalic ether, and NH_4AcPh (Wislicenus, 189°).
 18° at 24 mm.). S.G. $\frac{1.159}{4}$. Formed by the action of sodium on an ethereal solution of oxalic and acetic ethers (Wislicenus, B. 19, 8225; 20, 8892; A. 246, 815). Oil. FeCl_3 colours its alcoholic solution red.

Reactions.—1. Decomposed by dilute acids into acetic and oxalic acids.—2. Dilute (10 p.c.) H_2SO_4 yields pyruvic acid.—3. Sodium forms the compound $\text{CO}_2\text{Et}.\text{CHNa}.\text{CO}.\text{CO}_2\text{Et}$, which reacts with alkyl iodides, forming alkyl-oxal-acetic ethers $\text{CO}_2\text{Et}.\text{CHX}.\text{CO}.\text{CO}_2\text{Et}$. The copper compound $\text{Cu}(\text{C}_2\text{H}_3\text{O}_3)_2$ crystallises from alcohol in green needles [163°].—4. *Phenyl-hydrazine* reacts forming a phenyl-hydrazide $\text{CO}_2\text{Et}.\text{CH}.\text{C}(\text{N}_2\text{HPh})\text{CO}_2\text{Et}$ [78°], crystallising in plates, and forming $\text{CO}_2\text{Et}.\text{C}(\text{CH}_3\text{CO}.\text{N}.\text{NPh})$ [182°] on heating.—5. *Atiline* at 0° forms $\text{CO}_2\text{Et}.\text{CH}_2.\text{C}(\text{NPh})\text{CO}_2\text{Et}$ (c. 200° at 10 mm.), which gives no colour with alcoholic FeCl_3 . The condensation-products include $\text{C}_7\text{H}_{11}\text{NO}_3$ [108°] and $\text{C}_7\text{H}_{11}\text{NO}_3$ [218°] (Wislicenus a. Spiro, B. 22, 3349).—6. Aqueous KOAc yields $\text{CO}_2\text{Et}.\text{CH}.\text{C}(\text{CO}_2\text{H})\text{CH}(\text{CO}_2\text{Et})\text{CO}.\text{CO}_2\text{Et}$, which forms the crystalline salts BaA_2 , 2aq and PbA_2 (Claisen a. Hori, B. 24, 124).—7. Its oxim is reduced by sodium-amalgam to mono-ethyl aspartates $\text{CO}_2\text{H}.\text{CH}(\text{NH}_2).\text{CH}_2.\text{CO}_2\text{Et}$ [201°] and $\text{CO}_2\text{H}.\text{CH}_2.\text{CH}(\text{NH}_2).\text{CO}_2\text{Et}$ [165°] (Piuetti, C. C. 1888, 68, 1459).—8. *Benzamidine hydrochloride* and dilute (10 p.c.) aqueous caustic soda yields $\text{CO}_2\text{Et}.\text{CO}.\text{CH}_2.\text{CO}.\text{NH}.\text{CPh}:\text{NH}$ [180°] (Pinner, B. 22, 1628, 2615).

Reference.—AMIDO-OXALOXYL-ACETIC ACID.

OXALAMIDO-BENZOIC ACID v. CARBOXY-PHENYL-OXAMIC ACID.

OXALANTIN $\text{C}_8\text{H}_7\text{N}_3\text{O}_6$. Formed by reducing alloxanic acid with zinc and HClAq (Limpriht, A. 111, 133; cf. Schlieper, A. 66, 2). Small crystals, sl. sol. water. Decomposed by alkalis into NH_3 and oxaluric acid.

OXALBUTYRIC ETHER

$\text{CO}_2\text{Et}.\text{CO}.\text{CHEt}.\text{CO}_2\text{Et}$. (138° at 20 mm.). Formed from oxalic ether, butyric ether, and NaOEt (Arnold, A. 246, 337). Oil. Gives a red colour with FeCl_3 .

OXALETHYLAMYLIN v. ETHYL-BUTYL-GLYOXALINE.

OXAL-ETHYL-ETHYLIN v. METHYL-ETHYL-GLYOXALINE.

OXALETHYLIN v. METHYL-ETHYL-GLYOXALINE.

OXALETHYLENANTHYLIN v. ETHYL-HEXYL-GLYOXALINE.

OXAL-ETHYL PROPYLIN v. DI-ETHYL-GLYOXALINE.

OXALIC ACID $\text{H}_2\text{C}_2\text{O}_4$, 2aq, i.e. $\text{CO}_2\text{H}.\text{CO}_2\text{H}$ 2aq or $\text{C}(\text{OH})_2.\text{C}(\text{OH})_2$, [187°] (when anhydrous) (Staub a. Smith, B. 17, 1742 note). S.G. (hydrated) $\frac{1.658}{4}$ (Clarke, Ann. 2, 174). S. (of $\text{H}_2\text{C}_2\text{O}_4$) 9.5 at 14.5° (Nichols, C. N. 22, 14); (of $\text{H}_2\text{C}_2\text{O}_4$) 5.3 at 10°, 10.2 at 20°, 12.0 at 90° (Alluard, C. R. 59, 500); 5.5 at 10°; 8.8 at 20°; 65.8 at 70°. S. (alcohol) 28.5 at 15° (Burgoin, Bl. [2] 29, 248). S. (ether) 1.27 at 15° (Miczynski, M. 7, 257). B.p. 86.74 (in a 7.41 p.c. aqueous solution) (Kanonnikoff, J. pr. [3] 81, 847). H.C.v. 61, 100;

H.C.p. 60, 200. H.F. 196, 800 (Stohmann, J. pr. [2] 40, 204); 198, 000 (von Rechenberg). S.H. 50° 8859 (Hess, A. Ch. [2] 86, 410). Heat of neutralisation 28,100.

Occurrence.—As acid potassium salt in sorrel (*Oxalis acetosella* and *Rumex acetosa*) (Savary, A.D. 1778; Wiegler, A.D. 1779); as sodium salt in *Salsola* and *Salicornia*; as calcium salt in the root, bark, and leaves of many plants, (often found as crystals, raphides), in urine, urinary calculi, and in the Malpighian vessels of the caterpillar of *Sphinx Convolvuli*. Calcium oxalate is found also in many lichens, and as the mineral Whewellite. Ferrous oxalate occurs in lignite beds; and ammonium oxalate in guano. Free oxalic acid occurs in some fungi (e.g. *Fistulina hepatica* (Hamlet a. Plowright, C. N. 36, 93).

Formation.—1. By the oxidising action of fused potash or of nitric acid on alcohol, glycol, sugars, starch, cellulose, citric, tartaric, myristic, and other fatty acids. Also by oxidising acetic acid and phenol with alkaline KMnO_4 (Japp, C. J. Proc. 4, 91).—2. Ammonium oxalate is among the products of the decomposition of cyanogen by water.—3. By heating sodium or potassium formate above 400° (Merz a. Weith, B. 15, 1507). 4. By the action of NaOEt on di-bromo-acetic ether.—5. By passing CO_2 over a mixture of sodium and sand at about 360° (Drechsel, Z. [2] 4, 120).—6. By heating C_2Cl_4 with dry KOH for some days at 220° (Geuther, A. 111, 174). C_2Cl_4 with dry KOH at 200° forms oxalate and hydrogen.—7. By the spontaneous decomposition of $\text{CH}_3.\text{CH}(\text{ONO}_2).\text{CO}_2\text{H}$ (Henry, B. 12, 1837).—8. By the action of damp oxygen upon $\text{CCl}_3.\text{CCl}(\text{OMe})$ (Henry).—9. A product in the preparation of picric acid from phenol (Perkin, C. J. Proc. 4, 91).—10. By oxidising chloranilic acid (Groves, C. J. Proc. 4, 91).—11. A by-product in the preparation of nitrous ether (Frickhinger, Ar. Ph. [8] 24, 1065).

Preparation.—By heating sawdust with a mixture of NaOH and KOH at 240°–250°, the yield being less when NaOH is used alone (Thorn, D. P. J. 210, 24). The product is boiled with water, and the filtrate evaporated. Sodium oxalate separates in granules, which are then boiled with milk of lime. The calcium salt is then decomposed by H_2SO_4 . Oxalic acid may be freed from the last trace of alkaline oxalates by crystallisation from boiling dilute (10 p.c.) HClAq . Octahedral crystals of anhydrous oxalic acid $\text{H}_2\text{C}_2\text{O}_4$ may be obtained by allowing a solution of oxalic acid (1 pt.) in warm H_2SO_4 (12 pts.) to stand for some days. These crystals take up water (2aq) from the air, and fall to powder (Villiers, C. R. 90, 821; cf. Richardt, J. 1864, 871). "According to Lescqur (C. R. 104, 1799) dried oxalic acid takes up 2½ aq from the air.

Estimation.—By precipitation as calcium oxalate, followed by conversion into CaCO_3 or CaO ; or by titration with KMnO_4 or baryta-water.

Properties.—Large monoclinic crystals (containing 2aq), v. sol. water and alcohol. Gives off its water of crystallisation at 100°, and, in a few weeks, over H_2SO_4 (Erdmann, J. pr. 85, 218). Partially sublimes at 150°, but is partly split up into water, CO , and CO_2 . Its aqueous solution decomposes slowly in light, but the decomposition of dilute solutions may be prevented by

OXALIC ACID.

heating for half an hour (Fr. 9, 892). When a gas is passed through a strong solution of oxalic acid at 100° CO₂ is given off (Charles, *C. R.* 71, 228). A 5 p.c. solution containing 1 p.c. of uranium nitrate is rapidly decomposed by sunlight into CO₂, formic acid, and CO (Seekamp, *A.* 122, 113). Ammonium oxalate is also decomposed by sunlight, but the oxalates of K, Li, and Na are but slightly affected (Downes & Blunt, *Pr.* 29, 219). Ferric chloride is reduced by oxalic acid in sunlight, and also by heating above 50° (Lemoine, *Bl.* [2] 46, 289). Oxalic acid reduces Au and Pt from their salts. Oxalic acid expels HCl when heated with dry NaCl. CaCl₂ ppts. solutions of alkaline oxalates, the p.p.d. CaC₂O₄ being insol. acetic acid and ammonia, but sol. HClAq, and immediately reppd. by ammonia.

Reactions.—1. Heated with glycerin (1 pt.) it yields CO₂ and formic acid, but when a small quantity of glycerin ($\frac{1}{2}$ pt.) is used, decomposition takes place at a higher temperature, allyl alcohol being formed from the glycerin. Oxalic acid also yields formic acid when distilled with glycol, mannite, dulcitol, erythritol, and quercitol, but not with sugars (Lorin, *C. R.* 77, 129, 363; 84, 1136).—2. On heating with conc. H₂SO₄ or with P₂O₅ it is resolved into water, CO₂, and CO₂.—3. PCl₅ yields CO, CO₂, HCl, and POCl₃. PCl₅ acts in like manner.—4. Boiling nitric acid slowly oxidises it to CO₂.—5. PbO₂ and MnO₂ rapidly oxidise it in aqueous solution, yielding CO₂ and the corresponding oxalate. Dried oxalic acid is oxidised by rubbing with PbO₂, great rise of temperature occurring.—6. MnO₂ and dilute H₂SO₄ completely oxidise it to CO₂. KMnO₄ and CrO₃ also oxidise it.—7. Chlorine-water and HClO yield HCl and CO₂.—8. Potash-fusion yields hydrogen and a carbonate.—9. Liberates Cl, Br, and I when its saturated solution is boiled with KClO₃, KBrO₃, and KIO₃ respectively (Guyard, *Bl.* [2] 31, 299).—10. The copper-zinc couple forms small quantities of glycollic acid (Balbiano & Alessi, *G.* 12, 190; cf. Plimpton, *B.* 11, 516).—11. SbCl₃ in chloroform forms crystals of Sb₂Cl₂C₂O₄ [149°], which are decomposed by water with formation of oxalic acid (Anschütz & Evans, *A.* 239, 285).—12. Primary alcohols heated with dry oxalic acid yield a mixture of mono- and di-alkyl oxalates; on distillation the mono-alkyl oxalates split up into CO₂ and alkyl formates. Secondary alcohols give but little alkyl oxalate, while tertiary alcohols are wholly split up by oxalic acid into water and hydrocarbons (Cahours & Demarçay, *C. R.* 83, 668; 86, 991).—13. Electrolysis of potassium oxalate yields CO₂ at the positive pole (Burgoin, *A. Ch.* [4] 14, 157).—14. A solution of molybdic acid in oxalic acid yields, on addition of HNO₃ and evaporating, monoclinic crystals of H₂C₂O₄MoO₄aq; $a:b:c = .947:1:1.073$; $\beta = 98^\circ 52'$. This 'oxalo-molybdic acid' yields the salts Ag₂C₂O₄MoO₄, BaC₂O₄MoO₄, and Na₂C₂O₄MoO₄ 5aq (Péclard, *C. R.* 108, 1058).—15. Ammonioval cupric oxide at 150° yields (NH₄)₂CO₃ and Cu₂O (Cazeneuve, *Bl.* [2] 82, 277).

Salts (Souhay & Lenssen, *A.* 99, 81; 190, 808; 102, 35, 41; 108, 308; 105, 245).—K₂A"aq: monoclinic crystals; $a:b:c = .675:1:1.157$; $\beta = 69.6^\circ$ (De la Provostaye, *A. Ch.* [3] 4, 454). S. 88 at 16° (Nichols).—K₂A"3aq.—KHA". Salt of sorrel.

Monoclinic crystals (Marignac, *J.* 18:

KHA"aq.—KHA"aq: trimetric crystals; $a:b:c = .459:1:6.196$. S. 8-8 at 8°.—KHA"aq: trimetric crystals (Rammelsberg, *P.* 93, 24).—KHA"aq: Triclinic prisms; $a:b:c = 2.100:3.256:1$; $\alpha = 96.12^\circ$; $\beta = 79.29^\circ$; $\gamma = 97.05^\circ$ (Wollaston, *Tr.* 1808, 99; Anderson, *C. J.* 1, 231; De la Provostaye, *S.* 1-6 at 13° (N.).—Na₂A". S. 8 at 15°. Neutral in reaction.—NaHA"aq: monoclinic crystals which redden litmus. S. 1-7 at 15°.—Li₂A". S. 8 at 19.5°.—LiHA"aq. S. 8 at 17°.—(NH₄)₂A"aq. S. 4-2 at 15° (N.); 2-2 at 0° (Engel. *C. R.* 102, 365). Hemihedral efflorescent trimetric prisms; $a:b:c = .776:1:733$ (Anschütz, *B.* 18, 1394). Ppd. by adding NH₄Cl or NH₄OAc to its solution (Heintz, *pr.* 8, 309).—(NH₄)₂A"2aq. Occurs in guano (Tanner, *C. N.* 82, 162).—(NH₄)HA"aq: trimetric prisms; $a:b:c = .453:1:559$.—(NH₄)H₂A"2aq: triclinic prisms, isomorphous with KHA"aq. S. 3-25 at 0° (Engel).—(NH₄)HSO₄H₂C₂O₄: monoclinic crystals.—Rb₂A"aq (Piccard, *J. pr.* 86, 449).—RbH₂A"3aq (Stolba, *C. C.* 1878, 331).—CaA"aq. Crystalline powder, formed by ppg. hot solutions (Schmid, *A.* 97, 225).—CaA"3aq occurs, mixed with CaA"aq in the pp. formed from cold solutions. —(CaA")₂CaCl₂24aq.—CaA"CaCl₂7aq (Fritzsche, *P.* 28, 121).—Sra"aq. S. 5 at 100°.—Sra"3aq (Wicke, *A.* 90, 101).—Sra₂A"2aq.—Sra"SrCl₂6aq.—(Sra")₂SrCl₂16aq (Raney, *Pr.* 14, 144).—BaC₂O₄aq. S. .04.—BaH₂A"2aq. S. 8 at 15° (Clapton, *C. J.* 5, 223).—Be(NH₄)₂A" (Sénarmont, *J.* 1857, 295; Shadwell, *J.* 1881, 681).—BeK₂A"—BeK₂A"(OH)₂2aq (Philipp, *B.* 16, 752).—MgA"2aq. S. .07 at 16°; .08 at 100°.—Mg(NH₄)₂A"9aq.—Mg₃(NH₄)₂A"24aq.—Mg(NH₄)₂A"8aq.—Mg(NH₄)₂A"8aq.—Mg₃(NH₄)₂A"2aq (Brandes, *Schw.* *J.* 27, 18).—MgK₂A"6aq.—ZnA"2aq.—Zn(NH₄)₂A"8aq (Kayser, *P.* 60, 140).—ZnK₂A"4aq.—CdA"3aq. Mono-methyl ether MeHA''. (169° at 12 mm.). Solid (Anschütz, A. Ch. [2] 58, 44; 1442; A. 254, 8). — KMeA'' (Salomon, B. 8, 1508).

Di-methyl ether Me $_2$ A''. Mol. w. 118. [54°]. (164°) (Dumas a. Péligot, A. Ch. [2] 58, 44; Wöhler, A. 81, 376; Erlenmeyer, N. Rep. Pharm. 23, 624; Purdie, C. J. 51, 629). S.V. 116.7. H. F. 180,900 (Stohmann, J. pr. [2] 40, 358). Mono-clinic tables, sol. water, alcohol, and ether. Its

aqueous solution slowly decomposes into oxalic acid and MeOH.

Tetra-methyl ether CO $_2$ Me $_2$ C(OMe) $_2$ (76° at 12 mm.). S.G. $\frac{4}{3}$ 1.1812. Formed from CO $_2$ Me $_2$ CCl $_2$ (OMe) and NaOMe (Anschütz, A. 254, 81). Converted by PCl $_5$ into Me $_4$ C $_2$ O.

Mono-ethyl ether EtHA''. **Ethyl-oxalic acid**. (117° at 15 mm.). S.G. $\frac{4}{3}$ 1.2175. Formed from Et $_2$ C $_2$ O $_4$ (1 mol.) and KOH (1 mol.) in alcohol (Mitscherlich, P. 33, 332). Formed also by heating anhydrous oxalic acid (1 pt.) with absolute alcohol (1 pt.) at 135°, decanting from unused oxalic acid, and distilling *in vacuo* (Anschütz, B. 16, 2413; A. 254, 9). Liquid. When distilled under atmospheric pressure it yields formic acid and Et $_2$ C $_2$ O $_4$. — KETA'' : scales, decomposed by heat into CO and K $_2$ CO $_3$ (Eitelkoff, B. 6, 1259).

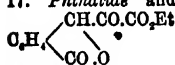

Di-ethyl ether Et $_2$ A''. **Oxalic ether**. (186° cor.). S.G. $\frac{4}{3}$ 1.0793. μ 1.4156; n_D^{20} 1.4156 (Brühl). S.V. 166.2 (Brühl, A. 203, 27); $\frac{4}{3}$ 1.0856; $\frac{4}{3}$ 1.0761 (Perkin, C. J. 45, 508). M.M. 6.654 at 12.8°. S.H. 45 (R. Schiff, G. 17, 286). Formed by distilling dehydrated oxalic acid (11 pts.) with absolute alcohol (14 pts.) (Bergmann, Opuscula, i. 256; Löwig, J. pr. 83, 129), or by heating KHC $_2$ O $_4$ (1 pt.) with alcohol (1 pt.) and H $_2$ SO $_4$ (2 pts.) (Dumas a. Boullay, J. Ph. 14, 113).

Preparation.—Equal weights of dry oxalic acid and alcohol (97 p.c.) are boiled for 4 hours and distilled; as soon as the thermometer reaches 110° a quantity of alcohol equal to the weight of the distillate is added, and the mixture boiled again for 4 hours; the mixture is then distilled; 825 g. oxalic acid give 750 g. (or 56 p.c.) oxalic ether and 110 g. formic ether (Schatzky, J. pr. [2] 34, 500).

Properties.—Colourless oil with slight odour, v. sol. alcohol. Decomposed by water, especially on heating. Alcoholic potash yields a pp. of K $_2$ C $_2$ O $_4$. With SnCl $_2$ it forms crystalline Et $_2$ C $_2$ O $_4$ SnCl $_2$, decomposed by water (Lewy, C. R. 21, 371). TiCl $_4$ yields Et $_2$ C $_2$ O $_4$ TiCl $_4$ and Et $_2$ C $_2$ O $_4$ 2TiCl $_4$ (Demarçay, C. R. 70, 1414).

Reactions.—1. Gaseous NH $_3$ yields CO $_2$ Et $_2$ CONH $_2$.—2. Aqueous NH $_3$ forms oxamide. 3. **Ethylamine** yields C $_2$ O $_4$ (NHEt) $_2$; **diethylamine** forms CO $_2$ Et $_2$ CONEt $_2$; while **triethylamine** has no action (Hofmann). Alanine forms two compounds C $_2$ H $_5$ N $_2$ O $_4$ [127°] and [154°].—4. **Sodium and potassium** decompose it, yielding CO and Et $_2$ CO. NaOEt acts in the same way (Geuther, Z. [2] 4, 656).—5. **Sodium-amalgam** yields des-oxalic ether C $_2$ H $_5$ Et $_2$ O $_4$, and, when alcohol is present, tartaric and glycollic acids. —6. ZnEt $_2$, followed by water, yields CO $_2$ Et $_2$ C $_2$ O $_4$ (OH) (Frankland, Pr. 12, 396). Other zinc-alkyls act in the same way (Frankland a. Duppa, Pr. 13, 140; 14, 17, 79, 88, 191).—7. Acted on by Zn and a mixture of EtI and allyl iodide a mixture of HO.CEt $_2$.CO $_2$ Et and HO.C(C $_2$ H $_5$) $_2$.CO $_2$ Et is formed, and not HO.CEt $_2$ (C $_2$ H $_5$) $_2$.CO $_2$ Et (Baratseff, J. pr. [2] 85, 7).—8. **Resorcin** (1 mol.) and NaOEt (2 mols.) in alcohol slowly form C $_2$ H $_5$ O $_4$, which crystallises from alcohol in pale-yellow prisms [c. 256°], and yields the acetyl derivative C $_2$ H $_5$ Ac $_2$ O $_4$ [127°] (Michael, J. pr. [2] 35, 510).—9. **Phenyl-hydrasine** forms C $_2$ O $_4$ (N $_2$ H $_5$ Ph) $_2$ [378°] and N $_2$ H $_5$ Ph.CO.CO $_2$ Et [119°] (E. Fischer, A. 190,

181; Bulow, A. 236, 197). In presence of alcoholic NaOEt the product is $\text{N}_2\text{H}_4\text{Ph.CO.CO.H}$ [170°] (Michael, J. pr. [2] 85, 458).—10. *Acetone* in presence of NaOEt (1 pt.) in alcohol (60 pts.) forms $\text{CH}_3\text{CO.CH}_2\text{CO.CO.CO.Et}$ [18°] (214°). This body is converted by baryta-water into oxytoluic acid, an intermediate body being $\text{CH}_3\text{Ac.C(OH)(CO}_2\text{H).CHAc.CO.CO.H}$ [90°]. Acetone (2 mols.) and NaOEt (2 mols.) in ether yield $\text{CH}_3\text{CO.CH}_2\text{CO.CO.CO.CH}_2\text{CO.CH}_3$ [121°] crystallising in white prisms (Claisen a. Stylos, B. 20, 2188; 21, 1141; 22, 8271; 24, 116). A mixture of acetone, NaOAc, KOAc, and Ac_2O yield a coloured product $\text{C}_6\text{H}_5\text{O}$. Another product of the action of alcoholic NaOEt on acetone and oxalic ether is $\text{CO(CH}_2\text{CO.CO.CO.Et)}$ [104°], which yields chelidonic acid on warming with mineral acids. On adding sodium* to a mixture of oxalic ether and EtOAc dissolved in Et_2O , oxalacetic ether is formed.—11. *Succinic ether* and NaOEt yield oxalosuccinic ether $\text{CO.Et.CH(CO.CO.Et).CH}_2\text{CO.Et}$ and a compound $\text{C}_{12}\text{H}_{16}\text{O}_{10}$ [90°] (Wislicenus, B. 22, 889).—12. *Alcoholic acetophenone* and NaOEt form benzoyl-pyruvic acid $\text{C}_6\text{H}_5\text{CO.CH}_2\text{CO.CO.H}$ [158°]. Acetophenone and NaOEt in ether yield $\text{BzCH}_2\text{CO.CO.CO.CH}_2\text{Bz}$ [180°] (Claisen, B. 21, 1181).—13. *Chloro-acetic ether* and zinc yield 'ketipis' ether $\text{CO.Et.CH(CO.CO.CO.CO.Et).CO.Et}$ [77°] (Fittig a. Daimler, B. 20, 202).—14. Heating with *oxalic, formic, or acetic acids* at 140° yields formic ether, CO_2 , and CO . Benzoic acid has no action even at 240° (Lorin, Bl. [2] 49, 844).—15. *Benzyl cyanide* and NaOEt yield ON.CHPH.CO.CO.Et [130°] whence boiling dilute H_2SO_4 forms phenyl-pyruvic acid [155°] (Erlenmeyer, B. 22, 1483).—16. A solution of urea in alcoholic NaOEt gives a pp. of sodium parabanate $\text{CO.NNa} > \text{CO}$ (Michael, J. pr. [2] 85, 457).—17. *Phthalide* and NaOEt in ether yield

hydrazine forms $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [159°] (Wislicenus, A. 246, 342).—18. *Chlorine* in sunlight forms $(\text{C}_6\text{Cl}_4)_2\text{O}$ [144°], whence potash yields $\text{CCl}_4\text{CO}_2\text{K}$ (Malaguti, A. Ch. [2] 74, 299).

Tetra-ethyl ether CO.Et.CO.Et.CO.Et (98° at 12 mm.). S.G. $\frac{2}{3}$ 1.0020. Formed from $\text{CO}_2\text{Et.CCl}_4(\text{OEt})$ and NaOEt (Anschütz, A. 254, 82). Converted by POCl_3 into $\text{Et}_2\text{C}_2\text{O}$.

Methyl-ethyl ether CO.Me.CO.Et (174°). S.G. $\frac{1}{4}$ 1.1557. S.V. 189-1 (Wiens, A. 253, 297). Formed by distilling KEtC_2O with K_2SO_4 (Chanceol, Compt. Chim. 1850, 878, 403), and by the action of MeOH on $\text{COCl.CO}_2\text{Et}$ or of EtOH on COCl.CO.Me (Paul, C. J. Proc. 2, 168). Converted by repeated distillation into a mixture of $\text{Me}_2\text{C}_2\text{O}$, and $\text{Et}_2\text{C}_2\text{O}$.

Di-methyl di-ethyl ether $\text{CO}_2\text{Me.C(OEt)(OEt)}$ (92° at 13 mm.). Formed from $\text{CO}_2\text{Me.CCl}_4(\text{OMe})$ and NaOEt at 100° (Anschütz, A. 254, 85).

Di-methyl di-ethyl ether $\text{CO}_2\text{Et.O(Et)(OMe)}$ (98° at 12 mm.). Formed from $\text{CO}_2\text{Et.CCl}_4(\text{OEt})$ and NaOMe at 100°.

n-Propyl-ether PrHA^* (119° at 18 mm.). S.G. $\frac{2}{3}$ 1.1578. Liquid (Anschütz a. Schönfeld, B. 19, 1442; A. 254, 6).

Di-n-propyl ether Pr_2A^* (218-5°).

S.G. $\frac{1}{4}$ 1.0384. S.V. 215-5 (W.; cf. Cahours, C. R. 77, 749). S.H. 451.

Tetra-n-propyl ether $\text{CO}_2\text{Pr.CO(Pr)}$ (257°). S.G. $\frac{2}{3}$ 1.9568. Formed from $\text{CO}_2\text{Pr.CCl}_4(\text{OPr})$ and NaOPr (A.).

Iso-propyl ether $\text{CO}_2\text{Pr.CO}_2\text{H}$ (111° at 13 mm.). S.G. $\frac{2}{3}$ 1.1657. Decomposes on boiling into $\text{Pr}_2\text{C}_2\text{O}$, isopropyl formate, CO_2 , CO , and water (Anschütz, A. 254, 6).— $\text{CO}_2\text{Pr.CO}_2\text{K}$.

Di-isobutyl ether $(\text{C}_4\text{H}_9)_2\text{A}^*$ (225°). S.G. $\frac{1}{4}$ 1.002. S.H. 457. Yields $\text{K(C}_4\text{H}_9)_2\text{C}_2\text{O}$ (Cahours, C. R. 77, 1408).

Tetra-isobutyl-ether $(\text{C}_4\text{H}_9)_4\text{O}$, $\text{C}_4\text{CO}_2\text{C}_4\text{H}_9$ (146° at 10 mm.). S.G. 321. Formed from $\text{C}_4\text{H}_9\text{O.CCl}_4\text{CO}_2\text{C}_4\text{H}_9$ and NaOOC_4H_9 (Anschütz, A. 254, 83).

Di-n-butyl ether $(\text{C}_4\text{H}_9)_2\text{A}^*$ (248°). S.G. $\frac{1}{4}$ 1.0099. S.V. 258-4 (Wiens).

Isoamyl ether $(\text{C}_5\text{H}_{11})_2\text{A}^*$. Oil, smelling of bugs (Balard, A. Ch. [3] 12, 809).— CaA^* , 2aq.— AgA^* : pearly scales.

Di-isamyl ether $(\text{C}_5\text{H}_{11})_2\text{O}$ (265°). S.G. $\frac{1}{4}$ 1.063 (Delffs, J. 1854, 26). S.H. 464 (Schiff). Oil, smelling of bugs (Balard).

Tetra-amyl ether $(\text{C}_5\text{H}_{11})_4\text{O}$, $\text{C}_5\text{CO}_2\text{C}_5\text{H}_{11}$ (190° at 14 mm.). S.G. $\frac{2}{3}$ 1.9141 (A.).

Ethyl heptyl ether $\text{CO.Et.CO}_2\text{C}_6\text{H}_{13}$ (263-7°). S.G. $\frac{1}{4}$ 1.054. S.V. 284-9 (Wiens).

Propyl heptyl ether $\text{Pr(C}_6\text{H}_{13})_2\text{A}^*$ (284°). S.G. $\frac{1}{4}$ 1.0814. S.V. 315-7.

Propyl octyl ether $\text{Pr(C}_7\text{H}_{15})_2\text{A}^*$ (291°). S.G. $\frac{1}{4}$ 1.0725. S.V. 340-4 (Wiens).

Allyl ether $(\text{C}_3\text{H}_5)_2\text{A}^*$ (215-5° i.v.) (Kekulé, B. 6, 387). S.G. $\frac{1}{4}$ 1.055. Formed from $\text{Ag}_2\text{C}_2\text{O}_3$ and allyl iodide (Hofmann a. Cahours, A. 102, 288).

Di-phenyl ether $\text{Ph}_2\text{C}_2\text{O}$ [130°]. Formed by heating phenol (1 pt.) with dry oxalic acid (1 pt.) and POCl_3 (1 pt.) at 115° (Nencki, J. pr. [2] 25, 283). Prisms (from alcohol), sl. sol. ether.

Di-phenyl ortho-oxalate $(\text{PhO})_2\text{C}_2(\text{OH})_2$ [127°]. A by-product in the manufacture of aurin. Formed by distilling phenol with dry oxalic acid, or by dissolving oxalic acid and excess of phenol in HOAc (Claparède a. Smith, C. J. 43, 358; Staub a. Smith, B. 17, 1740). Thin white plates, distilling with decomposition at 150°-180°. Sol. water, but almost at once split up into phenol and oxalic acid. Alcohol yields phenol and oxalic ether. On heating with H_2SO_4 it yields aurin.

Di-(a)-naphthyl ortho-oxalate $(\text{C}_{10}\text{H}_7\text{O})_2\text{C}_2(\text{OH})_2$ [163°]. Formed by heating (a)-naphthol with dry oxalic acid and HOAc (S. a. S.). Crystalline powder.

Di-(b)-naphthyl ortho-oxalate $(\text{C}_{10}\text{H}_7\text{O})_2\text{C}_2(\text{OH})_2$ [167°]. White crystalline powder (from HOAc); partly decomposed on distillation (Staub a. Watson Smith, C. J. 45, 803).

Penta-chloro-ethyl ether $\text{CO}_2\text{H.CO}_2\text{Cl}$. Formed from $\text{CO(NH}_4)_2\text{CO}_2\text{Cl}$ and NH_4Ag (Malaguti, A. Ch. [2] 74, 808). Colourless deliquescent needles.— NH_4A^* .

Chloride of the methyl ether CO.Me.COCl (120°). S.G. $\frac{1}{4}$ 1.8816. Formed by heating $\text{CO}_2\text{Me.CCl}_4(\text{OMe})$ for 40 hours at 215° (Anschütz, A. 254, 26). Liquid.

Chloride of the ethyl ether CO.Et.COCl (186°). S.G. $\frac{1}{4}$ 1.2223. POCl_3 acting upon oxali

ether first forms $\text{COCl}(\text{OEt})\text{CO}_2\text{Et}$, which may be distilled under 15 mm. pressure; when distilled under atmospheric pressure it is split up into EtCl and COClCO_2Et (Anschütz, *B.* 19, 2158; *A.* 254, 27). Formed also from oxalic ether and POCl_3 (Henry, *B.* 4, 598; 5, 949). Decomposed by water. Alcoholic NH_3 yields ethyl oxamate. Aniline forms $\text{CO}(\text{NPhH})\text{CO}_2\text{Et}$. Mercaptan forms $\text{CO}_2\text{Et.CO.SEt}$ (Mocley & Saint, *C. J.* 43, 400). ZnEt_2 followed by water forms $\text{CET}(\text{OH})\text{CO}_2\text{Et}$. Carbamic ether yields $\text{CO}_2\text{Et.NH.CO.CO}_2\text{Et}$ [45°] (Salomon, *J. pr.* [2] 9, 290). $\text{CO}(\text{NH}_2)\text{CO}_2\text{Et}$ at 130° yields $\text{NH}(\text{CO.CO}_2\text{Et})_2$ [67°].

Chloride of the propyl ether
 COClCO_2Pr . (164°). S.G. $\frac{4}{2}$ 1.1670. Formed by treating $\text{Pr}_2\text{C}_2\text{O}_4$ with PCl_5 and heating the resulting $\text{CO.Pr.CCl}(\text{OPr})$ at 190° (Anschütz).

Chloride of the isobutyl ether
 $\text{COClCO}_2\text{C}_4\text{H}_9$. (165°). S.G. $\frac{4}{2}$ 1.1153. Formed in like manner.

Chloride of the isoamyl ether
 $\text{COClCO}_2\text{C}_5\text{H}_{11}$. (185°). S.G. $\frac{4}{2}$ 1.0931 (Δ).

Oxamic acid $\text{CO}(\text{NH}_2)\text{CO}_2\text{H}$. Mol. w. 89. [210°]. S. 1.4 at 14°. Formed by heating $\text{CO}(\text{NH}_2)\text{CO}_2\text{H}$ or by boiling oxamide with aqueous NH_3 (Balard, *A. Ch.* [3] 4, 93; Tousseint, *A.* 120, 237). The NH_3 salt is also formed by passing NH_3 into a cold alcoholic solution of oxalic ether (De Coppet, *A.* 137, 105). Excreted when animals are fed with oxamic ether. Prepared by heating an aqueous solution of $\text{CO}(\text{NH}_2)\text{CO}_2\text{Et}$ to boiling, adding ammonia gradually till the liquid is alkaline (Oelkers, *B.* 22, 1566). Prepared also by heating ammonium oxalate with NH_4NO_3 for four hours at 175° (Mathieu-Plessy, *C. R.* 109, 653). Crystalline powder, sl. sol. alcohol. Converted by boiling water into $(\text{NH}_4)\text{HCO}_3$.— $\text{NH}_4\text{A}'$.— $\text{NH}_4\text{A}'\frac{1}{2}\text{aq}$.— $\text{NaA}'\frac{1}{2}\text{aq}$.— $\text{KA}'\text{aq}$ (Engström, *J.* 1856, 453).— $\text{MgA}'\frac{1}{2}\text{aq}$.— $\text{CaA}'\frac{1}{2}\text{aq}$. S. (of $\text{CaA}'\frac{1}{2}$) 1.6 at 13°; 4 at 100°.— $\text{BaA}'\frac{1}{2}\text{aq}$.— $\text{PbA}'\frac{1}{2}\text{aq}$.— $\text{Pb}(\text{OH})\text{A}'$.— $\text{FeA}'\text{aq}$.— $\text{NiA}'\text{aq}$.— $\text{CuA}'\frac{1}{2}\text{aq}$ (Bacaloglio, *J. pr.* 81, 869).— AgA' : needles.

Methyl ether MeA' . Cubes.

Ethyl ether $\text{CO}(\text{NH}_2)\text{CO}_2\text{Et}$. **Oxamethane**. [115°]. Formed from oxalic ether and dry or alcoholic NH_3 . Plates (from alcohol). With COClCO_2Et it forms $(\text{CO}_2\text{Et.CO})_2\text{NH}$ [67°]. With cyanic acid vapour at 130° it yields $\text{C}_3\text{H}_2\text{N}_4\text{O}_{12}$ [155°–160°] (Grimaux, *Bl.* [2] 21, 154), crystallising from water in needles. Chloral forms $\text{CCl}_3\text{CH}(\text{OH})\text{NH.CO}_2\text{OEt}$ [121°] (Moscovles, *B.* 24, 1804).

Penta-chloro-ethyl ether $\text{C}_2\text{Cl}_5\text{A}'$. [184°]. Formed from $(\text{C}_2\text{Cl}_5)_2\text{C}_2\text{O}_4$ and NH_3 (Malaguti).

Isobutyl ether $\text{O}_4\text{H}_9\text{A}'$. [90°]. Prisms (Cahours, *C. R.* 77, 1403; Wallach, *B.* 18, 507).

Isoamylether $\text{C}_5\text{H}_{11}\text{A}'$. [93°].

Phenyl ether $\text{CO}(\text{NH}_2)\text{CO}_2\text{Ph}$. [132°]. Formed from $\text{CO}_2\text{Et.CCl}(\text{NH}_2)$ and phenol.

Acetyl derivative of the ethyl ether
 $\text{CO}(\text{NHAc})\text{CO}_2\text{Et}$. [54°]. Needles.

Oxamide $\text{CO}(\text{NH}_2)_2\text{CO}(\text{NH}_2)_2$. S. 0.37 at 73° (Henry, *C. R.* 100, 943). H.P. 169,000 (Berthelot).

Formed from oxalic ether and NH_4Aq (Bauhof, *ad.* 1817). Formed also by heating ammonium oxalate (Dumas, *A. Ch.* [2] 44, 129; 54, 240) and by the slow decomposition of cyanogen by water containing aldehyde (Liebig, *A.* 118,

246), or by conc. HClAq (Schmidt & Gluts, *B.* 1, 66). It also occurs among the products of oxidation of HCy , cyanides, and ferrocyanides (Playfair; Atfield, *C. J.* 16, 94).

Properties.—White powder, sl. sol. hot water, insol. alcohol. Cupric acetate forms the salt $\text{Cu}(\text{C}_2\text{H}_3\text{N}_2\text{O}_2)_2\text{aq}$.

Reactions.—1. By passing through a red-hot tube it is decomposed into CO , ammonium carbonate, HCy , and urea.—2. P_2O_5 yields, on heating, cyanogen, CO_2 , and CO .—3. Boiling dilute acids yield oxalic acid.—4. Boiling aqueous alkalis also saponify it. Magnesia acts in the same way (Berthelot, *Bl.* [2] 47, 840).—5. Water at 224° forms ammonium oxalate.—6. Heating with HgO yields urea, CO_2 , and Hg (Williamson). Boiling with water and HgO forms a compound $(\text{C}_2\text{H}_3\text{N}_2\text{O}_2)_2\text{HgO}$ (Dessaignes, *A.* 82, 233).—7. Ac_2O has no action at 160°. Bz_2O at 200° forms benzamide.—8. Conc. HNO_3 decomposes it in the cold.

Oxalimide $\text{CO} \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} \text{NH}$. Formed from oxamic acid, PCl_5 , and POCl_3 at 80°–90° (Ost & Meute, *B.* 19, 3228). Monoclinic prisms, v. sl. sol. cold water, sol. NH_4Aq . Boiling water produces oxamide and oxalic acid.— $\text{C}_2\text{O}_2\text{NH}_2\text{HCl}$: crystalline powder, insol. water.

Methyl-oxamide $\text{CO}(\text{NHMe})\text{CO}_2\text{H}$. [146°] (Hantzsch, *B.* 17, 2919). Formed by heating methylamine acid oxalate (Wurtz, *A. Ch.* [3] 30, 443), and, as a subsidiary product, by oxidising caffeine with CrO_3 (Maly & Hinteregger, *M.* 2, 128). Crystals (from hot water or by sublimation).— KA' .— CaA'_2 .— $\text{CaA}'_2\frac{1}{2}\text{aq}$.— $\text{BaA}'_2\text{aq}$: monoclinic crystals; $a:b:c = 1.018:1.1:3.06$; $\beta = 87^\circ 18'$.

Methylether MeA' . [85°]. Formed from $\text{Me}_2\text{C}_2\text{O}_4$ (76 g.) and methylamine (20 g.) in MeOH (30 g.) (Franchimont & Klobbie, *R. T. C.* 8, 805).

Ethylether EtA' . (243°). Oil.

Methyl-oxamide $\text{CO}(\text{NH}_2)\text{CO}(\text{NHMe})$. [229°]. Formed from oxamic ether and NMeH_2 (Wallach & West, *B.* 9, 262). Minute needles.

Di-methyl-oxamide $\text{C}_2\text{O}_2(\text{NHMe})_2$. [217°] (Mylius, *B.* 17, 291). Needles. Conc. HNO_3 yields $\text{C}_2\text{O}_2\text{NMe}_2\text{NO}_2$ [124°] (Franchimont; *R. T. C.* 2, 94; 4, 193). PCl_5 yields $\text{C}_2\text{H}_2\text{ClN}_2$.

Di-methyl-oxamic acid $\text{CO}(\text{NMe})_2\text{CO}_2\text{H}$.— CaA'_2 : crystalline (Duvillier, *A. Ch.* [5] 28, 315).

Ethyl ether EtA' . (c. 244°). Not attacked by HNO_3 (S.G. 1.5) (Franchimont & Klobbie, *R. T. C.* 8, 804).

Ethyl-oxamic acid $\text{CO}(\text{NHEt})\text{CO}_2\text{H}$. [120°]. Tables.— $\text{CaA}'_2\frac{1}{2}\text{aq}$. Prisms (Heintz, *A.* 127, 43).— $\text{CaA}'_2\frac{1}{2}\text{aq}$. S. 8.17 at 17.5°.— $\text{BaA}'_2\text{aq}$.

Ethyl ether EtA' . (245°). Oil (Wallach, *A.* 184, 59). Decomposed by water.

Ethyl-oxamide $\text{CO}(\text{NH}_2)\text{CO}(\text{NHEt})$. [208°]. Needles (W.).

s-Di-ethyl-oxamide $\text{CO}(\text{NHEt})\text{CO}(\text{NHEt})$. [179°] (Schiff, *B.* 17, 1034). Formed from oxalic ether and ethylamine (W.).

u-Di-ethyl-oxamide $\text{CO}(\text{NH}_2)\text{CO}(\text{NEt}_2)$. [126°]. (268° cor.). From $\text{CO}_2\text{Et.CO}(\text{NEt}_2)$ and ammonia (Wallach, *A.* 214, 263). With PCl_5 it yields 'chloroxalethylene' $\text{C}_2\text{H}_2\text{ClN}_2$.

Tri-ethyl-oxamide $\text{CO}(\text{NHEt})\text{CO}(\text{NEt}_2)_2$. (258°). Formed from diethyl oxamic ether and ethylamine (W.).

OXALIC ACID.

Methyl-ethyl-oxamide $\text{CO}(\text{NHMe})\text{CO}(\text{NHEt})$. [157°]. Formed from methylamine and $\text{CO}_2\text{Et}\cdot\text{CONHMe}$ (W.).

Di-ethyl-oxamic acid $\text{CO}(\text{NEt})_2\cdot\text{CO}_2\text{H}$. [101°]. Prisms. PCl_5 yields $\text{CO}(\text{NEt})_2\cdot\text{COCl}$ — CaA' , 2aq.

Ethyl ether EtA'. (250°–254°). Isopropyl-oxamic acid $\text{CO}(\text{NHPr})_2\cdot\text{CO}_2\text{H}$ — CaA' , (Duvillier).

Di-propyl-oxamide $\text{C}_3\text{O}_2(\text{NHPr})_2$. [162°]. Plates, which feel fatty (Wallach, A. 214, 812).

Di-isobutyl oxamide [167°]. Plates, w. sol. alcohol (Malbot, C. R. 104, 228).

Isocamyl-oxamide [181°]. Needles.

Di-isocamyl-oxamide [129°].

Di-amyl-oxamide $\text{C}_5\text{O}_2(\text{NHCH}_2\text{CMe}_2)_2$. [165°]. Needles (Freund, B. 23, 2868).

Di-allyl-oxamide $\text{C}_3\text{O}_2(\text{NHCH}_2\text{CH}_2)_2$. [154°]. (274°). Br yields $\text{C}_3\text{O}_2(\text{NHCH}_2\text{CH}_2\text{Br})_2$ (Wallach a. Strecker, B. 13, 513).

Ethylene-oxamide $\text{C}_2\text{O}_2\text{N}_2\text{H}_2(\text{CH}_2)_2$. Amorphous precipitate formed, together with soluble $\text{CO}_2\text{Et}\cdot\text{CO}\cdot\text{N}_2\text{H}_2\text{CH}_2$, by the action of alcoholic ethylene-diamine on oxalic ether (Hofmann, B. 5, 247). Similar products are obtained from propylene-diamine (Strache, B. 21, 2360).

Ethylidene-oxamide $\text{C}_2\text{O}_2\text{N}_2\text{H}_2(\text{CHMe})_2$. Formed from cyanogen and crude aldehyde (Berthelot, A. 128, 338).

Phenyl-oxamic acid $\text{CO}(\text{NHPh})\cdot\text{CO}_2\text{H}$. **Oxamic acid**. [151°]. Formed by heating dehydrated oxalic acid (20 g.) with aniline (25 g.) at 140° for an hour (Saurer, A. 68, 15; Claus, Z. [2] 4, 158; Aschan, B. 23, 1820). The product is crystallised from water and the acid set free by dilute H_2SO_4 . Needles (containing Aq) or anhydrous scales (from ether), sl. sol. cold water, v. sol. alcohol. Yields CO_2 , water, CO_2 , and div. sol. alcohol. Yields CO_2 water, CO_2 , and div. sol. alcohol on heating strongly. Yields on nitration *p*-nitro-phenyl-oxamic acid [210°] crystallising in prisms containing aq (Aschan, B. 18, 2936). The isomeric *o*-nitro-phenyl-oxamic acid [112°] is formed by heating oxalic acid with *o*-nitro-aniline (Hübner a. Heoff, A. 209, 867). *m*-Nitro-phenyl-oxamic ether [150°] is formed from oxalic ether and *m*-nitro-anilino. — $\text{NH}_4\text{A}'$. — $(\text{NH}_4)_2\text{HA}'_2$. — KA' aq. — NaA' 8aq; plates, v. sl. sol. cold water. — PbA'_2 . — CuA'_2 (Anschütz, B. 22, 736). — BaA'_2 . — AgA' : white tables. — $(\text{NH}_4\text{Ph})\text{HA}'_2$: needles (from water).

Chloride $\text{CO}(\text{NHPh})\cdot\text{COCl}$. [82°].

Methyl ether MeA'. [114°]. Formed from $\text{Me}_2\text{C}_2\text{O}_4$ and aniline (Anschütz, A. 254, 10). Plates (from alcohol) or needles (from ligroin).

Ethyl ether EtA'. [67°]. Converted by AcCl into $\text{CO}(\text{NPhAc})\cdot\text{CO}_2\text{Et}$ [67°]. PCl_5 yields $\text{NHPh}\cdot\text{CCl}_2\cdot\text{CO}_2\text{Et}$ [72°], which splits up on melting into HCl and $\text{NPh}\cdot\text{CCl}_2\cdot\text{CO}_2\text{Et}$ [91°], whence aniline forms $\text{NHOC}_2\text{H}_5\cdot\text{CO}\cdot\text{CNPh}(\text{NHPh})$ [235°].

Propyl ether PrA'. [92°]. Needles.

Isopropyl ether IPA'. [52°]. Needles.

Isobutyl ether IBuA'. [85°]. Plates.

Amyl ether CA'. [50°]. Needles.

References.—Bromo-, Carboxy-, Di-chloro-, and Iodo-phenyl-oxamic acid.

Phenyl-oxamide $\text{CO}(\text{NHPh})\cdot\text{CONH}_2$. A product of the action of HClAq on cyananiline (Hofmann, A. 73, 181). Formed also from phenyl-oxamic ether and NH_3 (Klinger, A. 184, 279). Crystals (from water).

Di-phenyl-oxamide $\text{CO}(\text{NHPh})\cdot\text{CO}(\text{NHPh})$. [245°] (H.); [241°] (T.); [252°] (P.).

(Reissert, B. 23, 2245). (820°). Formed by heating aniline oxalate at 170° (Gerhardt, A. Ch. [8] 14, 120; 15, 88) and by decomposing cyananiline with HClAq (Hofmann, A. 66, 56; 73, 181; 74, 35). Formed also from ethyl camphor-oxalate and aniline (Tingle, C. J. 57, 655). Naereous scales, insol. water, sl. sol. hot alcohol.

Reactions.—1. **Nitrolic acid** passed into its solution in glacial acetic acid forms the nitrosamine $\text{CO}(\text{NHPh})\cdot\text{CO}(\text{NPhNO})$ [86°] and di-*p*-nitro-oxanilide (Fischer, B. 10, 960; Senf, J. pr. [2] 35, 521).—2. **Chlorine** forms tetra-chloro-di-phenyl-oxamide [c. 255°] (Dyer a. Mixer, Am. 8, 849).—3. **Bromine** yields $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{Br})_2$ [above 300°] whence HNO_3 yields the nitro-compounds $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{Br}(\text{NO}_2))_2$ [288°] and $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{Br}(\text{NO}_2)_2)_2$ [c. 287°] (Mixer a. Willcox, Am. 9, 362).—4. **Iodine** HNO_3 and HOAc yield $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{I}(\text{NO}_2))_2$ [260°]; the compounds $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{I}(\text{NO}_2))_2$ [260°] and $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{I}(\text{NO}_2)_2)_2$ [300°] (Mitter a. Walther, Am. 9, 355; cf. Hübner, A. 209, 866). The hexa-nitro-oxanilide is converted by aqueous KHCO_3 into $\text{CO}(\text{NH}_2)\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4(\text{NO}_2)_3$ [c. 260°] and *p*-picric acid. Di-*o*- and di-*m*-nitro-oxanilides melt above 300° and 270° respectively (H.). Di-*o*-nitro-oxanilide yields, on reduction by tin and HOAc , a base $\text{C}_6\text{H}_4\text{N}_2$ [above 300°] which forms the salts $\text{B}^+\text{H}_2\text{Cl}_2$ 2aq and $\text{B}^+\text{H}_2\text{SO}_4$ 2aq.

References.—Di-bromo- and Tetra-chloro-phenyl-oxamide.

Phenyl-oxamide carboxylic acid $\text{CO}(\text{NH}_2)\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$. Formed by boiling the so-called carboxamido-carbimidamido-benzic acid $\text{CO}(\text{NH}_2)\cdot\text{C}(\text{NH})\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ with water (Griess, B. 18, 2411). Small white plates. — BaA' 5aq. — AgA' .

Di-phenyl-oxamide *m*-carboxylic acid $\text{CO}(\text{NHPh})\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_3(\text{CO}_2\text{H})$ [1:3]. **Alloxal-benzamic acid**. [300°–305°]. Formed from carboxy-phenyl-oxamic acid (or its mono-ethyl ether) and boiling aniline (Schiff, A. 232, 185). Plates (from alcohol).

Anilide $\text{NHPh}\cdot\text{CO}\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{NHPh}$. [290°–296°]. Small needles.

Di-phenyl-oxamide-di-*m*-carboxylic acid $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{CO}_2\text{H})_2$. Formed by heating $\text{CO}_2\text{Et}\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_3(\text{CO}_2\text{H})$ (Schiff, A. 232, 137). **Mono-amide** $\text{C}_6\text{H}_4(\text{NH}_2)\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$. Formed by heating amido-benzamide with the compound $\text{CO}_2\text{H}\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_3(\text{CO}_2\text{H})$. Crystalline. At 200° it yields the imide $\text{C}_6\text{H}_4(\text{N}_2\text{O})\cdot\text{CO}(\text{NH})$, a powder, insol. ammonia.

Di-amide $\text{C}_2\text{O}_2(\text{NHCH}_2\text{CH}_2\text{CO}_2\text{NH}_2)_2$. Formed by heating $\text{CO}_2\text{Et}\cdot\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_3(\text{CO}_2\text{NH}_2)$ with amido-benzamide. Insoluble powder.

***m*-Amido-phenyl-oxamic acid** $\text{C}_6\text{H}_3(\text{NH}_2)\cdot\text{NH}\cdot\text{CO}\cdot\text{CO}_2\text{H}$. Formed from *m*-phenylene-diamine and oxalic acid (Klusemann, B. 7, 1263). Needles. — AgA' .

Di-methyl-amido-phenyl-oxamic acid v. p. 273.

The **anhydrides of the methylohydroxides** $\text{C}_6\text{H}_4(\text{NMe}_2)_2\cdot\text{CO}$ are formed by the action of MeI in MeOH upon the sodium amido-phenyl-oxamates, the products being decomposed by Ag_2CO_3 (Griess, B. 18, 2408). The *w*-compound crystallises with $3\frac{1}{2}$ aq and yields

the salts $B'Hiaq$ and $B'_2H_2PtCl_4$. The *p*-isomeride crystallises (with $2\frac{1}{2}$ aq) in needles, v. sol. hot water.

m-Phenylene-oxamide $C_6O_2(NH)_2C_6H_4$. Formed from *m*-phenylene-diamine and oxalic ether (K.). Amorphous.

Di-phenyl-di-ethyl oxamide $C_6O_2(NH.C_2H_5)_2$. Crystals (Neubert, B. 19, 1826).

Di-phenyl-di-methyl oxamide $C_6O_2(NMePh)_2$. (250°). Formed from methyl-aniline and oxalic ether.

o-Tolyl-oxamic acid $CO(NHC_6H_4)_2.CO_2H$. [137°]. Formed by fusing $KEtC_2O_4$ with *o*-toluidine (Mauthner a. Suida, M. 7, 233; 9, 735). Needles (containing aq). Yields indole when heated with zinc-dust. $-CaA'$, $-BaA'$, aq. $-AgA'$.

p-Tolyl-oxamic acid. [170°]. Obtained from its ether $CO(NHC_6H_4)_2.CO_2Et$ [87°] which is formed by heating oxalic ether with *p*-toluidine.

Nitro-tolyl-oxamic acid $C_6H_4(NO_2)$, i.e. [4:3] $C_6H_4Me(NO_2).NH.CO.CO_2H$. Formed by heating nitro-*m*-toluidine with oxalic acid (Hinsberg, B. 15, 2691). Yellowish-red plates (containing aq). $-NaA'$, aq. $-BaA'$, aq.

Ethyl ether EtA' . [127°].

o-Tolyl oxamide $CO(NH_2).CO(NHC_6H_4)$ (Bladin, B. [2] 41, 129).

Di-*o*-tolyl-oxamide $C_6O_2(NHC_6H_4)_2$. [200°]. Formed by heating oxalic acid with *o*-toluidine at 220° (M. a. S.). Crystals (from benzene). Converted by treatment with fuming HNO_3 into $C_6O_2(NH.C_6H_4Me(NO_2)_2)$ (2:1:3:5), which decomposes at about 270° (Mixer a. Kleeberg, Am. 11, 236). On oxidation by neutral $KMnO_4$ it yields $C_6O_2(NH.C_6H_4.CO_2H)_2$, which forms the salts $Ca_2A''O$ and Ag_2A'' .

p-Tolyl-oxamide $CO(NH_2).CO(NHC_6H_4)$. [237°]. Formed from *p*-toluidine cyanide ($C_6H_4NH_2)Cy_2$ and $HOAc$ (Bladin). Needles, v. sol. alcohol.

Di-*p*-tolyl-oxamide $C_6O_2(NHC_6H_4)_2$. [269°]. Crystals, v. sol. hot $HOAc$. Yields on nitration $C_6O_2(NHC_6H_4Me(NO_2)_2)$ and $C_6O_2(NHC_6H_4(NO_2)_2)_2$.

Amido-tolyl-oxamic ether $C_6H_4(NH_2)C_6H_4Me(NH).NH.CO.CO_2Et$. Tolylic-oxamethane. [168°]. Formed from tolylene-*m*-diamine and oxalic ether in alcohol (Tiemann, B. 3, 222). Plates (from alcohol). When dilute alcohol of 90 p.c. only is used the acid $C_6H_4Me(NH_2).NH.CO.CO_2H$ [234°] is formed (Schiff, B. 23, 1819). Phenyl thiocarbimide yields $C_6H_4Me(NH.CS.NHPh).NH.CO.CO_2Et$ [155°], a crystalline compound [138°], and $C_6H_4Me(NH.CO_2Et).NH.CO_2Et$ [198°]. $ClCO_2Et$ forms [1:2:4] $C_6H_4Me(NH.CO_2Et).NH.CO_2Et$ [131°], whence alcoholic ammonia yields $C_6H_4Me(NH.CO_2Et).NH.CO_2NH_2$ [209°] (Schiff a. Vanni, B. 24, 687, 1315). The compounds [1:2:2] $C_6H_4Me(NH.CO_2Et).NH.CO_2Et$ [128°] and [1:4:2] $C_6H_4Me(NH.CO_2Et).NH.CO_2NH_2$ [236°] are also crystalline. The following bodies of like character are also crystalline:

[1:2:4] $C_6H_4Me(NH.CO_2Et).NH.CO_2Et$ [218°], [1:2:4] $C_6H_4Me(NH.CO_2NH_2).NH.CO_2NH_2$ [239°], [1:2:4] $C_6H_4Me(NH.CO_2Et).NH.CO_2NH_2$ [210°], [1:2:4] $C_6H_4Me(NH.CO_2Et).NH.CO_2NH_2$ [180°], and [1:2:4] $C_6H_4Me(NH.CO_2NH_2).NH.CO_2NH_2$ [220°]. The compounds [1:2:4] $C_6H_4Me(NH.CO_2Et).NH.CO_2NH_2$ [170°] and

[1:2:4] $C_6H_4Me(NH.CO_2NH_2).NH.CO_2H$ [205°] have also been prepared.

Amide $C_6H_4Me(NH_2).NH.CO_2H$ [1:2:4].

[228°]. From the ether and alcoholic NH_3 .

Anilide $C_6H_4Me(NH_2).NH.CO_2NHPh$ [186°] (Schiff, B. 24, 871).

Xylol-oxamic acid $CO(NHC_6H_4Me)_2.CO_2H$. [129°]. Formed by heating *m*-xylylidine with $KEtC_2O_4$ (Mauthner a. Suida, M. 9, 745). Needles (containing aq). On heating it yields di-xylyl-oxamid $C_6O_2(NHC_6H_4Me)_2$ [210°]. $-CuA'$, $-AgA'$.

ψ -Cumyl-oxamic acid $CO(NHC_6H_4Me)_2.CO_2H$. [167°]. Yellow needles which on heating yield di- ψ -cumyl-oxamide $C_6O_2(NHC_6H_4Me)_2$ [230°]. $-NaA'$, aq. $-KHA'$, $-CaA'$, aq. $-AgHA'$, $-AgA'$.

Di-propyl-di-benzyl-oxamide $C_6O_2(NH.CH_2CH_2Ph)_2$. [182°] (Goldschmidt a. Gessner, B. 27, 932). Crystalline.

Tetra-phenyl-di-propyl-oxamide $C_6O_2(NH.CH_2CH_2Ph.CH_2CH_2Ph)_2$. [116°]. Formed from $CH_2Ph.CHPh.CHPh.CHPh$, and oxalic ether (Freund a. Remse, B. 23, 2862).

(a)-Naphthyl-oxamic acid $CO(NHC_{10}H_7)_2.CO_2H$. [180°]. Formed from oxalic ether and (a)-naphthylamine (Ballo, B. 6, 247). Needles. $-KA'$, $-CaA'$, $-BaA'$, $-C_{10}H_7NH_2.HA'$. [154°]. Needles (from water).

Ethyl ether EtA' . [106°]. Needles.

Di-(a)-naphthyl-oxamide $C_6O_2(NHC_{10}H_7)_2$. [200°]. Small scales (Zinin, A. 108, 228).

Benzylidene-oxamide $C_6H_4CH(NH).C_6O_2$. Formed from oxamic ether and benzoic aldehyde (Medicus, A. 157, 50). Plates (containing aq).

Piperidyl-oxamic ether $C_6H_4NH.CO.CO_2Et$. (290°). Formed from piperidine and oxalic ether (Wallach a. Lehmann, A. 237, 245). Oil.

Oxamidine $C(NH)(NH_2).C(NH)NH_2$. The hydrochloride of this base $B'HCl$ aq is formed by the action of alcoholic NH_3 on the hydrochloride of oximido-ethyl ether (Pinner, B. 16, 1656). It crystallises in plates, v. sol. water.

Oxalamidoxim $O(NOH)(NH_2).C(NOH)(NH_2)$. [200°]. Formed by the action of hydroxylamine on cyananiline or on cyanogen (E. Fischer, B. 22, 1932; Ephraim, B. 22, 2305; Zinkeisen, B. 22, 2946; Vorlander, B. 24, 814). Colourless prisms, v. sol. hot water, sl. sol. alcohol. $ClCO_2Et$ forms $C(NO.CO_2Et)NH_2.C(NO.CO_2Et)NH_2$ [168°]. Aldehyde produces $CH_3CH \begin{smallmatrix} HN \\ \diagup \end{smallmatrix} \begin{smallmatrix} ON \\ \diagdown \end{smallmatrix} C \begin{smallmatrix} NH \\ \diagup \end{smallmatrix} \begin{smallmatrix} NO \\ \diagdown \end{smallmatrix} CH_3$

[198°]. Succinic anhydride yields the acid $CO_2H.C_6H_4.O \begin{smallmatrix} N \\ \diagup \end{smallmatrix} \begin{smallmatrix} N \\ \diagdown \end{smallmatrix} C \begin{smallmatrix} N \\ \diagup \end{smallmatrix} \begin{smallmatrix} NO \\ \diagdown \end{smallmatrix} CO_2H.CO_2H$

[200°]. Chloral yields $C_6H_4NH_2.OCl$ [197°]. $-B'HCl$: prisms, insol. alcohol.

Di-acetyl derivative [184°]. Crystals. On heating with Ac_2O it yields

$OMe \begin{smallmatrix} N \\ \diagup \end{smallmatrix} \begin{smallmatrix} N \\ \diagdown \end{smallmatrix} C \begin{smallmatrix} N \\ \diagup \end{smallmatrix} \begin{smallmatrix} NO \\ \diagdown \end{smallmatrix} CMe$. [165°].

Di-benzoyl derivative [217°]. Excess of $BzCl$ forms $PhC \begin{smallmatrix} N \\ \diagup \end{smallmatrix} \begin{smallmatrix} N \\ \diagdown \end{smallmatrix} C \begin{smallmatrix} N \\ \diagup \end{smallmatrix} \begin{smallmatrix} NO \\ \diagdown \end{smallmatrix} CPh$ [246°], insol. water.

Di-ethyl ether $C(NOEt)(NH_2).C(NOEt)(NH_2)$. [115°]. Formed from oxalamidoxim, EtI , and $NaOEt$ (Zinkeisen, B. 22, 2950). Needles, sl. sol. hot water.

Oxalunamidoxim $C(NOH)(NH.CO.NH_2).C(NOH).NH.CO.NH_2$. [192°]. Formed from oxalamidoxim and conc.

OXALYL-METHYL-AMIDE

aqueous potassium cyanate (Z.). White needles, sol. cold water.

Phenyl-oxalamidoxim
 $\text{O}(\text{NOH})(\text{NHPh})\text{C}(\text{NOH})(\text{NH})_2$. [c. 180°]. (Z.); [148°] (Tiemann, B. 22, 1936). Formed from alcoholic hydroxylamine hydrochloride and solid cyananiline (Zinckeisen, B. 22, 2954). Plates.

Ac_2O produces $\text{C}(\text{NOH})(\text{NHPh})\text{O} \leftarrow \text{N} \rightarrow \text{CMe}$ [172°].— $\text{B} \cdot \text{HCl}$: colourless needles.

Di-benzoyl derivative [189°]. Needles. Hydroxylamide of oxalic acid $\text{C}_2\text{O}_2(\text{NH}_2\text{OH})_2$. Formed from oxalic ether and hydroxylamine (Lossen, A. 150, 314). Minute prisms (from water). Explodes at 105°.— NaHA — KHA — CaA — BaHA — ZnA — AgA — $\text{NH}_2(\text{OH})\text{HA}$.

Oxalyl-tetra-methyl-di-hydrazine
 $\text{C}_2\text{O}_2(\text{NH}_2\text{NMe}_2)_2$. [220°]. Formed from di-methyl-hydrazine and oxalic ether (Renout, B. 18, 2172). Plates, sol. alcohol.

Oxalyl-di-ethyl-di-hydrazine
 $\text{C}_2\text{O}_2(\text{NH}_2\text{NHEt})_2$. [204°]. Formed from ethyl-hydrazine and oxalic ether (Fischer, A. 199, 297). Needles. Gives rise to the nitrosamine $\text{C}_2\text{O}_2(\text{N}(\text{HPh})\text{NO})_2$, [145°], crystallising from water in prisms.

Oxalphenylhydrazic acid $\text{CO}(\text{N}_2\text{HPh})\text{CO}_2\text{H}$. [170°]. Formed from oxalic ether, phenyl-hydrazine, and alcoholic NaOEt (Michael, J. pr. [2] 35, 458).— NaA — EtA . [119°].

Oxalyl-di-phenyl-di-hydrazine
 $\text{C}_2\text{O}_2(\text{N}_2\text{HPh})_2$. [278°]. Formed from oxalic ether and phenyl-hydrazine at 110° (E. Fischer, A. 190, 131). Plates. With COCl_2 it yields $\text{C}_2\text{O}_2(\text{N}_2(\text{CO})\text{Ph})_2$, [above 800°].

Semi-nitrile of oxalic acid v. **CYANOFORMIC ACID**.

Semi-nitrile of ortho-oxalic acid. **Tri-ethyl ether** $\text{C}(\text{OEt})_3\text{CN}$. (161°). S.G. 1.003. Polymerises on standing (Bauer, A. 229, 178).

Tri-propyl derivative $\text{C}(\text{OPr})_3\text{CN}$. (216°–219°).

Nitrile of oxalic acid is **CYANOGEN**.
OXALIMIDO-ETHYL ETHER $\text{C}_2\text{H}_2\text{N}_2\text{O}_2$, i.e. $\text{C}(\text{NH})(\text{OEt})\text{C}(\text{NH})(\text{OEt})$. [c. 25°]. (c. 170°). Formed from cyanogen and alcoholic HCl (Pinner & Klein, B. 11, 1481). Long prisms. Benzylamine at 110° forms $(\text{CH}_2\text{PhNH})_2\text{C}_2(\text{NH})_2$, [150°] (Vorländer, B. 24, 806). *p*-Toluidine forms the isomeric $(\text{C}_6\text{H}_4\text{MeNH})_2\text{C}_2(\text{NH})_2$, [220°–230°], which is converted by hydroxylamine sulphate into $\text{C}(\text{NOH})(\text{NH}_2)\text{C}(\text{NOH})\text{NHC}_6\text{H}_5$, [175°], which yields a dibenzoyl derivative [194°], and by hydroxylamine hydrochloride into $\text{C}(\text{NOH})(\text{NH}_2)\text{C}(\text{NH})\text{NHC}_6\text{H}_5$, [148°], whence may be got $\text{C}(\text{NOEt})\text{NH}_2\text{C}(\text{NH})\text{NHC}_6\text{H}_5$, [133°] and $\text{C}(\text{NOCH}_2\text{Ph})(\text{NH}_2)\text{C}(\text{NH})\text{NHC}_6\text{H}_5$, [165°].

OXALINES. A name given to certain alkyl-glyoxalines (Wallach, A. 214, 278, 325; Japp, O. J. 43, 197; Radziszewski, B. 15, 2706). They are described as alkyl-glyoxalines (v. also **GLY- OXALINES**).

OXAL-METHYL-ETHYLENE v. **DI-METHYL-GLYOXALINE**.

OXALMETHYLENE is identical with **METHYL-GLYOXALINE** (q. v.).

OXAL-METHYL-PROPYLINE v. **METHYL-ETHYL-GLYOXALINE**.

OXALOXYL-AMIDO-BENZOIC ACID v. **CYANIC ACID** and **CARBOXY-PHENYL-OXAMIC ACID**.

OXALPROPIONIC ETHER v. **METHYL-OXAL-ACETIC ETHER**.

OXALPROPYLAMYLENE v. **PROPYL-BUTYL-GLYOXALINE**.

OXALPROPYLBUTYLENE v. **DI-PROPYL-GLY- OXALINE**.

OXAL-PROPYL-ETHYLENE v. **METHYL-PRO- PYL-GLYOXAMINE**.

OXALPROPYLINE v. **ETHYL-PROPYL-GLY- OXALINE**.

OXALSUCCINIC ETHER
 $\text{CO}_2\text{Et} \cdot \text{CO} \cdot \text{CH}(\text{CO}_2\text{Et}) \cdot \text{CH}_2 \cdot \text{CO}_2\text{Et}$. (156° at 17 mm.). Formed by the action of NaOEt on an ethereal solution of oxalic and succinic ethers (W. Wislicenus, B. 22, 885). Oil, v. sol. alkalis. FeCl_3 gives a deep-red colour in alcoholic solutions. Split up, in dilute solutions, on warming into oxalic and succinic acids and alcohol. Yields a phenyl-hydrazide.

OXALURIC ACID $\text{C}_2\text{H}_2\text{N}_2\text{O}_6$, i.e. $\text{NH}_2 \cdot \text{CO} \cdot \text{NH} \cdot \text{CO} \cdot \text{CO} \cdot \text{NH}_2$. Mol. w. 182. H.F. 2,500 (Matignon, C. R. 113, 198). "Occurs as ammonium salt in urine (Schunck, J. 1866, 749). Formed by heating parabanic acid with aqueous alkalis (Liebig & Wöhler, A. 26, 287), and occurs among the products of the action of HCl and KClO_4 on guanine (Strecker, A. 118, 151). Its ether is produced by the action of urea on $\text{COCl} \cdot \text{CO}_2\text{Et}$ in the cold (Henry, B. 4, 644). White crystalline powder, sl. sol. water. It reddens litmus. Its aqueous solution is decomposed on boiling into urea and oxalic acid. POCl_3 converts it into parabanic acid (Grimaux, C. R. 77, 1548). HNO_3 slowly decomposes it into CO_2 (54 c.c.), N_2O (38 c.c.), CO and N (15 c.c. together) (Franchimont, R. T. C. 6, 216).

Salts.— NH_4A : silky needles, v. sol. hot water.— KA aq. Trimetric crystals: $a:b:c = 1.601:539:294$. S. 205 at 15°; 5 at 100° (P. Waage, A. 118, 301).— BaA , 2 aq. S. 158 at 9°; 1.8 at 100°.— AgA : long silky needles.

Ethyl ether EtA. [178°] (Salomon, B. 9, 374). Silky needles.

Amide $\text{NH}_2 \cdot \text{CO} \cdot \text{NH} \cdot \text{CO} \cdot \text{CO} \cdot \text{NH}_2$. [155°–160°]. Formed, together with dialuric acid, by the action of NH_4Aq and HCy on allofan (Rösing & Schischkoff, A. 106, 255; Strecker, A. 113, 48). Formed also by the action of alcoholic ammonia on oxaluric ether, and of dry NH_3 on parabanic acid at 130° (Roudinskaja, Bl. [2] 45, 250). Produced by heating urea with oxamic ether (CaC_2O_4 v. J. pr. [2] 9, 143). Crystalline powder, insol. cold water. Converted into ammonium oxalurate by boiling water.

Oxaluryl-hydrazine $\text{CO}(\text{NH}_2) \cdot \text{CO} \cdot \text{CO} \cdot \text{N}_2\text{HPh}$. [215°]. Formed by heating phenyl-hydrazine parabanate (Skinner & Ruhemann, C. J. 55, 550).

Dimethyl-oxaluramide $\text{C}_2\text{H}_2\text{N}_2\text{O}_6$. [225°]. Formed from di-methyl-parabanic acid and alcoholic NH_3 at 100° (Menschutkin, A. 178, 208). Needles.

OXALYL-DI-CHLORO-ACETIC ETHER v. **TETRA-CHLORO-TETRA-OXY-ADIPIC ETHER**.

OXALYL-DI-p-DIMETHYLPHENYLENE DIAMINE v. **TETRA-METHYL-DI-AMIDO-DI-PHENYL OXAMIDE**.

OXALYL-METHYL-THIO-UREA v. **METHYL-THIO-PARABANIC ACID**.

OXALYL-METHYL-UREA *v.* **Methyl-Parabanic Acid.**

OXALYL-TOLYLENE-DIAMINE

$[1\frac{8}{4}] \text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{NH} \cdot \text{CO} \\ \text{NH} \cdot \text{CO} \end{smallmatrix} \text{or } \text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{N} \cdot \text{C}(\text{OH}) \\ \text{N} \cdot \text{C}(\text{OH}) \end{smallmatrix}$
Di-oxy-methyl-quinoxaline. Formed by heating the acid oxalate of tolylene-diamine to 160° (Hinsberg, *B.* 16, 1531). Converted by PCl_5 into $\text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{N} \cdot \text{CCl} \\ \text{N} \cdot \text{CCl} \end{smallmatrix}$ [116°], crystallising in needles, insol. water.

Oxalyl-di-tolylene-tetramine
 $\text{C}_6\text{O}_2(\text{NH} \cdot \text{C}_6\text{H}_4\text{Me} \cdot \text{NH})_2$ [4:1:3], [above 300°]. Formed by reducing di-nitro-di-tolyl-oxamide (*v.* **OXALIC ACID**). Small needles. Above 300° it forms $\text{C}_6\text{H}_4\text{Me} \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \text{C} \cdot \text{C} \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} \text{C}_6\text{H}_4\text{Me}$.

Salts. — $\text{B}'\text{H}_2\text{SO}_4$, 5aq. — $\text{B}'\text{H}_2\text{Cl}_2$, aq. — $\text{B}'\text{H}_2\text{PtCl}_6$: yellow amorphous pp.

OXALYL-UREA *v.* **PARABANIC ACID.**

OXAMETHANE is the *Ethyl ether of oxamic acid* *v.* **OXALIC ACID.**

OXAMETHANE CHLORIDE *v.* **DI-CHLORO-AMIDO-ACETIC ETHER.**

OXAMIC ACID *v.* **OXALIC ACID.**

OXAMIDE *v.* **OXALIC ACID.**

OXAMIDINE *v.* **OXALIC ACID.**

OXAMIDO-ACETOPHENONE-OXIM

$\text{C}_6\text{H}_5\text{C}(\text{NOH})\text{CH}_2\text{NH}(\text{OH})$. [163°]. Formed by digesting a dilute alcoholic solution of ω -bromo-acetophenone with hydroxylamine hydrochloride for several hours at the boiling-point (Schramm, *B.* 16, 2183). White crystalline solid. Sol. alcohol and ether, insol. cold water and ligroin. Dissolves in alkalis. — $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{Ag}$.
OXAMIDO-CARBIMIDO-CARBOXAMIDO-BENZOIC ACID
 $(\text{OH})\text{NH} \cdot \text{C}(\text{NH}) \cdot \text{CO} \cdot \text{NH} \cdot \text{C}_6\text{H}_4 \cdot \text{CO}_2\text{H}$. Formed by the action of an aqueous solution of hydroxylamine upon cyanocarboxamido-benzoic acid $\text{NC} \cdot \text{CO} \cdot \text{NH} \cdot \text{C}_6\text{H}_4 \cdot \text{CO}_2\text{H}$ (vol. i. p. 157) (Griess, *B.* 18, 2416). White needles. Sl. sol. hot water. — BaA'_2 , 4aq.

OXANILIC ACID is *Phenyl-oxamic acid* *v.* **OXALIC ACID.**

OXANILIDE is *Di-phenyl-oxamide* *v.* **OXALIC ACID.**

OXANTHRANOL $\text{C}_{12}\text{H}_{10}\text{O}_2$, *i.e.*

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{CH}(\text{OH}) \end{smallmatrix} \text{C}_6\text{H}_5$. *Anthrahydroquinone.*

Prepared from anthraquinone (1 pt.), zinc-dust (2 pts.), and NaOH (30 pts. of 50 per cent. solution). The filtrate is *ppd.* by acids, but the *ppd.* oxanthranol must be kept in a closed bottle under carbonic acid water, as it is reoxidised by air to anthraquinone (Graebe & Liebermann, *A.* 160, 126; 212, 65). The red solution of oxanthranol in KOH is attacked by alkyl iodides forming alkyl-oxanthranols. The alkyl-oxanthranols may be reduced to alkyl-anthracene di-hydrides, which may be re-oxidised to the alkyl-oxanthranols. The alkyl oxanthranols give, with PCl_5 , alkyl-oxanthranyl chlorides. In these respects methyl-oxanthranol behaves differently from the others. The alkyl-oxanthranyl chlorides are converted by water back to alkyl-oxanthranols. Alkyl-oxanthranols (1 pt.) are reduced by zinc-dust (2 pts.) and ammonia (8 pts. of S.G. '88) and water (5 pts.) to alkyl-hydro-anthranols (Liebermann, *A.* 212, 108).

Acetyl derivative $\text{C}_{12}\text{H}_8\text{AcO}_2$. Formed

from oxanthranol, NaOAc and Ac_2O . Crystalline solid.

Methyl-oxanthranol $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{CH}(\text{OMe}) \end{smallmatrix} \text{C}_6\text{H}_5$

or $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{OMe}(\text{OH}) \end{smallmatrix} \text{C}_6\text{H}_5$ [187°]. Formed by heating a mixture of anthraquinone, NaOH , zinc-dust, water, and MeBr (Liebermann & Landshoff, *B.* 14, 456; *A.* 212, 75). Colourless plates, sl. sol. alcohol, forming a solution with blue fluorescence. Reduced by HI and P to anthracene dihydride. Not attacked by PCl_5 . An isomeride of methyl-oxanthranol [98°] is sometimes formed by the action of NaOHAq and MeI on oxanthranol (Liebermann, *B.* 21, 1175).

Ethyl-oxanthranol $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{CH}(\text{OEt}) \end{smallmatrix} \text{C}_6\text{H}_5$

[107°]. Formed from oxanthranol, NaOHAq , and EtI at 100°. Formed also by oxidation of $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{CH}(\text{OEt}) \end{smallmatrix} \text{C}_6\text{H}_5$ [77°] with CrO_3 in HOAc (Goldmann, *B.* 21, 2507). Needles or trimetric prisms; $a:b:c = 741:1:495$. Its alcoholic solution exhibits strong blue fluorescence. It is insol. aqueous alkalis. Reacts with hydroxylamine (E. von Meyer, *J. pr.* [2] 29, 496). HI and P reduce it to ethyl-anthracene dihydride. Conc. H_2SO_4 forms crystalline $\text{C}_{12}\text{H}_{10}\text{O}_2$. Yields a di-bromo-derivative $\text{C}_{12}\text{H}_8\text{Br}_2\text{O}(\text{OEt})$ [123°] and a di-nitro-derivative crystallising in small needles. PCl_5 forms $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{CH}(\text{OEt}) \end{smallmatrix} \text{C}_6\text{H}_5$ [89°].

Isobutyl-oxanthranol

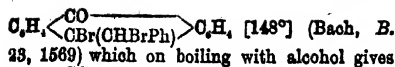

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{C}(\text{C}_4\text{H}_9)(\text{OH}) \end{smallmatrix} \text{C}_6\text{H}_5$. [130°]. Prisms or needles (Liebermann & Walder, *B.* 14, 462). PCl_5 yields the chloride $\text{C}_6\text{H}_4 \cdot \text{C}(\text{OCl})(\text{C}_4\text{H}_9) \cdot \text{C}_6\text{H}_5$ [78°], which reproduces isobutyl-oxanthranol on boiling with water.

Isoamyl-oxanthranol

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{C}(\text{C}_5\text{H}_{11})(\text{OH}) \end{smallmatrix} \text{C}_6\text{H}_5$. [125°]. Monoclinic tables (from benzene-ligroin). Conc. H_2SO_4 removes E_2O , forming $\text{C}_{12}\text{H}_{10}\text{O}$ [72°] which separates from alcohol as yellow needles, and forms a dibromide $\text{C}_{12}\text{H}_8\text{Br}_2\text{O}$ [120°]. Further action of H_2SO_4 forms a cherry-coloured liquid, whence alcohol ppts. yellow needles of $\text{C}_{12}\text{H}_{10}\text{O}$ [206°], a body which, on oxidation, yields anthraquinone carboxylic acid and a compound $\text{C}_{12}\text{H}_{12}\text{O}_4$ [167°]. The compound $\text{C}_{12}\text{H}_{10}\text{O}$ is reduced by HI in HOAc to $\text{C}_{12}\text{H}_{12}$ [98°] which crystallises from alcohol in needles, and forms on nitration a compound $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_5$ (Liebermann, *A.* 212, 99). Phosphorus pentachloride converts isoamyl-oxanthranol into the chloride $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CO} \\ \text{CCl}(\text{C}_5\text{H}_{11}) \end{smallmatrix} \text{C}_6\text{H}_5$ [85°] which forms monoclinic crystals; $a:b:c = 1266:1:2752$; $\beta = 68^\circ 23'$. NaOAc converts the chloride into $\text{C}_{12}\text{H}_{10}\text{AcO}_2$ [78°].

Benzyl-oxanthranol $\text{C}_{12}\text{H}_{10}\text{O}_2$. [146°]. Formed by boiling anthraquinone (5 pts.), zinc-dust (5 pts.), KOH (7½ pts.), benzyl bromide (5 pts.), and water (100 pts.), for a long time (Levi, *B.* 18, 2153). White tables, *v.* sol. alcohol. Conc. H_2SO_4 at 70° forms a violet solution containing the anhydride $\text{C}_{12}\text{H}_8\text{O}$ which crystallises in yellow needles, oxidised by CrO_3 to anthraquinone. The anhydride yields a dibromide

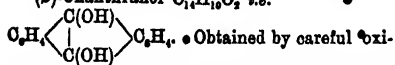

OXIDATION.

Acetyl derivative

(*B*)-Oxanthranol $\text{C}_{11}\text{H}_{10}\text{O}_2$, i.e.

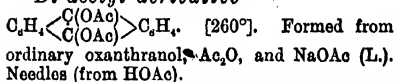

tion of anthracene by adding 5.6 grms. of lead peroxide to a hot solution of 2 grms. of pure anthracene in 50 c.c. of acetic acid (Schulze, B. 18, 3036). Greenish-yellow needles (from alcohol). The alkaline solution is red, but quickly becomes decolourised on shaking with air from oxidation to anthraquinone. It is very oxidisable. In its properties it closely resembles oxanthranol. With ammoniacal AgNO_3 it gives a pp. of metallic silver. Cupric hydrate mixed with excess of NaOH is reduced to black cuprous oxide.

Di-methyl ether $\text{C}_{11}\text{H}_{10}(\text{OMe})_2$ [196°].

Di-ethyl ether $\text{C}_{11}\text{H}_{10}(\text{OEt})_2$; crystals.

Di-benzyl ether $\text{C}_{11}\text{H}_{10}(\text{OC}_6\text{H}_5)_2$ [220°]; small colourless glistening crystals.

Di-acetyl derivative

Di-oxy-(*B*)-oxanthranol v. Tri-oxy-anthranol. OXATOLUIC ACID v. Di-benzyl-glycollic acid.

OXAZINES. Compounds derived from the hypothetical oxazine $\text{NH} \begin{smallmatrix} \text{CH:CH} \\ \text{CH:CH} \end{smallmatrix} \text{O}$. Quin-

OXAZOLES. Compounds derived from the hypothetical oxazole $\text{N} \begin{smallmatrix} \text{CH:CH} \\ \text{:CH} \end{smallmatrix} \text{O}$ (Hantzsch, B.

OXETHYL- v. OXY-ETHYL.

OXETONES. Compounds derived from the

They are formed by treating lactones with sodium and heating the products (Fittig, A. 256, 57). Thus valerolactone $\text{C}_5\text{H}_8\text{O}_2$ yields $\text{C}_{10}\text{H}_{16}\text{O}_4$, which, when boiled with NaOMe forms $\text{C}_{10}\text{H}_{18}\text{NaO}_4$, whence the acid $\text{C}_{10}\text{H}_{16}\text{O}_4$, which is split up by heat into CO_2 and di-methyl-oxetone

• OXIDATION. This term was used formerly to connote chemical changes wherein oxygen was added on to an element or compound, or a compound was decomposed by the action of O with formation of oxidised products. The term was nearly synonymous with combustion in the earlier and more restricted meaning of that word. For an account of the phlogistic theory of combustion v. Combustion, vol. ii. p. 241.

The term oxidation has been widened until at present it is applied to all chemical changes which result in an addition of negative radicals, simple or compound, to elements or compounds, or a decrease in the relative quantity of the positive radicle of a compound, whether this is or is not accompanied by substitution of negative radicle. Thus the following changes are classed together as oxidations:— $4\text{Fe} + 3\text{O}_2 = 2\text{Fe}_2\text{O}_3$; $2\text{Fe} + 3\text{Cl}_2 = 2\text{FeCl}_3$; $2\text{BaO} + \text{O}_2 = 2\text{BaO}_2$; $4\text{Cu} + \text{S}_2 = 2\text{Cu}_2\text{S}$; $2\text{HgI} + \text{I}_2 = 2\text{HgI}_2$; $2\text{KNO}_2 + \text{O}_2 = 2\text{KNO}_3$; $\text{BaS} + 2\text{O}_2 = \text{BaSO}_4$; $4\text{FeSO}_4 + 2\text{H}_2\text{SO}_4 + \text{O}_2 = 2\text{Fe}_2(\text{SO}_4)_3 + 2\text{H}_2\text{O}$; $2\text{K}_2\text{FeCy}_4 + \text{Cl}_2 = 2\text{K}_2\text{FeCy}_4 + 2\text{KCl}$; $2\text{Cr}_2\text{O}_3 + 4\text{K}_2\text{O} + 3\text{O}_2 = 4\text{K}_2\text{CrO}_4$; $4\text{K}_2\text{MnO}_4 + \text{O}_2 = 4\text{KMnO}_4 + 2\text{K}_2\text{O}$; $\text{Bi}_2\text{O}_3 + 4\text{Cl}_2 + 2\text{H}_2\text{O} + 4\text{KOE} = \text{Bi}_2\text{O}_5 + 4\text{KCl} + 4\text{H}_2\text{O}$; $3\text{C}_2\text{H}_4\text{O} + 2\text{CrO} = 3\text{C}_2\text{H}_4\text{O} + 3\text{H}_2\text{O} + \text{Cr}_2\text{O}_3$.

Processes of oxidation are accompanied by processes of reduction or deoxidation. The following examples make this clear (cf. Deoxidation, vol. ii. p. 377):—

Original element or compound.		Oxidiser.		Oxidised Product.		Deoxidised Product.
H_2	+	O	=	H_2O		H_2O
		(The H_2O may be regarded as oxidised H_2 , or as reduced O .)				
2Hg	+	O_2	=	Hg_2O		O_2
		(The O_2 may be regarded as reduced ozone [O_3].)				
SbCl_3	+	Cl_2	=	SbCl_5		SbCl_3
		(The SbCl_3 is oxidised SbCl_3 , or reduced Cl_2 .)				
Sn	+	2HNO_3	=	$\text{SnO}_2 + \text{H}_2\text{O}$	+	N_2O
$3\text{H}_2\text{C}_2\text{O}_4\text{Aq}$	+	$2\text{KMnO}_4\text{Aq}$	=	$6\text{CO}_2 + 3\text{H}_2\text{O}$	+	$2\text{MnO}_2 + \text{K}_2\text{OAq}$
PbO	+	$2\text{Cl} + 2\text{KOH Aq}$	=	$\text{PbO}_2 + \text{H}_2\text{O}$	+	2KCl Aq
$\text{K}_2\text{FeCy}_4\text{Aq}$	+	Cl_2	=	$\text{K}_2\text{FeCy}_4\text{Aq}$	+	2KCl Aq
$4\text{KMnO}_4\text{Aq}$	+	O_2	=	$4\text{KMnO}_4\text{Aq}$	+	$2\text{K}_2\text{O}$
(In the three cases in the bracket, KCl and K_2O may be regarded as reduced Cl and O respectively.)						
$3\text{SO}_4\text{Aq}$	+	$2\text{HNO}_3\text{Aq} + 2\text{H}_2\text{O}$	=	$3\text{H}_2\text{SO}_4\text{Aq}$	+	2NO

21, 944). They are formed by the action of the halogen derivatives of ketones on acetamide and its homologues, e.g. $\text{Ph.CO.CH}_2\text{Br} + \text{Me.CO.NH}_2$

Compounds derived from $\text{CH:CH} \begin{smallmatrix} \text{CH:CH} \\ \text{OH:N} \end{smallmatrix} \text{O}$ may be

called is-oxazoles. Thus phenyl-isoxazole is formed by the action of AcCl on the oxim of benzoyl-acetic aldehyde (Claisen, B. 24, 184).

Vol. III.

Any element or compound which frequently reacts to produce substances containing relatively more negative radicle than the original substance acted on, is called an *oxidiser* or *oxidising agent*. Among the substances commonly used in the laboratory to effect oxidations are oxygen, ozone, chlorine, hypochlorites, nitric acid, potassium permanganate, potassium chlorate, molten potash, and chromium trioxide. The conditions under which oxidation occurs vary much; thus Hg is oxidised by ozone at the

ordinary temperature, but by O only at temperatures near the B.P. of Hg; KMnO_4 oxidises $\text{H}_2\text{C}_2\text{O}_4$ completely only in the presence of H_2SO_4 , and at a moderately high temperature; O does not oxidise SO, under ordinary conditions, but if the gases are passed over hot spongy Pt, SO, is produced rapidly. When O is absorbed by charcoal, and the charcoal is then brought into contact with H_2S , PH_3 , $\text{C}_2\text{H}_2\text{O}$, &c., oxidation proceeds rapidly (v. Calvert, *C. J.* [2] 5, 293). The products of oxidation obtained from a specified substance often vary according to the oxidiser employed; thus ozone produces Hg_2Cl_2 from Hg at ordinary temperatures, but HgO is formed by the action of O on hot Hg; carbohydrates generally give H_2CO_2 when oxidised by CrO_3 , but $\text{H}_2\text{C}_2\text{O}_4$ when oxidised by HNO_3 ; phthalic acids, $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$, are obtained by oxidising naphthalene, C_{10}H_8 , by CrO_3 in glacial acetic acid, but the chief product of the oxidation of the same compound by $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 (which is essentially a solution of CrO_3) is naphthoquinone, $\text{C}_{10}\text{H}_6\text{O}_2$. There are some compounds the presence of which in a solution of an oxidisable body hastens the oxidation when O is passed into the solution; thus, $\text{H}_2\text{C}_2\text{O}_4$ is oxidised by CrO_3 in presence of MnSO_4 (Harcourt, *B. A.* 1864, 34); SO_2 is rapidly oxidised by O in the presence of certain salts, especially MnSO_4 , CuSO_4 , FeCl_3 , CoCl_2 , &c. (v. L. Meyer, *B.* 20, 3058; Roessler, *D. P. J.* 242, 278; cf. Mendeleeff, *B.* 19, 2656). M. M. P. M.

OXIDES. *Binary compounds of oxygen.* For the purposes of this definition, those compounds of O with organic radicles which react similarly to oxides of elements must be classed among binary compounds (e.g. the ethers); in the present article, however, only the binary compounds of O with elements are considered. Oxides of all elements except Br and F have been isolated.

Oxides are frequently prepared by the direct union of O with other elements; O unites directly with all the elements except Br, Cl, F, I, Au, and Pt. Metallic oxides are formed by the action of heat on carbonates, nitrates, and other salts of volatilisable acids; but the alkali oxides cannot be thus prepared. Most (if not all) metals decompose water or steam, forming oxides or hydroxides, and evolving H. Many metallic sulphides yield oxides when roasted in air or O. Those oxides or hydroxides of metals which are not easily soluble in water are generally formed by the reaction of alkalis or alkaline oxides with solutions of metallic salts. The higher oxides of metals are often obtained by the action of hypochlorites, or Cl and KOH , on the lower oxides, sometimes by the action of conc. HNO_3 on the lower oxides or the metals, and sometimes by reacting on salts of the metals in solution with H_2O_2 in presence of an alkali.

1. Fusion of metallic oxides with KOH or KNO_3 generally results in the formation of alkali salts of metal-containing acids in the cases of those metals which are capable of forming such salts. The higher oxides of metals are generally more or less easily reduced to lower oxides; this reduction occurs sometimes by heating, in other cases by the action of such reducers as H, CO, SO_2 , SO , or H_2S . The oxides of non-metals are frequently formed by combining O with the non-

metal, e.g. B_2O_3 , SO_2 , SO , CO, CO_2 , H_2O , NO , P_2O_3 , P_2O_5 ; sometimes they are produced by such indirect methods as decomposing oxyacids or salts of oxyacids of the non-metals, e.g. N_2O from HNO_3 , I_2O from HIO_3 , Cl_2O from KClO_3 ; sometimes they are formed by very indirect methods, e.g. Cl_2O by the reaction of Cl with HgO .

Oxides may be divided into classes in accordance with their empirical composition; thus, monoxides, M_2O and MO ; sesquioxides, M_2O_3 ; dioxides, MO_2 ; trioxides, MO_3 ; tetroxides, MO_4 ; pentoxides, M_2O_5 ; heptoxides, M_2O_7 .

A better classification is that based primarily on chemical properties; on this system, oxides are classified as *basic*, *acidic*, *indifferent* or *neutral*, and *peroxides*. None of these terms can be defined with strictness. The term *basic* is applied to those oxides which react with acids or with oxides more negative than themselves to form salts. *Acidic oxides* are those which react with water to produce acids, or are formed by removing water from acids, or react with oxides more positive than themselves to form salts. *Acidic oxides* are sometimes called *anhydrides*. *Peroxides* react with acids to form salts which correspond with oxides containing less O than the peroxides. Some peroxides also form acids when dissolved in water, or react with acidic oxides to produce salts. Peroxides which exhibit acidic functions may be called *acidic peroxides*, e.g. CrO_5 ; peroxides which exhibit no acidic functions may be called *basic peroxides*, e.g. BaO_2 . Certain other oxides are sometimes included in the class peroxides (v. *infra*). The class of *indifferent* or *neutral* oxides includes all oxides not belonging to one or other of the three preceding classes.

Basic oxides. Most of the lower oxides of metals belong to this class. The characteristic reactions of the class are shown by the following two typical changes:— $\text{BaO} + \text{H}_2\text{SO}_4 = \text{BaSO}_4 + \text{H}_2\text{O}$; $\text{PbO} + \text{SO}_2 = \text{PbSO}_4$. None of the oxides of any undoubted non-metal is distinctly basic. Oxides of non-metals, however, exist which form salts by reacting with certain strong acids, or the anhydrides of certain strong acids, and which also form salts by reacting with oxides more basic than themselves; thus, B_2O_3 reacts with H_2SO_4 containing SO_3 to form $\text{B}(\text{HSO}_3)_2$, and B_2O_3 also reacts with K_2O to form $\text{K}_2\text{B}_2\text{O}_7$; similarly As_2O_3 reacting with SO_3 forms compounds belonging to the salt type, $\text{xAs}_2\text{O}_3 \cdot \text{ySO}_3$, and with K_2O it forms KAsO_2 .

Some metallic oxides are basic, and nevertheless also form compounds with water which react as weak acids towards the more positive oxides; thus Al_2O_3 is distinctly basic, $\text{Al}_2\text{O}_3 + \text{H}_2\text{C}$ is also basic, yet it reacts with K_2O to form the unstable salt $\text{K}_2\text{Al}_2\text{O}_5$; similarly $\text{Au}_2\text{O}_3 + 3\text{H}_2\text{C}$ dissolves in HNO_3 to form the salt $\text{Au}(\text{NO}_3)_3$, and $\text{Au}_2\text{O}_3 + 3\text{H}_2\text{O}$ also dissolves in K_2O to form $\text{K}_2\text{Au}_2\text{O}_7$. The term basic oxide is sometimes widened to include oxides which correspond with salts, although these salts may not be formed directly from the oxides; thus, no salt have been obtained by the action of oxyacid on OsO_3 , but a few salts corresponding with this oxide are produced by indirect methods, e.g. OsSO_4 is formed by reacting on OsO_3 with SO_3 . The *alkali-forming oxides* constitute

vision of the basic oxides; these oxides are distinctly and markedly basic; they also dissolve in water to form alkalis (v. ALKALI, vol. I. 111; v. also BASE, vol. I. p. 445).

Acidic oxides or anhydrides. The greater number of the oxides of non-metals belong to this class. SO_2 is a typical acidic oxide; it reacts with water to form the acid H_2SO_3 ; it is obtained by removing H_2O from H_2SO_4 by heating the acid; it reacts with basic oxides to form salts, e.g. with BaO it produces BaSO_3 . All acidic oxides do not exhibit the three characteristic reactions; some yield acids with water, but are not obtained by removing water from their acids, e.g. P_2O_5 ; some are obtained by removing water from acids, but do not react with water to form acids, e.g. Sb_2O_3 ; some do not form acids with water, are not obtained by removing water from acids, but react with oxides more positive than themselves to produce salts, e.g. As_2O_3 . Those acidic oxides which do not form corresponding acids by reacting with water generally show basic functions when they react with strong acids. Should an oxide form no acid with water, nor be obtained by removing water from an acid, but yet react with basic oxides to form salts, this oxide, although classed as acidic, will be found, almost certainly, to react as a basic oxide towards strong acids, or the anhydrides of strong acids. Thus, As_2O_3 does not form an acid with water, nor is it obtainable from a corresponding acid, it does, however, react with strongly basic oxides, e.g. with K_2O to form salts; now As_2O_3 combines with SO_3 to form $\text{As}_2\text{O}_3 \cdot 2\text{SO}_3$, a compound in which As_2O_3 acts as a basic oxide. Some of the higher oxides of metals react as feebly acidic oxides; the salts corresponding with these oxides are generally obtained by fusing the oxides with KOH or NaOH (v. ANHYDRIDES, vol. I. p. 267).

Peroxides. This class includes those oxides which react with acids to produce salts that correspond with oxides containing less O than the peroxides. The following reactions exhibit this typical property of peroxides:— $\text{BaO}_2 + \text{H}_2\text{SO}_4\text{aq} = \text{BaSO}_4 + \text{H}_2\text{Oaq} + \text{O}$; $2\text{CrO}_2 + 12\text{HClaq} = 2\text{CrCl}_3\text{aq} + 6\text{H}_2\text{O} + 3\text{Cl}_2$. Some oxides which react in this way also dissolve in water to form acids, e.g. $\text{CrO}_2 + \text{H}_2\text{O} + \text{Aq} = \text{H}_2\text{CrO}_4\text{aq}$; others do not form acids with water, but react with strongly basic oxides to produce salts, e.g. $\text{PbO}_2 + \text{K}_2\text{O}$ (molten) = K_2PbO_4 . Peroxides which exhibit acidic functions may be called *acidic peroxides*, e.g. CrO_2 , PbO_2 ; peroxides which do not exhibit acidic functions, i.e. which do not form acids with water, nor salts by reacting with basic oxides, may be called *basic peroxides*, e.g. CaO_2 , K_2O_2 . The more important *basic peroxides* are Na_2O_2 , K_2O_2 , CaO_2 , SrO_2 , BaO_2 (?) CdO_2 , CuO_2 , (?) Bi_2O_2 . Among the *acidic peroxides* may be mentioned CrO_2 , PbO_2 , and MnO_2 . Several highest oxides of metals cannot be assigned with certainty to the class of acidic peroxides, or to that of basic peroxides; e.g. Bi_2O_3 reacts with acids as a basic peroxide, and probably forms salts by fusion with a large excess of KOH , but the salts have not been isolated; UO_3 is distinctly acidic, with acids it forms uranyl salts, e.g. UO_2SO_4 ; OsO_3 is slightly acidic, no corresponding salts have been obtained by the re-

action of acids, but these reactions have not been examined sufficiently.

The term *peroxide* is used sometimes to include any oxide of a specified element which contains more O than the highest definitely basic or acidic oxide of that element. This statement does not define peroxide, because no formal definitions of the terms 'definitely basic oxide' and 'definitely acidic oxide' can be given. Such oxides as S_2O_3 , Cr_2O_3 (if it exists), MnO_3 , and Mn_2O_3 , would thus be classed as peroxides (v. *infra*).

Indifferent or neutral oxides. Oxides which do not form acids with water, are not obtained by removing water from acids, and do not form salts by reacting with either basic or acidic oxides, or with acids, are generally called *neutral or indifferent oxides*. Examples of such oxides are H_2O , NO , P_2O , (?) Fe_2O , Pb_2O , Ag_2O , (?) Mn_2O .

None of the qualifying terms applied to oxides can be defined with strictness; such an oxide as MnO is basic, because it forms salts by reacting with acids; MnO_2 is also acidic, because when fused with K_2O in presence of O, it forms a salt (KMnO_2); it is also a peroxide, because the salts which it forms with acids correspond with the lower oxide MnO ; and lastly, it may be classed as an indifferent oxide, because it does not form an acid with water, is not obtained by removing water from an acid, and does not form corresponding salts by the action of acids, acidic oxides, or basic oxides. When it is remembered that the properties expressed by the terms basic oxide, acidic oxide, and peroxide, are properties which come into play only when the oxides react with other substances, it is evident that these properties must depend to some extent on those of the other substances. Keeping this in mind, one sees how difficult, if not impossible, it must be to define the properties in question.

Oxides have been classified as *indifferent and salt-forming*; and the salt-forming oxides have been subdivided into those which form corresponding salts by reacting with acids or negative oxides, those which form corresponding salts by reacting with basic oxides, and those which form salts, but not corresponding salts, by one or other of these reactions. This classification is practically the same as that which has been sketched already, although it is expressed in somewhat different terms.

What is the composition of the basic oxides? Which elements form acidic oxides? Can the composition of peroxides be stated in general terms? Alkali-forming oxides are oxides of the most positive metals. The following are usually included in this group:— Li_2O , Na_2O , K_2O , Rb_2O , Cs_2O , TiO ; MgO , CaO , SrO , BaO ; (?) Ag_2O , (?) PbO . Basic oxides, which are not alkali-forming, are oxides of fairly positive metals: e.g. BeO , ZnO , CdO , HgO , Sc_2O_3 , Ba_2O_3 , Al_2O_3 , Ga_2O_3 , Fe_2O_3 , NiO , CoO , TiO_2 , ZrO_2 , SnO , SnO_2 , PbO , Bi_2O_3 . Acidic oxides are oxides of negative elements, or they are compounds of elements, which on the whole are positive, with relatively much O: e.g. N_2O_5 , N_2O_4 , P_2O_5 , P_2O_4 , Cl_2O , I_2O_5 , SiO_2 , CO_2 , CrO_3 , UO_3 , Ta_2O_5 . Peroxides, in the sense explained above, are usually the highest oxides of metals: e.g. CrO_2 , PbO_2 ; in the widest sense, peroxides

also include some of the highest oxides of non-metals, e.g. S_2O_8 . Two oxides of the same element may exist, and one of these may be a basic, and the other an acidic, oxide; thus Cr_2O_3 is basic, but CrO_3 is acidic. Hence, whether an oxide is basic or acidic seems to depend not only on the general chemical character of the element combined with O, but also on the relative quantities of O and the other element. None of the elements whose lower oxides are alkali-forming forms an acidic oxide, but some of these elements form basic peroxides; in other words, the association of much O with a very distinctly positive element does not produce an acidic oxide, but does produce a basic peroxide. It is impossible to divide the elements into two classes, and say all on one side of the division-line generally form basic oxides, but may also form acidic oxides. All that can be said is, the lower oxides of the metallic elements, as a class, are basic, but many of these elements also form higher oxides, some of which are distinctly acidic, and some are acidic peroxides; the oxides of the non-metallic elements as a class, are acidic, but some of these elements also form indifferent oxides, and a few oxides of non-metals are peroxides.

The peroxides have been divided by Mendeleeff into two classes (*J. R.* 1881, [1] 561; abstract in *B.* 15, 242; v. also Traube, *B.* 19, 1111, 1115, 1117; Richarz, *B.* 21, 1675). Mendeleeff distinguishes peroxides belonging to the type H_2O from those which belong to the type H_2O_2 ; the latter class he calls *superoxides*, the former *polyoxides*. In the polyoxides, according to M., the O is all in direct union with the other element, and none of the O atoms is directly united with any other; whereas the O atoms of superoxides are regarded as in direct union with each other, as well as with the other element. BaO_2 is a typical superoxide, and is

supposed to have the structure $Ba \begin{smallmatrix} O \\ \diagup \diagdown \\ O \end{smallmatrix}$; MnO_2

is a typical polyoxide, and is supposed to have the structure $O.Mn.O$. The views of Traube (*loc. cit.*) and Richarz (*loc. cit.*) are practically the same as those expressed by Mendeleeff. The superoxides yield H_2O_2 by reacting with dilute acids, and therefore reduce $KMnO_4$ in presence of H_2SO_4 ; the polyoxides do not yield H_2O_2 , but H_2O and O. Peroxides formed by the action of alkaline oxidisers, e.g. $KClO_4$, seem always to belong to the class of polyoxides. The peroxides K_2O_2 , Na_2O_2 , CaO_2 , SrO_2 , BaO_2 , ZnO_2 , CdO_2 , CuO_2 , PbO_2 , and some others, are superoxides; i.e. they give H_2O_2 when acted on by dilute acids. According to Mendeleeff, S_2O_8 is a superoxide; it gives H_2O_2 when dissolved in much water; the constitution is probably $O.SO_2 \begin{smallmatrix} O \\ \diagup \diagdown \\ O \end{smallmatrix}$.

Mendeleeff (*loc. cit.*) says that the power possessed by any element of forming a characteristic basic or acidic oxide, from which salts are obtained, is connected with the position of the element in the periodic scheme of classification. But besides forming a salt-forming oxide, or more than one such oxide, some elements are also capable of producing superoxides belonging

to the type $HO.OH$. Glancing at the groups or elements, as the elements are arranged in the periodic scheme of classification (v. Classification, vol. ii. p. 204), and expressing the composition of the highest characteristic oxides of each group in a general formula, we have the result shown in the table on p. 661.

The molecular weights of very few oxides have been determined with certainty; on this subject v. Henry, *P. M.* [5] 20, 81; cf. Carnelley & Walker, *C. J.* 53, 59. M. M. P. M.

OXIDO-DI-NAPHTHYL-AMINE v. IMIDO-DI-NAPHTHYL OXIDE.

OXIMIDO-ACETIC ETHER C_2H_3NO , i.e. $CH(NOH).CO_2Et$. Nitroso-acetic ether. Formed, together with oxalic acid, by the action of fuming HNO_3 on aceto-acetic ether (Pröpper, *A.* 232, 48). Oil. Yields oxalic acid and hydroxylamine when heated with $HClAq$ at 140° . Cold $KOHAq$ yields KCy , K_2CO_3 , and alcohol. $(NH_4)_2O.H_2NO_2$ aq: silky needles. $C_2H_3NaNO_2$ aq: needles (from water).

OXIMIDO-ACETOACETIC ETHER v. NITROSO-ACETOACETIC ETHER.

OXIMIDO-compounds v. NITROSO-compounds.

OXIMIDO-ETHER v. OXALIMIDO-ETHER.

TRI-OXIMIDO-METHYLENE $C_3H_3N_3O_3$, i.e. $CH \begin{smallmatrix} N(OH).CH_2 \\ N(OH).CH \end{smallmatrix} N(OH)$. Formed from formic aldehyde and hydroxylamine (Scholl, *B.* 24, 574). White amorphous solid, insol. water, alcohol, and ether. At 183° it passes directly into gas.

OXIMIDO-NAPHTHOL v. AMIDO-NAPHTHOL-QUINONE.

OXIMS or OXIMES. Compounds containing the group $C:N.OH$, obtained by the action of hydroxylamine on aldehydes, ketones, and ketonic compounds, by the reaction $RR'CO + H_2N.OH = RR'C(NOH) + H_2O$ (V. Meyer, *B.* 15, 1184, 1324, 1526, 2784; 16, 822, 2992; 19, 1618) (v. Aldoxims, vol. i. p. 111). The reaction is best performed with hydroxylamine hydrochlorid (1 mol.) and aqueous $NaOH$ (3 mols.) in the cold (Auwers, *B.* 22, 604). Oxims are split up by boiling $HClAq$ into hydroxylamine and the original aldehyde or ketonic compound. The oxims do not exhibit Liebermann's reaction with phenol and H_2SO_4 . The oxims yield acetyl alkyl, and sodium derivatives. Ketoxims (i.e. oxims of ketones) are converted by warming with conc. H_2SO_4 at 100° into the isomeric amides; thus $Ph.C:N.OH$ becomes $Ph.CO.NHPh$, while $PhMeC:N.OH$ yields acetanilide (Beckmann, *B.* 20, 1507; Wegerhoff, *A.* 252, 1; Günther, *B.* 252, 44). PCl_5 acts like H_2SO_4 . Oxims are readily reduced, in alcoholic solution by means of sodium amalgam and acetic acid, to the corresponding amines, thus: $XYC:N.OH + 2H = XYCH.NH_2 + H_2O$ (Goldschmidt, *B.* 19, 328). Benzoic aldehyde gives two oxims and two sets of alkyl-oxims (Beckmann, *B.* 22, 1584), a benzil also gives a greater number of oxims and alkyl-oxims than the ordinary formulae indicate. These isomerisms may perhaps be explained considering the arrangement in space of the atoms in the molecule (Beckmann, *B.* 20, 276; *B.* 23, 1680; Auwers & V. Meyer, *B.* 21, 71; 22, 1996; 23, 2408; Hantzsch, *B.* 24, 31, 115).

Groups.	I	II	III	
Elements in group	H, Li, Na, K, Cu, Rb, Ag, Cs, Au	Be, Mg, Ca, Zn, Sr, Cd, Ba, Hg	B, Al, Sc, Ga, Y, In, La, Yb, Tl	
Composition of highest basic or acidic oxide characteristic of the group	M_2O	MO	M_2O_3	
Character of highest basic or acidic oxide characteristic of the group	Basic	Basic	Basic except B_2O_3 , which is a weak anhydride	
Superoxides, type of HO.OH	$H_2O_2, Na_2O_2, K_2O_2, CuO_2, Ag_2O_2$	$CaO_2, ZnO_2, SrO_2, CdO_2, BaO_2$	(? TiO_2)	
Groups.	IV	V	VI	VII
Elements in group	C, Si, Ti, Ge, Zr, Sn, Ce, Pb, Th	N, P, V, As, Nb, Sb, Bi, Er, Ta, Bi	(O), S, Cr, Se, Mo, Te, W, U	F, Cl, Mn, Br, I (group very incomplete)
Composition of highest basic or acidic oxide characteristic of the group	MO_2	Li_2O_2	MO_3	M_2O_3 ; represented only by Mn_2O_7 , $[Cl_2O, ClO_2, I_2O_5]$; no oxide of F or Br
Character of highest basic or acidic oxide characteristic of the group	Acidic when $M = C$ or Si; acidic and basic when $M = Ti, Ge, Zr, Sn$ (? Ce), Pb (becoming more basic as M increases); basic when $M = Th$	Acidic, except Bi_2O_3 , which acts as a feebly acidic peroxide (polyoxide)	Acidic; becoming less acidic as M increases; UO_2 shows some basic properties	Acidic
Superoxides, type of HO.OH	TiO_2, CeO_2	(? NO_2 , ? Bi_2O_5)	S_2O_8 (? $Cr_2O_7, 2UO_6$)	none

Group VIII.

	Family 1. Fe, Ni, Co.	Family 2. Ru, Rh, Pd.	Family 3. Os, Ir, Pt.
Highest characteristic oxide	M_2O_3	MO_3 ; represented only by RuO_4	MO_4 ; represented only by OsO_4
Character of oxide	Basic	Feebly acidic.* (These elements also form MO, M_2O_3 , and MO_2 , which are feebly basic)	Feebly acidic. (These elements also form MO, M_2O_3 , and MO_2 , which are feebly basic)
Superoxides, type of $HO.OH$? FeO_2 , ? $Ni_2O_3.xO$, ? $Co_2O_3.xO$	none	none

Oxims of ketones may be changed to phenylhydrazides by heating with phenyl-hydrazine (Just, B. 19, 1205).

OXINDOLE C_8H_7NO i.e. $C_6H_5 \cdot \langle \begin{smallmatrix} CH_2 \\ NH \end{smallmatrix} \rangle CO$ or

$C_6H_5 \cdot \langle \begin{smallmatrix} OH \\ N \end{smallmatrix} \rangle CO.OH$ (Baeyer & Comstock, B. 10, 1704). Anhydride of *o*-amido-phenyl-acetic acid. Mol. w. 133. [120°]. Formed by reducing *o*-nitro-phenyl-acetic acid with tin and HCl. Obtained also by reducing dioxindole with sodium-amalgam (Knop, J. pr. 97, 65; Baeyer & Knop, A. 140, 1; Baeyer, B. 11, 583; 12, 457). If the mixture of isomeric nitro-acids got by heating phenyl-acetic acid with fuming HNO_3 on the water-bath be reduced with tin and $HClAq$, and, after removal of tin by H_2S , be boiled with

$BaCO_3$, only the *m*- and *p*-nitro-phenyl-acetic acids will form barium salts, and the oxindole may be extracted by ether.

Properties.—Long colourless needles (from water). Oxidised slowly by moist air, forming dioxindole. Reduces ammoniacal silver nitrate, forming a mirror. Extracted by ether from its alkaline solution. Not affected by boiling baryta-water, but at 150° it yields barium amido-phenyl-acetate. Nitrous acid forms nitroso-oxindole which is an oxim of I_4 . PCl_5 yields $C_6H_5 \cdot \langle \begin{smallmatrix} CHCl \\ N \end{smallmatrix} \rangle COCl$ [104°] reduced by iron-filings and KOH to indole. Salts.— $AgC_8H_6NO \cdot B^+HCl^-$: deliquescent spicules. Acetyl derivative [126°]. Long colour-

less needles. Sl. sol. cold water and ligroin, v. sol. alcohol (Suida, B. 12, 1826). Converted by dilute NaOH aq into $\text{C}_8\text{H}_7(\text{NHAc})\text{CH}_2\text{CO}_2\text{H}$ [142°].

Bromo-oxindole $\text{C}_8\text{H}_6\text{BrNO}$. [176°]. Formed, together with tri-bromo-oxindole $\text{C}_8\text{H}_3\text{Br}_3\text{NO}$ 2aq, by the action of bromine-water on oxindole. Both compounds form feathery crystals.

Nitro-oxindole $\text{C}_8\text{H}_6(\text{NO})_2\text{NO}$. Prepared by nitration. Yellow needles, sol. alcohol. Begins to decompose at 175°.

Amido-oxindole $[\text{4 } \frac{1}{2}] \text{C}_8\text{H}_6(\text{NH}_2) \langle \text{CH} \rangle_{\text{NH}} \text{CO}$. [c. 200°]. Prepared by reduction of (4,2',1)-di-nitro-phenyl-acetic acid (Gabriel & Myer, B. 14, 882). Long spikes, v. sol. hot water.

Exo-amido-oxindole $\text{C}_8\text{H}_6 \langle \text{CH}(\text{NH}_2) \rangle_{\text{NH}} \text{CO}$. The hydrochloride, formed by reducing isatin-oxim with tin and HCl aq, is decomposed by water, yielding a red resin.

Methyl-oxindole v. p. 351.

Ethyl-oxindole $\text{C}_8\text{H}_6 \langle \text{CH} \rangle_{\text{NEt}} \text{CO}$. Formed by heating oxindole with EtI and NaOEt . Liquid, al. sol. water. Very difficult to saponify by acids or alkalis.

Dioxindole $\text{C}_8\text{H}_6\text{NO}$, i.e. $\text{C}_8\text{H}_6 \langle \text{CH}(\text{OH}) \rangle_{\text{NH}} \text{CO}$.

Isatin dihydride. Anhydride of Hydrindic acid. Mol. w. 149. [180°]. S. 8-5 in the cold; 17 at 100°. S. (alcohol) 7 in the cold; 10 at 78°. Formed by reducing an aqueous solution of isatin with zinc-dust and HCl aq, and extracting with ether (Baeyer, B. 12, 1309). Yellowish monoclinic prisms (from water) or colourless crystals (from alcohol). Forms a violet liquid on melting. Its aqueous solution becomes red on exposure to the air, forming isatyde and isatin. In acid solution it may be reduced to oxindole. Chlorine forms chloro-dioxindole $\text{C}_8\text{H}_5\text{ClNO}$ and dichloro-dioxindole $\text{C}_8\text{H}_4\text{Cl}_2\text{NO}$. The corresponding bromo-derivatives melt at 165° and 170° respectively. PCl_5 yields $\text{C}_8\text{H}_5\text{Cl}_2\text{N}$. Ammonia colours its solution violet, and on boiling throws down a violet colouring matter, sol. HCl aq. Potash and baryta produce a dark-violet colour, changing to red and finally yellow.

Salts. — $\text{C}_8\text{H}_6\text{NO}_2\text{HCl}$: nodular crusts. — $\text{C}_8\text{H}_6\text{NO}_2\text{H}_2\text{SO}_4$: ppd. by adding water to its solution in H_2SO_4 . — $\text{NaC}_8\text{H}_6\text{NO}_2$ 2aq: silvery scales, v. sol. water, insol. alcohol. — BaA' 4aq: white cubes, al. sol. water. Gives off aniline on heating. — PbA' 2aq: ppd. by lead subacetate. — AgA' : crystalline pp. Gives off benzoic aldehyde at 60°.

Acetyl derivative $\text{C}_8\text{H}_5\text{AcNO}$. [127°]. Short prisms, al. sol. cold water (Suida, B. 12, 1826). Cold baryta-water converts it into acetyl-hydrindic acid $\text{C}_8\text{H}_6(\text{NHAc})\text{CH}(\text{OH})\text{CO}_2\text{H}$ [142°] which is also formed by reducing acetyl-hydrindic acid with 3 p.c. sodium-amalgam in acid solution (Suida, B. 11, 586).

Nitroso-dioxindole $\text{C}_8\text{H}_6(\text{NO})\text{NO}$. [800°-810°]. Formed by passing nitrous acid vapour into an alcoholic solution of dioxindole. Yellowish crystals, al. sol. water. May be sublimed. On boiling with FeSO_4 and KOH aq it yields 'azodioxindole' $\text{C}_8\text{H}_6\text{N}_2\text{O}$, which is ppd. by HCl aq in white needles [800°], yielding with AgNO_3 and NH_3 a white f.p. of $\text{Ag}_2\text{C}_8\text{H}_6\text{N}_2\text{O}_2$. Sodium-amalgam

and a little water reduce nitroso-dioxindole to 'azoxindole' $\text{C}_8\text{H}_6\text{N}_2\text{O}$, ppd. by HCl aq as an amorphous powder (containing 3aq) and crystallising from alcohol in cubes. Bromine-water converts nitroso-dioxindole into $\text{C}_8\text{H}_6\text{Br}_2\text{N}_2\text{O}$ 8aq [275°].

Salts. — $\text{NH}_4\text{C}_8\text{H}_6(\text{NO})\text{NO}$ 1½aq: white silky laminae. — $\text{BaC}_8\text{H}_6\text{N}_2\text{O}_2$. — $\text{AgC}_8\text{H}_6\text{N}_2\text{O}_2$: yellowish-white pp.

OXOTENOL $\text{C}_8\text{H}_6\text{O}$, i.e.

$\text{CMe}_2\text{C}(\text{OH}) \langle \text{CMe}_2 \rangle_{\text{O}} ?$ [49-5°]. (178°). V.D.

4-8 (at 185°). A product of the oxidation of isodibutylene by KMnO_4 (Butleroff, J. R. 14, 203; C. J. 42, 936; B. [2] 88, 553). Long thin prisms, smelling like camphor; al. sol. water, v. sol. alcohol and ether. Does not react with hydroxylamine (Meyer & Nageli, B. 16, 1622). Not attacked by hot bromine.

Acetyl derivative $\text{C}_8\text{H}_5\text{AcO}$. (201°). Formed by heating with Ac_2O at 150°.

OXOCTYLIC ACID v. OXY-OCTOIC ACID.

OXONIC ACID $\text{C}_8\text{H}_6\text{N}_2\text{O}_2$. A salt of this acid is formed by the atmospheric oxidation of an alkaline solution of uric acid (Strecker; Medicus, A. 175, 230; B. 10, 546). The free acid splits up at once into glyoxyl-urea, CO_2 , and NH_3 . — $\text{NH}_4\text{HA}'$ aq. — KHA' . — KA' 1½aq. — $\text{Ba}(\text{HA}')_2$ ½aq: minute needles.

OXYACANTHINE $\text{C}_{10}\text{H}_8\text{NO}$. Occurs in the root of *Berberis vulgaris*, together with berberine, berbamine, and at least one other alkaloid. Needles (from alcohol or ether), or amorphous solid. In the amorphous state it melts at [138°-150°], in the crystalline state at [208°-214°]. V. sol. benzene and chloroform, scarcely in petroleum spirit. In chloroform $[\alpha]_D = +131.6$. Conc. H_2SO_4 , or conc. H_2SO_4 and molybdic acid, gives no colour at first, but on standing or heating, a yellow colour. From iodic acid it separates iodine.

Salts. — $\text{B}'\text{HCl}$ 2aq: small colourless needles; in aqueous solution $[\alpha]_D = +163.6$. — $\text{B}'\text{HNO}_3$ 2aq: colourless needles. — $\text{B}'\text{H}_2\text{SO}_4$ 2aq: microscopic plates. — $\text{B}'\text{H}_2\text{SO}_4$ 6aq: small prisms. — $\text{B}'\text{H}_2\text{Cl}_2\text{PtCl}_2$ 5aq: yellow pp. (Hesse, B. 19, 3190; cf. Pölex, A. Ph. 6, 265; Wacker, J. 1861, 545).

DIOXY-ACENAPHTHENE $\text{C}_{12}\text{H}_8 \langle \text{CH}(\text{OH}) \rangle_{\text{CH}(\text{OH})}$.

Acenaphthylene-glycol. [205°]. Formed by saponifying its acetyl derivative, which is obtained from di-bromo-acenaphthene $\text{C}_{12}\text{H}_6 \langle \text{CHBr} \rangle_{\text{CHBr}}$ (Ewan & Cohen, C. J. 55, 578). Long colourless needles, al. sol. cold MeOH and hot water. On treatment with Na and alcohol it yields the ketone $\text{C}_{12}\text{H}_8 \langle \text{CH}_2 \rangle_{\text{CO}}$ [119°].

Mono-acetyl derivative $\text{C}_{12}\text{H}_7\text{AcO}$. [112°]. Long needles, v. sol. alcohol.

Di-acetyl derivative $\text{C}_{12}\text{H}_6\text{Ac}_2\text{O}$. [180°]. Benzoyl derivative $\text{C}_{12}\text{H}_5\text{BzO}$. [190°].

OXY-ACETIC ACID v. GLYOXYLIC ACID.

DI-OXY-ACETIC ACID v. GLYOXYLIC ACID.

DI-OXY-ACETOACETIC ETHER.

Di-ethyl derivative $\text{C}_{12}\text{H}_{14}\text{O}_4$, i.e. $\text{CH}_3(\text{OEt})\text{CO}\text{CH}(\text{OEt})\text{CO}_2\text{Et}$. (245°). Formed by the action of Na on a solution of $\text{CH}_3(\text{OEt})\text{CO}_2\text{Et}$ in benzene (Conrad, B. 11, 56).

Liquid; gives a violet colour with FeCl_3 . Forms Na and Ba derivatives. Split up by alkalis into alcohol and $\text{CH}_3(\text{OEt})_2\text{CO}_2\text{H}$.

OXY-ACETONE v. ACETYL-CARBINOL.

***s*-Di-oxy-acetone. Di-ethyl derivative** $\text{C}_6\text{H}_5(\text{O})_2\text{C}(\text{CO}(\text{CH}_2\text{OEt})_2)_2$. (195°). S.G. 1.2898. V.D. 4.95. Formed by allowing the ether $\text{CH}_3(\text{OEt})_2\text{CO}(\text{CH}(\text{OEt})_2)_2$ (v. the preceding article) to stand for three days with cold dilute (2.5 p.c.) KOH, neutralising with H_2SO_4 , extracting with ether, and distilling (Grimaux a. Lefèvre, C. R. 107, 914). Sweet aromatic liquid, sl. sol. Aq. sol. alcohol, volatile with steam. Combines with NaHSO_4 . Reduces Fehling's solution and yields a mirror with warm ammoniacal AgNO_3 .

***u*-Di-oxy-acetone v. PYRUVIC ALDEHYDE.**

***p*-OXY-ACETOPHENONE** $\text{C}_6\text{H}_4(\text{OH})(\text{O})\text{COCH}_3$. [14]. [107°]. Obtained by diazotising *p*-amido-acetophenone and boiling the solution (Klingel, B. 18, 2691). Formed also by heating phenol with ZnCl_2 and HOAc (Michael a. Palmer, Am. 7, 277). White needles. Sol. water, alcohol, and ether. FeCl_3 gives a dark-brown colouration.

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})(\text{O})\text{C}(\text{CH}_3)_2$. [39°] (Gattermann, B. 23, 1201). (258°) (G.); (221°) (O). Formed by heating anisic aldehyde with Na and MeI in ethereal solution (Oliveri, G. 13, 275).

Ethyl derivative. [61°]. (above 260°).

***o*-Oxy-acetophenone v. BENZOYL-CARBINOL.** The phenyl derivative $\text{Bz}(\text{CH}_2\text{OPh})_2$ [72°] and the *p*-nitro-phenyl derivative $\text{Bz}(\text{CH}_2(\text{OOC}_6\text{H}_4\text{NO}_2))_2$ [144°] may be obtained from *o*-bromo-acetophenone (Möhlau, B. 15, 2497). The phenyl-hydrazides $\text{C}_6\text{H}_5\text{C}(\text{N}(\text{HPh}))_2\text{CH}_2\text{OH}$ [112°] and $\text{C}_6\text{H}_5\text{C}(\text{N}(\text{HPh}))_2\text{CH}(\text{N}(\text{HPh}))\text{CH}_2\text{OH}$ [152°] have been prepared by Laubmann (A. 243, 247).

(4:2:1)-Di-oxy-acetophenone

$[\text{4:2:1}]\text{C}_6\text{H}_3(\text{OH})_2(\text{O})\text{COCH}_3$. **Resacetophenone.** [142°]. Formed by fusion of *β*-methyl-umbelliferon with KOH (Pechmann a. Duisberg, B. 16, 2123). Prepared by heating resorcin (1 pt.) with HOAc (1½ pts.) and ZnCl_2 (1½ pts.) at 150° (Nencki a. Sieber, J. pr. [2] 23, 147, 546). Fine white needles. Gives a red colouration with FeCl_3 . With HOAc , ZnCl_2 , and POCl_3 it gives $\text{C}_6\text{H}_3(\text{OH})_2(\text{O})_2\text{Ac}$ [180°] (Crépeux, B. [3] 6, 152).

Acetyl derivative $\text{C}_6\text{H}_3(\text{OAc})_2(\text{O})\text{COCH}_3$. [73°]. [308°]. White needles.

Phenyl hydrazide

$\text{C}_6\text{H}_3(\text{OH})_2\text{CMe}(\text{N}(\text{HPh}))_2$. [189°]. Tables (from xylene) (Michael a. Palmer, Am. 7, 276).

Methyl derivative

$[\text{3:4:1}]\text{C}_6\text{H}_3(\text{OH})(\text{OMe})(\text{O})\text{COCH}_3$. [47°]. Occurs in Japanese peonies (Will, B. 19, 1776).

Di-ethyl derivative. [68°] (G.).

(5, 2, 1)-Di-oxy-acetophenone. [202°]. Made in like manner from hydroquinone (Nencki).

Tri-oxy-acetophenone $\text{C}_6\text{H}_2(\text{O})_3$, *i.e.*

$\text{C}_6\text{H}_2(\text{OH})_2\text{COOH}$. **Gallacetophenone.** [168°]. Formed by heating pyrogallol (1 pt.) with HOAc (1½ pts.) and ZnCl_2 (1½ pts.) at 150° (Nencki a. Sieber, J. pr. [2] 23, 147, 538). Pearly plates. Alcoholic KOH ppts. $\text{C}_6\text{H}_2(\text{O})_3\text{KOH}$.

OXY-ACETOPHENONE-CARBOXYLIC ACID.

Phenyl derivative $\text{C}_6\text{H}_4(\text{O})_2\text{C}(\text{CO}_2\text{Ph})_2$, *i.e.* $\text{C}_6\text{H}_4(\text{CO}_2\text{H})(\text{O})\text{COCH}_2\text{OPh}$. [110°]. Prepared by dissolving $\text{C}_6\text{H}_4(\text{CO})_2\text{CH}_2\text{OPh}$ in alkalis and acidifying the solution. Needles (Gabriel, B. 14, 923).—A₂Ag: white flocculent pp.

***β*-OXY-ACETYL-PROPIONIC ACID**

$\text{C}_6\text{H}_5(\text{OH})\text{O}_2$. ***β*-Oxy-levulic acid.** Formed in chief quantity, together with acetoacrylic acid, by the action of aqueous Na_2CO_3 upon *β*-bromo-levulic acid. Yellowish oil. V. sol. water and alcohol, sl. sol. other solvents. Very prone to enter into reactions. Reduces alkaline silver solutions. Hydroxylamine gives an oxim [145°]. By heating with NH_3 it yields tetra-methyl-pyrazine (di-methyl-ketene), with evolution of CO_2 . The salts are amorphous and easily decomposable (Wolff, B. 20, 426; A. 264, 234). On heating it yields two anhydrides [240°] and [268°].

The isomeric *α*-oxy-acetyl-propionic acid $\text{CH}_3\text{Ac}(\text{CH}(\text{OH}))\text{CO}_2\text{H}$ [104°] is crystalline.

OXYACIDS v. vol. i. p. 57.

OXY-ACRYLIC ACID v. GLYCIDIC ACID and PYRUVIC ACID.

OXY-ADIPIC ACID $\text{C}_6\text{H}_8\text{O}_6$, *i.e.*

$\text{CO}_2\text{H}(\text{CHMe}(\text{OMe})(\text{OH}))\text{CO}_2\text{H}$. Formed by treating methyl-acetoacetic ester with HCy and boiling the product with HClAq (König, B. 12, 768). Crystalline mass.—Na₂A⁺.—Ag₂A⁺.

Isomeride v. ADIPOMALIC ACID.

Di-oxy-adipic acid $\text{C}_6\text{H}_8\text{O}_6$. Formed by the action of Ag_2O on the di-bromo-adipic acid prepared from hydromucic acid (v. p. 443) (Limpricht, A. 185, 267). Syrup, sol. alcohol and ether.—BaA⁺ 4aq: hygroscopic powder.

Di-oxy-adipic acid. Got from its nitrile, which is formed by warming the anhydride $\text{C}_6\text{H}_8\text{O}_6$ of erythrite with dry HCy at 55° (Przybytek, B. 17, 1094). Crystalline.—KHA⁺.—CdaA⁺ 4aq.—PbA⁺ 2aq: amorphous pp.

Tri-oxy-adipic acid $\text{C}_6\text{H}_8\text{O}_6$. Prepared by boiling tri-bromo-adipic acid with baryta-water (Limpricht). Prisms (from alcohol-benzene).—BaA⁺ 3aq: v. sol. water.

Tri-oxy-adipic acid $\text{C}_6\text{H}_8\text{O}_6$. [147°]. Formed by oxidising metasaccharin with HNO_3 (S.G. 1.2) at 50° (Kiliani, B. 18, 644, 1555). Small monoclinic plates, v. sol. water, v. sl. sol. alcohol and ether. Reduced by HI to adipic acid [140°].—CaA⁺ 4aq.—ZnA⁺ 3aq.—CuA⁺ 4aq.—Ag₂A⁺.

Tetra-oxy-adipic acid v. MUCIC ACID and SACCHARIC ACID.

OXY-ALDEHYDO-BENZOIC ACID v. ALDEHYDO-OXY-BENZOIC ACID.

OXY-ALDEHYDO-CYMENE v. CARVACROTIC ALDEHYDE.

OXY-ALDEHYDO-PHENOXOXY-ACETIC ACID

Methyl derivative $\text{C}_6\text{H}_5(\text{OMe})(\text{CHO})\text{OCH}_2\text{CO}_2\text{H}$ [2:4:1]. [188°]. Prepared by melting chloro-acetic acid with vanillin, adding aqueous KOH (S.G. 1.2), and heating on the water-bath (Elkan, B. 19, 8054). Slender needles (from water), v. sol. alcohol and ether.—Ag₂A⁺: white pp.

OXY-TRI-ALDINE v. ALDEHYDO.

OXYAMENYL-NAPHTHOQUINONE v. LUPACHIC ACID.

OXY-AMIDO-ACETIC ACID $\text{C}_6\text{H}_4\text{NO}_2$, *i.e.* $\text{CH}(\text{NH}_2)(\text{OH})\text{CO}_2\text{H}$. Formed by the action of alcoholic NH_3 on glyoxylic acid (Böttiger, A. 198, 217). Syrup.—CaA⁺: insol. cold water. Yields pyrrho² on distillation.

OXY-AMIDO-ACETOPHENONE-OXIM v. OXY-AMIDO-ACETOPHENONE-OXIM.

(3)-OXY-AMIDO-ANTHRAQUINONE

$\text{C}_6\text{H}_3(\text{CO}_2\text{C}_6\text{H}_4(\text{OH})(\text{NH}_2))_2$ [1:2:4:8]. Formed, together with a smaller quantity of the (β)-iso-

neride by heating alizarin with NH_4Aq for 8 hours at 200° (Liebermann & Troschke, A. 183, 102). Brown needles (from alcohol) with green lustre, insol. water. Yields alizarin on fusing with potash, and on heating with HClAq at 250° . —Ba Δ .

Acetyl derivative $\text{C}_{14}\text{H}_9\text{O}_4(\text{OH})(\text{NHAc})$. 170° . Formed by heating with Ac_2O for 2 hours at 120° (Von Perger, J. pr. [2] 18, 143). Yellow needles (from HOAc); insol. water, sol. alkalis.

Ethyl ether $\text{C}_{14}\text{H}_9\text{O}_4(\text{OEt})(\text{NH}_2)$. $[182^\circ]$. Red plates (Liebermann & Hagen, B. 15, 1796).

(8)-Oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_7\text{O}_5\text{C}_2\text{H}_4(\text{OH})(\text{NH}_2)$ [1:2:3:4]. Formed by boiling di-amido-anthraquinone with KOH Aq (Von Perger, J. pr. [2] 18, 139). Brown needles (from alcohol), insol. water, sol. H_2SO_4 . Begins to sublime at 150° . On boiling with baryta it yields an insoluble Ba salt (difference from the α -isomeride). Its solution in KOH Aq deposits the K salt on standing. Potash fusion forms alizarin. Bimination of NH_2 yields erythro-oxy-anthraquinone.

Acetyl derivative $\text{C}_{14}\text{H}_7\text{O}_5(\text{OH})(\text{NHAc})$. $[185^\circ]$. Small brownish needles (from alcohol).

Oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_7\text{O}_5(\text{OH})(\text{NH}_2)$. $[301^\circ]$. Prepared by heating sodium anthraquinone sulphionate with NH_4Aq at 180° (Bouchart, B. 12, 1418). Red needles. Yields the tri-acetyl derivative $\text{C}_{14}\text{H}_3\text{Ac}_3\text{NO}$, $[257^\circ]$.

Oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_7\text{O}_5(\text{NH}_2)(\text{OH})$. Formed by heating purpur-oxanthin with NH_4Aq (Liebermann, A. 183, 217). Brown needles with green lustre.

Di-oxy-amido-anthraquinone $\text{C}_{14}\text{H}_5(\text{OH})_2\text{NH}_2$

(α)-**Amido-alizarin**. Formed by reducing (β)-nitro-alizarin with sodium-amalgam (Perkin, C. J. 80, 578). Crystallises from alcohol in black needles with green lustre. Its alcoholic and alkaline solutions are crimson.

Di-oxy-amido-anthraquinone $\text{C}_{14}\text{H}_5(\text{OH})_2\text{NH}_2$

(β)-**Amido-alizarin**. [above 300°]. Formed by reducing (β)-nitro-alizarin with zinc-dust and KOH , or with glucose and H_2SO_4 (Schunck & Roemer, B. 12, 588; Brunner & Chuard, B. 18, 445). Lustreous red prisms, sl. sol. alcohol, forming a reddish-yellow solution. Its alkaline solution is blue. Dyes iron mordants grey, and alumina red.

Acetyl-ethenyl derivative

$\text{C}_6\text{H}_4\text{CO} \begin{array}{c} \diagup \text{C}_6\text{H}(\text{OAc}) \diagdown \\ \diagdown \text{C}_6\text{H}_2 \diagup \end{array} \text{COCH}_3$. $[240^\circ]$.

Formed by heating amidoalizarin with acetic anhydride. Yellowish-brown crystals (from benzene or acetic anhydride); sublimes in small yellow plates. By boiling with HCl it is reconverted into amidoalizarin.

Di-acetyl derivative

$\text{C}_6\text{H}_4\text{CO} \begin{array}{c} \diagup \text{C}_6\text{H}(\text{OH})(\text{OAc})(\text{NHAc}) \diagdown \\ \diagdown \text{C}_6\text{H}_2 \diagup \end{array} \text{COCH}_3$. $[268^\circ-271^\circ]$.

Formed by boiling the preceding body with dilute acetic acid till dissolved. Red-brown crystals; soluble in alcohol with a yellow colour. Alcoholic $\text{Pb}(\text{OAc})_2$ gives a violet pp., alcoholic $\text{Cu}(\text{OAc})_2$ a red solution. It dissolves in aqueous Na_2CO_3 with a violet, in KOH with a blue, colour. Alumina mordants are dyed a deep red.

Benzoyl-benzoyl derivative

$\text{C}_6\text{H}_4\text{CO} \begin{array}{c} \diagup \text{C}_6\text{H}(\text{OBz}) \diagdown \\ \diagdown \text{C}_6\text{H}_2 \diagup \end{array} \text{COCH}_3$. [above 300°].

Formed by heating amidoalizarin with benzoyl chloride. Small glistening needles; sublimes in yellow needles; nearly insol. all solvents. Alcoholic KOH gives a blue solution on boiling (Roemer, B. 18, 1666).

Di-oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_7\text{O}_5(\text{OH})(\text{NH}_2)$. **Amidoisoanthraflavic acid**. Formed by heating anthrapurpurin with ammonia at $150^\circ-180^\circ$ (Perkin, C. J. 33, 216). Dark-green crusts (from alcohol), almost insol. water. Its alkaline solution is purple. Nitrous acid converts it into isoanthraflavic acid.

Tetra-amido-di-oxy-anthraquinone

$\text{C}_{14}\text{H}_3\text{O}_5(\text{NH}_2)_4(\text{OH})_2$. **Hydrochrysamide**. Formed by reducing tetra-nitro-di-oxy-anthraquinone (chrysammic acid) (Schunck, A. 65, 284; Stenhouse & Miller, A. 142, 91; Liebermann, A. 183, 182). Bluish-black needles with coppery lustre, insol. boiling water, sl. sol. hot alcohol. Its alkaline solution is blue.

(α)-OXY-AMIDO-ANTHRAQUINONE SULPHONIC ACID $\text{C}_{14}\text{H}_7\text{O}_5(\text{OH})(\text{NH}_2)\text{SO}_3\text{H}$

Formed from (α)-oxy-amido-anthraquinone and H_2SO_4 at 130° (Von Perger, J. pr. [2] 18, 182). Brick-red crystalline aggregates (from alcohol). V. sol. water, giving it a reddish-brown colour. Insol. ether. Forms a violet solution with NaOH , a violet-blue pp. with baryta water, and a reddish-brown pp. with BaCl_2 . Dyes, with iron mordant, a pale brown. With N_2O it gives oxy-anthraquinone sulphonic acid.

β -Oxy-amido-anthraquinone sulphonic acid

Formed from amido-erythro-oxy-anthraquinone and H_2SO_4 at 115° . Crystals obtained from water exhibit a green metallic lustre. Aqueous solutions are red. Insol. ether. Forms a purple solution with NaOH , a reddish-violet pp. with baryta-water and a violet-red pp. with BaCl_2 . Dyes, with iron mordants, yellow. With N_2O it gives erythro-oxy-anthraquinone sulphonic acid.

Oxy-amido-anthraquinone sulphonic acid

Got by heating sodium anthraquinone disulphonate with NH_4Aq at 180° (Bouchart, B. 12, 1419). Violet pp., forming a red solution in ammonia. — $\text{NH}_4\text{A}^2\text{aq}$.

Di-oxy-amido-anthraquinone sulphonic acid

$\text{C}_{14}\text{H}_5(\text{OH})_2(\text{NH}_2)\text{SO}_3\text{H}$. Formed by the action of boiling alkali upon the anhydride $\text{C}_{14}\text{H}_3\text{N}_2\text{S}_2\text{O}_6$, or the sulphate, which are got by heating (α)-nitro-anthraquinone sulphonic acid with H_2SO_4 at 200° (Claus, B. 15, 1522; 16, 903; Lifschütz, B. 17, 902). Red powder with green lustre. Decomposed by heat. Its alkaline solution is bluish-violet.

OXY-AMIDO-AZO- v. AZO-

OXY-AMIDO-BENZENE v. AMIDO-PHENOL

Di-oxy-amido-benzene v. AMIDO-HYDROQUINONE, AMIDO-PYROGATECHIN, and AMIDO-RESORCIN

Di-oxy-di-amido-benzene v. DI-AMIDO-HYDROQUINONE and DI-AMIDO-RESORCIN

Tri-oxy-tri-amido-benzene Tribenzoyl derivative $\text{C}_{14}\text{H}_3(\text{OH})_3(\text{NH}_2)_3$ [1:3:5:2:4:6] **Tribenzoyl-tri-amido-phloroglucin**. [c. 156°]. Got by the action of NAOEt on hippuric ether (Rügheimer, B. 21, 8329). Needles (containing 1 aq), v. sl. sol. water. — $\text{Cu}_2\text{A}^{III}$ — $\text{Pb}_2\text{A}^{III}$.

Tetra-oxy-amido-benzene

$\text{C}_6\text{H}_2(\text{OH})_4(\text{NH}_2)_4$ [1:2:4:5:6]. Formed from nitro-di-oxy-quinone, SnCl_4 , and HCl (Nietzki & Schmidt, B. 22, 1661). — $\text{B}^*\text{HCl aq}$: needles.

Penta-acetyl derivative. $[243^\circ]$.

Tetra-oxy-di-amino-benzene $C_6(NH_2)_4(OH)_2$. Formed by reduction of nitranilic acid or of nitro-amido-tetra-oxy-benzene with an excess of $SnCl_4$; the yield is 90 p.c. of the theoretical. The base could not be isolated, being readily oxidised to di-imido-di-oxy-quinone $C_6(NH)_2(OH)_2O_2$. By HNO_3 it is converted into benzene-tri-quinone C_6O_3 . By boiling with KOH , NH_3 is evolved with separation of a black crystalline substance; if this is boiled with water and evaporated with a little KOH , it yields croconic acid $C_6H_2O_8$. Distillation with zinc-dust yields *p*-phenylene-diamine. *Hydrochloride*: $C_6(OH)_4(NH_2)_2H_2Cl_2$; colourless needles.

Di-acetyl derivative. Needles.

Hexa-acetyl derivative

$C_6(NHAc)_6(OAc)_2$; [α. 240°]; small colourless tables (Nietzki a. Benckiser, B. 18, 502; 19, 2727; 21, 1852).

OXY-AMIDO-BENZENE SULPHONIC ACID
v. AMIDO-PHENOL SULPHONIC ACID.

Di-oxy-amido-benzene sulphonic acid $C_6H_4(OH)_2(NH_2)(SO_3H)$. *Amido-resorcin sulphonic acid*. Formed by reducing the nitro-acid (Hazura, M. 4, 613; Brünner a. Krüner, B. 17, 1870). Plates, with greenish lustre, sl. sol. hot water. Its alkaline solution soon becomes blue, then green, and finally black.

OXY-AMIDO-BENZOIC ACID $C_7H_5NO_5$, i.e. $C_6H_4(OH)(NH_2)CO_2H$ [2:5:1]. *Amido-salicylic acid*. Mol. w. 153. Obtained by reducing the nitro-acid (Beilstein, A. 130, 243; Hübner, A. 195, 18). Obtained also by reducing $C_6H_4N_2C_6H_4(OH)CO_2H$ (P. F. Frankland, C. J. 37, 748) and $C_6H_4N_2C_6H_4(OH)CO_2H$ (Limpricht, B. 22, 2908). Satiny needles, insol. alcohol, sl. sol. hot water. $FeCl_3$ colours its aqueous solution cherry-red.

Reactions.—1. *Distillation* produces *p*-amido-phenol.—2. *Nitrous acid* forms diazo-salicylic acid $C_6H_4(OH)N_2CO_2H$, which is converted by conc. HCl into iodo-salicylic acid $C_6H_4I(OH)CO_2H$ [193:5°] (Frankland).—3. *Urea* forms, on heating, crystalline uramidosalicylic acid $C_6H_4N_2O_4$, which at 200° forms 'carboxamidosalicylic' acid $C_6H_4N_2O_4$ (Griess, J. pr. [2] 1, 235).

Salts.— $HA'HCl$.— $HA'HSnCl_4$ (Goldberg, J. pr. [2] 19, 362).— $HA'HI$ (Schmitt, J. 1864, 383, 423).— $HA'H_2SO_4$ aq; prisms.— CaA' , 5½ aq.— BaA' , 4 aq. Needles, v. sol. water.— MgA' , 8 aq.— ZnA' , 10 aq. needles (Wattenberg, B. 8, 1221).

Acetyl derivative $C_7H_5(OH)(NHAc)CO_2H$. [218°]. Thick needles (containing ½ aq); v. sol. water.

Benzoyl derivative $C_7H_5(OH)(NHPh)CO_2H$. [252°]. Yields the salts BaA' , 6 aq and CaA' , (Dabney, Am. 5, 22).

Oxy-amido-benzoic acid $C_7H_5(OH)(NH_2)(CO_2H)$ [2:3:1]. Formed by reducing the nitro-acid (Hübner, A. 195, 17).— $HA'HCl$ aq; needles, v. sol. water.

Benzoyl derivative. [189°]. Needles.

Oxy-amido-benzoic acid $C_7H_5(OH)(NH_2)CO_2H$ [5:2:1]. [235°]. Formed from benzene-azo-*m*-oxy-benzoic acid and $SnCl_4$ (Limpricht, A. 268, 234). Prisms, v. sl. sol. water.— $HA'HCl$: white needles.

Oxy-amido-benzoic acid $C_7H_5(OH)(NH_2)CO_2H$ [4:3:1]. Got by reducing

nitro-*p*-oxy-benzoic acid (Barth, Z. 1866, 648; Deninger, J. pr. [2] 42, 553). Needles.— $H_2A'H_2SO_4$: needles, m. sol. water.

Ethyl ether EtA'. Plates

Methyl derivative $C_7H_5(OMe)(NH_2)CO_2H$. *Amido-anisic acid*. [181°]. S. 125 at 100°. Formed by reducing $C_7H_5(OMe)(NO_2)CO_2H$ (Zinin, A. 92, 327; Cahours, A. Ch. [3] 53, 322).— AgA' : curdy pp.— $HA'HCl$.— $H_2A'H_2PtCl_6$.— $HA'HNO_3$.— $H_2A'H_2SO_4$.—Ethers MeA' .— $(MeA')_2H_2PtCl_6$: reddish prisms.— EtA' .— $EtA'HCl$.— $(EtA')_2H_2PtCl_6$: brownish-red prisms.

Oxy-amido-benzoic acid. *Methyl derivative* $C_7H_5(OMe)(NH_2)(CO_2H)$ [4:2:1]. Formed from $C_7H_5Br(OMe)(NH_2)CO_2H$ by treatment with zinc and HCl (Balbiano, G. 14, 247). It melts at 204°.

Oxy-di-amido-benzoic acid

$C_7H_4(OH)(NH_2)_2CO_2H$ [2:3:5:1]. Formed by reducing $C_7H_4(OH)(NO_2)_2CO_2Me$ with HI and P (Saytzeff, A. 133, 321). Small needles, sl. sol. cold water.— $HA'HCl$.— $HA'H_2I$, 1½ aq.— $HA'H_2SO_4$ aq. dimetric prisms, sl. sol. water.

Di-oxy-amido-benzoic acid. *Di-methyl derivative* $C_7H_4(CH_3)_2(OMe)_2CO_2H$. Formed with evolution of CO_2 by reduction of nitrohemipic acid $C_7H_4(NO_2)(OMe)_2CO_2H$, with tin and HCl (Grüne, B. 19, 2305).— $A'HCl$: white needles.

Di-oxy-amido-benzoic acid. *Di-methyl derivative* [4:3:2:1] $C_7H_4(OMe)_2(NH_2)CO_2H$. *Amido-veratric acid*. Formed by reducing nitro-veratric acid (Tiemann a. Matsumoto, B. 9, 942; 11, 135). Tables. *Ethyl ether EtA'*. [89°].

Di-oxy-amido-benzoic acid. *Di-methyl derivative* $C_7H_4(OMe)_2(NH_2)CO_2H$ [5:3:4:1]. [182°]. Got by reduction (Meyer, M. 8, 432). Six-sided prisms (from alcohol).— CuA' , 2 aq.— $HA'HCl$: needles, m. sol. cold water.

Di-oxy-amido-benzoic acid. *Acetyl-methylene derivative* of the *Nitrite* $C_7H_4(O_2CH_2)(NHAc)CN$. [216°]. Formed from the oxim of amido-piperonal, Ac_2O , and $NaOAc$ (Haber, B. 24, 626). Yellow needles (from chloroform).

Reference.—BROMO-OXY-AMIDO-BENZOIC ACID.

DI-OXY-AMIDO-BENZOIC ALDEHYDE
Oxim of the methylene derivative $C_7H_4(O_2CH_2)(NH_2)CH:NOH$. [175:5°]. Got by reducing the oxim of *o*-nitro-piperonal with ammonium sulphide (Haber, B. 24, 625). Yellow plates. Yields a di-acetyl derivative [188°].

OXY-AMIDO-BENZYLAMINE. *Methyl derivative* $C_7H_5(OMe)(NH_2)CH_2NH_2$ [1:2:4]. Formed from $C_7H_5(OMe)(NO_2)CH_2NH_2$, tin, and HCl aq (Goldschmidt a. Polonowska, B. 20, 2412).— $B'HCl$: needles.— $B'H_2PtCl_6$: plates.

Di-acetyl derivative. [185°]. Needles.

α-OXY-β-AMIDO-BUTYRIC ACID $C_7H_9NO_5$, i.e. $CH_3CH(NH_2)CH(OH)CO_2H$. S. 4 at 16°. Formed by heating β-methyl-glycidic acid in sealed tubes with NH_3 aq at 100° (Pavloff, B. 27, 43, 115; Melikov, J. R. 16, 525). Prisms, with sweet taste.

Oxy-amido-isobutyric acid. S. 55 at 15°. Formed from α-methyl-glycidic acid and NH_3 .

OXY-AMIDO-CINNAMIC ACID

Methyl derivative

[5:2:1] $C_9H_7(NH_2)(OMe)CH:CHCO_2H$. [189°]. Formed by reduction of nitro-methoxy-cinnamic

acid with FeSO_4 and NH_3 (Schnell, B. 17, 1884). Colourless needles. V. sol. alcohol and ether, almost insol. cold water. An aqueous solution of the ammonium salt gives pps. with AgNO_3 , CuSO_4 , $\text{Pb}(\text{OAc})_2$, and ZnSO_4 .

Anhydride $\text{C}_9\text{H}_7(\text{NH}_2) < \begin{smallmatrix} \text{O} \\ \text{CH} \end{smallmatrix} \text{CO} \text{ Amido-coumarin}$. [170°] (Frapolli a. Chiozza, A. 95, 253); [161°] (Taegz, B. 20, 2110). Got by reduction of nitro-coumarin.— $\text{B}^+ \text{H}_2\text{PtCl}_6$.

Di-oxy-amido-cinnamic acid. *Methylene derivative*.

$\text{CH}_2 < \begin{smallmatrix} \text{O} \\ \text{O} \end{smallmatrix} \text{C}_9\text{H}_7(\text{NH}_2) \cdot \text{CH} \cdot \text{CH} \cdot \text{CO}_2\text{H}$. [207°].

Formed by reducing the nitro-acid with NH_3 and hot aqueous FeSO_4 (F. M. Perkin, C. J. 56, 158). Brownish needles, v. sol. HOAc.

DI-OXY-AMIDOTHYL-BENZOIC ACID.

Methylene derivative $\text{C}_{10}\text{H}_{11}\text{NO}_4$, i.e. $\text{C}_6\text{H}_4(\text{O} \cdot \text{CH}_2)(\text{CH}_2 \cdot \text{CH}_2 \cdot \text{NH}_2) \cdot \text{CO}_2\text{H}$. "*o*-Amidoethylpiperonylcarboxylic acid." [182°]. Formed, together with hemipic acid, by boiling anhydroberberlic acid with water (W. H. Perkin, jun., C. J. 57, 1055). Needles, sl. sol. alcohol, m. sol. cold water.— $(\text{HA}')_2\text{H}_2\text{SO}_4 \cdot 2\text{aq}$. [203°]. Colourless prisms.— $\text{HA}'\text{HCl}$ — $\text{HA}'\text{H}_2\text{C}_2\text{O}_4$. [203°].— $(\text{HA}')_2\text{H}_2\text{PtCl}_6$. [222°].— $\text{HA}'\text{H}_2\text{AuCl}_4$.

Di-benzoyl derivative $\text{C}_{22}\text{H}_{17}\text{NO}_8$. [150°].

Anhydride $\text{CH}_2 < \begin{smallmatrix} \text{O} \\ \text{O} \end{smallmatrix} \text{C}_6\text{H}_4 < \begin{smallmatrix} \text{CO} \cdot \text{NH} \\ \text{CH}_2 \cdot \text{CH}_2 \end{smallmatrix}$.

Formed by heating the acid, and, along with its ψ -opianate and ψ -opianic acid by the action of alkalis on berberal. It is also a product of the oxidation of berberine with KMnO_4 . Yields the compound $\text{C}_{10}\text{H}_7\text{BrNO}_3$. [240°].—Opianate $\text{B}^+\text{C}_6\text{H}_4(\text{OMe})_2(\text{CO}_2\text{H})_2$. [132°].— ψ -Opianate. $\text{C}_{10}\text{H}_7\text{NO}_3$. [149°]. Needles, sl. sol. cold water. Yields berberal when heated.

OXY-AMIDO-GLUTAMIC ETHER $\text{C}_9\text{H}_{11}\text{N}_2\text{O}_4$, i.e. $\text{CO}(\text{NH}_2) \cdot \text{CH}_2 \cdot \text{C}(\text{OH})(\text{NH}_2) \cdot \text{CH}_2 \cdot \text{CO}_2\text{Et}$. [86°]. Formed from acetone dicarboxylic ether and conc. NH_4Aq (Stokes a. Von Pechmann, B. 19, 2694). Needles, sl. sol. cold water, insol. alkalis. FeCl_3 gives a red colour. Dilute HClAq yields a body melting at 61° turned purple by FeCl_3 . Nitrous acid yields a nitroso-derivative [178°]. Boiling alkaline carbonates yield glutazine (v. Di-oxy-amido-pyridine).

OXY-AMIDO-HEPTOIC ACID $\text{C}_9\text{H}_9\text{NO}_4$, i.e. $\text{OMe}(\text{NH}_2) \cdot \text{CH}_2 \cdot \text{CMe}(\text{OH}) \cdot \text{CO}_2\text{H}$. *Amidotri-methylbutylactic acid*. [210°]. Formed by the action of boiling baryte water on its anhydride which is obtained by the action of boiling conc. HClAq upon the product of the union of HCy with diacetoneamine (Heintz, A. 189, 231; 192, 329; Weil, A. 232, 208). Prisms (from water); insol. alcohol and ether. Neutral to litmus. Yields its anhydride when heated.—Salts $\text{CuC}_9\text{H}_7\text{NO}_4 \cdot 2\text{aq}$; minute greenish-blue prisms.— $(\text{HA}')_2\text{H}_2\text{SO}_4$ — $\text{HA}'\text{HCl}$; crystalline.

Anhydride $\text{OMe}(\text{OH}) < \begin{smallmatrix} \text{CO} \cdot \text{NH} \\ \text{CH}_2 \cdot \text{CMe} \end{smallmatrix}$. *Di-oxy-methyl-pyrrole*. Prisms (by sublimation). Melts above 180°.

OXY-AMIDO-HYDRO-ISATIN v. ISATIN.

OXY-AMIDO-IMIDO-DIPHENYL SULPHIDE $\text{C}_{12}\text{H}_7\text{N}_2\text{SO}$ i.e.

Thionoline. Formed by adding H_2S and FeCl_3 successively to an aqueous solution of p -

amido-phenol hydrochloride (Bernthsen, A. 290, 202). Yellowish-brown plates or needles with green lustre (from alcohol).

OXY-AMIDO-DI-ISATIN-DIAMIDE v. ISATIN-DI-OXY-DI-AMIDO-TETRAMETHENYL.

Di-benzoyl derivative $\begin{smallmatrix} \text{C}(\text{NHBz}) \cdot \text{C}(\text{OH}) \\ \text{C}(\text{OH}) = \text{C}(\text{NHBz}) \end{smallmatrix}$. [188°]. Formed by heating hippuric ether with NaOEt , or with Na , at 160° (Rügheimer, B. 21, 8325; 22, 114). Needles, m. sol. alcohol, v. e. sol. benzene. FeCl_3 colours its alcoholic solution violet. Decomposed by acids into benzoic acid and di-amido-acetone. Hydroxylamine does not affect it. Methyl alcohol and gaseous HCl form a body $(\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_2)$ crystallising in plates [200°].

Oxy-tetra-amido-pentamethenyl hydride

$\text{CH}(\text{OH}) < \begin{smallmatrix} \text{C}(\text{NH}_2) \cdot \text{C}(\text{NH}_2) \\ \text{C}(\text{NH}_2) \cdot \text{C}(\text{NH}_2) \end{smallmatrix}$. *Tetra-amido-pentol*.

Formed from the tetra-oxim of leuconic acid SnCl_4 , and HClAq (Nietzki a. Rosemann, B. 22, 926).— $\text{B}^+\text{H}_2\text{HCl}$: octahedra.— $\text{B}^+\text{H}_2(\text{H}_2\text{SO}_4)_2 \cdot \text{aq}$.

Tetra-oxy-tetra-amido-octomethenyl.

Tetra-benzoyl derivative $\text{C}_{22}\text{H}_{17}\text{N}_4\text{O}_8$, i.e. $\begin{smallmatrix} \text{C}(\text{NHBz}) \cdot \text{C}(\text{OH}) \cdot \text{C}(\text{NHBz}) \\ \text{C}(\text{OH}) < \begin{smallmatrix} \text{C}(\text{NHBz}) \cdot \text{C}(\text{OH}) \end{smallmatrix} \end{smallmatrix}$. A product of the action NaOEt on hippuric ether (Rügheimer, B. 22, 1962). Small yellow needles. Does not melt below 270°.— $\text{BaC}_4\text{H}_4\text{N}_4\text{O}_8$: pp.

Anhydride $\text{C}_{10}\text{H}_7\text{N}_4\text{O}_8$.

OXY-AMIDO-METHYL-ANTHRAQUINONE

$\text{C}_{11}\text{H}_{11}\text{NO}_3$, i.e. $\text{C}_{10}\text{H}_7\text{Me}(\text{OH})(\text{NH}_2)\text{O}_2$. Formed by heating chrysophanic acid with NH_4Aq at 200° (Liebermann, A. 183, 218). Brown plates.

Oxy-di-amido-methyl-anthraquinone

$\text{C}_{11}\text{H}_{12}\text{N}_2\text{O}_4$. *Di-amido-chrysophanic acid*. Formed by heating chrysophanic acid with excess of NH_4Aq at 150°. With Ac_2O it yields $\text{C}_{11}\text{H}_{11}\text{AcN}_2\text{O}_4$ crystallising from chloroform in lustrous violet needles.

OXY-DIAMIDO-METHYL-DIPHENYL

Ethyl derivative $\text{C}_6\text{H}_4(\text{NH}_2) \cdot \text{C}_6\text{H}_4\text{Me}(\text{OEt})(\text{NH}_2)$ [1:2:5:4]. [107°]. Formed from the hydrazo-derivative $\text{C}_6\text{H}_4 \cdot \text{NH} \cdot \text{NH} \cdot \text{C}_6\text{H}_4\text{Me}(\text{OEt})$ by dissolving in cold HClAq (Noelting a. Werner, B. 23, 8263). Needles, v. sl. sol. water.

Oxy-di-amido-methyl-diphenyl [3:4:2]

$\text{C}_6\text{H}_4\text{Me}(\text{NH}_2) \cdot \text{C}_6\text{H}_4(\text{OH})(\text{NH}_2)$ [1:3:4]. [177°]. Formed by the action of water at 180° on the sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2) \cdot \text{C}_6\text{H}_4(\text{OH})(\text{NH}_2)\text{SO}_3\text{H}$ [1:3:4:6], got by reducing the dye from diazotised *o*-toluidine and *p*-phenol sulphonic acid (Weinberg, B. 20, 8174). Plates, v. sl. sol. water.

Ethyl derivative

$\text{C}_6\text{H}_4\text{Me}(\text{NH}_2) \cdot \text{C}_6\text{H}_4(\text{OEt})(\text{NH}_2)$. [117:5°]. Formed in like manner from $\text{C}_6\text{H}_4(\text{OEt})(\text{NH}_2)\text{SO}_3\text{H}$, which yields $\text{HA}'\text{HCl}$ 4aq and BaA' 8aq.

OXY-AMIDO-METHYL-QUINOLINE

$\text{C}_9\text{H}_7(\text{OH})(\text{NH}_2)\text{MeN}$. Formed by reducing nitro-(Py. 1)-oxy-(Py. 8)-methyl-quinoline (Conrad a. Limpach, B. 20, 950). Prisms, decomposing at 225° without melting.— B^+HCl aq.

OXY-AMIDO-NAPHTHALENE v. AMIDO-NAPHTHOL.

(1,2,3)-Di-oxy-amido-naphthalene

$\text{C}_6\text{H}_3 < \begin{smallmatrix} \text{C}(\text{OH}) \cdot \text{C}(\text{OH}) \\ \text{N} \end{smallmatrix} \text{C}(\text{NH}_2)$ *Di-oxy-naphthylamine*

Obtained by reduction of nitro-(β)-naphtho-

jafrone (Korn, B. 17, 906). Reduces cold AgNO_3 . FeCl_3 gives a blue-black pp.

(2,2',1)-Di-oxy-amido-naphthalene

$\text{C}(\text{OH})\text{CH}_2\text{C}(\text{NH}_2)\text{C}(\text{OH})\text{CH}_2\text{C}(\text{OH})$. Formed by reducing the (a)-oxim of (2')-oxy-(β)-naphthoquinone with SnCl_2 (Clausius, B. 23, 521).— B^1HCl : needles, turning blue in air.

Di-oxy-amido-naphthalene. Got by reducing amido-(a)-naphthoquinone (Graebe & Ludwig, A. 154, 320). Tables, v. e. sol. water. Blackens in moist air.

Tri-oxy-amido-naphthalene

$\text{C}_6\text{H}_4\text{C}(\text{OH})\text{C}(\text{NH}_2)\text{C}(\text{OH})\text{C}(\text{OH})\text{C}(\text{OH})$. Formed by reducing nitro-oxy-(a)-naphthoquinone with SnCl_2 (Kehrmann, B. 21, 1780; J. pr. [2] 40, 179). Monoclinic crystals. Cold conc. HNO_3 appears to form $\text{C}_6\text{H}_4\text{CO}_2\text{C}(\text{N.NO})\text{CO}_2$ crystallising in reddish yellow needles. Yields a tetra-acetyl derivative [145°].

OXY-AMIDO-NAPHTHALENE SULPHONIC ACID O_2 AMIDO-NAPHTHOL SULPHONIC ACID

Oxy-di-amido-naphthalene sulphonic acid $\text{C}_6\text{H}_3(\text{NH}_2)_2(\text{OH})(\text{SO}_3\text{H})$ [4:1:4]. The hydrochloride B^1HCl is formed by reducing di-nitro-naphthol sulphonic acid with SnCl_2 and HCl (Nietzki & Zübelen, B. 22, 455). It crystallises in colourless needles.

OXY-m-AMIDO-NAPHTHOIC ACID

$\text{C}_6\text{H}_3(\text{OH})(\text{NH}_2)\text{CO}_2\text{H}$. Formed by reducing the nitro-acid (Schmitt & Burkard, B. 20, 2700). Decomposes above 200°.

Acetyl derivative [185°].

Oxy-p-amido-naphthoic acid. Got by reducing $\text{C}_6\text{H}_3(\text{SO}_3\text{H})(\text{NH}_2)\text{CO}_2\text{H}$ with tin and HCl (S. a. B.). Decomposes above 200°.

Acetyl derivative [195°].

Oxy-amido-naphthoic acid

$\text{C}_6\text{H}_3(\text{OH})(\text{NH}_2)(\text{CO}_2\text{H})$ [1:4:2?]. [above 200°]. Formed from (a)-oxy-naphthoic acid by combining it with diazobenzene chloride and warming the product with SnCl_4 and HCl (Nietzki & Guitermann, B. 20, 1275). Crystalline powder, insol. water. Decomposes above 230° into CO_2 and (a)-amido-(a)-naphthol.

OXY-AMIDO-(a)-NAPHTHOQUINONE

$\text{C}_6\text{H}_3\text{CO}_2\text{C}(\text{NH}_2)\text{C}(\text{OH})\text{C}(\text{OH})$. Amido-naphthalic acid. Formed by reduction from nitro-oxy-naphthoquinone (Diehl & Merz, B. 11, 1319) and from di-nitroso-di-oxy-naphthalene (Kostanecki, B. 22, 1316). Formed also by oxidising tri-oxy-amido-naphthalene with aqueous FeCl_3 (Kehrmann, B. 21, 1781). Red prisms, sl. sol. water. Its alkaline solutions are blue— BaA^1 : violet pp.— AgA^1 : grey pp.

Acetyl derivative $\text{C}_6\text{H}_3\text{O}_2(\text{OH})(\text{NHAc})$. [220°]. Formed from $\text{C}_6\text{H}_3(\text{OAc})(\text{NHAc})$ and KOHAc (Kehrmann & Weichardt, J. pr. [2] 40, 182). Yellow needles, insol. water.— KA^1 : blue-black needles.

Oxim $\text{C}_6\text{H}_3\text{CO}_2\text{C}(\text{NH})\text{C}(\text{OH})\text{C}(\text{OH})$. Greenish flocculent pp.— B^1HCl : yellow needles.

Acetyl derivative of the oxim

$\text{C}_6\text{H}_3\text{CO}_2\text{C}(\text{NHAc})\text{C}(\text{OH})\text{C}(\text{OH})$. Golden needles, sl. sol. alcohol. Decomposes at 190°-200°.

OXY-DIAMIDO-DIPHENYL $\text{C}_{12}\text{H}_9\text{N}_2\text{O}$ i.e.

[4:1] $\text{C}_6\text{H}_4(\text{NH}_2)\text{C}_6\text{H}_4(\text{NH}_2)(\text{OH})$ [1:4:2]. [185°]. Formed by the action of water at 180° on the hydrochloride of its sulphonic acid, which is got by reducing $\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4(\text{OH})\text{SO}_3\text{H}$ with SnCl_2 at 30° (Weinberg, B. 20, 8173; Noeltling & Werner, B. 23, 8256). Plates, sl. sol. water.— $\text{HA}^1\text{H}_2\text{SO}_4$: insol. water.— HA^1HCl .— $(\text{HA}^1)_2\text{PtCl}_6$ 5aq: sl. sol. water.

Ethyl derivative

$\text{C}_6\text{H}_4(\text{NH}_2)\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})$. [185°]. Needles, sl. sol. water.— $\text{HA}^1\text{H}_2\text{SO}_4$: prisms.

Di-oxy-di-amido-diphenyl. Di-ethyl-derivative

[4:3:1] $\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})$ [1:4:3]. Di-ethoxy-benzidine. [117°]. Formed from [2:1] $\text{C}_6\text{H}_4(\text{OEt})(\text{NH})\text{NH}\text{C}_6\text{H}_4(\text{OEt})$ [1:2] and conc. HClAc (Möhlau, J. pr. [2] 19, 381). Needles or plates, sol. hot water.— $\text{B}^1\text{H}_2\text{Cl}_4$.— $\text{B}^1\text{H}_2\text{SO}_4$.— $\text{B}^1\text{H}_2\text{PtCl}_6$.— $\text{B}^1\text{H}_2\text{SO}_4$: needles, sol. hot water.

Di-oxy-di-amido-diphenyl

[3:4:1] $\text{C}_6\text{H}_3(\text{NH}_2)(\text{OH})\text{C}_6\text{H}_3(\text{NH}_2)(\text{OH})$ [1:3:4]. [above 300°]. Formed by reducing di-nitro-di-oxy-diphenyl (Kunze, B. 21, 3332; Schütz, B. 21, 3531). Needles or plates. Ac_2O yields the di-acetyl derivative. AcCl forms the di-ethenyl derivative [195°].— $\text{B}^1\text{H}_2\text{Cl}_4$: needles.— $\text{B}^1\text{H}_2\text{SO}_4$.

Di-acetyl derivative

$\text{C}_{12}\text{H}_6(\text{OH})_2(\text{NHAc})_2$. [210°]. Needles, sol. alkalis, insol. acids.

Tetra-acetyl derivative $\text{C}_{12}\text{H}_6\text{Ac}_4\text{N}_2\text{O}_2$. [225°]. White needles (K.).

Di-oxy-tetra-amido-diphenyl

$\text{C}_6\text{H}_3(\text{NH}_2)_2(\text{OH})\text{C}_6\text{H}_3(\text{NH}_2)_2(\text{OH})$. Formed from tetra-nitro-di-oxy-diphenyl (Kunze). Colourless needles or silvery plates, turning blue in air. AcCl converts it into a compound $\text{C}_{12}\text{H}_6\text{N}_4\text{O}_2$.— $\text{B}^1\text{H}_2\text{Cl}_4$ 4aq.— $\text{B}^1\text{H}_2\text{SO}_4$: white needles.

Tetra-acetyl derivative

$\text{C}_{12}\text{H}_6(\text{NHAc})_4(\text{OH})_2$. [280°]. Got by boiling the hexa-acetyl derivative with NaOHAc .

Hexa-acetyl derivative

$\text{C}_{12}\text{H}_6(\text{NHAc})_6(\text{OAc})_2$. [300°]. Formed from the base and boiling Ac_2O .

Tetra-oxy-di-amido-diphenyl

$\text{C}_6\text{H}_3(\text{OH})_2(\text{NH}_2)\text{C}_6\text{H}_3(\text{OH})_2(\text{NH}_2)$.

Tetra-methyl derivative

$\text{C}_{12}\text{H}_6(\text{OMe})_4(\text{NH}_2)_2$. [210°]. Formed by molecular change from tetra-methoxy-hydrazobenzene under the influence of acids (Baessler, B. 17, 2128). Silky white needles; v. sol. chloroform, CS_2 , EtOH , and hot benzene, sl. sol. water and liguin.— $\text{B}^1\text{H}_2\text{Cl}_4$: small white, easily soluble needles.— $\text{B}^1\text{H}_2\text{Cl}_4\text{PtCl}_6$: yellow pp. The di-acetyl derivative forms white needles [251°], sol. hot alcohol, benzene, chloroform, and CS_2 .

Tetra-ethyl derivative

$\text{C}_{12}\text{H}_6(\text{NEt})_4(\text{OEt})_2$. [129°]. Formed, in like manner, from the hydrazo-compound got by reducing the di-ethyl ether of nitro-hydroquinone with powdered zinc and alcoholic potash (Nietzki, B. 12, 39). Leaflets.— $\text{B}^1\text{H}_2\text{Cl}_4$.— $\text{B}^1\text{H}_2\text{PtCl}_6$: yellow crystalline pp.

Tetra-oxy-tetra-amido-diphenyl. Tetra-acetyl derivative $\text{C}_{12}\text{H}_6(\text{NHAc})_4(\text{OH})_4$.

White needles, formed by reduction of the corresponding quinone ($\text{C}_6\text{H}_3(\text{NHAc})(\text{OH})_2$) $_2$ [268°] which is formed by oxidation of tri-acetyl-tri-amido-phenol (Bamberger, B. 26, 2408).

α*-OXY-*o*-AMIDO-PHENYL-ACETIC ACID.Hydrindic acid.**Acetyl derivative*

$C_6H_4(NHAc).CH(OH).CO_2H$. [142°]. Got by reducing acetyl-isatic acid with sodium-amalgam in presence of acetic acid (Suida, B. 11, 686). Needles, v. sol. water.

Anhydride v. DI-AMIDOLE.

p-Oxy-*α*-amido-phenyl-acetic acid. *Methyl derivative* $C_6H_4(OMe).CH(NH_2).CO_2H$. [225°]. Formed from anisic aldehyde by successive treatment with HCl, alcoholic NH_3 , and HCl (Tiemann & Köhler, B. 14, 1979). Needles (from dilute alcohol).— CuA_2 : blue amorphous pp.

Di-oxy-α-amido-phenyl-acetic acid. Methylene derivative $CH_2O_2.C_6H_3.CH(NH_2).CO_2H$. [210°]. Formed from piperonal by successive treatment with HCl, alcoholic NH_3 , and HCl (Lorenz, B. 14, 794). Needles, sl. sol. water.

OXY-AMIDO-PHENYL-ACRIDINE v. CHRYSOPHENOL.**OXY-AMIDO-DI-PHENYL-AMINE**

$C_6H_5.NH.C_6H_4(OH)(NH_2)$. [13:4]. [135°]. Formed by reducing nitroso-oxy-di-phenyl-amine (Köhler, B. 21, 910). Plates, v. sol. chloroform.

OXY-AMIDO-PHENYL-CARBAMICETHERS. Formed from the nitro-compounds (Köhler, J. pr. [2] 29, 263).

[4:3:1] $C_6H_4(OEt)(NH_2).NH.CO_2Et$. [88°]. Small needles.—B'HCl. [156°]. Needles.

[4:8:2:1] $C_6H_4(OEt)(NH_2).NH.CO_2Et$. Needles.—B'HCl. [238°]. Six-sided plates, sol. water.

$C_6H(OEt)(NH_2).NH.CO_2Et$. Small needles, rapidly oxidising in air.—B'HCl. [233°]. Needles.

OXY-AMIDO-DI-PHENYL-METHANE v. AMIDO-BENZYL-PHENOL.

Oxy-di-amido-tri-phenyl-methane. Methyl derivative $C_6H_4(OMe).CH(C_6H_5NH_2)_2$. Formed by heating anisic aldehyde with aniline and HClAq (Mazzara & Possetto, G. 15, 57). Crystalline crust (containing C_6H_5) melting at 65°.

Di-oxy-tri-amido-tri-phenyl-methane. Dimethyl derivative $C_6H_4(NH_2).CH(C_6H_4(NH_2).OMe)_2$. [183°]. Obtained by reduction of the di-methyl derivative of nitro-di-amido-di-oxy-tri-phenyl-methane (Fischer, B. 15, 681). Plates or tables. Yields on oxidation 'rosanidine', a bluish-red colouring matter with blue fluorescence.

OXY-AMIDO-PHENYL-METHYL-PYRAZOLE $C_{10}H_{11}N_3O$ i.e. $C_6H_5N \begin{smallmatrix} \diagup CO_2CH(NH_2) \\ \diagdown N:CM_6 \end{smallmatrix}$.

Formed by reducing the nitro-compound (Knorr, A. 238, 189). Rapidly oxidised by air.—B'HCl.

OXY-DI-AMIDO-PHENYL-METHYL-PYRIMIDINE $C_{11}H_{12}N_4O$. [232°-240°]. Formed from $C_6H_5CH \begin{smallmatrix} \diagup N:CO_2CH \\ \diagdown N:CM_6 \end{smallmatrix} CH$ by nitration and reduction (Pinner, B. 20, 2364). Golden needles, sol. NaOH aq.—B'H₂PtCl₆.—B'H₂I₂: prisms.

OXY-DI-AMIDO-PHENYL-NAPHTHALENE. *Ethyl derivative*

[2:1:4] $C_{10}H_7(OEt)(NH_2).C_6H_4NH_2$. [1:4]. [72°]. Formed by reducing $C_6H_5.N_2.C_6H_4OEt$ in alcoholic solution with $SnCl_2$ and HCl (Weinberg, B. 20, 8177). White flakes.—B'HCl.—B'H₂SO₄: sl. sol. water.

OXY-AMIDO-PHENYL-PROPIONIC ACID

$C_6H_4.CH(NH_2).CH(OH).CO_2H$. [190°] (P.). Formed from sodium phenyl-glycidate and NH_3 (Plöchl, B. 16, 2822; Erlenmeyer, jun., B. 22, 1482). Decomposes at 221° (E.).

***α*-Oxy-*o*-amido-phenyl-propionic acid.**

Anhydride $C_6H_4 \begin{smallmatrix} \diagup CH_2CH(OH) \\ \diagdown NH.CO \end{smallmatrix}$ *Oxyhydro-*

carbostyryl. [198°]. Got by reducing the product of the nitration of *α*-oxy-phenyl-propionic acid (Erlenmeyer & Lipp, A. 219, 229). White plates (from alcohol). Sl. sol. ether, v. sol. hot water.

***α*-Oxy-*p*-amido-phenyl-propionic acid**

$C_6H_4(NH_2).CH_2CH(OH).CO_2H$. [189°]. Got by reducing the nitrate of nitro-oxy-phenyl-propionic acid (Erlenmeyer & Lipp, A. 219, 227). Slender needles (containing $\frac{1}{2}$ aq) from dilute (93 p.c.) alcohol. More sol. alcohol or ether than tyrosine. Readily soluble in alkalis or acids. Unlike tyrosine, its solution is acid and it does not give Piria's reaction. Boiled with $Hg(NO_2)_2$, it forms a yellow flocculent pp., which, on adding HNO_3 , turns red. HA^+HCl . V. sol. water br alcohol, without decomposition.

p-Oxy-*α*-amido-phenyl-propionic acid v. TYROSINE.

αβ-Di-oxy-*o*-amido-phenyl-propionic acid $C_6H_4(NH_2).CH(OH).CH(OH).CO_2H$. [218°]. Produced in the reduction of *o*-nitro-cinnamic acid by tin and HClAq (Morgan, J. 1877, 788). Yellow needles (from alcohol). Its solutions fluoresce green.

Di-oxy-amido-propionic acid. Anhydride of the methylene derivative

$CH \begin{smallmatrix} \diagup O \\ \diagdown \end{smallmatrix} C_6H_4 \begin{smallmatrix} \diagup NH.CO \\ \diagdown CH_2CH_2 \end{smallmatrix}$ *Ethylamidopiperonyl-*o*-carboxylic anhydride*. [235°]. Formed by reducing $(CH_3O)_2C_6H_4(NO_2).CH_2CH.CO_2Et$ in alcoholic solution with tin and gaseous HCl (F. M. Perkin, C. J. 59, 159). Crystalline pp.

OXY-AMIDO-PHENYL-PYRAZOLE CARBOXYLIC ACID.

Benzoyl derivative $NPh \begin{smallmatrix} \diagup CO_2CH.NHBz \\ \diagdown N:CO_2CH \end{smallmatrix}$. [185°-190°]. Formed from its ether and NaOH (Wislicenus, B. 24, 1261). Yellowish needles, sl. sol. water.

Ethyl ether EtA'. [195°]. Formed by boiling the phenyl-hydrazide of benzoyl-amido-oxalacetic ether with HOAc. Yellow crystals.

OXY-*m*-AMIDO-PHENYL-PYROTARTARIC ACID. *Anhydride* $C_{11}H_{11}NO$, i.e.

$C_6H_4(NH_2).CH \begin{smallmatrix} \diagup CH(CO_2H) \\ \diagdown O.CO_2CH_2 \end{smallmatrix}$ *Amidophenylparaconic acid*. Formed by reducing the corresponding nitro-compound (Salomonson, R. T. C. 6, 18).—B'HCl: prisms.—B'H₂PtCl₆. The isomeric oxy-*p*-amido-phenyl-pyrotartaric anhydride yields a similar hydrochloride.

(B. 2)-OXY-*p*-AMIDO-(Py. 3)-PHENYL-

QUINOLINE $C(OH).CH.C_6H_4.CH \begin{smallmatrix} \diagup CH \\ \diagdown CH:CN \end{smallmatrix} :C.C_6H_4.NH_2$.

[294°]. Formed by passing oxygen over a mixture of (B. 2)-oxy-quinoline hydrochloride, aniline hydrochloride, aniline, and platinised asbestos at 220° (Weidel & Georgievitch, M. 9, 146). Needles (from amyl alcohol), sl. sol. alcohol and ether.—B'HCl aq.—B'H₂SO₄ 1 aq. *Acetyl derivative* $C_{11}H_{10}Ac_2N_2O$. Scales.

(Py. 4:1:2)-Oxy-amido-phenyl-isoquinoline
 $C_{17}H_{17}N_3O$ i.e. $C_6H_5 \begin{matrix} O(NH_2):OPh \\ | \\ C(OH):N \end{matrix}$. *Amido-iso-*
benzyl-phthalimidine. [c. 190°]. Formed by
 reduction of the nitro-derivative with P and HI
 (Gabriel, B. 19, 838). Fine yellow needles.
 V. sol. acetic acid and hot alcohol.

DI-OXY-DI-AMIDO-DI-PHENYL SUL-
PHONE $C_{17}H_{17}N_3SO_4$ i.e. $SO_3(C_6H_5(NH_2)OH)_2$.
 Formed by reducing the nitro-compound (Anna-
 heim, B. 7, 436; 8, 1063). Crystals (from
 water). Alcoholic isoamyl nitrite forms golden
 plates of $C_{17}H_{17}N_3SO_4$. Salts.— $B^+H_2Cl_2$ 2aq.—
 $B^+H_2L_2$ 2aq.— $B^+H_2SO_4$ 2aq: thick prisms.—
 $C_{17}H_{17}Me_2N_3SO_4H_2L_2$. Forms long needles.—
 $C_{17}H_{17}Et_2N_3SO_4H_2L_2$: needles.

OXY-DI-AMIDO-DIPHENYL SULPHONIC
ACID $[4:1]C_6H_4(NH_2).C_6H_4(NH_2)(OH)SO_3H$.
 [1:4:3:6]. Prepared by reducing the azo-com-
 pound $C_{17}H_{17}N_3C_6H_4(OH)SO_3Na$ with aqueous
 SnCl (Weinberg, B. 20, 377; Feer a. Müller,
 C. C. 1888, 1358). Needles, v. sol. water.— B^+HCl :
 transparent crystals.

Ethyl derivative
 $C_{17}H_{17}(NH_2).C_6H_4(NH_2)(OEt)SO_3H$. Got in like
 manner. Needles.— B^+HOAc 2aq: needles, v. sol.
 water.

OXY-AMIDO-DIPHENYL DISULPHONIC
ACID $C_6H_4(NH_2)(SO_3H).C_6H_4(OH)(SO_3H)$.
 Formed from benzidine disulphonic acid by the diazo-
 reaction (Lamprecht, A. 261, 815). Light-
 yellow crystalline mass, v. e. sol. water, insol.
 ether.— BaA^+8aq : reddish-yellow crystals.

OXY-AMIDO-PHENYL-TOLYL KETONE
 $C_{17}H_{17}NO$, i.e. $C_6H_4(NH_2).CO.C_6H_4Me(OH)$ or
 $C_6H_4(OH).CO.C_6H_4Me(NH_2)$. A product of the
 action of water at 270° on commercial rosaniline
 (Liebermann, B. 16, 1927). Small colourless
 needles, sol. acids and alkalis.

Di-benzoyl derivative. [193°]. Needles.
DI-OXY-AMIDO-PHTHALIC ACID. *Methyl*
derivative of the anhydride

$C_6H(OMe)(OH)(CO_2H) \begin{matrix} CO \\ | \\ NH \end{matrix} [4:3:2:1]$. *Nor-*
methylazopropionic acid. [175°]. Formed by
 reducing $C_6H(NO_2)(OMe)(OH)(CHO)CO_2H$ with
 conc. NaCl and HCl (Elbel, B. 19, 2307).
 Colourless needles, nearly insol. ether. Yields
 an acetyl derivative $C_6H_2NO_2(OMe)(OAc)$ [198°],
 and a di-acetyl derivative [105°].

Di-methyl derivative of the anhy-
dride v. Amido-hemipic acid, vol. ii. p. 672.

DI-OXY-AMIDO-PHTHALIDE. *Di-*
methyl derivative v. Amido-Meconin (p.
 198) and *Amido-ψ-Meconin* (p. 199).

α-OXY-β-AMIDO-PROPIONIC ACID
 $CH_2(NH_2).CH(OH).CO_2H$. *Amido-lactic acid*.
 S. 1:5 at 20°. Formed from $CH_2Cl.CH(OH).CO_2H$
 and conc. NH_3 (Melikoff, C. C. 1881, 854; B.
 13, 958, 1266; Erlenmeyer, B. 13, 1077). Mono-
 clinic prisms.— B^+HCl : needles.

OXY-AMIDO-ISOPROPYL-BENZOIC ACID
 $CM_2(OH)C_6H_4(NH_2).CO_2H$ [4:2:1]. [158°]. Got
 from the nitro- acid (Widman, B. 19, 271).
 Prisms. Yields amido-propenyl-benzoic acid
 on boiling with HClAq.

Acetyl derivative [174°]. Tables.
Exo-oxy-amido-isopropyl-benzoic acid
 $CM_2(OH)C_6H_4(NH_2)(CO_2H)$ [4:3:1]. Does not

melt below 270° (Widman, B. 16, 2571). Its
 acetyl derivative is not melted at 280°.

OXY-AMIDO-PYRIDINE $C_7H_7N(OH)(NH_2)$.
 [214°]. Got by reducing oxy-comazine (Krippen-
 dorf, J. pr. [2] 32, 162). Pyramids (containing
 aq), v. e. sol. hot water.— B^+HCl .— $B^+H_2PtCl_6$.

Di-oxy-amido-pyridine $NH \begin{matrix} CO_2CH_3 \\ | \\ CO_2CH_3 \end{matrix} > C:NH$
 or $N \begin{matrix} C(OH).CH \\ | \\ C(OH).CH \end{matrix} > C:NH_2$. *Glutazine*. [c. 300°].

Formed by boiling β-oxy-β-amido-glutamic ether
 $CO_2Et.CH_2.C(OH)(NH_2).CH_2.CONH_2$ with aque-
 ous Na_2CO_3 (Stokes a. Von Pechmann, B. 19,
 2694; 20, 2655; Am. 8, 875). Rectangular
 plates, m. sol. hot water, almost insol. hot alco-
 hol. Gives a deep-red colour with $FeCl_3$, turning
 dark green on warming.

Reactions.—1. Hot HClAq yields tri-oxy-
 pyridine. —2. Bromine in excess forms
 $CBBr_2.CO.CBr_2.CONH_2$ [c. 148°]. —3. By heating
 with PCl_5 (6 to 7 pts.) is converted into a
 mixture of tri-chloro-oxy-amido-pyridine [287°]
 and tetra-chloro-amido-pyridine [212°], together
 with small quantities of di-chloro-di-oxy-amido-
 pyridine [242°] and tri-chloro-amido-pyridine
 [158°]. —4. Yields nitro-glutazine [170°-180°]
 and crystalline di-nitro-glutazine on treatment
 with nitrous acid gas. With $NaNO_2$ and acetic
 acid there is formed the nitro-nitrosamine
 $C_7H_7N_3O_2(NO)$ whence $NaC_7H_7N_3O_2$ crys-
 tallising in yellow needles, which on warming
 with $NaNO_2$ and $HOAc$ yields the di-nitro-
 nitrosamine salt $NaC_7H_7N_3O_2$, a scarlet powder.

Salts.— B^+HCl aq: prisms, v. sol. alcohol.—
 AgA' : plates.

Acetyl derivative $C_7H_7H_2AcO$, [285°-
 290°]. Tables; not attacked by hydroxylamine
 — NH_2A' aq.

Di-benzoyl derivative $C_9H_9H_2O$,
 [216°]. Brownish plates, insol. water.

DI-OXY-AMIDO-PYRIMIDINE CARBOXY-
LIC ACID $NH \begin{matrix} CO.NH \\ | \\ CO.C(NH_2) \end{matrix} > C.CO_2H$. Formed

by reducing the nitro- acid (Behrend, A. 240, 21).
 Not affected by boiling potassium cyanate.—
 KA' aq.

Ethyl ether EtA' . [260°] (Köhler, A.
 236, 32).

OXY-AMIDO-PYROTARTARIC ACID
 $CH_2.C(OH)(CO_2H).CH(NH_2).CO_2H$ or
 $CH_2.C(NH_2)(CO_2H).CH(OH)(CO_2H)$. *Amido-*
citramalic acid. S. 5:1 at 18°. Formed from
 oxycitrazonic acid and NH_3 aq at 100° (Mälikoff
 a. Feldmann, A. 253, 92). Monoclinic prisms.—
 B^+HCl : prisms, v. sol. water.

DI-OXY-AMIDO-PYRROLE. *Benzoyl de-*
rivative, $N \begin{matrix} CH=C(OH) \\ | \\ C(OH).CH.NHBz \end{matrix}$. [200-5°].

Got by heating at 140° the product of the action
 of $NaOEt$ on hippuric ether (Rügheimer, B. 22,
 1957). Plates (from $MeOH$), v. sol. warm water.

OXY-AMIDO-QUINIZINE-CARBOXYLIC
ACID $?C_{17}H_{17}N_3O_2$. *Anhydride of amido-oxal-*
acetic-acid-phenyl-hydrazide. Formed by warm-
 ing the phenyl-hydrazide of amido-oxalacetic
 acid (vol. i. p. 169) with conc. H_2SO_4 . White
 glistening plates. Insol. hot water and ether,
 v. s. sol. hot alcohol. Dissolves in alkalis and
 in conc. H_2SO_4 . Reduces Fehling's solution on
 gently warming. Mercuric salts are reduced in

the cold with formation of a deep orange-red colouration (Tafel, *B.* 20, 246).

(*B.* 4:1)-OXY-AMIDO-QUINOLINE

$C_6H_4(OH)(NH_2)N$ *is.* $CH:C(NH_2).C.OH:CH$
 $CH:C(OH).C.N:CH$
Formed by reduction of sulpho-benzene-azo-oxy-quinoline (from diazotised sulphaphilic acid and (*B.* 4)-oxy-quinoline) (Fischer a. Renouf, *B.* 17, 1643). Crystalline solfs. Very oxidisable. On oxidation it gives quinoline-quinone. Salts.— $B''H_2Cl_2$ — $B''H_2SO_4$: sparingly soluble needles.

(*B.* 2, 4)-Oxy-amido-quinoline

$C(OH).CH.C.CH:CH$
 $CH:C(NH_2).C.N:CH$ Obtained by reducing (*B.* 4, 2)-nitro-oxy-quinoline (Altschal, *B.* 21, 2255). Needles (containing 2aq) becoming yellowish-green on drying at 100°. Its acetyl derivative yields at 235° a crystalline ethenyl derivative.

(*B.* 2, 1)-Oxy-amido-quinoline

$C(OH).C(NH_2).C.CH:CH$
 $CH=CH.C.N:CH$ [143°]. Got by reducing the nitroso-compound with $SnCl_4$ and HCl (Von Kostanecki, *B.* 24, 153). Radiating needles.— $B''H_2SO_4$, 2aq: needles.

(*Py.* 3) Oxy-amido-quinoline *v.* AMIDO-CARBO-
STYRIL.

Oxy-amido-quinoline dihydride *v.* AMIDO-
HYDROCARBOSTYRIL.

OXY-AMIDO-QUINONE. *Acetyl deriva-*

tive $C(NHAc).CH.CO$
 $C(OH):CH.CO$ [170°]. Formed from tetra-acetyl-di-amido-hydroquinone, $NaOHAq$, and $FeCl_3$ (Nietzki a. Schmidt, *B.* 22, 1657). Golden plates (by sublimation).

Di-oxy-di-amido-quinone $C_6O_2(OH)_2(NH_2)_2$
[142:5:3:6]. Formed from tetra-oxy-di-amido-benzene hydrochloride by atmospheric oxidation in presence of aqueous $NaOAc$ (Nietzki, *B.* 21, 1850). Reddish-brown needles. Yields a crystalline di-acetyl derivative.

OXY-AMIDO-SULPHOBENZZOIC ACID

$C_6H_4(OH)(NH_2)(SO_3H).CO_2H$ [2:5:1:1]. Obtained by reducing the nitro-acid (Hübner, *B.* 10, 1701). Needles (containing aq). An isomeric acid, crystallising in needles (containing 8aq) is got by sulphonating (2, 5, 1)-oxy-amido-benzoic acid. It yields CaA' , 5aq crystallising in nodules.

OXY-AMIDO-THYMOQUINONIMIDE *v.* vol.
i. p. 180

OXY-AMIDO-TOLUID² ACID¹

$C_6H_4Me(OH)(NH_2)CO_2H$ [1:2:5:3]. Formed from *o*-cresotic acid by combining it with diazobenzene and reducing the azo-compound (Nietzki a. Ruppert, *B.* 23, 3476). Plates, melting above 300°. Yields an acetyl derivative [275°].

OXY-DI-AMIDO-DITOLYL. *Ethyl deriva-*
tive [1:3:4] $C_6H_4Me(NH_2).C_6H_4Me(OEt)(NH_2)$
[1:2:5:4]. [75°]. Formed from the hydrazo-derivative and H_2SO_4 (Noelting a. Werner, *B.* 23, 326°). Needles: sl. sol. water.

OXY-ISOAMYL-AMINE $C_6H_{11}(OH).NH_2$
(158°). S.G. 1.0265. Formed from amylene chlorhydrin (chiefly consisting of tri-methyl-ethylene chlorhydrin) and NH_4Aq (Wurtz, *A. Suppl.* 7, 89; Radziszewski a. Schramm, *B.* 17, 898). Oil, *v.* sol. water. Alkaline in reaction. P_2O_5 forms some terpene.— $B''H_2PtCl_4$: orange crystals.

Di-oxy-di-isoamyl-amine $NH(C_6H_{11}OH)_2$
(250°). S.G. 1.0950. Accompanies the preceding base. Strongly alkaline syrup, sol. alcohol and ether.

OXY-AMYL-ANTHRACENE

$C_6H_4<\frac{CO}{CH(C_6H_5)}>C_6H_5$ *Amyl-hydroanthrone*.
[253°]. Formed by boiling anthranol with $KOHAq$ and isoamyl iodide (Hallgarten, *B.* 21, 2508). Yellowish crystals.

DI-OXY-AMYL-BENZENE

$CHPr(OH).CH(OH).C_6H_5$ [82°]. Formed from isobutyric aldehyde, benzoic aldehyde, and alcoholic potash (Fossek, *M.* 5, 120). Crystals.

DI-OXY-DI-AMYL KETONE ANHYDRIDE

$CH_2<\frac{CH_2}{CH_2Et.O}>O<\frac{CH_2}{O.CH_2Et}>CH_2$ (209° i.v.).
S. 26 at 14°. Obtained by boiling its carboxylic acid with water (Fittig, *A.* 256, 141). Oil. Yields $C_{11}H_{20}Br_2O$ [35°].

Carboxylic acid

$CH_2<\frac{CH_2}{CH_2Et.O}>O<\frac{CH(CO_2H)}{O.CH_2Et}>CH_2$ [106°].
Got by the action of warm $NaOHAq$ on 'dihexolactone,' an oil formed by boiling the lactone of oxyhexoic acid with alcoholic $NaOEt$. Prisms.— NaA' — CaA'_2 — BaA'_2 (dried at 100°).— AgA' : white flocculent pp.

OXY-AMYL-PHOSPHONIC ACID *v.* Oxy-
PENTANE PHOSPHONIC ACID.

Di-oxy-di-isoamyl hypophosphorous acid
 $(C_6H_5.CH(OH))_2PO.OH$ [160°]. Formed by heating isovaleric aldehyde with hypophosphorous acid in a current of CO_2 at 95° (Ville, *Bl.* [3] 2, 202; *C. R.* 109, 73). Globular masses of slender needles, *v.* sl. sol. water. Gives off PH_3 and isovaleric aldehyde on heating.— KA' 8aq.— BaA'_2 aq.— PbA'_2 5aq: granules, *v.* sl. sol. water.

OXY-ISOAMYL-SUCCINIC ACID. *Lactone*. $PrCH_2CH<\frac{CH(CO_2H)}{O.CO}>CH_2$. *Isobutyl*

paraconic acid. [124°]. Formed by reducing, with sodium-amalgam, the isobataconic acid $PrCH_2CH<\frac{C(CO_2H)}{O.CO}>CH$ [168°] which is got by the action of boiling water on brominated isobutylitaconic acid. Prepared by heating valeric aldehyde with Ac_2O and sodium succinate at 110° (Fittig, *A.* 255, 97; 256, 103). Thin needles (from water). Boiling baryta-water yields C_6H_5BaO , whence C_6H_5AgO — CaA'_2 2aq.— BaA'_2 3aq.— ZnA'_2 1.5aq.— AgA' .

Ethyl ether EtA' [17°]. (293°).

OXY-ANGELIC ACID. *Ethyl derivative*
 $CH_3C(OEt).CMe.CO_2H$ [133°]. Formed by heating chlorotiglic acid with $NaOEt$ at 130°–160° (Friedrich, *A.* 219, 357). Prisms.

Oxy-angelic acid

$CH_3.CH.CH.CO_2H$. Formed by saponifying with $HClAq$ the product of the union of liquid HCl and crotonic aldehyde (Lobry de Bruyn, *Bl.* [2] 42, 159).— BaA'_2 : crystalline.

Oxy-angelic lactones *v.* ANGELICO-LACTONES.

OXY-ANTHRACENE *v.* ANTHRACOL and
ANTHROL.

Di-oxy-anthracene $C_6H_4(OH)_2$. *Chrysozol*.
Formed by fusing anthracene (a)-disulphonis acid with KOH (Liebermann, *B.* 12, 185). Yellow needles. Gives a bluish-green colouration with $FeCl_3$ or bromine.

Acetyl derivative [184°]. Needles.

OXYANTHRAQUINONES. Oxyanthraquinones having two hydroxyls in the position occupied by them in alizarin possess tinctorial properties (Liebermann & Wense, *B.* 20, 862).

Erythro-oxyanthraquinone $C_{14}H_8O_4$, *i.e.*
 $C_6H_4 \begin{smallmatrix} \diagup CO.C(OH):CH \\ \diagdown CO.C(OH)=CH \end{smallmatrix}$. Mol. w. 224. [1917].

Formation.—1. By fusing *o*-bromo-anthraquinone with KOI at 150° (Pechmann, *B.* 12, 2127).—2. Together with its isomeride by heating phenol with phthalic anhydride and H_2SO_4 (Baeyer a. Caro, *B.* 7, 968).—3. By the action of nitrous acid on *o*-amido-anthraquinone (Roemer, *B.* 15, 1793).—4. By passing nitrous acid gas into an alcoholic solution of di-amido-anthraquinone or (*β*)-oxy-amido-anthraquinone (Von Perger, *J. pr.* [2] 18, 148).—5. Together with three isomeric di-oxy-anthraquinones, by heating a mixture of benzoic acid (120 grms.) and *m*-oxy-benzoic acid (60 grms.) with 120 grms. of H_2SO_4 and 120 grms. of water for 10 hours at 180°–200° (Liebermann a. Kostanecki, *B.* 19, 729).—6. By oxidation of oxy-anthranol dihydride (Liebermann, *A.* 212, 20).

Properties.—Orange feathery needles (from alcohol), insol. water, sol. ether and benzene. Yields alizarin on fusion with KOH. Insol. cold baryta-water, but boiling baryta yields a violet sol. Insol. NH_4Aq , sol. $HOAc$. Its ethereal solution shaken with baryta-water forms a violet pp., while the isomeric oxyanthraquinone gives a red solution. KOH dissolves it with difficulty, forming a brown solution. May be sublimed at 140° in a current of gas.

Acetyl derivative $C_{14}H_6O_5$, [176°–179°].

Oxy-anthraquinone $C_{14}H_8O_4 \begin{smallmatrix} \diagup CO.C(OH):CH(OH) \\ \diagdown CO.C(OH)=CH \end{smallmatrix}$. [302°].

Formation.—1. A by-product in the preparation of alizarin by fusing anthraquinone sulphonic acid with KOH or NaOH (Liebermann, *B.* 4, 108; 5, 868; *A.* 160, 141; Simon, *B.* 14, 464). Occurs also in the product of the dry distillation of sodium anthraquinone sulphonate (A. G. a. W. H. Perkin, *C. J.* 47, 680).—2. Obtained also from *m*-bromo-anthraquinone by careful potash fusion (Graebe a. Liebermann, *A.* 212, 25; *Suppl.* 7, 290).—3. By the action of nitrous acid on *m*-amido-anthraquinone.

Properties.—Yellow needles (by sublimation). Readily soluble in excess of baryta-water. Its alkaline solution is reddish-brown. Potash-fusion yields alizarin. $HIAq$ reduces it to anthrol and anthracene hexahydride. Sol. NH_4Aq , forming a reddish-yellow liquid.— $Ba(C_{14}H_6O_5)_2$.— $Ba(C_{14}H_6O_5)_2 \cdot aq$.

Acetyl derivative [158°]. Small needles. Formed by acetylation and also by oxidation of the acetyl derivative of anthrol.

Ethyl ether $C_{14}H_{10}O_4(OEt)$. [135°]. Sol. alcohol. Very difficult to saponify (Liebermann a. Hagen, *B.* 15, 1793).

Di-oxy-anthraquinone

$C_{14}H_8 \begin{smallmatrix} \diagup CO.C(OH):C(OH) \\ \diagdown CO.C(OH)=CH \end{smallmatrix}$. **Alizarin**. Mol. w.

240. [290°]. S. 0.34 at 100° (Plessy a. Schutzgaber, *C. R.* 43, 167). Occurs in madder, the root of *Rubia tinctoria*, which contains its glucoside $C_{14}H_{12}O_6$, (ruberythric acid), and the glucosides of purpurin, purpurin carboxylic acid, purpuroxanthin, and purpuroxanthin carboxylic acid (Robiquet a. Colin, *A. Ch.* [2] 84, 225; Bunge, *J. pr.* 5, 362; Schunck, *A.* 66, 174, 201; 81, 386; 87, 344; *P. M.* [4] 5, 410, 495; 12, 200, 370; *J. pr.* 59, 465; Roehlied, *A.* 80, 321; 82,

205; Debus, *A.* 66, 351; Wolf a. Strecker, *A.* 75, 1; Wartha, *B.* 8, 545, 673; Willig, *A.* 82, 389; Rosenstiehl, *A. Ch.* [5] 18, 285; *C. K.* 88, 1194; Wurtz, *C. R.* 96, 465; Liebermann, *B.* 20, 2241; Bergami, *B.* 20, 2247).

Formation.—1. By fusing di-bromo-anthraquinone with potash (Graebe a. Liebermann, *Bl.* [2] 11, 518; *A. Suppl.* 7, 300).—2. By fusing anthraquinone sulphonic acid with potash (Perkin, *C. J.* 23, 133; *B.* 9, 281). The yield may be improved by addition of $KClO_3$.—3. By heating pyrocatechin with phthalic anhydride and H_2SO_4 at 140° (Baeyer a. Caro, *B.* 7, 972).

Purification.—1. By repeated solution in $NaOHAq$ and ppn. by CO_2 , the pp. being decomposed by HCl (Liebermann a. Troschke, *B.* 8, 379).—2. Crude commercial alizarin, a mixture of alizarin, flavo-purpurin, and isopurpurin, is fractionally sublimed when the alizarin comes over from 100° to 160°, and a mixture of flavo-purpurin and isopurpurin from 160° to 170°; the crystals of these two bodies can be distinguished in the sublimate with a microscope and can be separated by means of benzene, in which isopurpurin is only slightly soluble, but the flavo-purpurin very soluble (Schunck a. Römer, *B.* 13, 41).

Properties.—Red trimetric needles, v. sol. alcohol and ether. Sometimes crystallises in golden scales (containing 2aq (Schunck). Its solutions in alkalis and alkaline carbonates are purple. $BaCl_2$ and $CaCl_2$ give purple pps. in these solutions. Alumina decolorises its alcoholic solution forming a red lake. Salts of Mg, Fe, Cu, and Ag give purple pps. in the ammoniacal solution.

Reactions.—1. Yields phthalic acid on oxidation with HNO_3 .—2. Distillation with zinc-dust yields anthracene (G. a. L.).—3. Zinc-dust and ammonia reduce it to di-oxy-anthranol.—4. Aqueous ammonia at 200° gives oxy-amido-anthraquinone, di-amido-anthraquinone, and other bodies (Von Perger, *J. pr.* [2] 18, 129).

Salts.— CaA^+aq .— BaA^+aq (dried at 100°).— PbA^+aq : violet-brown pp.

Di-acetyl derivative [160°] (P.); [179°–183°] (Baeyer, *B.* 9, 1232). Pale-yellow crystals (Perkin, *C. J.* 26, 21).

Methyl ether $C_{14}H_{10}O_4(OH)(OMe)$. From alizarin, KOH, and MeI (Schunck, *C. N.* 27, 171).

Di-ethyl ether $C_{14}H_{12}O_4(OEt)_2$. Got by heating alizarin with $EtSO_3$ and KOH at 170° (Habermann, *M.* 5, 228). Needles.

Bromo-alizarin v. vol. i. p. 599.

Chloro-alizarin v. vol. ii. p. 102.

Nitro-alizarin v. NITRO-DI-OXY-ANTHRAQUINONE.

Amido-alizarin v. DI-OXY-AMIDO-ANTHRAQUINONE.

Alizarin blue. $C_{14}H_8NO_4$, *i.e.*

$C_6H_4 \begin{smallmatrix} \diagup CO.C(OH):C(OH).CN=CH \\ \diagdown CO.C(OH)=CH \end{smallmatrix}$. [270°].

Formed by heating (*β*)-nitro-alizarin (1 pt.) with glycerin (1½ pts.) and H_2SO_4 (5 pts.) at 107°–200° (Prudhomme, *Bl.* [2] 23, 62; Auerbach, *C. J.* 35, 799; Graebe, *A.* 201, 333; *B.* 12, 1418). Brown needles. Alkalis form a blue solution, but excess of alkali throws it down again. Dyes chromium acetate mordant blue. Yields $C_{14}H_8NO_4(OH)NH_2$ [255°]. Gives anthraquinol,

lue when distilled with zinc-dust.—B'HCl—B'HOAc.— $\text{B}'\text{C}_6\text{H}_4(\text{NO}_2)_2\text{OH}$. [245°].— $\text{Ba}_2\text{OCl}_2\text{H}_2\text{NO}_2$ 5aq: greenish-blue pp.

Di-acetyl derivative $\text{C}_{14}\text{H}_8\text{Ac}_2\text{O}_4$. [225°].

Di-benzoyl derivative [244°].

Alizarin-blue 8 $\text{C}_{14}\text{H}_8\text{NO}_2(\text{SO}_3\text{Na})_2$. Prepared by dissolving alizarin-blue in a cold concentrated solution of NaHSO_3 (Brunck a. Graebe, B. 15, 1783). Reddish-brown crystalline powder. V. sol. water, sl. sol. 95 p.c. of alcohol. At 60° it begins to decompose into its constituents.*

Isolizarin occurs in madder that has been heated with HClAq or dilute H_2SO_4 (Rochleder, B. 3, 292). Its alkaline solutions are blood-red, and it forms a red solution with baryta-water. It does not dye mordants.

p-Di-oxy-anthraquinone

$\text{C}_6\text{H}_4\text{—CO.C.C(OH).CH}$ *Quinizarin*. [195°].
 $\text{C}_6\text{H}_4\text{—CO.C.C(OH).CH}$

Formed by heating hydroquinone or *p*-chlorophenol with H_2SO_4 and phthalic anhydride at 140° (Grimm, B. 6, 506). Red needles (from alcohol). Its alkaline solutions are blue. Yields anthracene on distillation with zinc-dust. Its ethereal solution shows greenish-yellow fluorescence. Baryta gives a bluish-violet lake. Oxidised by MnO_2 and H_2SO_4 at 140° to purpurin (Baeyer a. Caro, B. 8, 152).

Reactions.—1. HI (S.G. 1.7) and a little red

P give a dihydride, $\text{C}_6\text{H}_4\text{—CH(OH)—CH(OH)—C}_6\text{H}_4(\text{OH})_2$

which forms golden plates or needles (from alcohol). It forms with NaOH a yellow solution, turned blue by air. SnCl_2 and HCl also reduce quinizarin to this dihydride (Liebermann, A. 213, 11).—2. A longer treatment with HI forms hydroquinizarol, $\text{C}_{14}\text{H}_{12}\text{O}_2$. It forms orange needles (from alcohol). This body is probably $\text{C}_6\text{H}_4\text{—CH(OH)—CH}_2\text{—C}_6\text{H}_4(\text{OH})_2$.—3. Conc. HI (S.G. 1.9) and red P after an hour's boiling reduce quinizarin to oxy-anthranol dihydride (*q. v.*).

Di-acetyl derivative [200°]. Prisms.

Ethyl ether $\text{C}_{14}\text{H}_8\text{O}_2(\text{OEt})_2$. [151°].

Di-ethyl ether $\text{C}_{14}\text{H}_8\text{O}_2(\text{OEt})_2$. [177°].

Yellow needles (Liebermann, B. 21, 1168).

m-Di-oxy-anthraquinone

$\text{C}_6\text{H}_4\text{—CO.C.C(OH).CH}$ *Purpuroxanthin*.
 CO.C.CH=O(OH)

Xanthopurpurin. [265°]. Occurs, together with its carboxylic acid, in madder (Schützenberger, Bl. 4, 12). May be got by reducing purpurin with HIAq or with SnCl_2 and NaOH . Formed also by dissolving P in a hot alkaline solution of purpurin (Rosenstiehl, C. R. 79, 764); by the action of nitrous acid on purpuramide (di-oxy-amido-anthraquinone) (Liebermann a. Fischer, B. 89, 974); and, together with anthrachryson, by heating a mixture of *s*-di-oxy-benzoic acid (1 pt.), benzoic acid (5 pts.), and H_2SO_4 at 105°–110° (Noah, B. 19, 832).

Properties.—Yellow needles, sol. alcohol, HOAc, and benzene, insol. water. May be sublimed. Its alkaline solution is red. Its barium salt is easily soluble. Gives purpurin on fusion with KOH . Nitric acid oxidises it to phthalic acid. Reduced by HI and P to a dihydride, which dyes alumina mordants like quercitron (Rosenstiehl, A. Oh. [5] 18, 224; C. R. 79, 764). Yields anthracene on distillation with zinc-dust.

VOL. III.

NH_4Aq at 150° yields brown needles of $\text{C}_{14}\text{H}_8\text{O}_2(\text{OH})(\text{NH}_2)$ (Liebermann, A. 133, 217).

Acetyl derivative $\text{C}_{14}\text{H}_8\text{O}_2(\text{OAc})_2$. [184°].

Dimethyl ether. [180°] (Plath, B. 9, 1204).

Di-ethyl ether $\text{C}_{14}\text{H}_8\text{O}_2(\text{OEt})_2$. [170°].

(B. 1, 4). *Di-oxy-anthrquinone*

$\text{CH:CH—C.CO.C.C(OH).CH}$ *Anthrarufin*.
 $\text{CH:C(OH).C.CO.C.CH=CH}$

[280°]. Formed in small quantity (2 g.), together with anthraflavic acid (30 g.) and *m*-benzdioxyanthraquinone (5 g.), by the action of H_2SO_4 on *m*-oxy-benzoic acid (100 g.) (Schunck a. Römer, B. 11, 1176, 1616). Formed also by potash-fusion from anthraquinone (*p*-disulphonic acid (Liebermann a. Dehnst, B. 12, 1287), and by the action of nitrous acid on the di-amido-anthraquinone. Obtained by reduction of di-nitro-anthraquinone (above 300°) (Römer, B. 16, 369).

Properties.—Yellow tables, insol. water, sl. sol. alcohol, HOAc, ether, and CS_2 , v. sol. benzene. Forms oxyanthrarufin on fusion with KOH . Almost insol. baryta-water, Na_2CO_3 , and NH_4Aq , sol. KOHAc . Its solution in I_2SO_4 is cherry-red with scarlet fluorescence. Its Ca and Ba salts are crimson and insoluble.

Acetyl derivative $\text{C}_{14}\text{H}_8\text{O}_2(\text{OAc})_2$. [244°]. Got by oxidising (8)-di-oxy-anthracene with CrO_3 in HOAc. Yellow needles.

Di-oxy-anthraquinone $\text{C}_{14}\text{H}_8\text{O}_2$. *Anthraflavic acid*. [above 330°]. S. (95 p.c. alcohol) 1.18 at 10° (Rosenstiehl, Bl. [2] 29, 401, 434). A by-product in the preparation of alizarin, being formed by fusing anthraquinone (*p*-disulphonic acid with KOH (Schunck, B. 4, 360; 9, 1628; 9, 379, 679; Perkin, C. J. 24, 1109; 26, 19; 29, 851). Formed also from *m*-oxy-benzoic acid and H_2SO_4 (*v. supra*). Radiating yellow needles (from alcohol), insol. ether and benzene, sl. sol. HOAc. Its solution in H_2SO_4 is yellow. Its solution in alkalis is yellowish-red. Its Ba and Ca salts are sl. sol. water. It does not dye mordanted cotton. Potash-fusion forms flavopurpurin. Distillation with zinc-dust forms anthracene. Boiling with zinc-dust and NH_4Aq forms $\text{C}_{14}\text{H}_{10}\text{O}_2$, whence $\text{C}_{14}\text{H}_7(\text{OAc})_2$ [165°] (Liebermann, B. 21, 445).

Salts.— Na^+ 5aq: sl. sol. water.— BaA^+ 2aq: reddish-brown needles.

Di-acetyl derivative $\text{C}_{14}\text{H}_8\text{O}_2(\text{OAc})_2$. [229°].

Di-benzoyl derivative $\text{C}_{14}\text{H}_8\text{O}_2(\text{OBz})_2$. [275°].

Di-methyl ether $\text{C}_{14}\text{H}_8\text{O}_2(\text{OMe})_2$. [248°].

Di-ethyl ether [235°]. Yellow needles.

Di-oxy-anthraquinone $\text{C}_{14}\text{H}_8\text{O}_2$. [above 330°].

Isoanthraflavic acid. Occurs in crude commercial alizarin, being formed by fusing anthraquinone (*p*-disulphonic acid with potash (Schunck a. Römer, B. 9, 379; 15, 1041; Perkin, C. J. 20, 851). Yellow needles (containing Na^+), almost insol. benzene and ether, sl. sol. HOAc and alcohol. It dissolves in cold baryta-water and in KOH with dark red colour. Does not possess tinctorial properties. Its solution in H_2SO_4 is red. Yields anthrapurpurin on fusion with KOH .— BaA^+ 2aq: red needles, v. sol. Aq.

Di-acetyl derivative [c. 195°]. Crystals.

Di-ethyl ether [194°]. Yellow needles.

XX

(B. 1, 1' or 3'). **Di-oxy-anthraquinone** $C_{14}H_8(OH)_2 \cdot O_2$. *Chrysasin*. [192°]. Formed by eliminating amidogen from di-oxy-tetra-amido-anthraquinone (hydrochrysamide) (Liebermann a. Giesel, B. 8, 1043; 9, 829; A. 183, 184). Formed also by fusing anthraquinone χ -disulphonic acid with potash (Liebermann a. Dehnst, B. 12, 1287). Golden lamina or reddish-brown needles; m. sol. alcohol and HOAc. Insol. cold NH_4 Aq and Na_2CO_3 Aq. Its solution in KOHAq is yellowish-red, and that in H_2SO_4 is red. Potash-fusion yields oxychrysazin, and *o*- and *m*-oxy-benzoic acid. Yields anthracene when distilled with red-hot zinc-dust. Baryta- and lime-water give red pps. Does not dye mordanted cotton.

Di-acetyl derivative [232°]. Prepared by oxidising di-acetyl-chrysazol $C_{14}H_8(OAc)_2$ with CrO_3 (Liebermann, B. 12, 186).

Di-oxy-anthraquinone $C_{14}H_8O_4$. *Isochrysasin*. [175°-180°]. Formed, together with *m*-benzodioxynthraquinone, by the action of nitrous acid and alcohol on the dye $C_{14}H_8N_2O_2$, got from *o*-di-nitro-anthraquinone and H_2SO_4 (Eilfschütz, B. 17, 897). Deep-red needles (from alcohol); readily sublimed. Its solutions in NH_4 Aq and KOHAq are violet-red; that in H_2SO_4 is reddish-yellow. Its Ba salt is insoluble. It does not dye mordants.

Di-acetyl derivative [160°-165°]. Needles.

Di-oxy-anthraquinone $C_{14}H_8O_4$. '*m*-Benedi-oxyanthraquinone.' [293°]. A product of the action of H_2SO_4 on *m*-oxy-benzoic acid (Schunck a. Römer, B. 11, 969). Formed also as above. Yellow needles, insol. water and CS_2 , sol. alcohol, HOAc, ether, and benzene. Its alkaline solution is yellow. Gives purpurin by potash-fusion. Its solution in H_2SO_4 is brownish-yellow. When freshly ppd. it dissolves in hot baryta-water, and on cooling the Ba salt separates in red needles, which, after drying, are insoluble. Has no tinctorial power.

Di-acetyl derivative [199°]. Needles.

Di-oxy-anthraquinone $C_{14}H_8O_4$. *Frangulic acid*. [254°]. Obtained, together with glucose, by hydrolysing frangulin which occurs in the bark of *Rhamnus Frangula* (Faust, A. 165, 229). Orange needles (containing 1½ aq), sl. sol. hot water, m. sol. alcohol. Its solution in KOHAq is cherry-red. Its ammoniacal solution gives a red pp. with $BaCl_2$. Distillation over zinc-dust gives anthracene.

Di-acetyl derivative [184½°]. Prisms.

Di-oxy-anthraquinone

$C_{14}H_8 \cdot CO_2CH_3 \cdot CO_2CH_3$. *Hystazarin*. [282°]. Formed by heating pyrocatechin (5 g.) with phthalic anhydride (4.8 g.) and H_2SO_4 (70 g.) at 146° for 5 hours (Liebermann a. Schöller, B. 21, 2503; 22, 683). Orange-yellow needles (from acetone), almost insol. benzene, v. sl. sol. alcohol, ether, and HOAc. Its solution in KOHAq is blue; that in NH_4 Aq is violet; and that in H_2SO_4 blood-red. The Ba salt is blue, the Ca salt violet and insol. water. It dyes mordants slightly. Yields anthracene on distillation with zinc-dust.

Di-acetyl derivative [207°]. Needles.

Ethyl ether $C_{14}H_8O_4(OEt)_2$. [284°-

240°]. Yellow needles, forming a crimson solution in alkalis.

Di-ethyl ether $C_{14}H_8O_4(OEt)_2$. [160°-168°]. From hystazarin, KOH, and EtI. Yellow needles.

Eleven di-oxy-anthraquinones have been described, but ten only are indicated by theory.

Tri-oxy-anthraquinone

$C_{14}H_8 \cdot CO_2C(OH) \cdot CO_2C(OH) \cdot CO_2C(OH) \cdot CH$. *Purpurin*. [253°].

Occurs in madder-root, probably as glucoside (Colin a. Robiquet, A. Ch. [2] 84, 244; Gauthier de Claubry a. Persoz, A. Ch. [2] 48, 69; 51, 110; Runge, A. Ch. [2] 68, 282; Schiel, A. 60, 74; Debus, A. 66, 851; 86, 117; Wolff a. Strecker, A. 75, 1; Rochleder, A. 80, 321; 82, 205; Stenhouse, Pr. 12, 633; 13, 145; Schützenberger, J. 1864, 542; Bl. [2] 4, 12). Formed by the action of MnO_2 and H_2SO_4 at 150° on alizarin (De Lalande, C. R. 79, 669) and on quinizarin (Baeyer a. Caro, B. 8, 152); and also by heating tri-bromo-anthraquinone with H_2SO_4 at 300° (Diehl, B. 11, 184). It may be separated from alizarin by repeatedly dissolving in boiling alum solution and ppg. by acid. Orange prisms obtaining aq (from dilute alcohol) or dark-red anhydrous needles (from absolute alcohol). May be sublimed. Sl. sol. boiling water, forming a yellow liquid. Its ethereal solution is yellow and shows two absorption bands (Stokes, C. J. 12, 220; Vogel, B. 9, 1641). Its solution in H_2SO_4 is rose-red and shows three absorption bands. Aqueous KOH, Na_2CO_3 , and NH_3 yield purple-red solutions. Almost insol. alcoholic potash. Baryta-water forms an insoluble purple lake. Its alkaline solution is oxidised in daylight by the air becoming yellow (unlike alizarin) the product containing phthalic acid (Schunck a. Römer, C. J. 31, 665; Dralle, B. 17, 376). Boiling alum forms a pink solution with yellow fluorescence. Lead acetate gives in an alcoholic solution a dark-crimson pp., soluble in excess, forming a crimson liquid with three absorption bands (the lead compound of alizarin is insol. alcoholic lead acetate). Dyes cotton, mordanted with alumina, red.

Reactions.—1. Yields anthracene on heating with zinc-dust.—2. Forms some quinizarin when heated in sealed tubes at 300°.—3. Phosphorus and NaOHAq reduce it to purpuroxanthin.—4. Nitric acid oxidises it to phthalic acid.—5. Aqueous ammonia forms brown purpuramide $C_{14}H_8O_4(NH_2)(OH)_2$.

Acetyl derivative $C_{14}H_8O_4(OAc)_3$. [198°] (L); [200°] (S. a. R.). Yellow needles.

Ethyl ether $C_{14}H_8O_4(OEt)_3$. Red crystals.

Tri-oxy-anthraquinone $C_{14}H_8O_4(OH)_3$. *Anthrapurpurin*. *Isoapurpurin*. [above 330°]. A by-product in the preparation of artificial alizarin, being formed by fusing anthraquinone (8)-disulphonic with potash (Perkin, C. J. 25, 659; 26, 425; 29, 851; Caro, B. 9, 682). Formed also by potash-fusion from isocanthraflavic acid, from *m*-benzodioxanthraquinone (Schunck a. Römer, B. 9, 679; 11, 972), and from (a)-di-bromo-anthraquinone (Perkin, C. J. 87, 557). Orange needles (from alcohol), v. sol. hot alcohol, sl. sol. hot water and ether. Conc. H_2SO_4 forms a red solution; potash, NH_4 Aq, and Na_2CO_3 Aq give a violet solution. Sl. sol. hot baryta-water, forming

a violet solution. Alcoholic lead acetate gives a purple pp., sol. excess. Its colours mordants.

Reactions.—1. Nitric acid gives no phthalic acid.—2. Aqueous ammonia at 100° forms an unstable blue dye, decomposed by HCl or KOH with regeneration of anthrapurpurin.—3. Aqueous ammonia at 170° forms anthrapurpuramide $C_{12}H_{10}O_2(OH)_2(NH_2)$ which does not dye mordants (Perkin, C. J. 33, 216).

Tri-acetyl derivative [222°]. Yellow scales.

Tri-benzoyl derivative [185°]. Crystals.

Mono-ethyl ether $C_{12}H_{10}O_2(OH)(OEt)$. [265°]. Orange-red needles (Liebmann a. Jellinek, B. 21, 1170).

Di-ethyl ethers $C_{12}H_{10}O_2(OH)(OEt)_2$ [162°] and [170°]. Yellow needles (L. a. J.).

Tri-oxy-anthraquinone $C_{12}H_6O_5$. **Flavopurpurin**. [above 330°]. Formed by potash fusion from anthraflavic acid and from anthraquinone (a)-disulphonic acid. Purified by means of its lead salt (S. a. E.; C.; Liebmann, B. 21, 441, 2524). Golden needles (from alcohol), v. sol. cold alcohol. Its solution in conc. H_2SO_4 is red; that in KOHAq is purple, becoming red on dilution. Sl. sol. baryta-water, forming a red solution. Its solution in NH_4Aq and Na_2CO_3Aq is yellowish-red. Alcoholic lead acetate forms a reddish-brown pp., v. sl. sol. excess. On heating with phenyl cyanate at about 160° it forms $C_{12}H_6O_5(CO.NHPh)$, crystallising in yellowish plates (Tesmer, B. 18, 2610).

Di-acetyl derivative [238°]. Golden plates.

Tri-acetyl derivative [196°]. Yellow needles.

Di-benzoyl derivative [210°]. Needles.

Ethyl ether $C_{12}H_{10}O_2(OH)(OEt)$. V. sol. other.

Di-ethyl ether [209°]. Needles.

Tri-oxy-anthraquinone

$C_{12}H_6 \begin{matrix} \text{CO.C(OH).C(OH)} \\ \text{CO.C.CH=C(OH)} \end{matrix}$ **Anthragallol**. [310°] (Cahn, B. 19, 2335). Formed by heating a mixture of benzoic acid, gallic acid, and H_2SO_4 at 70° (Seuberlich, B. 10, 38). Formed also from pyrogallol, phthalic anhydride, and H_2SO_4 . Orange needles (by sublimation), nearly insol. water. Its alkaline solution is green. Dilute HNO_3 forms phthalic acid. Distillation over zinc-dust gives anthracene. Dyes alumina mordants brown. Alcoholic lead acetate ppts. violet-brown $C_{12}H_6O_5Pb_2OAc$. Boiling alcoholic NH_3 forms anthragallolamide $C_{12}H_6O_5(NH_2)(OH)$, crystallising in black needles with green reflex. HCl and HNO_3 form $C_{12}H_6O_5$ whence $C_{12}H_6O_5AcO$, [265°] (L.).

Tri-acetyl derivative [178°]. Needles.

Ethyl ether $C_{12}H_{10}O_2(OH)(OEt)$. [175°]. From the K salt and EtI at 80°. The Pb salt and EtI at 220° yields an isomeride [245°].

• **Di-ethyl ether** [184°]. Formed from the K salt (L. a. J.). The Pb salt yields an isomeride [198°].

Tri-oxy-anthraquinone $C_{12}H_6O_5$. **Oxychrysin**. Formed by potash-fusion from chrysazin and from anthraquinone ρ and χ disulphonic acids (Liebmann, A. 183, 191; 12, 1289). Probably identical with oxyanthrarufin. Red needles (from alcohol). Its alkaline solutions are blue.

Baryta-water gives a blue insoluble pp. Dyes mordants.

Tri-acetyl derivative [193°]. Yellow needles.

Tri-oxy-anthraquinone

$C_{12}H_6(OH).C(O).C(O).C(O).C(O)_2$. **Oxyanthrarufin**. Prepared by fusing anthrarufin with KOH (Liebmann a. Boeck, B. 11, 1617). Red needles (by sublimation). Its alkaline solutions are blue. Dyes mordants like alizarin.

Tetra-oxy-anthraquinone $C_{12}H_4O_6$, i.e.

$C(OH).CH.C.CO.C(OH).CH=C(OH)$ **Anthrachryson**. $CH:C(OH).C.CO.C(OH).CH$

Mol. w. 272. Formed by heating *s*-di-oxybenzoic acid alone or with H_2SO_4 (Barth a. Senhofer, A. 164, 109; Noah, B. 19, 754). Silky needles (containing 2aq), not melted at 260°. V. sol. alcohol, v. sl. sol. water and ether. Yields anthracene on distilling with zinc-dust. Its solution in KOHAq is reddish-yellow. — $Ba(C_{12}H_4O_6)_2$ 11aq; red needles.

Tetra-acetyl derivative [253°]. Needles.

Tetra-oxy-anthraquinone $C_{12}H_4O_6$. **Oxyapurin**. Formed by heating purpurin with KOH at 240° (Diehl, B. 11, 195). Brown nodules, not melted at 290°. Almost insol. alcohol. Its alkaline solution is brownish-red. Its acetyl derivative melts above 240°.

Tetra-oxy-anthraquinone

$CH:C(OH).C.CO.C(OH).C(OH)$ **Quinalizarin**. $CH:C(OH).C.CO.C(OH).CH$

[above 275°]. Obtained by heating its di-methyl ether with HOAc and HCl at 200°. Formed also by heating alizarin with H_2SO_4 at 210° (Graebe, B. 23, 3739). Long red needles, sol. HOAc, sl. sol. alcohol. Dyes mordants well. Its solution in H_2SO_4 is blue. The Ba and Ca salts are insol. water. Yields anthracene on distillation with zinc-dust.

Tetra-acetyl derivative [201°]. Needles.

Di-methyl ethyl [225°–230°]. Obtained

by heating hemipic acid $C_{12}H_6(OMe)_2(CO_2H)$, [6:5:2:1] with hydroquinone and H_2SO_4 at 130° (Liebmann a. Wense, B. 20, 864; A. 240, 298). Minute brownish-red plates. Forms a bluish-violet solution in alkalis and a blue solution in H_2SO_4 . Does not dye. Yields $C_{12}H_6O_5(OMe)_2(OAc)_2$, [211°].

Tetra-oxy-anthraquinone $C_{12}H_4O_6$. **Rufin**.

Formed by heating opianic acid with H_2SO_4 at 180° (Liebmann a. Chojnacki, B. 4, 194; A. 162, 322). Yellowish-red needles, sl. sol. boiling water, m. sol. hot alcohol. Its solution in KOHAq is violet-red; that in NH_4Aq is reddish-brown, and is ptd. by $BaCl_2$ and $CaCl_2$. Yields anthracene on distilling with zinc-dust. Conc. H_2SO_4 gives a violet-red solution. Dyes alumina mordants brownish-red. — $BaQ_{12}H_4O_6$ aq.

Tetra-oxy-anthraquinone $C_{12}H_4O_6$. (a)-

anthragallol [above 350°]. Formed, together with the (b)-isomeride and rufigallic acid, by heating pyrogallol with *m*-oxy-benzoic acid and H_2SO_4 at 160° (Noah; Liebmann a. Koszanek, A. 240, 270). Golden needles (from alcohol) or red needles (from benzene). Conc. H_2SO_4 forms a violet solution. KOHAq gives a green solution. Insol. baryta-water. Dyes mordants.

Tetra-acetyl derivative [209°].

• **Tetra-oxy-anthraquinone** $C_{12}H_4O_6$. (b)-**anthragallol**. [above 380°]. Formed, as above.

Red needles (from alcohol), insol. benzene. Conc. H_2SO_4 gives a brownish-yellow solution. KOHAq forms a green solution. Dyes mordants.

Tetra-acetyl derivative [189°].

Of the two oxyanthraquinones one should have the hydroxyls in the position 1,2,3,2', and the other in 1,2,3,4'.

Penta-oxo-anthraquinone

$\text{C}(\text{OH})_2\text{CH}_2\text{C}(\text{CO})_2\text{C}_6\text{H}_2 = \text{C}(\text{OH})\text{CH}_2\text{C}(\text{OH})_2\text{C}(\text{CO})_2\text{C}_6\text{H}_2$. Formed by heating gallic acid with *s*-di-oxo-benzoic acid H_2SO_4 for 15 minutes at 165° (Liebermann & Noth, B. 19, 751; A. 240, 273). Small yellowish-red plates (by sublimation), not melted at 360°. V. sol. hot alcohol, al. sol. ether, nearly insol. benzene and hot water. Its solution in KOHAq is green; that in H_2SO_4 is brownish-red. Dyes mordanted fabrics.

Penta-acetyl derivative [229°].

Needles.

Hexa-oxo-anthraquinone

$\text{C}(\text{OH})_2\text{C}(\text{OH})_2\text{C}(\text{CO})_2\text{C}_6\text{H}_2 = \text{C}(\text{OH})\text{C}(\text{OH})_2\text{CH}_2\text{C}(\text{OH})_2\text{C}(\text{CO})_2\text{C}_6\text{H}_2$. *Rufgallic acid*. Formed by heating gallic acid with H_2SO_4 (Robiquet, A. 19, 204; Wagner, C. O. 1861, 47; Löwe, J. pr. 107, 296; Jaffé, B. 3, 694; Widman, B. 9, 856; Klobulowski & Nötting, B. 8, 819; 9, 1256; 10, 880). Red crystals (containing 2aq), v. sl. sol. alcohol and ether. Its solution in conc. KOHAq is blue, becoming violet-red on dilution. Conc. H_2SO_4 forms a red solution. Baryta-water forms a blue insoluble salt. Dyes fabrics, mordanted with alumina, brown; with iron salts, black.

Reactions.—1. Yields anthracene on heating with *sinc*-dust.—2. Nitric acid gives no phthalic acid.—3. Boiling HIAq and P form minute needles of $\text{C}_{14}\text{H}_8\text{O}_4$.—4. Potash-fusion yields *m*-oxy-benzoic acid, *γ*-oxy-isophthalic acid, and an anhydride of hexa-oxo-diphenyl $\text{C}_{12}\text{H}_2\text{O}_6$, 4aq, crystallising in colourless needles (Malin, A. 141, 346; Schreder, M. 1, 432).

Hexa-acetyl derivative. Needles.

Chloro-acetyl derivative $\text{C}_{14}\text{H}_7\text{ClO}_6$.

Needles.

Tri-ethyl ether [195°]. Orange needles.

Tetra-methyl ether [c. 220°]. Needles.

Tetra-ethyl ether [above 180°]. Red needles.

Hexa-ethyl ether $\text{C}_{14}\text{H}_{18}(\text{OEt})_6$. [c. 140°]. Orange needles, sol. hot alcohol.

References.—BACON, CHLORO-, and NITRO-OXYANTHRAQUINONE and OXY-AMPHO-ANTHRAQUINONE.

OXY-ANTHRAQUINONE CARBOXYLIC

ACID $\text{C}_6\text{H}_4\text{C}(\text{CO})_2\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{H}$. [260°]. Prepared by fusing anthraquinone carboxylic acid with caustic soda (Hammerschlag, B. 11, 83). Orange needles (by sublimation). Yields phthalic acid on oxidation with HNO_3 . Its Ba salt is a blue pp. Its alkaline solutions are purple.

(erythro)-Oxy-anthraquinone-carboxylic acid [238°]. Formed by heating *(erythro)-oxy-methyl-anthraquinone* with H_2SO_4 ; a portion of the quinone probably oxidising the methyl of the rest (Birukoff, B. 20, 2438). Long yellow needles. V. sol. boiling water. Heated to about 270° it loses CO_2 and gives *(erythro)-oxy-anthra-*

quinone. The Ca and Ba salts are sparingly soluble.

Di-oxo-anthraquinone carboxylic acid $\text{C}_6\text{H}_4(\text{OH})_2\text{C}_6\text{H}_2\text{CO}_2\text{H}$. *Alizarin carboxylic acid*. [305°]. Formed by soda-fusion from the sulphonic acid got by heating anthraquinone carboxylic acid with H_2SO_4 (Hammerschlag, B. 11, 86). Dull-red powder or red needles (by sublimation), v. sol. aqueous NaOAc. Decomposed by heat into CO_2 and alizarin. Its alkaline solutions are purple. Gives a red lake with alumina. Nitric acid oxidises it to trimellitic acid.— $\text{Ba}_2(\text{C}_{14}\text{H}_7\text{O}_6)_2$: blue pp.

Di-oxo-anthraquinone carboxylic acid $\text{C}_{14}\text{H}_8\text{O}_6$. *Munjistin. Purpuroanthic acid*. [231°]. Occurs in madder (Schunck & Römer, B. 10, 172; C. J. 31, 666; 33, 423) and in munjeet or East Indian madder (Stenhouse, Pr. 12, 633; 13, 36, 146). Golden scales (from HOAc), split up at 233° into CO_2 and purpuroxanthin. M. sol. boiling water and alcohol. Its alkaline solutions are red. Conc. H_2SO_4 forms an orange solution. Dilute nitric acid oxidises it to phthalic acid. Fuming HNO_3 gives a di-nitro-derivative. Dyes fabrics, mordanted with alumina, orange; with iron mordants, brownish-red. Forms a red insoluble Ba salt. Yields purpurin when boiled for a long time with conc. KOHAq. Ammonia at 100° forms purpurinamide. Br in HOAc forms di-bromo-purpuroxanthin [231°].

Tri-oxo-anthraquinone carboxylic acid $\text{C}_{14}\text{H}_8\text{O}_7$. *Purpurin carboxylic acid. Pseudo-purpurin*. [220°]. Occurs in madder (Schützenberger & Schiffrt, Bl. 4, 13; Rosenstiel, C. R. 84, 561; Liebermann, B. 10, 1618). Red plates, almost insol. water and alcohol. Split up by heat, or by boiling with water, potash, or alcohol into CO_2 and purpurin. Its alkaline solution is orange-red. Does not dye mordanted fabrics unless the water is free from CaCO_3 (difference from purpurin). Bromine-water yields bromo-purpurin [275°].

o-OXY-ANTHRAQUINONE SULPHONIC ACID $\text{C}_6\text{H}_4\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})$ [1:3:2:3 or 4]. *Erythro-oxo-anthraquinone sulphonic acid*. Formed from *o*-amido-anthraquinone sulphonic acid by the action of nitrous acid (Lifschütz, B. 17, 900). Yellow plates, v. sol. water, alcohol, and ether. Its alkaline solution is red. On fusion with potash it gives alizarin.—AgA': yellow needles.

Anhydride $\text{C}_{14}\text{H}_2\text{O}_6 < \text{SO} > \text{O}$. Grey needles, insol. water, alcohol, and ether, sl. sol. HOAc. Requires to be heated with alkalis before yielding the acid.

Oxy-anthraquinone sulphonic acid. Formed by sulphonating erythro-oxo-anthraquinone at 180°. Sol. water and alcohol, insol. ether. Its alkaline solution is reddish-yellow. Baryta gives a blood-red pp., crystallising from hot water. BaCl₂ gives a similar yellow pp. Lead acetate gives a yellowish-brown pp., sol. hot water. Gives neither alizarin nor purpurin on potash-fusion.

m-Oxy-anthraquinone sulphonic acid $\text{C}_6\text{H}_4\text{O}_2(\text{OH})(\text{SO}_3\text{H})$. Formed by heating *m*-oxy-anthraquinone with H_2SO_4 at 130° (Von Perger, J. pr. [2] 18, 176). Crystals (from alcohol), m. sol. cold water, insol. ether. Its alkaline solu-

tion is reddish-brown. Lead acetate gives a brownish-yellow, and lime-water a brown, pp. Yields alizarin sulphonic acid on fusion with potash at 180°.—BaC₂H₃SO₄: orange crystals.

When (α)- or (β)-anthraquinone disulphonic acid is fused with moist potash, a mixture of anthraquinone disulphonic acid, oxyanthraquinone sulphonic acid, and tri-oxy-anthraquinone is got. The mono-sulphonic acid is obtained by stopping the fusion as soon as the blue colour begins to turn violet (Graebe & Liebermann, *A.* 160, 139). According to Von Perger (*J. pr.* [2] 18, 168) it is doubtful whether the product is not a di-oxy-anthraquinone sulphonic acid. The acid prepared from (α)-anthraquinone disulphonic acid gives on fusion with potash anthraflavic acid and flavo-purpurin, and is therefore isomeric with that from (β)-anthraquinone disulphonic acid, which gives isanthraflavic acid and anthrapurpurin on potash-fusion.

Di-oxy-anthraquinone sulphonic acids C₁₄H₈O₄(OH)₂(SO₃H). Pure alizarin heated with strong H₂SO₄ at 120° forms at least three sulphonic acids. On adding water two sulphonic acids dissolve and another remains on the filter as a brown mass. The latter dissolves in alkalis, forming a cherry-red liquid. It is slightly soluble in water, but is slowly decomposed by boiling water, regenerating alizarin. Of the two sulphonic acids which are readily soluble, the one that is formed in greatest quantity is the most soluble, and it is decomposed by potash-fusion at 200° without forming either alizarin or purpurin. The other sulphonic acid is formed in very small quantity, but by potash-fusion it is converted at 140° into purpurin, the mass becoming crimson (Von Perger, *J. pr.* [2] 18, 173).

Di-oxy-anthraquinone sulphonic acid C₁₄H₈O₄(OH)₂SO₃H. *Quinizarin sulphonic acid*. Formed in small quantity in the preparation of quinizarin from hydroquinone, phthalic anhydride, and H₂SO₄ (Liebermann, *A.* 212, 11). Its Na salt forms a deep-orange solution, turned deep-blue by alkalis. It does not dye mordants.

OXY-AZELAIC ACID C₈H₁₀(OH)(CO₂H)₂. [91°]. Formed by the action of NaOHAq upon the product of the action of Br and a little red P upon azelaic acid (Bujard & Hell, *B.* 22, 68). Nodules (from water or ether).—BaA" ½ aq. S. 2-56 at 18°.—CaA" 1½ aq. S. 65 at 20°.—ZnA" 2 aq. S. 628 at 20°.—SrA" 1½ aq. MgA" 2 aq.—CdA" 2 aq.—CuA" 1½ aq.—PbA" ½ aq.—AgA".

OXY-AZO compounds v. Azo compounds.

OXY-AZOPHENINE C₁₀H₇N₂O. [197°]. Formed by heating nitroso-m-oxy-diphenylamine with aniline and aniline hydrochloride on the water-bath (O. Fischer & Hepp, *B.* 20, 2481; Kohler, *B.* 21, 910). Needles (from toluene), sol. alcoholic NaOH, insol. NaOHAq. Conc. H₂SO₄ forms a reddish-brown solution.

DI-OXY-BEHENIC ACID C₂₂H₄₀(OH)₂O₂. [127°] (H.); [133°] (H. & G.). Formed by boiling oxy-erucic acid with potash (Haussknecht, *A.* 143, 58), or by oxidising erucic acid with alkaline KMnO₄ (Irwantzoff, *J.* 21, 13; *J. pr.* 39, 334; Hazura & Grüssner, *M.* 9, 947). Plates (from alcohol), insol. water and ether. With HCl it gives iodobehenic acid reduced by zinc and

HCl to behenic acid. NaA': grains, sl. sol. water.—BaA': insoluble pp.

Iso-di-oxy-behenic acid C₂₂H₄₀(OH)₂O₂. [93°]. Formed by oxidising brassic acid with alkaline KMnO₄ (Grüssner & Hazura, *M.* 10, 197). Minute plates, insol. water and ligroin, v. sol. hot alcohol.

DI-OXY-BEHENIC ACID C₂₂H₄₀O₂. [91°]. Formed by oxidising behenic (behenic) acid with fuming HNO₃ (Haussknecht, *A.* 143, 46). Yellowish scales (from alcohol).—AgA': white pp.

OXYBENZALDEHYDE v. OXYBENZOIC ALDEHYDE.

OXYBENZAMIDE v. Amide of OXYBENZOIC ACID.

o-OXY-BENZAMIDINE. *Ethyl ether.* C₈H₇(OEt).C(NH).NH₂. A product of the action of alcoholic HCl, followed by alcoholic NH₃, on C₈H₇(OEt).CN (Pinner, *B.* 23, 2952). The hydrochloride B'HCl [218°] crystallises in short hexagonal columns, v. sol. water.

p-Oxy-benzamide. *Ethyl ether.* The hydrochloride C₈H₇(OEt).C(NH)NH₂.Cl [260°] is formed by the action of alcoholic NH₃ on the hydrochloride of ethyl-p-oxy-benzimidether. It is converted by acetoacetic ether and NaOHAq into ethylated dioxy-phenyl-methyl-pyrimidine C₈H₇(OEt).C<N(CMe)>N(COH)>CH.

OXY-BENZENE v. PHENOL.

Di-oxy-benzene v. HYDROQUINONE, PYROCATHECHIN, and RESORCIN.

u-Tri-oxy-benzene C₆H₃(OH)₃. [1:2:4]. *Oxyhydroquinone*. [140-5°]. Formed, together with hexa-oxy-diphenyl, by fusing hydroquinone (1 pt.) with moist NaOH (9 pts.) (Barth & Schreder, *M.* 4, 176; 5, 589). Monoclinic plates (from ether); a:b:c = 76:1:1.01; α = 91°46'. V. a. sol. water, alcohol, ether, and HOAc, almost insol. chloroform and benzene. Its alkaline solution rapidly becomes brown through absorption of oxygen. FeCl₃ gives a transient bluish-green colour. H₂SO₄ forms a green solution becoming cherry-red on warming. Bromine forms C₆Br₂(OH)₂O₂ [206°]. Nitric acid yields greyish-blue crystals of oxyquinhydrone.

Tri-acetyl derivative C₆H₃(OAc)₃. [96°].

Methyl ether C₆H₃(OMe)₃(OH)₂. [2:4:1]. [84°]. Got by reducing the methyl ether of oxyquinone with aqueous SO₂ (Will, *B.* 21, 406). Colourless plates. Turned yellow by FeCl₃, being reconverted into C₆H₃(OMe)₃O₂.

Tri-methyl ether C₆H₃(OMe)₃. (247°). Formed from the preceding ether, methyl iodide, and KOH (W.). Obtained also from asarone C₆H₃(OMe)₃.CH:CHMe by oxidation to C₆H₃(OMe)₃CO₂H and distillation of this acid with lime (Rizza & Butlerow, *J. R.* 1887, 1). Oil, volatile with steam.

Mono-ethylether C₆H₃(OH)₂(OEt) [1:4:8]. [M2°]. Formed by reduction of the ethyl ether of oxyquinone C₆H₃(OEt)₃ with SO₂. Colourless prisms. Sublimes in fine plates. V. sol. water, alcohol, and ether, m. sol. benzene. Fe₂Cl₃ gives a dark-brown colouration.

Tri-ethyl ether C₆H₃(OEt)₃. [84°]. Formed by ethylation of the preceding body. Long white glistening needles; v. g. sol. alcohol and ether, insol. water; volatile with steam. This body is identical with that obtained from secoculetin, which is therefore a derivative of

***o*-tri-oxy-benzene** (Will. a. Pukall, *B.* 20, 1133; Herzig a. Zeisel, *M.* 10, 150).

Isomerides are described as PHENOLGLUCIN and PHENOLALLOL.

***a*-Tetra-oxy-benzene** $C_6H_2(OH)_4$ [1:2:4:5]. [α . 218°]. Formed by reducing di-oxy-quinone with $SnCl_2$ (Nietzki, *B.* 21, 2377): Colourless plates, v. s. sol. water, alcohol, and ether. Its aqueous solution rapidly turns brown, and its alkaline solution is oxidised by air or by $FeCl_3$ to di-oxy-quinone.

Acetyl derivative $C_6H_2(OAc)_4$. [217°]. Colourless plates.

Di-methyl ether $C_6H_2(OH)_2(OMe)_2$ [1:4:2:5]. [166°]. Formed by reducing $C_6H_2O_2(OMe)_2$ with stannous chloride (Nietzki a. Reehberg, *B.* 23, 1217). Colourless plates.

Di-ethyl ether $C_6H_2(OH)_2(OEt)_2$ [1:4:2:5]. [188°]. Got in like manner. Colourless needles (from hot water). Yields $C_6H_2O_2(OEt)_2$ on oxidation. Acetic anhydride forms the compound $C_6H_2(OAc)_2(OEt)_2$. [148°].

Tetra-ethyl ether $C_6H_2(OH)_2(OEt)_4$. [148°]. Formed from $C_6H_2(OH)_2(OEt)_2$, alcoholic $NaOEt$ and $EtBr$ at 100° (Nietzki, *B.* 23, 1214). Colourless plates, smelling like anise. May be sublimed.

***u*-Tetra-oxy-benzene. Di-methyl ether** $C_6H_2(OH)_2(OMe)_2$ [1:4:3:5]. [158°]. Formed by reducing the corresponding $C_6H_2O_2(OMe)_2$ with Zn and $HClAq$, with $SnCl_2$, or with SO_2 (Hofmann, *B.* 8, 67; 11, 332; Will, *B.* 21, 609). Needles, reconverted into the quinone by $FeCl_3$. $HOAc$ forms an acetyl derivative [133°] which forms a green solution in H_2SO_4 . Ac_2O forms an acetyl derivative [128°] which does not give a green solution in H_2SO_4 (H). Benzoyl chloride yields $C_6H_2(OMe)_2(OBz)_2$ [245°], v. sl. sol. alcohol.

Tri-methyl ether $C_6H_2(OH)(OMe)_3$. [146°]. Formed, together with the tetra-methyl ether by the action of methyl iodide and KOH on the di-methyl ether. Needles (from alcohol).

Tetra-methyl ether $C_6H_2(OMe)_4$. [47°]. [271°]. Plates (from ether). Yields $C_6Br_2(OMe)_2$. [78°].

***c*-Tetra-oxy-benzene. Di-methyl ether** $C_6H_2(OH)_2(OMe)_2$. **Di-methyl-apionol**. [106°]. [298°]. Formed by heating apionic acid $C_6H_2O_2(OMe)_2CO_2H$ with alcoholic potash, at 180° (Ciamician a. Silber, *B.* 22, 119, 2482; 23, 2291). Insol. water, sol. alcohol, ether, and benzene. Its solution in KOH becomes brownish-red. Ferric chloride gives a violet-black colour. Lead acetate gives a gelatinous pp. $AgNO_3$ forms minute needles, quickly turning black. Yields a crystalline acetyl derivative [141°].

Tetra-methyl ether $C_6H_2(OMe)_4$ [1:2:3:4]. [81°]. White needles, v. sol. ether.

Hexa-oxy-benzene $C_6(OH)_6$ (so-called '*tri-hydrocarboxylic acid*' of Lerch). Long nearly colourless needles. Soluble in hot water, slightly soluble in cold water, alcohol, ether, and benzene.

Formation.—1. By the action of dilute HCl upon freshly prepared carbonic-oxide potassium. 2. By reduction of tri-quinone C_6O_3 with stannous chloride.

Properties.—Reduces $AgNO_3$ in the cold. Is oxidised by HNO_3 to benzene-tri-quinone. Gives a violet colouration with $FeCl_3$. The solution in aqueous Na_2CO_3 is readily oxidised by the air to tetra-oxy-quinone $C_6(OH)_4O_2$. By distillation with zinc-dust it gives benzene and diphenyl. By evaporation in an open dish with dilute KOH it yields croconic acid $C_6H_2O_4$.

Salt $C_6(OK)_6$. Formed by combination of CO with K at 80°, occurring as a by-product in the preparation of K (Liebig, *A.* 11, 182; Brodie, *A.* 113, 358; Lerch, *A.* 121, 20). Grey mass, becoming explosive on exposure to air.

Hexa-oxy-benzene derivative $C_6(OAc)_6$: [203°]; small colourless prisms; sl. sol. hot acetic acid, nearly insol. alcohol, ether, and benzene (Nietzki a. Benckiser, *B.* 18, 505, 1833).

OXY-BENZENE CARBOXYLIC ACID v. Oxy-BENZOIC ACID.

Oxy-benzene dicarboxylic acid v. Oxy-PHTHALIC, Oxy-ISOPHTHALIC, and Oxy-TEREPHTHALIC ACIDS.

Tri-oxy-benzene carboxylic acid v. GALLOIC ACID.

Tri-oxy-benzene tri-carboxylic acid PHENOLGLUCIN TRICARBOXYLIC ACID.

Di-oxy-benzene tetra-carboxylic acid v. HYDROQUINONE TETRA-CARBOXYLIC ACID.

DI-OXY-BENZENE-DIQUINONE v. DI-OXY-DIQUINONE.

OXY-BENZENE SULPHONIC ACID PHENOL SULPHONIC ACID.

Di-oxy-benzene sulphonic acid $C_6H_2(OH)_2SO_3H$. [280°]. Formed by heating phenol ' β '-disulphonic acid with potash at 240° (Senhofer, *J.* 1879, 749). Crystallises from water in needles (containing aq). Coloured violet by $FeCl_3$. — BaA , 79a. — ZnA , 279a. — PbA , 89a; long thin plates.

Isomerides. HYDROQUINONE, PYROCATECHIN, and RESORCIN SULPHONIC ACIDS.

OXY-BENZENYL-AMIDO-PHENYL MERCAPTAN C_6H_4NSO &c. $C_6H_4\langle\begin{smallmatrix} N \\ S \end{smallmatrix}\rangle C_6H_4OH$.

[129°]. Formed by heating salicylic aldehyde with *o*-amido-phenyl-mercaptan (Hofmann, *B.* 13, 1237). Needles. — $B'HCl$. — Platinochloride $B'H_2PtCl_6$: pp.

***o*-OXY-BENZENYL-AMIDOXIM**

$C_6H_4(OH).C(NO)H.NH_2$. **Salicyenyl-amidoxim**. [99°]. Formed from $C_6H_4(OH).CS.NH_2$, hydroxylamine hydrochloride, and Na_2CO_3Aq (Spilker, *B.* 22, 274). Colourless needles, v. sol. alcohol and ether, m. sol. hot water. Gives a greenish pp. with $CuSO_4$ and a mirror with $AgNO_3$.

Reactions.—1. Ac_2O forms the acetyl derivative and, on further digestion, the azoxim

$C_6H_4(OH).C\langle\begin{smallmatrix} N \\ O \end{smallmatrix}\rangle OMe$ [77°] which yields an acetyl derivative [74°].—2. Concentrated sulphuric acid at 150° yields the sulphonic acid $C_6H_4(SO_3H)(OH).C(NO)H.NH_2$, v. sl. sol. cold water, insol. alcohol. — 3. $ClCO.Et$ yields $C_6H_4(OH).C(NH_2).NO.CO.Et$ [96°] (Miller, *B.* 23, 2799).—4. **Succinic anhydride** forms, on melting, the azoxim $C_6H_4(OH).C(NO)H.C_6H_4.CO_2H$ [117°].—5. **Potassium cyanate** and HCl yield $C_6H_4(OH).C(NO)H.NH.CO.NH_2$ [148°]. — 6.

Phenyl cyanate forms by direct combination $C_6H_5(OH).C(NOH).NH.CO.NHPh$ [119°].

Salts.— $BHCl$. [173°]. V. s. sol. water.— $B'H_2PtCl_6$.— $Na_2C_6H_4N_2O_8$.— $Na_2O.H_2N_2O_8$.

Acetyl derivative
 $C_6H_5(OH).C(NOAc).NH_2$. [117°]. White plates, al. sol. water.

Di-acetyl derivative. Formed from the Na salt and $AcCl$. Crystalline.

Benzoyl derivative
 $C_6H_5(OH).C(NOBS).NH_2$. [173°]. Needles, v. sol. ether. Yields $C_6H_5(OH).C \begin{smallmatrix} N.O \\ > N \end{smallmatrix} > CPh$ [128°], which forms a benzoyl derivative [120°].

Di-benzoyl derivative
 $C_6H_5(OBS).C(NOBS).NH_2$. [127°]. Formed from the amidoxim, $NaOEt$, and $BzCl$ in ether. Indistinct crystals.

Ethyl ether $C_6H_5(OH).C(NOEt).NH_2$. (278°). Formed from the amidoxim, alcoholic $NaOEt$, and EtH . Oil. By HCl and $NaNO_2$ it is converted into $C_6H_5(OH).C(NOEt)Cl$ (234°).

Methyl derivative
 $C_6H_5(OMe).C(NOH).NH_2$. [123°]. Formed from $C_6H_5(OMe).CN$ and alcoholic hydroxylamine (Miller, B. 22, 2791). Needles (from hot water). Yields $BHCl$ [168°]. With Ac_2O it yields

$C_6H_5(OMe).C \begin{smallmatrix} N.O \\ > N \end{smallmatrix} > CMe$ [88°]. Aldehyde forms

$C_6H_5(OMe).C \begin{smallmatrix} N.O \\ > NH \end{smallmatrix} > CMe$ [127.5°]. $ClCO_2Et$ forms $C_6H_5(OMe).C(NH_2).NO.CO_2Et$ [120°], which on heating becomes $C_6H_5(OMe).C \begin{smallmatrix} N.O \\ > NH \end{smallmatrix} > CO$ [203°].

Methyl-acetyl derivative
 $C_6H_5(OMe).C(NOAc).NH_2$. [106°]. Formed from the oxim and $AcCl$ in chloroform. Prisms.

Methyl-benzoyl derivative
 $C_6H_5(OMe).C(NOBS).NH_2$. [148°]. White granules, v. sol. alcohol.

Methyl-ethyl derivative
 $C_6H_5(OMe).C(NOEt).NH_2$. [52°]. Prisms, v. sol. alcohol.

Di-ethyl derivative
 $C_6H_5(OEt).C(NOEt).NH_2$. (195° at 160 mm.). Formed from the amidoxim, $NaOEt$, EtH , and alcohol. Oil, miscible with alcohol and ether.

m-Oxy-benzenyl-amidoxim
 $C_6H_4(OH).C(NH_2)(NOH)$. [71°]. Made by heating *m*-oxy-benzonitrile with hydroxylamine hydrochloride and Na_2CO_3 (Clemm, B. 24, 823). Groups of needles, v. sol. water.

Di-benzoyl derivative
 $C_6H_4(OBS).C(NH_2).NOBS$. [152.5°]. Crystals.

Acetyl derivative
 $C_6H_4(OH).C(NH_2).NOAc$. [90°]. Plates.

Di-ethyl ether $C_6H_4(OEt).C(NH_2).NOEt$ [109°]. Needles. *p*-Oxy-benzenyl-amidoxim. [158°]. Made in like manner (Krone, B. 24, 884.— $BHCl$. [179°].

Acetyl derivative. [122.5°].

Benzoyl derivative. [166°].

Di-benzoyl derivative. [186°].

Di-ethyl ether. [84°].

***o*-OXY-BENZENYL-*o*-PHENYLENE-DI-**

AMINE $C_6H_4 \begin{smallmatrix} NH \\ > N \end{smallmatrix} > C_6H_4.OH$. [228°]. Formed

by reducing the *o*-nitro-anilide of salicylic acid with tin and HCl (Hübner a. Menzies, B. 13, 489; A. 210, 846). Needles, v. sol. alcohol and

ether.— $BHCl$ aq.— $B'H_2SO_4$ aq: sparingly soluble needles.

***o*-OXY-BENZENYL-DI-UREA** $C_6H_4N_2O_8$, i.e. $C_6H_4(OH).CH(NH.CO.NH_2)_2$. Formed from salicylic aldehyde and aqueous urea (Schiff, A. 151, 199). Nodular groups of needles (containing aq.). V. sl. sol. water, sl. sol. alcohol, insol. ether.— $Cu(C_6H_4N_2O_8)_2$. Green pp.

Ethyl ether $C_6H_4(OEt).CH(NH_2.CO_2)_{2aq}$. Crystals.

By fusing salicylic aldehyde with urea there is formed $(C_6H_4(OH).CH)_2(NH_2.CO_2)_2$.

***p*-Oxy-benzenyl-di-urea**. *Methyl ether* $C_6H_4(OMe).CH(NH.CO.NH_2)_2$. Formed from anisic aldehyde, an aqueous solution of urea, and a little $MOAc$. Yellow plates.

DI-OXY-BENZIL. *Di-methyl derivative* $C_6H_4(OMe).CO.CO.C_6H_4(OMe)$. *Anisil*. [133°]. Formed by oxidising anisoin with alkaline copper solution (Boesler, B. 14, 527). Golden needles (from alcohol).

Hexa-oxy-benzil. ***Hexa-methyl derivative*** $C_6H_4(OMe).CO.CO.C_6H_4(OMe)_2$. [189°]. Formed by the action of sodium-amalgam on an alcoholic solution of the tri-methyl derivative of the amide of gallic acid (Marx, A. 266, 253). Satiny needles, coloured bluish-green by H_2SO_4 . ***p*-OXY-BENZIMIDO-FTHEE**. *Ethyl derivative* $C_6H_4(OEt).C(NH)(OEt)$. The hydrochloride is crystalline and is formed from $C_6H_4(OEt)CN$ and alcoholic HCl (Pinner, B. 23, 2953).

***o*-OXY-BENZOIC ACID** $C_6H_5O_3$, i.e. $C_6H_4(OH).CO_2H$. *Salicylic acid*. Mol. w. 138. [156°] (Hübner, A. 162, 74); [159° cor.] (Reisert, B. 23, 2244); [157° cor.] (Dunstan a. Bloch, P. 3 [3] 21, 429). S. -09 at 0° (Ost, J. pr. [2] 17, 230); -15 at 0°; -225 at 15°; -7-925 at 100° (Bourgoign, J. Pharm. Chim. [4] 30, 488; C. R. 87, 62); H.C. 734,990 (Berthelot a. Recoura, A. Ch. [6] 13, 320); 729,500 (Stohmann, J. pr. [2] 40, 129). H.F. 106,000 (Von Rechenberg); 135,500 (S.). Occurs in the blossoms of the meadow-sweet (*Spiraea ulmaria*) (Löwig a. Weidmann, P. 46, 88), and in the leaves and stems of *Tulipa*, *Yucca*, and *Hyacinthus* (Griffiths, C. J. Proc. 5, 122). Occurs as methyl ether in the oil of wintergreen (from *Gaultheria procumbens*) (Cahours, A. 48, 60; Hartley, C. J. 53, 664). Methyl salicylate constitutes the essential oils of *Gaultheria purcata* and *G. leucocarpa* (Köhler, B. 2, 246).

Formation.—1. By oxidation of *o*-oxy-benzyl alcohol (saligenin), and of *o*-oxy-benzoic aldehyde (salicylic aldehyde).—2. By potash-fusion from salicin, coumarin, indigo, *o*-resol (Barth, A. 154, 360), toluene *o*-sulphonic acid, *p*-chloro-toluene sulphonic acid (Vogt, Z. [2] 5, 577), and other bodies.—3. By heating cupric benzoate with water in sealed tubes for 3 hours at 180° (Smith, Am. 2, 338); cf. Etting, A. 53, 83).—4. From *o*-amido-benzoic acid by the diazo-reaction (Hübner a. Petermann, A. 149, 199; cf. Gerland, A. 86, 147).—5. Together with *p*-oxy-benzoic acid by heating phenol with $COCl_2$ and alcoholic potash (Tiemann a. Reimer, B. 9, 1285).—6. By oxidising *o*-tolyl sulphuric acid $C_6H_4MeO.SO_3H$ with alkaline $KMnO_4$ (Heymann a. Königs, B. 19, 708).—7. By heating C_6H_4ONa with sodium carbonate in a current of carbonic oxide at 200°: $PhONa + Na_2CO_3 + CO$

— $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Na} + \text{HCO}_2\text{Na}$ (Schroeder, *A.* 221, 41).—8. By oxidising toluene *o*-phosphonic acid with alkaline KMnO_4 (Heymann & Königs, *B.* 19, 8306).—9. By distilling sodium phenyl carbonate with NaOEt in a current of CO_2 (Hentschel, *J. pr.* [2] 27, 39).—10. By heating phenyl ethyl carbonate with NaOPh at 200° in a current of hydrogen, PhOEt being also formed. 11. Together with PhOEt by heating Ph_2CO_2 with NaOEt in a current of hydrogen (*H.*).

Preparation.—By passing CO_2 over sodium-phenol heated at 180° $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Na}$ being formed and phenol distilling over (Kolbe, *A.* 115, 201; *J. pr.* [2] 10, 93). CO_2 is first absorbed, and this can also take place at a lower temperature, and the resulting sodium phenyl carbonate $\text{C}_6\text{H}_5\text{O.CO}_2\text{Na}$ changes into the isomeric sodium salicylate $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Na}$. This change can take place at 130° . The sodium salicylate reacts upon excess of sodium phenol at 180° , setting free phenol, which distils over, leaving basic sodium salicylate behind $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Na} + \text{PhONa} = \text{PhOH} + \text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Na}$ (R. Schmitt, *J. pr.* [2] 81, 404; cf. Baumann, *B.* 11, 1910). Salicylic acid is set free by acidifying the basic sodium salicylate. By using a measured quantity of CO_2 , starting the operation at a low temperature and finishing it at 130° , the formation of basic sodium salicylate may be avoided, so that half the phenol may be saved.

Properties.—Colourless needles (from hot water) or monoclinic prisms (from alcohol). Sublimes at 200° . Volatile with steam. FeCl_3 colours its aqueous solution violet, the colour not being removed by acetic acid. Prevents ppn. of copper sulphate ($\frac{1}{2}$ mol.) by alkalis. With albuminoids it forms compounds containing about 14 p.c. of the acid (Farsky, *C. J.* 1877, 148). Bromine-water yields app. of $\text{C}_6\text{H}_4\text{Br}_2\text{O}$ in dilute aqueous solutions. Iodine and potash give a red powder $\text{C}_6\text{H}_3\text{I}(\text{OI})\text{CO}_2\text{K}$ (Messinger & Vortmann, *B.* 22, 2321). Antiseptic. Antirheumatic.

Reactions.—1. Split up into CO_2 and phenol when rapidly heated to 220° ; at 250° diphenylene-ketone oxide [174°] is formed (Klepl, *J. pr.* [2] 28, 217).—Cond. HClAq at 150° decomposes it in like manner (Graebe, *A.* 139, 143). Potash-fusion also gives phenol.—2. KMnO_4 oxidises it to formic acid and CO_2 .—*Chromic acid mixture* acts in like manner.—3. *Chlorine* forms chloroxy-benzoic and dichloroxy-benzoic acids.—4. *Iodine* and HIO_3 give mono-, di-, and tri-iodoxy-benzoic acids and tri-iodo-phenol.—5. *Nitrous acid* passed into its ethereal solution forms nitro- and diazo-oxy-benzoic acids (Goldberg, *J. pr.* [2] 19, 869).—6. PCl_5 forms $\text{C}_6\text{H}_4(\text{COCl})_2\text{O.PCl}_5$ (168° at 11 mm.). This compound is partially decomposed on distillation, yielding *o*-chloro-benzoyl chloride. Moist air converts it into $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2\text{O.PO}(\text{OH})_2$. Further treatment with PCl_5 at 170° forms $\text{C}_6\text{H}_4(\text{UOCl})_2\text{OPCl}_5$ (179° at 11 mm.) converted by water into $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2\text{OP}(\text{OH})_2$. Excess of PCl_5 forms $\text{C}_6\text{H}_4\text{Cl}_2\text{CCl}_2$ (Couper, *A.* 109, 870; Anschütz, *A.* 228, 314; 239, 314; Chassanovitch, *B.* 20, 1166).—7. PCl_5 forms $\text{C}_6\text{H}_4\text{ClPO}_2$, which may be $\text{C}_6\text{H}_4\text{CO}_2\text{O.PCl}_5$. It forms crystals [87°] (127° at 11 mm.), and is sol. ether, benzene, and CHCl_3 , but decomposed by water into sal-

icylic and phosphorous acids (Anschütz & Emery, *A.* 289, 301). It is converted by PCl_5 or free chlorine into $\text{C}_6\text{H}_4\text{Cl}_2\text{PO}_2$ (187° at 11 mm.), S.G. 1.537; whence water forms $\text{C}_6\text{H}_4(\text{OH})_2\text{PO}_2$ [142°]. The chloride $\text{C}_6\text{H}_4\text{ClPO}_2$ takes up bromine forming $\text{C}_6\text{H}_4\text{ClBr}_2\text{PO}_2$ (c. 187° at 12 mm.). 8. *Aniline* at 210° produces aniline, phenol, and $\text{C}_6\text{H}_4(\text{OH})\text{CONPh}$ (Limpricht, *B.* 22, 2906).—9. *Cyanamide* and alcohol at 100° form urea and *o*-oxy-benzoic ether.—10. *Benzamidine* forms a compound $\text{C}_{12}\text{H}_8\text{N}_4\text{O}$ (Pinner, *B.* 23, 8824).—11. *Glycerin* and gaseous HCl forms $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{OC}_2\text{H}_4\text{Cl}$ [44°], S.G. 1.331 (Göttig, *B.* 24, 508), whence sodic salicylate at 180° – 200° forms crystalline $\text{C}_6\text{H}_4(\text{O.CO}_2\text{C}_2\text{H}_4\text{OH})_2$ and $\text{CH}(\text{OBz})_2(\text{CH}_2)_3\text{OOC}_2\text{H}_4\text{OH}$ [95°] (Fritsch, *B.* 24, 779).—12. *Acetochlorohydrate* forms $\text{C}_{12}\text{H}_{16}\text{O}_4$ [185°], whence $\text{C}_{12}\text{H}_{16}(\text{OAc})_2\text{O}$ [111°] (Michael, *B.* 15, 1922).—13. *Phenol* and SnCl_4 at 120° yield *op*-di-oxy-benzophenone [144°] (Michael, *Am.* 5, 83).—14. *Resorcin* at 200° forms tri-oxy-benzophenone.—15. *Orcin* gives '(β)-oxy-methyl-xanthone' $\text{C}_6\text{H}_4\text{CO}_2\text{C}_6\text{H}_4\text{Me}(\text{OH})$ [285°] (Von Kostanecki & Nessler, *B.* 24, 1895).

16. *Phloroglucin* forms iso-euxanthone $\text{C}_6\text{H}_4\text{CO}_2\text{C}_6\text{H}_3(\text{OH})_2$ [247°].—17. When taken internally it is excreted as salicyluric acid or salicyl-glycocholic $\text{C}_6\text{H}_4\text{NO}_2$ (c. 160°) (Bertagnini, *Il Nuovo Cimento*, i. 363).—18. With camphor it forms a compound $\text{C}_{12}\text{H}_{16}\text{O}_2\text{C}_6\text{H}_4\text{O}$ [60°] (α) = + $27^\circ 8'$ (in dilute alcohol) (Léger, *C. R.* 111, 110).—19. $\text{K}_2\text{S}_2\text{O}_8$ (17 pts.) added to a solution of salicylic acid (10 pts.) and KOH (8 pts.) in water (25 pts.) forms the crystalline compound $\text{C}_6\text{H}_4(\text{CO}_2\text{K})_2\text{OSO}_3\text{K}$ (Baumann, *B.* 11, 1914).—20. A solution of salicylic acid and borax in water deposits crystals of $\text{C}_6\text{H}_4\text{NaBO}_3$, whence the corresponding salts NH_4A , KA , MgA , 10aq and CaA , 10aq (Jahns, *Ar. Ph.* [3] 12, 212).—21. *Chloral* at 140° forms $\text{C}_6\text{H}_4\text{CO}_2\text{OCH}_2\text{CCl}_3$ [124°] (Wallach, *A.* 193, 1).

Salts.— $\text{C}_6\text{H}_4(\text{ONa})\text{CO}_2\text{Na}$. With POCl_3 it gives di-phenylene-ketone-oxide $\text{C}_{12}\text{H}_8\text{O}_2$ [174°]. The normal salt $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Na}$ is converted by POCl_3 into an isomeric body [91°] (R. Richer, *J. pr.* [2] 23, 849; 28, 803).— NaHA . Large crystals, sol. alcohol (E. Hoffmann, *Ar. Ph.* [3] 12, 226).— KA . Decomposed at 210° into CO_2 , phenol, and disodium *p*-oxy-benzoate (Ost, *J. pr.* [2] 11, 892). In presence of excess of KOH the change does not take place. The Na salt does not give *p*-oxy-benzoic acid when heated alone or with NaOH , but when heated in a current of CO_2 at 300° it yields oxy-isophthalic and cxytrimesic acids.— NH_4A .— NH_4A . Small needles, sl. sol. cold water.— $\text{BaC}_6\text{H}_4\text{O}_2\text{aq}$. Needles, sl. sol. hot water.— SrA . 2aq .— CaA . 2aq . Octahedra, v. sol. water, sol. alcohol.— $\text{CaC}_6\text{H}_4\text{O}_2\text{aq}$. Crystalline powder, nearly insol. water.— MgA . 4aq .— ZnA . 3aq . S. 5 at 20° . Needles, sol. alcohol (Vulpinus, *Ar. Ph.* [3] 14; 239).— ZnA . 2aq (Marignac, *J.* 1855, 485).— CdA . aq .— $\text{Hg}_2\text{H}_2\text{O}$ (Lajoux & Grandval, *J. Ph.* [5] 20, 5).— HgA .— PbA . aq .— $\text{PbC}_6\text{H}_4\text{O}_2$.—Oxysalt: $\text{Pb}_2\text{O}_3(\text{C}_6\text{H}_4\text{O}_2)_2$.— TlA .— $\text{TiC}_6\text{H}_4\text{O}_2$.— BiOA . Insoluble powder got by adding sodium salicylate to a solution of bismuth nitrate in glycerin

(Wolff, Ph. [3] 14, 508).— AlA' : (Van der Velden, J. pr. [2] 15, 151).— FeA' : brown pp., quickly becoming violet.— MnA' , 2aq.— CuA' , 4aq: bluish-green needles, v. sol. water and alcohol.— $\text{CuC}_2\text{H}_3\text{O}_2$ aq. Insoluble.— $\text{CuK}_2(\text{C}_2\text{H}_3\text{O}_2)_4$ aq: green tables, v. sol. water.— $\text{CuBa}(\text{O}_2\text{C}_2\text{H}_3)_2$, 4aq (Pellizzari, G. 14, 365).— AgA' : monoclinic needles.

Methyl ether $\text{C}_2\text{H}_5(\text{OH})\text{CO}_2\text{Me}$. Mol. w. 152. (224° cor.). S.G. 1.197. S.V. 255.9 (Ramsay); 156.7 (Lossen, A. 254, 64). H.F. 129, 224 (Stohmann, J. pr. [2] 86, 353). Constitutes oil of wintergreen, oil of *Gaultheria punctata* and *leucocarpa*, and oil of birch (Köhler, B. 12, 246; Pettigrew, Ph. [3] 14, 167). POCl_3 yields $\text{C}_2\text{H}_5(\text{COCl})\text{OPOCl}_2$ (v. supra). Phenyl cyanate at 160° forms $\text{C}_2\text{H}_5(\text{CO}_2\text{Me})\text{OCONHP}$ [238°] (Snape, C. J. 47, 775). Hydroxylamine hydrochloride yields $\text{C}_2\text{H}_5(\text{OH})\text{CO}_2\text{NH}(\text{OH})$ [169°] (Jeaurenaud, B. 22, 1273). Benzamide forms, on heating, phenyl benzoate and a compound $\text{C}_{22}\text{H}_{25}\text{N}_3\text{O}$ [256° cor.] crystallising from chloroform in yellow needles (Guareschi, A. 171, 143). Forms the crystalline salts $\text{C}_2\text{H}_5(\text{OK})\text{CO}_2\text{Me}$ 4aq and BaA' aq.

Ethyl ether EtA' . (226°). H.F. 139, 252. Oil (Göttig, B. 9, 1473). With benzamidine hydrochloride it gives $(\text{C}_2\text{H}_5\text{O})_2\text{C}_2\text{H}_4\text{NO}$ [120°], benzamidine salicylate $\text{C}_2\text{H}_5\text{N}_2\text{O}_2$ [202°], and a compound $\text{C}_{21}\text{H}_{21}\text{N}_3\text{O}$ [246°], whence $\text{C}_{21}\text{H}_{21}\text{AcN}_3\text{O}$ [141°] (Pinner, B. 23, 2935).

Ethylene ether $\text{C}_2\text{H}_4\text{A}'$. [83°].

Propyl ether PrA' . (239°). S.G. 1.021. H.F. 147, 880.

Isocamyl ether $\text{C}_8\text{H}_{17}\text{A}'$. (270°).

Phenyl ether PhA' . Solol. [42°]. Formed by slowly adding POCl_3 (28 g.) to a mixture of salicylic acid (60 g.) with phenol (48 g.) at 135° (Seiffert, J. pr. [2] 31, 472). Anti-rheumatic. The yield is good (99 g.). Trimetric tablets (from alcohol, a:b:c = 963:1:697 (Léger), insol. water. Its alcoholic solution is coloured violet by FeCl_3 . Conc. NaOH forms solid $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Ph}$, but boiling NaOH aq saponifies it. When heated for a long time to boiling it gives CO_2 , phenol, and diphenylene ketone oxide. Dissolved in HOAc it is nitrated by HNO_3 to $\text{C}_6\text{H}_3(\text{NO}_2)_3(\text{OH})\text{CO}_2\text{Ph}$ [160°] and a di-nitro-compound [183°]. HNO_3 (S.G. 1.53) forms also $\text{C}_6\text{H}_3(\text{NO}_2)_3(\text{OH})\text{CO}_2\text{Ph}$ [100°] (Knebel, J. pr. [2] 42, 158).

Nitro-phenoxy-ethyl ether $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{O.C}_2\text{H}_5\text{A}'$. The o-isomeride [106°] yields an acetyl derivative [80°]. The p-isomeride crystallises from alcohol in needles [131°] (Wagner, J. pr. [2] 27, 215).

Tolyl ethers $\text{C}_6\text{H}_4\text{MeA}'$. The o-, m-, and p-compounds [35°], [74°], and [39°] are insol. water, sl. sol. alcohol (Nencki, C. R. 108, 254).

Methyl derivative $\text{C}_2\text{H}_5(\text{OMe})\text{CO}_2\text{H}$. [98.5°]. S.G. 1.1801. μ_s 1.5521. R_{20} 64.59 (Brühl), S. 5 at 20°. Formed by saponifying its methyl ether, which is formed from oil of Wintergreen, KOMe , and MeI (Cahours, A. 92, 815). Monoclinic tables (from water). Its aqueous solution is not coloured by FeCl_3 . Yields the salts BaA' , PhA' aq, and AgA' , and the ethers MeA' (238°), EtA' (235°) (Fölsing, B. 17, 486), and PhA' [59°] (Seiffert, J. pr. [2] 31, 474).

Ethyl derivative $\text{C}_2\text{H}_5(\text{OEt})\text{CO}_2\text{H}$. [19.4°]. Forms the salts CaA' , BaA' , PhA' 2aq,

CuA' , (OH) , and AgA' (Krant, A. 150, 1) and the ethers MeA' (245°) and EtA' (251°).

Isopropyl derivative $\text{C}_2\text{H}_5(\text{OPr})\text{CO}_2\text{H}$. Oil, forming the salts CaA' , 2aq, BaA' aq, and AgA' 4aq and the ether MeA' (250°).

Allyl derivative $\text{C}_2\text{H}_5(\text{OC}_2\text{H}_5)\text{CO}_2\text{H}$. [113°]. Forms the salt AgA' and the ether MeA' (245°) (Scichilone, C. 12, 449).

Ethylene derivative $\text{C}_2\text{H}_4(\text{O.C}_2\text{H}_5\text{CO}_2\text{H})_2$. [152°]. Formed by saponification of its ethyl ether EtA' [97°], which is itself got by heating $\text{C}_2\text{H}_5(\text{ONa})\text{CO}_2\text{Et}$ with ethylene bromide at 130°. Silky needles (from water) (Weddige, J. pr. [2] 21, 128).

Phenyl derivative $\text{C}_6\text{H}_5(\text{OPh})\text{CO}_2\text{H}$. [113°]. (355°). Formed by adding Na to $\text{C}_6\text{H}_5(\text{OH})\text{CO}_2\text{Ph}$ at 300° (Graebe, B. 21, 502), and also by the action of phenol on o-diazobenzole acid (Griess, B. 21, 982). Plates, v. sl. sol. hot water. Heated with conc. H_2SO_4 it yields diphenylene ketone oxide. Heating with baryta forms diphenyl oxide (254°). Bromine-water at 150° forms $\text{C}_6\text{H}_4\text{Br}_2\text{O.C}_6\text{H}_4\text{CO}_2\text{H}$ [176°], whence AgA' and EtA' [57°] (Arbenz, A. 25, 86). HNO_3 at 0° forms a di-nitro-derivative [153°], which gives the salts BaA' , 4aq, CaA' , 4aq, and AgA' , and the ethers MeA' [126°], EtA' [76°], and an amide [166°]. The phenyl derivative of salicylic acid forms the salts $\text{NH}_4\text{A}'$, KA' , CaA' , 2aq, BaA' aq, and AgA' , and the ether, MeA' and EtA' , boiling above 360°, and PhA' [109°].

Nitro-phenyl-ethylene derivative $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{O.C}_2\text{H}_4\text{CO}_2\text{H}$. The o-acid [142°-148°] forms a crystalline ether EtA' [c. 100°], and the p-acid [132°] forms a similar ether EtA' [81°] (Wagner, J. pr. [2] 27, 214). The o-acid yields on reduction an amido-acid [110°], forming $\text{C}_6\text{H}_3\text{NO}_2\text{HCl}$ [177°].

Benzyl derivative $\text{C}_6\text{H}_5\text{CH}_2\text{O.C}_2\text{H}_5\text{CO}_2\text{H}$. [75°]. Tables (Perkin, A. 148, 27).— AgA' .

Tolyl derivative. Occurs in natural salicylic acid (J. Williams, Ph. [3] 8, 785).

Acetyl derivative $\text{C}_2\text{H}_5(\text{OAc})\text{CO}_2\text{H}$. [118°]. Formed from the acid and AcCl (Kraut, A. 150, 9). Needles (from water), v. sl. sol. cold water. Hydrolysed by alkalis, but not by boiling water.

Benzoyl derivative $\text{C}_6\text{H}_5(\text{OBz})\text{CO}_2\text{H}$. The crystalline methyl ether MeA' is formed from methyl salicylate and BzCl (Gerhardt, A. Ch. [3] 45, 104).

Amide $\text{C}_2\text{H}_5(\text{OH})\text{CONH}_2$. [189°]. From the ethers and NH_3 aq (Limpricht, A. 98, 258). Formed by the action of AcCl on o-oxy-benzaloxim (Claisen a. Stock, B. 24, 138). Plates and tables. Gives saligenin on reduction with sodium amalgam (Hutchinson, C. J. 57, 957). With bromine-water it yields $\text{C}_6\text{H}_4\text{Br}_2(\text{OH})\text{CONH}_2$ [183°] (Spilker, B. 22, 2769). When heated in a current of HCl it forms $(\text{C}_2\text{H}_5(\text{OH})\text{CO})_2\text{NH}$ [199°], which yields $(\text{C}_2\text{H}_5\text{O})_2\text{NAg}$ and $(\text{C}_2\text{H}_5\text{NO}_2)_2\text{HCl}$.— AgA' : flocculent pp.

Benzoyl derivative of the amide $\text{C}_6\text{H}_5(\text{OBz})\text{CONH}_2$. [200°]. Needles, sl. sol. alcohol.

Cumyl derivative of amide [200°].

Methyl derivative of the amide $\text{C}_2\text{H}_5(\text{OMe})\text{CONH}_2$. [129°]. Prisms (from ether) (Grimaux, Bl. [2] 18, 26). The homologous ethyl derivative [110°] (Limpricht, A.

98, 264) and isopropyl derivative are crystalline.

Anilide $C_6H_5(OH).CONHPh$. [184°]. Prisms (from dilute alcohol) (Wanstrat, B. 6, 386; Kupferberg, J. pr. [2] 16, 442; Hübner a. Meusching, A. 210, 341). FeCl₃ colours its alcoholic solution violet. On heating with sulphur it forms $C_6H_5 \cdot \text{N} \cdot \text{C}_6H_5.OH$ [129°] (Hofmann, B. 18, 1237). Yields on nitration

$C_6H_5(NO_2)(OH).CONHPh$ [224°]. Forms the salts $KO_2C_6H_4NO_2$ and $TiCl_3H_4NO_2$.

Nitro-anilide $C_6H_5(OH).CO.NHC_6H_4NO_2$. The *o*-, *m*-, and *p*-varieties melt at 154°, 219°, and 230° respectively.

p-Toluide $C_6H_4(OH).NHC_6H_5$. [156°].

Piperidide $C_6H_5(OH).CO.NC_5H_{10}$. [142°]. Yellowish tables (Schotten, B. 21, 2252).

Hydroxylamide $C_6H_5(OH).CO.NH(OH)$. [169°]. Needles. Yield $Pb(C_6H_5NO_2)_2$ (Jeanrenaud, B. 22, 1270).

Anhydride $(C_6H_4CO)_2$. **Disalicylic acid**. Formed, together with salicylide, by the action of $POCl_3$ on dry sodium salicylate (Gerhardt, A. Ch. [3] 37, 822). Amorphous mass, v. sol. alcohol and ether. Gives no colour with FeCl₃. Dissolves unchanged in aqueous Na_2CO_3 . Boiling KOHAq converts it into salicylic acid. An anhydride $C_{12}H_8O_4$, is formed by heating sodium salicylate (3 pts.) with $POCl_3$ (1 pt.) at 150° (Kraut, A. 150, 13). It is insol. cold alcohol. A third anhydride $C_{12}H_8O_5$ is got by heating $C_6H_5(OAc).CO_2H$ at 200°–240° (Kraut). It is sol. alcohol, and softens at 70°.

Internal anhydride $C_6H_4O_2$ or $C_{10}H_6O_4$. $C_6H_5 \cdot \text{C} \cdot \text{C} \cdot C_6H_5$. **Salicylide**. [195°–260°].

Formed as above. Nodular groups of plates (from alcohol) (Schiff, A. 163, 220). Insol. water, sl. sol. alcohol. Not attacked by $AcCl$. Reconverted by potash into salicylic acid. A resinous anhydride $C_{12}H_8O_5$, accompanying salicylide is still less soluble in alcohol.

Nitrile $C_6H_5(OH).CN$. *o*-Cyanophenol. [98°]. Formed by the action of P_2O_5 or P_2S_5 on the amide, and also from $C_6H_5(OEt).CH:OH$ and Ac_2O (Miller, B. 22, 2771, 2797; Tiemann, B. 20, 3082; Meyer, B. 20, 3283; cf. Grimaux, B. [2] 13, 26; Ahrens, B. 20, 2953). Formed also from diazophenol chloride by Sandmeyer's reaction. In most of these preparations it is accompanied by a small quantity of a substance melting at 195°. Needles, v. sol. alcohol, m. sol. cold water. Coloured violet by FeCl₃. Gives a white crystalline pp. with bromine water. Gives a **methyl derivative** $C_6H_5(OMe).CN$ (256°), and an **ethyl derivative** $C_6H_5(OEt).CN$ (268°) which may be got from $C_6H_5(OEt)NH_2$ (Finner, B. 23, 2952). The **acetyl derivative** $C_6H_5(OAc).CN$ is an oil (253°) (Lach, B. 17, 1572) while the **benzoyl derivative** $C_6H_5(OBz).CN$ [148°] is crystalline (Limpricht, A. 99, 250; Henry, B. 3, 491).

Polynitrile $(C_6H_5(OH).CN)_n$. [296°–299°]. Obtained by heating the amide to 270° (L.) and as a by-product in preparing the nitrile (Miller, B. 22, 2798). Yellow needles, insol. alcohol, sl. sol. ether. Decomposed by HCl at 200° into CO_2 , phenol, and NH_3 .

m-Oxybenzoic acid $C_6H_4(OH).CO_2H$. [200°]. λ . 87 at 0° (Ost); 9 at 18° (Fittica, B. 11, 1208).

H.F. 111,000 (Von Rechenberg); 136,000 (Stebmann, J. pr. [2] 40, 129). H.C. 729,000.

Formation.—1. By the action of nitrous acid on amido-benzoic acid (Gerland, A. 91, 185; Graebe a. Schulzzen, A. 142, 350).—2. By fusing sulpho-benzoic acid with potash (Barth, A. 148, 30).—3. By potash-fusion from *m*-chloro-benzoic acid (Pembrey, A. 148, 222), *m*-cresol, and even benzoic acid (Farth, A. 154, 361; M. 3, 802).

Properties.—Nodular groups of needles (from water). May be distilled. V. sol. boiling water and alcohol. Volatile with steam. Blackens when quickly heated to 800°, but gives no phenol. When the acid (2 mols.) is heated with baryta (3 mols.) at 850° it forms no phenol unless the baryta is used in large excess (7 mols.) (Klepl, J. pr. [2] 27, 159). It tastes sweet. Its solutions are not coloured by FeCl₃. Iodine and KOHAq, followed by an acid, give a coffee-brown pp. (Messinger, B. 22, 2321). It is not acted upon by hydroxylamine.

Reactions.—1. Bromine (3 mols.) forms tribromo-*m*-oxy-benzoic acid, soluble in water (Werner, B. [2] 46, 276).—2. Sodium amalgam reduces it, in acid solution, to *m*-oxy-benzyl alcohol.—3. Conc. H_2SO_4 forms, on heating, several di-oxy-anthraquinones (*q. v.*). When benzoic acid is also present, the two oxy-anthraquinones are also formed.—4. Heated with cinamic acid and H_2SO_4 it yields anthracumarin $C_{14}H_8O_2$ [260°] (*v. CINNAMIC ACID, Reaction 14*).—5. By nitration with dilute nitric acid, which takes place extremely readily, it yields a mixture of three nitro-oxy-benzoic acids $C_6H_5(NO_2)(OH)CO_2H$ [4:3:1], [2:3:1], and [5:3:1] (Griess, B. 20, 403).—6. PCl_5 forms the chloride $C_6H_5(COCl).OPOCl_2$ of *m*-carboxy-phenyl-phosphoric acid (*q. v.*).—7. The K salt heated with $K_2S_2O_8$ forms $SO_3K.O.C_6H_4.CO_2K$ [220°–225°] (Baumann, B. 11, 1915).—8. When taken internally, it appears in the urine as oxybenzuroic acid $C_6H_5(OH).CO.NH.CH_2.CO_2H$, crystallising in needles (Baumann a. Herter, H. 1, 260).

Salts.— NH_4A' : needles, v. sol. cold water.— CaA'_2 8aq: m. sol. water.— BaA'_2 : gummy.— TiA' .— $Tl_2C_6H_4O_2$.— PbA'_2 .— CdA'_2 .— CuA'_2 aq: green needles.

Acetyl derivative $C_6H_5(OAc).CO_2H$. [127°].

Ethyl ether EtA' . [72°]. (282°). Tables (from water), nearly insol. cold water. Conc. $NaOHAq$ forms crystalline $C_6H_5(ONa).CO_2Et$.

Methyl derivative $C_6H_5(OMe).CO_2H$. [107°]. Formed from its methyl ether, and also by oxidising $CH_3.C_6H_4(OMe)$ with $KMnO_4$ (Oppenheim a. Pfaff, B. 8, 887). Formed also by the action of CO_2 and Na on $C_6H_5Br(OMe)$ (Körner, Bull. Acad. Belg. [2] 24, 155) and by boiling the sulphate of *m*-diazobenzoic acid with MeOH (Griess, B. 21, 979). White needles, v. sl. sol. cold water. It forms the salts CaA'_2 , aq and AgA' and the ether $C_6H_5(OMe)CO_2Me$ which is formed by heating *m*-oxybenzoic acid with KOH and MeI at 140°.

Ethyl derivative $C_6H_5(OEt).CO_2H$. [137°]. Formed from its ethyl ether $C_6H_5(OEt).CO_2Et$ (263°) (Heintz, A. 153, 331) or by boiling the sulphate of diazo-benzoic acid with alcohol (Fittica, B. 11, 1209; Griess, B. 21, 979). Needles. Yields CaA'_2 2aq, BaA'_2 2aq, and AgA' .

Allyl derivative $C_6H_5(CO_2H)_2.CO_2H$. [148°]. Colourless laminae. Its ethyl ether is a thick pungent oil (284°) (Sciobiline, G. 12, 449).

Phenyl derivative $C_6H_5(OPh)_2.CO_2H$. [145°]. Formed by the action of phenol on the sulphate of *m*-diazobenzoic acid (Griess, B. 21, 980). Needles, almost insol. hot water. Yields BaA' , 3' aq.

Amide $C_6H_5(OH).CONH_2$. [167°]. Formed from the ether and conc. NH_4Aq (Schölerud, J. pr. [2] 22, 290). Thin plates (from water), sol. alcohol and ether, insol. chloroform.

Anilide $C_6H_5(OH).CONHPh$. [155°]. Needles, insol. water (Kupferberg, J. pr. [2] 16, 442).

Nitrile $C_6H_5(OH).CN$. [82°]. Formed by the diazo-reaction from $C_6H_5(NH_2).CN$ by displacing NH_2 by OH (Griess, B. 8, 859) or from $C_6H_5(NH_2).OH$ by displacing amidogen by Cy (Ahrens, B. 20, 2953). Plates (from water) with intensely sweet taste. Its acetyl derivative $C_6H_5(OAc).CN$ [60°] is got by boiling *m*-oxybenzaloxim with Ac_2O (Clemm, B. 24, 827).

Anhydride $C_6H_4O_3$. Formed, together with an anhydride $C_6H_4O_3$, [165°] by the action of $POCl_3$ at 45° on *m*-oxybenzoic acid (Schiff, B. 15, 2588). Minute crystals, sol. boiling alcohol.

Tetra-hydrate $CH_2(CO_2CH_2)_2CH_2.CO_2H$.

Formed by warming the tetrahydrate of oxyterephthalic acid with water (Baeyer & Lutein, B. 22, 2183). Mixes with water. Forms the hygroscopic salt NaA' crystallising in slender needles. Yields an oxim $C_6H_5NO_2$ [170°] and a phenyl-hydrazide $C_6H_5N_2O_2$ [125°].

***p*-Oxy-benzoic acid** $C_6H_4(OH).CO_2H$. [213°]. S. 173 at 0° (Ost, J. pr. [2] 17, 230); -3 at 15° (Saytzeff). H.F. 113,000 (Von Rechenberg); 139,100 (Stohmann, J. pr. [2] 40, 130). H.C. 725,900.

Formation.—1. By heating anisic acid with conc. $HIAq$ at 130° for 12 hours (Saytzeff, A. 127, 129).—2. By the action of nitrous acid on *p*-amido-benzoic acid (G. Fischer, A. 127, 145).—3. By potash-fusion from *p*-sulpho-benzoic acid (Remsen, Z. [2] 7, 81; A. 178, 281), anethol (Ladenburg, A. Suppl. 3, 87), anisic acid (Barth, Sitz. W. 54 [2] 633), gum benzoin, acaroid resin (Hlasiwetz & Barth, A. 134, 265; 138, 61), tyrosine (Barth, A. 136, 110; Ost, J. pr. [2] 12, 159), carthamin (Malin, A. 136, 115), phloretic acid, *p*-cresol, and even benzoic acid (Barth, A. 152, 96; 154, 359; 164, 141; M. 3, 802).—3. By passing C_6H_5OK dissolved in boiling phenol, or, better, by heating C_6H_5OK in a current of CO_2 at 170°–210° (Kolbe, J. pr. [2] 8, 336; 10, 89, 451; 11, 24; Ost, J. pr. [2] 11, 385; Hartmann, J. pr. [2] 16, 35). At 130°–150° the product is salicylic acid.—4. The basic salt $C_6H_4(OK).CO_2K$ is formed, together with CO_2 and phenol, by heating potassium (but not sodium) salicylate at 220°. A mixture of salicylic acid (1 mol.) and excess of KOH (3 mols.) is not affected at 250°, but at 300° yields only K_2CO_3 and C_6H_5OK .—5. Together with a smaller quantity of salicylic acid by heating phenol with alcoholic potash (or soda) and CO_2 . The reaction takes place less quickly in aqueous solution (Tiemann & Reimer, B. 9, 1985; Hasse, B. 10, 2186).

Properties.—Monoclinic crystals (containing aq); $a:b:c = 1.370:1.102$; $\beta = 105^\circ 28'$. V. sol. hot water, alcohol, and ether, sl. sol. chloroform (unlike salicylic acid) and CS_2 (unlike benzoic acid). Split up at 220° into CO_2 and phenol. With iodine and potash it gives a pale-red pp., which becomes yellow on acidifying (Messinger & Vortmann, B. 22, 2311). Not attacked by hydroxylamine. With $FeCl_3$ it gives a yellow amorphous pp. Excess of bromine-water gives CO_2 and tri-bromo-phenol.

Reactions.—1. *p*-Oxy-benzoic acid (1 mol.) is converted by PCl_5 (1 mol.) into $C_6H_4Cl_2PO_2$, i.e. $C_6H_4(COCl)OPOCl_2$ (176° at 14 mm.). S.G. 1.542. This chloride shows the following reactions: (a) Water forms *p*-carboxy-phenyl-phosphoric acid $C_6H_4(CO_2H)OPO(OH)_2$, which forms plates [200°], v. sol. water, alcohol, and ether. It is not decomposed by boiling aqueous KOH , but water at 160° forms phosphoric acid and *p*-oxy-benzoic acid. (b) Distillation under atmospheric pressure somewhat decomposes it. (c) The chloride (1 mol.) heated with PCl_5 (1 mol.) at 160° forms *p*-chloro-benzoyl chloride, $C_6H_4Cl.COCl$ (Anschütz & Moore, A. 239, 342). 2. CO_2 distillation half of it splits up into phenol and CO_2 , the rest yields several anhydrides.—3. The K salt when distilled yields diphenylene oxide, diphenylene-ketone oxide, and phenol (Goldschmiedt, M. 4, 127).—4. Yields 50 or 60 p.c. of the theoretical amount of phenol on fusion with $NaOH$ (Barth & Schreder, B. 12, 1257).—5. The Na salt heated in a current of CO_2 at 290° yields salicylic acid (Kupferberg, J. pr. [2] 16, 424).—6. The Ca salt on dry distillation yields phenol, CO_2 , salicylic acid, oxydiphenylene-ketone oxide, diphenylene oxide, and diphenylene-ketone oxide.—7. H_2SO_4 at 100° forms $C_6H_4(OH)(SO_3H).CO_2H$ (Klepl, J. pr. [2] 28, 196).—8. The K salt heated with $K_2S_2O_8$ forms $C_6H_4(CO_2K).O.SO_3K$ (Baumann, B. 11, 1916).—9. Taken internally it appears in the urine as *p*-oxy-benzuric acid $C_6H_4NO_2$ (c. 223°).

Salts.— NaA' , 5aq: very soluble efflorescent plates. $Na_2C_6H_4O_3$.— KA' , 3aq: long efflorescent prisms. CaA' , 4aq: slender needles. BaA' , aq: flat needles. BaA' , 2aq: rhombohedra. $BaC_6H_4O_3$: sandy powder. TlA' .— CdA' , 4aq. CdA' , 6aq. ZnA' , 8aq. PbA' , 2aq. CuA' , 6aq. AgA' , 2aq.

Acetyl derivative $C_6H_4(OAc).CO_2H$. [185°]. By heating the acid with Ac_2O . Silvery plates (from $CHCl_3$).

Methyl ether MeA' . [117°]. (288°). H.F. 138,800. Formed from the acid, KOH , and MeI (Ladenburg & Fetz, A. 141, 250). Large tables (from ether), v. sl. sol. hot water.

Ethyl ether EtA' . [112–53° (G.); 116° (Hartmann)]. (298°). H.F. 147,690. Formed from the acid, alcohol, and HCl (Graebe & A. 139, 184). Crystalline. Yields solid $C_6H_4(ONa).CO_2Et$.

Phenyl ether PhA' . [176°]. Present in the volatile product of the destructive distillation of *p*-oxy-benzoic acid (Klepl, J. pr. [2] 28, 214). Tri-metric tablets (from chloroform). Saponified by cold $NaOHAq$. With alcohol and HCl it yields phenol and *p*-oxy-benzoic acid. The acetyl derivative $C_6H_4(OAc).CO_2Ph$ crystallises in long plates [84°].

Methyl derivative $C_6H_4(OMe).CO_2H$. **Anisic acid**. Mol. w. 152. [184°]p (275°–280°).

B. 04 at 18°. H.C.p. 895,200. H.F. 132,800 (Stohmann, *J. pr.* [2] 40, 181). Formed by oxidation of anise-camphor, and of oils of anise, fennel, and tarragon, being derived from the anethol contained therein (Cabrera, *A. Ch.* [3] 2, 287; 14, 483; 23, 351; 25, 21; 27, 439; Laurent, *Rev. scient.* 10, 6, 862; Gerhardt, *A. Ch.* [3] 7, 292; Ladenburg, *A.* 141, 241). Obtained also from its methyl ether, which is formed by heating *p*-oxy-benzoic acid (1 mol.) with KOH (2 mols.) and MeI (2 mols.) at 120° (Ladenburg). It is a product of the oxidation of chica (Erdmann, *J. pr.* 71, 198). It is also produced by oxidising $C_6H_5Me(OMe)$ (Körner, *Bl.* [2] 10, 468) and by boiling the sulphate of *p*-diazobenzonic acid with MeOH (Griess, *B.* 21, 979). Prepared by mixing basic potassium *p*-oxybenzoate (got by heating potassium salicylate at 220°, or by adding KOH to a solution of *p*-oxybenzoic acid) with a solution of K_2SO_4 and evaporating to dryness. The residue is treated with HCl, and the anisic acid separated from undecomposed *p*-oxybenzoic acid by solution in chloroform (E. v. Meyer and P. Richter, *J. pr.* [2] 32, 429). Monoclinic prisms, m. sol. hot water. Yields, on nitration, $C_6H_3(NO_2)(OMe)CO_2H$, $C_6H_3(NO_2)_2OMe$, and $C_6H_2(NO_2)_3OMe$. HIAq converts it into MeI and *p*-oxy-benzoic acid (Graebe, *A.* 139, 148). When taken internally it passes into the urine as anisuric acid (q. v.). $POCl_3$ forms the anhydride C_6H_4O [99°] (Pisani, *A.* 102, 284). PCl_5 forms crystalline $C_6H_4(OMe)COCl$. Forms the salts NH_4A' , KA' , NaA' , aq , NaA' , $5aq$, BaA' , $3aq$, SrA' , $2aq$, CaA' , aq , MgA' , $4aq$, PbA' , aq , ZnA' , $3aq$, CdA' , $3aq$, $Pb(OH)A'$, CrA' , $(OH)_2$, MnA' , $3aq$, CoA' , $3aq$, NiA' , $3aq$, CuA' , $3aq$, CuA' , (OH) , and AgA' (Borrelli, *G.* 15, 303). Its ethers are MeA' [47°], (255°) and EtA' (c. 253°). Its amide $C_6H_4(OMe)CONH_2$ [163°] is formed by the action of NH_3 on $C_6H_4(OMe)COCl$. It is also formed by passing cyanic acid vapour and dry HCl through C_6H_4OMe containing $AlCl_3$, and by the action of $ClCONH_2$ and $AlCl_3$ on C_6H_4OMe dissolved in CS_2 (Gattermann, *A.* 244, 62; *B.* 28, 1197). It crystallises from water in needles or plates. The anilide $C_6H_4(OMe)CONPhH$ [169°] is formed by the action of phenyl cyanate on anisole containing $AlCl_3$ (Leuchart and Schmidt, *B.* 18, 2338). The nitrile $C_6H_4(OMe)CN$, [62°], (254°), is formed by heating the amide alone or with PCl_5 (Henry, *Z.* [2] 6, 205; *B.* 2, 667), and by heating $C_6H_4(OMe)CH:NOH$ with $AcCl$ at 115° (Miller, *B.* 22, 2791). It crystallises in needles, v. sol. alcohol and ether. Hydroxylamine converts it into $C_6H_4(OMe)C(NH_2)NOH$ [123°].

Ethyl derivative $C_6H_4(OEt)CO_2H$ [195°]. Formed from its ether EtA' (275°) which is got from *p*-oxy-benzoic acid, KOH, and EtI (L. a. F.). Got also by oxidising the ethyl derivative of phloretic acid with chromic acid mixture (Körner and Corbetta, *B.* 7, 1781) and by boiling the sulphate of *p*-diazobenzonic acid with alcohol (Griess, *B.* 21, 980). Needles. Yields AgA' crystallising in needles. The amide $C_6H_4(OEt)CONH_2$ [202°] (G.), [206°] (P.), is formed by the action of cyanic acid or $ClCONH_2$ on C_6H_4OEt in presence of $AlCl_3$ (Gattermann, *A.* 244, 68; *B.* 23, 1197), and by adding $NaOHaq$ to *p*-ethoxy-benzamidide hydrochloride (Pinner, *B.* 23, 2954). The anilide $C_6H_4(OEt)CONPhH$ [170°] is formed by the action of phenyl cyanate

on phenolate in presence of $AlCl_3$ (L. a. S.). The nitrile $C_6H_4(OEt)CN$ [69°], (258°), is got from $C_6H_4(OEt)NH_2$ by Sandmeyer's reaction (Pinner, *B.* 23, 2958). It is volatile with steam.

Ethylene derivative. The amide $C_6H_4(OC_2H_4)CONH_2$, [280°] is formed by the action of $ClCONH_2$ on $C_6H_4(OPh)$, in CS_2 , in presence of $AlCl_3$ (Gattermann, *A.* 244, 69).

Allyl derivative $C_6H_4(OCH_2CH=CH_2)CO_2H$ [123°]. Formed from its ether EtA' [109°] (260°) which is got by heating *p*-oxy-benzoic ether with KOH and allyl iodide at 120° (Seichilone, *G.* 12, 451).

Phenyl derivative $C_6H_4(OPh)CO_2H$ [160°]. Obtained by the action of phenol on the sulphate of *p*-diazobenzonic acid (Griess, *B.* 21, 980), and also by the action of boiling alcoholic potash upon $C_6H_4(OPh)CO_2Ph$, a white sublimate [78°-78°] got by strongly heating *p*-oxybenzide in a current of hot CO_2 (Klepl, *J. pr.* [2] 28, 200).

Phenoxy-ethyl derivative $C_6H_4(OPh)OCH_2CH_2CO_2H$ [196°]. Satiny needles from alcohol (Wagner, *J. pr.* [2] 27, 227). Its ether EtA' [81°] is crystalline.

Nitro-phenoxy-ethyl derivative $C_6H_4(NO_2)OCH_2CH_2CO_2H$. The *o*-comp. [207°] forms an ether EtA' [103°] crystallising from alcohol in plates, and may be reduced to $C_6H_4(NH_2)OCH_2CH_2CO_2H$ [185°]. The *p*-isomeride [218°] forms a salt NaA' 3aq and an ether EtA' [131°] crystallising in minute needles.

Amide $C_6H_4(OH)CONH_2$ [162°]. Needles (containing aq). Forms the sodium compounds $C_6H_4(ONa)CONH_2$ and $C_6H_4(ONa)CONH_2Cl$ [206°]. Yields *p*-oxy-benzyl alcohol on reduction with sodium-amalgam (Hutchinson, *B.* 24, 175).

Anilide $C_6H_4(OH)CONPhH$ [197°]. Yellow plates, v. sol. alcohol.

Piperidide $C_6H_4(OH)CONC_4H_9$ [210°]. Prisms (from dilute alcohol) (Schotten, *B.* 21, 2254).

Nitrile $C_6H_4(OH)CN$. *p*-Cyanophenol. [118°]. Formed by distilling ammonium-*p*-oxybenzoate with P_2O_5 (Hartmann). Formed also from *p*-amido-phenol by Sandmeyer's reaction (Ahrens, *B.* 20, 2954), and by the action of NH_3 on *p*-oxy-benzide. Thin trimetric laminæ; $a:b:c = 855:1:2808$. M. sol. hot water. Forms an acetyl derivative $C_6H_4(OAc)CN$, [57°], (266°), crystallising in white needles.

Anhydride C_6H_4O . *p*-Oxybenzide. Left in the retort after distilling *p*-oxy-benzoic acid below 350° (Klepl, *J. pr.* [2] 25, 525; 28, 194). White amorphous powder, blackening at 350° without melting. Insol. alcohol. Reconverted into *p*-oxy-benzoic acid by boiling $KOHaq$; not attacked by NH_3 or Na_2CO_3aq . Heated in sealed tubes with PCl_5 it yields $C_6H_4Cl_2CCl_4$.

Anhydride C_6H_4O . *o*. $CO_2H.C_6H_4.O.CO.C_6H_4.OH$. [261°]. A product of the action of heat on *p*-oxy-benzoic acid. Minute needles, v. sol. alcohol. Quickly converted by alkalis into *p*-oxy-benzoic acid. Yields NaA' , BaA' , and C_6H_4OAcO , [217°].

Anhydride C_6H_4O . *i*. $CO_2H.C_6H_4.O.CO.C_6H_4.OH$. [280°]. S. (alcohol) 45 in the cold, 1.8 at 78°. Accompanies *p*-oxybenzide. Crystalline powder. Con-

verted by potash into *p*-oxy-benzoic acid. Gives NaA' and $C_6H_5O_2$, [280°].

Anhydride $C_{10}H_6O_4$. Formed from the acid and $POCl_3$ (Schiff, B. 15, 2588). Insoluble powder.

Di-oxy-benzoic acid $C_6H_4O_2$, *i.e.* $C_6H_3(OH)_2CO_2H$ [8:2:1]. *Pyrocatechin carboxylic acid*. Mol. w. 154. [204°]. Formed in small quantity, together with protocatechuic acid by heating pyrocatechin (1 pt.) with ammonium carbonate (4 pts.) and water (5 pts.) at 140° (A. Miller, C. J. 41, 398; A. 220, 116). Formed also by heating iodosalicylic acid with KOH. Needles (containing 2aq), m. sol. water, v. sol. alcohol and ether. $FeCl_3$ gives a blue colour not destroyed by excess, but changed to violet-red by Na_2CO_3 . Gives a flocculent pp. with $Pb(OAc)_2$.—BaA', 6aq; prisms. (S. of BaA') 1 at 18°.

Isomeride v. Protocatechuic acid.

s-Di-oxy-benzoic acid $C_6H_3(OH)_2CO_2H$ [5:3:1]. (a) *Resorcylic acid*. [222°] (B. a. S.); [233°] (B.). Formed by fusing *s*-di-sulpho-benzoic acid with potash (Barth a. Senhofer, A. 159, 222). Formed also from bromo-sulpho-benzoic acid by potash fusion (Böttger, B. 8, 374). Prisms or needles (containing 1½ aq), m. sol. cold water. Gives no colour with $FeCl_3$. Conc. H_2SO_4 at 140° forms a red solution whence water ppts. green flakes of anthrachrysone $C_{14}H_8O_3$. Yields resorcin on fusion with potash.

Salts.—NaA', 4aq.—BaA', 4aq.—CuA', 6½ aq.—CdA', 4½ aq.—AgA', crystalline pp.

Ethyl ether EtA'. [below 100°]. Prisms.

Methyl ether of the methyl derivative $C_6H_3(OH)(OMe)CO_2Me$. (316°). Formed, together with $C_6H_3(OMe)_2CO_2Me$ from *s*-di-oxy-benzoic acid, MeI, and KOH (Meyer, M. 8, 430). Oil.

Di-methyl derivative $C_6H_3(OMe)_2CO_2H$. [176°]. Formed by methylation and also by oxidation of the di-methyl ether of orcin (Tiemann a. Streng, B. 14, 2002). White needles, ol. hot water.—AgA': crystalline pp.

Methyl ether of the di-methyl derivative $C_6H_3(OMe)_3CO_2Me$. [81°]. (298°). Four-sided prisms (M.).

Di-ethyl derivative $C_6H_3(OEt)_2CO_2H$. 88°. Prisms. Forms oily $C_6H_3(OEt)_2CO_2Et$.

Di-oxy-benzoic acid $C_6H_3(OH)_2CO_2H$ [4:2:1]. (β) *Resorcylic acid*. [205°]. S. 26 at 17°. H.F. 188, 100. H.C.p. 676, 900 (Stohmann, J. pr. [2] 40, 132).

Formation.—1. From $C_6H_3Me(OH)(SO_3H)$ [12:4] by heating with KOH (Ascher, A. 161, 11). 2. From toluene disulphonic acid by oxidation and potash-fusion (Blomstrand, B. 5, 1088; Fahlberg, Am. 2, 196).—3. By oxidation of its aldehyde or of umbelliferone (Tiemann a. Reimer, B. 12, 997; 13, 2388).—4. By heating resorcin with ammonium carbonate and water at 125° (Brunner a. Senhofer, B. 13, 2356).—5. By oxidising morin with HNO_3 (Benedikt a. Hazura, M. 5, 170).—6. By warming $C_6H_3(OH)_2CS_2H$ with acid (Lippmann, M. 9, 806; 10, 620).

Preparation.—20 pts. of resorcin are heated for an hour and a half with a solution of 100 pts. of potassium or sodium hydric carbonate in 200 grms. of water; the yield is 80 p.c. of the resorcin (Bistraycki a. Kostanecki, B. 18, 1984).

Properties.—Crystallises from ether in needles (containing 8aq) and from water in

prisms (containing 1½ aq, 1½ aq, or 2½ aq). Decomposes at its melting-point into CO_2 and resorcin. $FeCl_3$ colours its solution dark rose-red. Bleaching-powder gives a violet tint, changing to brown. By treating the acid with $C_6H_3(OH)_2CO_2H$ [5:2:1] and Ac_2O and distilling the product there is formed euxanthone $[4 \frac{1}{2}] C_6H_3(OH) < \begin{smallmatrix} CO \\ O \end{smallmatrix} > [C_6H_3(OH)]_2^1$ 5] (Graebe, B. 22, 1405).

Salts.—KA', aq.—BaA', 4aq.—BaA', 7aq.—CuA', 8aq.—AgA'.

o-Methyl derivative

$C_6H_3(OH)(OMe)CO_2H$ [4:2:1]. Formed by oxidising $C_6H_3(OAc)(OMe)CHO$ (Tiemann a. Parisius, B. 13, 2354). Crystalline. Sol. water. Gives no colour with $FeCl_3$.

p-Methyl derivative

$C_6H_3(OMe)(OH)CO_2H$ [4:2:1]. [154°]. S. 1 at 20°. Got by partial methylation of the acid (T. a. P.), and also by the action of CO_2 on $C_6H_3(ONa)(OMe)$ at 215° (Körner a. Bertoni, Rendiconti d. R. Istit. Lombardo, 13, 741; B. 14, 847). Needles, sol. hot water. Gives a reddish-violet colour with $FeCl_3$.—NaA', 9aq.—KA',—BaA', 4aq.—PbA', aq.

Di-methyl derivative $C_6H_3(OMe)_2CO_2H$ [108°]. Got by methylation (T. a. P.) and by oxidation of the di-methyl derivative of (β) methyl-umbellie acid (Pechmann, B. 16, 2126; 17, 2133). Needles, sl. sol. cold water.—CuA',—PbA',—AgA': white pp.

Di-ethyl derivative $C_6H_3(OEt)_2CO_2H$. [99°]. Got from the aldehyde (Tiemann a. Lewy, B. 10, 2215).

Di-oxy-benzoic acid $C_6H_3(OH)_2CO_2H$ [6:2:1]. [9. 147°]. Formed, together with the (4, 2, 1)-isomeride, by heating resorcin with ammonium carbonate and water (B. a. S.). Obtained also from the methyl derivative of the nitrile (Lobry de Bruyn, R. T. C. 2, 205). Needles. Decomposes on fusion into CO_2 and resorcin. $FeCl_3$ gives a violet colour, changed to blue by excess. Bromine-water gives tri-bromo-resorcin.—BaA', aq.—CuA', 8aq.—AgA': crystalline pp.

Di-methyl derivative $C_6H_3(OMe)_2CO_2H$. [179°]. Tables (from alcohol).

Nitrile of the di-methyl derivative $C_6H_3(OMe)_2CN$. [118°]. (310°). Formed from $C_6H_3(OMe)(NO_2)CN$ by boiling with MeOH and KOH. Crystals. Gives with nitric acid a nitro-compound $C_6H_3Me_2O_2$ [111°]. The corresponding nitriles $C_6H_3(OMe)(OEt)CN$ [66°] and $C_6H_3(OEt)_2CN$ [122°] crystallise from alcohol, the former in trimetric crystals, *a:b:c* = 796:1:1.65, and the latter in di-metric crystals *a:c* = 1:565 (Lobry de Bruyn, R. T. C. 3, 883).

Di-oxy-benzoic acid $C_6H_3(OH)_2CO_2H$ [5:2:1]. *Gentisic acid*. *Hydroquinone carboxylic acid*. [197°].

Formation.—1. By fusing iodo-salicylic acid [196°] or bromo-salicylic acid with KOH (Lautemann, A. 120, 299; Bakowsky a. Leppert, B. 8, 789; Miller, A. 220, 124; P. F. Fankland, C. J. 37, 750).—2. From oxy-amido-benzoic acid (Goldberg, J. pr. [2], 19, 371).—3. By fusing gentisin with potash (Hlasiwetz a. Habermann, A. 175, 66; Tiemann a. Miller, B. 14, 1988).—4. By digesting $KHCO_3$ (4 pts.) with hydroquinone (1 pt.) and water (4 pts.) (Senhofer a. Sarlay, M. 2, 448).

Properties.—Needles or prisms, v. sol. water, alcohol, and ether. FeCl_3 colours its solution blue. Reduces Fehling's solution on heating. Split up on distillation into CO_2 and hydroquinone. Benzamidine forms a compound [266°] (Pinner, B. 23, 2939).

Salts.— NaA' , 5 $\frac{1}{2}$ aq. Deliquescent prisms. — KA' aq.— CaA' , 7aq.— BaA' , s. 40° at 18°.— PbA' , 2aq.— $\text{C}_6\text{H}_5\text{A}'$, 4 $\frac{1}{2}$ aq.

Ethyl ether EtA'. [75°]. Crystals.

m-Methyl derivative

$\text{C}_6\text{H}_4(\text{OH})(\text{OMe})\text{CO}_2\text{H}$ [2:5:1]. [142°]. S. 17 at 10°; 9 at 100°. Formed by oxidising the acetyl-methyl derivative of gentisic aldehyde $\text{C}_6\text{H}_3(\text{OAc})(\text{OMe})\text{CHO}$ with KMnO_4 , and saponifying the product (Tiemann a. Miller, C. 14, 1997). Formed also by the action of CO_2 at 225° on $\text{C}_6\text{H}_4(\text{ONa})(\text{OMe})$ (Körner a. Berton), needles. Its solution is coloured blue by FeCl_3 .

Di-methyl derivative $\text{C}_6\text{H}_3(\text{OMe})_2\text{CO}_2\text{H}$. [140°]. Formed by oxidising $\text{C}_6\text{H}_3(\text{OMe})_2\text{CHO}$. Needles.— AgA' : small white needles.

Tri-oxy-benzoic acid v. Gallic acid.

Tri-oxy-benzoic acid $\text{C}_6\text{H}_2(\text{OH})_3\text{CO}_2\text{H}$.

Tri-methyl derivative $\text{C}_6\text{H}_2(\text{OMe})_3\text{CO}_2\text{H}$. [109°]. Formed by oxidising the tri-methyl derivative of ascleutic acid (Will, B. 16, 2113).

Tri-ethyl derivative $\text{C}_6\text{H}_2(\text{OEt})_3\text{CO}_2\text{H}$. [134°]. Formed by oxidation of the tri-ethyl derivative of (a)- or (b)- ascleutic acid with KMnO_4 (W.). Slender needles.

Tri-oxy-benzoic acid

$\text{C}_6\text{H}_2(\text{OH})_3\text{CO}_2\text{H}$ [4:3:2:1]. Mol. w. 170. [206°–220°]. S. 13 at 12.5°. H.F. 231,300. H.C.p. 633,700 (Stohmann). Formed, together with pyrogallol dicarboxylic acid, by heating pyrogallol with ammonium carbonate (Senhofer a. Brunner, M. 1, 474; Kostanecki, B. 18, 3202; Schiff, A. 245, 35). Needles (containing $\frac{1}{2}$ aq), sol. alcohol. FeCl_3 colours its dilute solution violet. Bleaching-powder and nitric acid do the same. Lime and baryta-water gives a bluish pp. Reduces ammoniacal AgNO_3 in the cold. H_2SO_4 does not form rufigallic acid (difference from gallic acid). POCl_3 forms an acid $\text{C}_6\text{H}_2\text{O}_7$, greatly resembling tannin. It is an astringent yellow powder and gives $\text{Ba}(\text{C}_6\text{H}_2\text{O}_7)_2$ and $\text{C}_6\text{H}_2\text{Ac}_3\text{O}_7$.

Salts.— KA' aq.— NaA' 2aq.— BaA' 5aq.— CaA' 4 $\frac{1}{2}$ aq.— $\text{Pb}(\text{C}_6\text{H}_2\text{O}_7)_2$ 1 $\frac{1}{2}$ aq: white flocculent pp.

Methyl ether $\text{C}_6\text{H}_2(\text{OH})_2\text{CO}_2\text{Me}$. [152°]. Needles (containing 2 $\frac{1}{2}$ aq).

Tri-methyl derivative $\text{C}_6\text{H}_2(\text{OMe})_3\text{CO}_2\text{H}$. [99°]. Crystals (Will, B. 21, 2020).

Methyl ether of the tri-methyl derivative $\text{C}_6\text{H}_2(\text{OMe})_4\text{CO}_2\text{Me}$. (281°). Oil.

Ethyl ether EtA'. [102°]. Colourless crystals (containing aq) melting at 86° when hydrated. FeCl_3 gives a greenish-brown colour (Will a. Albrecht, B. 17, 2100; Schiff, A. 245, 40).

Tri-ethyl derivative $\text{C}_6\text{H}_2(\text{OEt})_3\text{CO}_2\text{H}$. [100°]. Formed by oxidation of the tri-ethyl derivative of daphnetic acid with KMnO_4 (Will, B. 17, 1088, 2099). Silky needles, sl. sol. cold water.— BaA' .— AgA' . Gives $\text{C}_6\text{H}_2(\text{OEt})_3$, when heated.

Ethyl ether of the tri-ethyl derivative $\text{C}_6\text{H}_2(\text{OEt})_4\text{CO}_2\text{Et}$. Oil. Formed by ethylating the acid.

Tri-oxy-benzoic acid $\text{C}_6\text{H}_2(\text{OH})_3\text{CO}_2\text{H}$. **Phloroglucin carboxylic acid.** Formed by boiling phloroglucin (1 pt.) with KHCO_3 (4 pts.) and water (4 pts.) (Will a. Albrecht, B. 17, 2103; 18, 1323). Colourless crystals (containing aq), sol. alcohol and ether. Split up by boiling water into CO_2 and phloroglucin. FeCl_3 gives a transient blue colour. Alcohol and HCl yields CO_2 and the diethyl ether of phloroglucin. On heating with POCl_3 it gives an isomeric of tannin, which is, however, not very astringent and gives no colour with FeCl_3 (Schiff).

Tri-methyl derivative?

$\text{C}_6\text{H}_2(\text{OMe})_3\text{CO}_2\text{H}$. **Asaronic acid.** [144°]. (300°). Formed by oxidising asarone with boiling aqueous KMnO_4 (Butlerow a. Rizza, J. R. 19, 3). Needles. On distillation with lime it yields $\text{C}_6\text{H}_2(\text{OMe})_3$ (246°).

References.—BROMO-, BROMO-NITRO-, CHLORO-, CHLORO-iodo-, CHLORO-NITRO-, IODO-, and IODO-NITRO-OXY-BENZOIC ACIDS.

O-OXY-BENZOIC ALDEHYDE $\text{C}_6\text{H}_3\text{O}_2$, i.e. $\text{C}_6\text{H}_3(\text{OH})_2\text{CHO}$. **Salicylic aldehyde.** Mol. w. 122. [c. –20°]. (196.5°). S.G. $\frac{1}{4}$ 1.1671 (Brühl). μ_d 1.5960. R_{m} 54.53. Occurs in the blossom of the meadow-sweet (*Spiraea ulmaria*) (Etting, A. 35, 247) and in *Crepis fatida* (Wicke, A. 91, 374).

Formation.—1. By oxidation of saligenin or salicin (Piria, A. 30, 153).—2. In the products of the dry distillation of quipic acid (Wöhler, A. 51, 146).—3. By mixing chloroform (15 pts.), phenol (10 pts.), NaOH (20 pts.), and water (35 pts.), at 60°, boiling with inverted condenser, distilling off excess of chloroform, acidifying and distilling with steam (Tiemann a. Reimer, B. 9, 423, 824).

Properties.—Liquid, with pleasant odour, v. sl. sol. water, miscible with alcohol and ether. Turns red in air. Added to 'Vermouth' and other liqueurs. Produces epileptic convulsions in dogs (Laborde a. Magnan, J. Ph. [5] 16, 448). FeCl_3 colours its aqueous solution violet. Does not reduce Fehling's solution. Combines with KHSO_4 forming $\text{C}_6\text{H}_3\text{O}_2(\text{OH})\text{SO}_3\text{K}$ crystallising in needles (Bertagnini, A. 85, 193).

Reactions.—1. Yields o-oxy-benzoic acid on oxidation.—2. **Sodium-amalgam** reduces it to saligenin (Beilstein a. Reinecke, A. 123, 979).—3. Heated with ZnCl_2 and HOAc it forms red amorphous $\text{C}_6\text{H}_3\text{O}_2$, insol. water, which dissolves in alkalis with violet-red colour but is insol. acids. It yields amorphous $\text{C}_6\text{H}_3\text{AcO}_2$ (Bourquin, B. 17, 502).—4. Ac_2O (2 mols.) at 180° forms $\text{C}_6\text{H}_3(\text{OAc})_2\text{CH}(\text{OAc})_2$ [100°] which splits up on distillation into Ac_2O and $\text{C}_6\text{H}_3(\text{OAc})_2\text{CHO}$ (255°). On treatment with soda the compound $\text{C}_6\text{H}_3(\text{OAc})_2\text{CH}(\text{OAc})_2$ yields $\text{C}_6\text{H}_3(\text{OH})_2\text{CH}(\text{OAc})_2$ [101°] (Darbier, C. R. 90, 37).—5. **Acetyl chloride** yields 'disalicyl aldehyde' $\text{C}_6\text{H}_3\text{O}_4$ [130°]. The same body is formed by the action of BzCl , succinyl chloride, and PCl_5 (Cahours, A. 78, 223; Perkin, A. 145, 209; Zwenger, A. Suppl. 8, 42). It crystallises from alcohol in long needles, and is converted by Br in HOAc to $\text{C}_6\text{H}_3\text{Br}_2\text{O}_4$ [166°], together with $\text{C}_6\text{H}_3\text{Br}(\text{OH})\text{CHO}$ [105°] and $\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{CHO}$ [83°] (Bradley, B. 22, 1134).—6. **Zinc dust** and HOAc form $\text{C}_6\text{H}_3\text{O}_4$ crystallising in needles [82°] (Tiemann, B. 19, 857).—7. **Bromine** forms $\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{CHO}$ and $\text{C}_6\text{H}_3\text{Br}_2\text{O}$ (Werner, B. [2] 46, 277).—8. **Cyanogen**

bromide forms crystalline C_6H_5NO , (Cahours, A. 106, 822).—9. Ammonium cyanide and alcohol form $C_6H_5N_3O$, [148°] and $C_6H_5N_3O$, [168°] (Haarmann, B. 6, 841).—10. Sodium succinate and acetic anhydride form, on heating, dicoumarin

—11. Thioglycollic acid and zinc chloride form $C_6H_5(OH).CH(SCH_2.CO_2H)_2$, [148°] (Bongartz, B. 21, 480).—12. Gaseous or alcoholic ammonia gives rise to 'hydrosalicylamide'

which forms yellow crystals [145°] (Ettling, A. 85, 249; Herzfeld, B. 10, 1270). It is insol. water, sl. sol. cold alcohol, and is decomposed by boiling acids and alkalis into NH_3 and o-oxybenzoic aldehyde. It is converted by alcoholic ammonium sulphide into crystalline $C_{12}H_{15}N_2SO_2$

and by HCl and HCl into two isomeric crystalline 'hydrocyanalides' $C_{12}H_{15}N_2O_2$ (Beilstein, A. 136, 170). Hydrosalicylamide forms the salts

—13. Methylamine gas forms $C_6H_5(OH).CH:NMe$ an oil (229°), resolved by acids and alkalis into NH_3 and salicylic aldehyde (Dennstedt a. Zimmermann, B. 21, 1553).—14. Ethylamine

forms the homologous C_6H_5NO (237°).—15. Aniline forms $C_6H_5(OH).CH:NPh$ [50-5°]

(Schischkoff, C. R. 45, 272; Emmerich, A. 211, 344). It forms a crystalline compound with HCl.

p-Nitro-aniline forms the compound $C_6H_5(NO_2).N:CH.C_6H_5OH$ [115°].

Di-methyl-p-phenylene diamine forms in like manner $C_6H_5(OH).CH:N.C_6H_4NMe_2$, [134°]

(Nuth, B. 18, 573). Di-methyl-aniline and $ZnCl_2$ form $C_6H_5(OH).CH(C_6H_4NMe_2)_2$.

—17. Benzidine in weak alcoholic solution forms the compound $C_{12}H_{16}(N:CH.C_6H_5.OH)_2$, crystallising from benzene in colourless needles [260°].

Di-amido-ditolyl forms the homologous $C_{14}H_{18}(N:CH.C_6H_4.OH)_2$ [202°] (Schiff a. Vanni, A. 258, 374).—18.

Ethylene-diamine forms $C_6H_5(N:CH.C_6H_5.OH)_2$ [126°] (Mason, B. 20, 271).—19. Ethylene-aniline

forms $C_6H_5(NPh)_2.CH.C_6H_5.OH$ [116°] (Moos, B. 20, 733).—20. p-Toluidine gives rise to $C_6H_5Me.N:CH.C_6H_5.OH$ [100°] (Jaillard, Z. 1865, 440).

—21. Phenylene-m-diamine hydrochloride yields $C_6H_5(N:CH.C_6H_4.OH)_2$ forming crystalline BH_3PtCl_2 (Schiff, A. 253, 329). Tolylene-m-diamine yields homologous $C_6H_5(N:CH.C_6H_4.OH)_2$

[109°].—22. Tolylene-o-diamine forms a compound $C_{10}H_{12}N_2O_2$ [106°-110°] and azurine $C_{10}H_{12}N_2O_2$ [250-5°] which exhibits blue fluorescence in alkaline solution (Ladenburg, B. 11, 596).

—23. (8) Naphthylamine reacts forming $C_{10}H_7N:CH.C_6H_5.OH$ [121°] (Emmerich, A. 241, 351).—24. Urea in aqueous solution gives crystalline $(NH_2.CO.NH).CH.C_6H_5.OH$ whence

—25. m-Amido-benzoic acid forms the compound $CO_2H.C_6H_4.N:CH.C_6H_5.OH$ [190°] which forms an amide [186°] (Schiff, A. 210, 114).

Salts.— $KC_6H_5O_2$ aq.: yellow tables. S. (alcohol) 5 (Michael, Am. J. 309).— $NaHA$, aq.— BaA , 2aq.— $Pb(OH)A$.— CuA : brownish-green crystals.

Acetyl derivative $C_6H_5(OAc).CHO$. [37°]. (253°). Formed from $C_6H_5(ONa).CHO$ in ether by adding Ac_2O (Perkin, A. 148, 208; 150, 82).

Butyryl derivative $C_6H_5(O_2C_3H_7).CHO$. (260°-270°). Oil.

Benzoyl derivative $C_6H_5(O_2C_6H_5).CHO$. Oil. Glucoside v. HELIX.

Methyl derivative $C_6H_5(OMe).CHO$. [35°]. (238°). Formed from $C_6H_5(ONa).CHO$, MeI, and MeOH (Perkin, A. 145, 302; C. J. 55, 550; Vöswinkel, B. 15, 2024). Thick prisms,

nearly insol. water, m. sol. alcohol, v. sol. ether. Alcoholic HCl and H_2S form the (8)-thioaldehyde $C_6H_5S_2O$, [224°].

While at -10° the (a)-isomeric $C_6H_5S_2O$, [157°] is formed (Baumann a. Fromm, B. 24, 1446). Alcohol and colourless ammonium sulphide yield $C_6H_5S_2O$, [85°-88°].

When KCy followed by HCl is added to the ethereal solution of $C_6H_5(OMe).CHO$ there is formed $C_6H_5(OMe).CH(OH).CN$ [71°]

whence alcoholic NH_3 at 70° yields $(C_6H_5(OMe).CHCy)_2NH$ [123°], and alcoholic aniline at 100° gives $C_6H_5(OMe).CH(NHPh).CN$ [61°] (V.).

Ethylene-diamine at 120° forms crystalline $C_6H_5(N:CH.C_6H_5.OMe)_2$.

Ethyl derivative $C_6H_5(OEt).CHO$. [7°]. (249°) (Göttig, B. 10, 8; Perkin, A. 145, 306; C. J. 55, 551).

With alcoholic NH_3 it yields crystalline $N_2(C_6H_5CH_2CH_2.OEt)_2$, which is converted by heating at 165° into an amorphous isomeride, yielding crystalline BH_3PtCl_2 (Perkin, A. 145, 308).

Forms with aniline oily $C_6H_5(OEt).CH:NPh$ (Schiff, A. 150, 195), and with ethyl-aniline oily $C_6H_5(OEt).CH(NEtPh)_2$.

Aqueous urea forms crystalline $C_6H_5N_3O_2$ aq.

Isobutyl derivative $C_6H_5(OC_4H_9).CHO$. (265°). Oil (Baumann a. Fromm, B. 24, 1448).

Alcoholic HCl and H_2S form the (a) [142°] and (8) [163°] isomerides $C_6H_5S_2O$. Ammonium sulphide yields $C_6H_5S_2O$, [52°-56°].

Benzyl derivative $C_6H_5(OC_6H_5).CHO$. [46°].

Derivatives of o-oxy-benzoic ortho-aldehyde

$C_6H_5(OH).CH(OAc)_2$, [104°]. Formed from the aldehyde and Ac_2O at 150° (Perkin, A. 146, 371°). Tables (from alcohol).

$C_6H_5(OAc).CH(OAc)_2$, [101°]. Needles (from alcohol).

$C_6H_5(OMe).CH(OAc)_2$, [75°]. Prisms.

$C_6H_5(OEt).CH(OAc)_2$, [89°]. Prisms, insol. Aq.

Oxim $C_6H_5(OH).CH:NOH$, [57°]. White crystals, resolved by warm HCl aq into its components (Lach, B. 16, 1782; 17, 1572).

Ac_2O converts it into acetyl-o-oxy-benzonitrile. The compound $NHPh.CO.O.C_6H_5.CH:NO.CO.NHPh$ [115°] is formed by phenyl cyanate (Goldschmidt a. Schulthess, B. 22, 3102).— $BHCl_2$ — $C_6H_5(ON_2).CH:NO.Na$ 3aq. small pearly scales.

Derivatives of the oxim

$C_6H_5(OMe).CH:NOH$, [92°]. With phenyl cyanate it yields $C_6H_5(OMe).CH:NO.CO.NHPh$ [105°] (Goldschmidt, B. 23, 2741).

$C_6H_5(OMe).CH:NO.Me$. Oil.

$C_6H_5(OEt).CH:NOEt$. Oil.

$C_6H_5(OH).CH:NOC_2H_5$. The (a)-isomeride [43°] is formed from o-oxy-benzoic aldehyde and (a)-benzyl-hydroxylamine, while the (8)-isomeride [100°] is obtained by using (8)-benzyl-hydroxylamine (Beckmann, B. 23, 3310).

Phenyl hydrazone $C_6H_5(OH).CH:N.NHPh$. [143°]. Colourless needles (from alcohol) (Fischer, B. 17, 575; Rossing, B. 17, 3003).

Yields $C_6H_5(OAc).CH:N.NaC_6H_5$ [133°], which forms a crystalline dibromide converted by boiling alcohol into $C_6H_5Br_2(OAc).CH:N.NHPh$ [168°], which

yields $\text{C}_6\text{H}_4\text{Br}(\text{OAc})\text{CH}(\text{N})\text{AcPh}$ [168°] and $\text{C}_6\text{H}_4\text{Br}(\text{OH})\text{CH}(\text{N})\text{HPh}$ [148°].

m-Oxy-benzoic aldehyde $\text{C}_6\text{H}_4(\text{OH})\text{CHO}$ [8:1]. [104°]. (240°). Formed by reduction of *m*-oxy-benzoic acid in acid solution by sodium-amalgam (Sandmann, B. 14, 969). Obtained also by oxidation and diazotisation from *m*-amido-cinnamic acid (Luff, B. 22, 294). Prepared from *m*-nitro-benzoic aldehyde by reduction and treatment of the amide compound with nitrous acid (Tiemann & Ludwig, B. 15, 2041). Needles (from water). Excess of Ac_2O forms $\text{C}_6\text{H}_4(\text{OAc})\text{CH}(\text{OAc})$, crystallising in plates [76°].

Acetyl derivative $\text{C}_6\text{H}_4(\text{OAc})\text{CHO}$. (263°). Formed from the K salt and Ac_2O . Oil.

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CHO}$. (230°).

Oxim $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{N})\text{OH}$. [17-5°]. Soft silky needles (Clemm, B. 24, 826).

Phenyl hydrazide

$\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{N})\text{HPh}$. [131°]. Prisms, v. sol. alcohol (Rudolph, A. 248, 102).

p-Oxy-benzoic aldehyde $\text{C}_6\text{H}_4(\text{OH})\text{CHO}$ [4:1]. [115°]. Formed by heating its methyl derivative with HClAq at 200° (Bücking, B. 9, 527). Prepared, together with the *o*-isomeride, by the action of chloroform and alkalis on phenol (Tiemann & Reimer, B. 9, 824; 10, 63).

Properties.—Needles (from water), v. sol. alcohol and ether. Not volatile with steam. FeCl_3 gives a slight violet tint to its aqueous solution. Reduces ammoniacal AgNO_3 . With NaHSO_3 it forms the crystalline compound $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{OH})\text{SO}_3\text{Na}$ [112°].

Reactions.—1. *Potash-fusion* forms *p*-oxy-benzoic acid.—2. *Sodium-amalgam* and water reduce it to $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{C}_6\text{H}_4(\text{OH})$ [222°] and the isomeric di-oxy-isohydrobenzoin [198°] which forms the crystalline derivative $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{C}_6\text{H}_4\text{OAc})_2$ [192°] (Herzfeld, B. 10, 1268; Tiemann, B. 19, 354).—3. *Bromine* ppts. $\text{C}_6\text{H}_4\text{Br}_2(\text{OH})\text{CHO}$ [181°] and, when in excess, forms $\text{C}_6\text{H}_4\text{Br}_2\text{O}$ (Werner, B. 2, 46, 278).—4. Boiling Ac_2O (3 pts.) forms $\text{C}_6\text{H}_4(\text{OAc})\text{CH}(\text{OAc})_2$ [94°] (Tiemann & Herzfeld, B. 10, 64; Barbier, C. R. 90, 37).—5. Heating with HOAc and ZnCl_2 forms red amorphous $\text{C}_6\text{H}_4\text{O}_3$, which gives a violet solution in alkalis (Bourquin, P. 17, 503).—6. *Ammonia* forms an oily compound.—7. *Aniline* in ethereal solution forms $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{NPh})$ [191°].—8. *p*-Toluidine yields the compound $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{N})\text{C}_6\text{H}_4$ [213°].—9. *Di-methyl-phenylene-diamine* gives rise to crystalline $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{N})\text{C}_6\text{H}_4\text{NMe}_2$, decomposing at 240° (Nuth, B. 18, 574).—10. (8)-*Naphthylamine* forms $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{N})\text{C}_{10}\text{H}_7$ [220°] (Emmerich, A. 241, 356).

Acetyl derivative $\text{C}_6\text{H}_4(\text{OAc})\text{CHO}$. (260°) (Barbier, B. 2, 33, 52; C. R. 90, 37); (265°) (T. a. H.). Formed from $\text{C}_6\text{H}_4(\text{OK})\text{CHO}$ and Ac_2O . Oil.

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CHO}$. *Anisic aldehyde*. Mol. w. 136. (248°). S.G. 1.128. Formed, together with anisic acid, by oxidation of anethol or oil of anise (Cahours, A. Ch. [8] 14, 484; 23, 354; Rossel, A. 151, 25). Formed also by distilling calcium anisate with calcium formate (Piria, A. 100, 105) and by methylation of *p*-oxy-benzoic aldehyde (T. a. H.). Oil, forming with H_2SO_4 a crimson solution, turned violet on heating. With NaHSO_3 it forms crystalline $\text{C}_6\text{H}_4\text{NaSO}_3\text{aq}$ (Bertagnini, A. 84,

368). *Reactions*.—1. *Alcoholic potash* forms the corresponding alcohol and acid.—2. *Alcoholic HCl* and H_2S form $\text{C}_6\text{H}_4\text{S}_2\text{O}$ [188°] and, at -10°, an isomeride [127°] (Baumann & Fromm, B. 24, 1442). *Alcoholic H₂S* forms the thio-aldehyde [75°-77°], while *alcoholic ammonium sulphide* forms a polymeric thioanisic aldehyde [92°] and the disulphide $(\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2)_2\text{S}_2$ (B. a. F.).—3. *Sodium-amalgam* forms two 'hydrazinoins' $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{C}_6\text{H}_4\text{OMe}$, melting at 172° and 125° (Samossadsky, Z. 1867, 678; 1868, 643). Boiling dilute H_2SO_4 converts the isomeride [172°] into $\text{C}_6\text{H}_4\text{O}_3$ [95°] (Rossel, A. 151, 36). *Zinc* and hydrochloric acid form $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{OH}$ and crystalline $\text{C}_6\text{H}_4\text{O}_3$ [215°].—4. *Aqueous HOY* (28 p.c.) forms $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{C}_6\text{H}_4\text{OMe}$ [68°], which yields $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{OH})\text{CO}_2\text{H}$ on saponification (Tiemann & Friedländer, B. 14, 1976).—5. *Alcoholic KOY* yields anisoin.—6. *Succinic acid* yields $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{CH}_2\text{CO}_2\text{H})_2$ and $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{CH}_2\text{CO}_2\text{H})\text{CH}(\text{C}_6\text{H}_4\text{OMe})\text{CO}_2\text{H}$ (Fittig, B. 18, 2523).—7. *Di-thio-glycol* gives rise to $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{S}_2\text{C}_6\text{H}_4)_2$ [65°] (Fasbender, B. 21, 1476).—8. *Aqueous ammonia* produces 'anishydramide' $\text{N}_2(\text{CH}_2\text{C}_6\text{H}_4\text{OMe})_2$ [120°] converted at 170° into crystalline 'anisine' $\text{C}_6\text{H}_4\text{N}_2\text{O}_3$, which forms the salts B^+HCl^- and $\text{B}^+\text{H}_2\text{PtCl}_6^-$ (Bertagnini, A. 88, 128).—9. *Ethylene-diamine* forms $\text{C}_6\text{H}_4(\text{N})\text{CH}_2\text{C}_6\text{H}_4(\text{N})$ [111°] (Mason, B. 30, 272).—10. *Aniline* gives rise to crystalline $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{NPh})$.—11. *Ethylene-aniline* forms $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{NPh})\text{C}_2\text{H}_4$ [164°] (Moos, B. 20, 733).—12. *o*-Toluidine reacts, forming $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})\text{C}_6\text{H}_4\text{Me}$ [32°]. The *p*-isomeride [92°] is also crystalline (Steinhart, A. 241, 340).—13. *Phenylene-di-methyl-p-diamine* forms $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})\text{C}_6\text{H}_4\text{NMe}_2$ [148°] (S.; cf. Nuth, B. 18, 574).—14. *Toluidine* reacts, forming hydrochloride forms $\text{C}_6\text{H}_4\text{N}_2\text{O}_3$ [152°-156°] (Ladenburg, B. 11, 1660).—15. (8)-*Naphthylamine* yields $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})\text{C}_{10}\text{H}_7$ [98°].—16. *Acetamide* at 120°-180° forms $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{NHAc})_2$ [180°] (Schuster, A. 154, 80).—17. *Benzamide* gives $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{NHAc})_2$ [192°].—18. *Urea* forms crystalline $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{NH.CO.NH}_2)_2$ and $\text{C}_6\text{H}_4\text{N}_2\text{O}_3$.—19. *Carbamic ether* and HCl give $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{NH.CO.Et})_2$ [172°].

Oxim $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{N})\text{OH}$. [65°] Formed from the aldehyde and hydroxylamine (Lach, B. 16, 1785). White needles. Converted by Ac_2O and by AcCl into $\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{N})\text{OAc}$ and $\text{C}_6\text{H}_4(\text{ONa})\text{CH}(\text{N})\text{ONa} \cdot 3\text{aq}$.

Methyl derivative of the oxim

$\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})\text{OH}$. (a) - Isomeride [62°]. Formed from anisic aldehyde and hydroxylamine (Westenberger, B. 16, 2993; Goldschmidt & Polonowska, B. 20, 2407; 22, 3102; 23, 2163; Beckmann, B. 21, 768; 23, 1687; Miller, B. 22, 2790). White plates, m. sol. hot water. Tastes sweet. Heated with Ac_2O and HCl it gives $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})$ [81°]. NaOEt and benzyl chloride yield the (a)-benzyl ether [46-6°]. Ac_2O forms $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})\text{OAc}$ [48°] (Hantzsch, B. 24, 41), crystallising in prisms. Phenyl cyanate forms $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})\text{CO.NHPh}$ [82°]. NaOMe and MeI form $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{N})\text{OMe}$ [43°] (246°).—(b) - Isomeride [130°]. Ppd. as hydrochloride by passing HCl into an ethereal solution of the (a)-isomeride. Slender needles. Has no taste. With NaOEt and benzyl chloride it yields the

(*p*)-benzyl ether [167°]. The acetyl derivative $C_6H_5(OMe).CH(OAc).CHO$ is converted by Na_2CO_3 into the nitrile [60°].

Phenyl-hydrazide $C_6H_5(OH).CH:N.NHPh$ [178°]. Tufts of needles (Rudolph, A. 248, 102).

Phenyl-hydrazide of the methyl derivative $C_6H_5(OMe).CH:N.NHPh$. [121°].

o-Di-oxy-benzoic aldehyde. *m*-Methyl derivative $C_6H_5(OMe)(OH).CHO$ [3:2:1]. [264°-268°]. Formed, together with vanillin, by the action of chloroform on a solution of guaiacol in dilute NaOH (Tiemann & Koppe, B. 14, 2020). Liquid, volatile with steam; sol. alcohol, ether, and benzene, nearly insol. water. $FeCl_3$ colours its alcoholic solution violet.

Di-oxy-benzoic aldehyde $C_6H_5(OH).CHO$ [4:2:1]. (*o*)-Resorcylic aldehyde. [135°]. Formed by the action of chloroform and $NaCH_3$ on resorcin (Tiemann & Lewy, B. 10, 2230). Needles (from water), v. sol. water, alcohol, and ether. $FeCl_3$ colours the aqueous solution reddish-brown. Readily resinsified.

o-Methyl derivative $C_6H_5(OH)(OMe).CHO$ [4:2:1]. [158°]. Formed, together with the *p*-methyl derivative, by the action of chloroform and NaOH on $C_6H_5(OH)(OMe)$ [1:3] (Tiemann & Parrisius, B. 13, 2365). Colourless plates, sl. sol. water. Gives white crystalline pps. with ammoniacal $AgNO_3$, and with $Pb(OAc)_2$. Yields an acetyl derivative $C_6H_5(OAc)(OMe).CHO$ [86°].

p-Methyl derivative $C_6H_5(OMe)(OH).CHO$ [4:2:1]. [63°]. Formed by partial methylation of the aldehyde. White plates, nearly insol. water. $FeCl_3$ colours its alcoholic solution reddish-violet. Gives pps. with ammoniacal $AgNO_3$ and lead acetate.

Di-methyl derivative $C_6H_5(OMe)_2.OHO$. [68°]. Obtained by methylation, and also by oxidation of the di-methyl derivatives of (*a*) and (*β*) umbellic acid with $KMnO_4$ (Will, B. 16, 2117). Needles (from dilute alcohol).

Di-ethyl derivative. [72°].

Phenyl hydrazide $C_6H_5(OH).CH:N.NHPh$. [c. 158°]. Needles (Rudolph, A. 248, 104).

Di-oxy-benzoic aldehyde

$C_6H_5(OH)_2.OHO$ [5:2:1]. *Gentisic aldehyde*. [99°]. Formed by boiling hydroquinone with chloroform and aqueous (18 p.c.) NaOH (Tiemann & Müller, B. 14, 1986). Flat yellow needles, v. sol. water. Gives a transient blue colour with $FeCl_3$. Yields gentisic acid on fusion with potash. Alcoholic aniline forms the anillide $C_6H_5(OH).CH:NPh$, crystallising in red needles.

m-Methyl derivative

$C_6H_5(OMe)(OH).CHO$ [5:2:1]. [4°]. [248°]. V.D. ($H=1$) 75.7 (obs.). Formed from methyl hydroquinone $C_6H_5(OH)(OMe)$ [1:4], chloroform, and NaOH. Liquid, volatile with steam, sl. sol. water. Gives a bluish-green colour with $FeCl_3$. Aniline yields $C_6H_5(OMe)(OH).CH:NPh$ [59°], crystallising in red needles. The acetyl derivative $C_6H_5(OMe)(OAc).CHO$ [68°] crystallises in needles, and is converted by boiling Ac_2O into $C_6H_5(OMe)(OAc).CH(OAc)$.

Di-methyl derivative $C_6H_5(OMe)_2.OHO$. [61°]. Volatile with steam. Not coloured by $FeCl_3$.

m-Ethyl derivative

$C_6H_5(OEt)(OH).CHO$ [5:2:1]. [58°]. [280°]. Yellow prisms, nearly insol. water. Coloured violet by $FeCl_3$. Yields $C_6H_5(OEt)(OAc).CHO$ [60°]. (c. 285°).

VOL. III.

Di-ethyl derivative $C_6H_5(OEt)_2.OHO$. [80°]. (c. 288°). Needles (T. A. M.; Hantzsch, J. pr. [2] 22, 468).

Di-oxy-benzoic aldehyde

$C_6H_5(OH)_2.OHO$ [4:3:1] v. PROTOCATHECIC ALDEHYDE.

Tri-oxy-benzoic aldehyde. Tri-ethyl derivative $C_6H_5(OEt)_3.OHO$ [4:3:2:1]. [70°]. Formed by oxidising the tri-ethyl derivative of daphnetic acid with $KMnO_4$ (Will & Jung, B. 17, 1088).

Tri-oxy-benzoic aldehyde. Tri-ethyl derivative $C_6H_5(OEt)_3.OHO$. [95°]. Formed by oxidation of the tri-ethyl derivative of (*a*)- or (*β*)-resorcylic acid with alkaline $KMnO_4$ (Will, B. 16, 2112). Large crystals, insol. water.

Tri-oxy-benzoic aldehyde. Tri-methyl derivative $C_6H_5(OMe)_3.OHO$. [114°]. Formed by oxidation of asarone (Butlerow & Rizza, J. P. 19, 3). Needles, v. sol. hot water.

References.—Bromo-, Chloro-, and Iodo-oxy-benzoic aldehyde.

m-OXY-BENZOPHENONE $C_6H_5.CO.C_6H_5(OH)$ [116°]. Formed by the action of nitrous acid upon *m*-amido-benzophenone (Geigy & Koenigs, B. 18, 2402). Needles.

p-Oxy-benzophenone $C_6H_5.CO.C_6H_5.OH$ [1:4].

p-Benzoyl phenol. Formed by heating pps. with $BzCl$ and $ZnCl_2$ (Grucarevitch & Merz, B. 6, 1245). Obtained also from *p*-amido-benzophenone by the diazo-reaction (Doebner & Weiss, B. 14, 1840; A. 210, 275). Needles or plates.

Acetyl derivative [81°]. Needles (from alcohol) (Doebner & Stackmann, B. 10, 1970).

Benzoyl derivative [113°].

Methyl derivative $C_6H_5.CO.C_6H_5.OMe$. [62°]. Four-sided prisms (Rennie, C. J. 41, 227). Possesses two oxims $C_6H_5.C(NO)(OH).C_6H_5.OMe$, a stable oxim [116°] yielding $BHCl$, an acetyl derivative [53°], and a benzyl ether [74°], and an unstable oxim [140°], which yields $BHCl$ [124°], an acetyl derivative [135°], and a benzyl ether [60.5°] (Schäfer, A. 264, 158; Hantzsch, B. 24, 53).

Ethyl derivative $C_6H_5.CO.C_6H_5.OEt$. [39°]. (above 300°). Formed from $C_6H_5.OEt$, benzoyl chloride, and $AlCl_3$ (Gattermann, Ehrhardt, & Marsch, B. 23, 1206).

Di-oxy-benzophenone $CO(C_6H_5.OH)_2$. [60°]. (c. 335°). Formed by heating diphenylene ketone oxide with alcoholic potash at 180° (Richter, J. pr. [2] 28, 273; Graebe & Feer, B. 19, 2607). Prisms or plates (from ligroin).— KHA' : yellow crystals (from alcohol).— K_2A' : crystals, v. e. sol. water.

Acetyl derivative $C_6H_5.Ac.O_2$. [90°] (G. & F.); [85°] (R.). Prisms (from alcohol).

Benzoyl derivative $C_6H_5.Bz.O_2$. [104°]. Methyl derivative $C_6H_5.Me.O_2$. [89°].

Di-methyl derivative $C_6H_5.Me_2.O_2$. [98°] (R.); [104°] (G. & F.). Prisms. Forms the oxim $C(NO)(OH)(C_6H_5.OMe)_2$. [186°].

Di-ethyl ether $C_6H_5.Et_2.O_2$. [109°]. Needles (from dilute alcohol). Yields the phenyl-hydrazide $C(NHPh)(C_6H_5.OEt)_2$. [114°].

Oxim $C(NO)(OH)(C_6H_5.OH)_2$. [99°].

Phenyl-hydrazide $C(NHPh)(C_6H_5.OH)_2$. [152°].

op-Di-oxy-benzophenone [2:1] $C_6H_5(OH).CO.C_6H_5(OH)$ [1:4]. [144°]. Formed by heating salicylic acid with phen

Y Y

and SnCl_4 at 120° (Michael, B. 14, 656; *Ann.* 5, 88). Large yellow plates, al. sol. water.— AgA^+ eq. 88.

Acetyl derivative $\text{C}_{12}\text{H}_9\text{Ac}_2\text{O}_2$. [86°].

Di-p-oxy-benzophenone $\text{CO}(\text{C}_6\text{H}_4\text{OH})_2$. [210°].

Formation.—1. From $\text{CH}_3(\text{C}_6\text{H}_4\text{OBz})_2$ by oxidation and saponification (Gail, A. 194, 834).
2. By fusing phenol-phthalein with potash (Baeyer & Burkhardt, B. 11, 1299; A. 202, 126).
3. By heating aurin with water at 240° (Caro & Graebe, B. 11, 1848), or rosaniline with water at 270° (Liebmann, B. 6, 951; 11, 1485).
4. By the action of HNO_3 on di-p-amido-benzophenone (Staedel & Sauer, B. 11, 1747).

Properties.—Long needles, m. sol. hot water. On treatment with PCl_5 followed by phenol and H_2SO_4 it yields aurin. Bromine forms $\text{C}_{12}\text{H}_7\text{Br}_2\text{O}_2$. [314°].

Acetyl derivative $\text{C}_{12}\text{H}_7\text{Ac}_2\text{O}_2$. [148°].

Benzoyl derivative $\text{C}_{12}\text{H}_5\text{Bz}_2\text{O}_2$. [182°].

Methyl derivative $\text{C}_{12}\text{H}_7\text{Me}_2\text{O}_2$. [144°].

Needles (Böslér, B. 14, 328). Yields $\text{C}_{12}\text{H}_7\text{Br}_2\text{O}_2$. [181°] and as oxim [183°].

Ethyl derivative $\text{C}_{12}\text{H}_9\text{Et}_2\text{O}_2$. [147°].

Di-ethyl derivative $\text{C}_{12}\text{H}_5\text{Et}_2\text{O}_2$. [147°]. (Gail); [181°] (Gattermann, B. 22, 1181).

(β)-*Di-oxy-benzophenone* $\text{C}_{12}\text{H}_6\text{O}_4$. [162°].

Formed from di-nitro-benzophenone [149°] by reduction and application of the diazo-reaction (Staedel & Sauer, B. 13, 836). Needles.

Acetyl derivative $\text{C}_{12}\text{H}_4\text{Ac}_2\text{O}_2$. [90°].

Benzoyl derivative $\text{C}_{12}\text{H}_2\text{Bz}_2\text{O}_2$. [102°].

Di-oxy-benzophenone $\text{C}_6\text{H}_4\text{CO}_2\text{C}_6\text{H}_4(\text{OH})_2$. [145°]. Formed from di-benzoyl-pyrocatechin, BzCl , and ZnCl_2 (Doebner, A. 210, 261). Needles (containing 1 aq.).

Benzoyl derivative $\text{C}_{12}\text{H}_2\text{Bz}_2\text{O}_2$. [95°].

Di-oxy-benzophenone $\text{C}_6\text{H}_4\text{CO}_2\text{C}_6\text{H}_4(\text{OH})_2$. *Benzoresorcin*. [144°]. Formed from resorcin, BzCl , and ZnCl_2 at 120° (Doebner & Stachmann, B. 11, 2270). Needles, sol. hot water.

Benzoyl derivative $\text{C}_{12}\text{H}_2\text{Bz}_2\text{O}_2$. [141°].

Tri-oxy-benzophenone

$\text{C}_6\text{H}_3(\text{OH})_3\text{CO}_2\text{C}_6\text{H}_3(\text{OH})_3$. [1:2:4]. [133°]. Formed by heating salicylic acid with resorcin at 200° (Michael, B. 14, 658), or by heating oxy-diphenylene ketone oxide with NaOH at 270° (Graebe, A. 254, 291). Plates, al. sol. water.

Tetra-oxy-benzophenone

$\text{CO}(\text{C}_6\text{H}_3(\text{OH})_3)_2$. [1:2:5]. [202°] is EUXANTHONIC ACID (q. v.).

Hexa-oxy-benzophenone $\text{CO}(\text{C}_6\text{H}_2(\text{OH})_4)_2$.

Anhydride $\text{C}_{12}\text{H}_2\text{O}_6$. *Anhydropyrogalloloketone*. Formed by fusing gallein with alkalis (Buchka, A. 209, 270). Brown powder.

Acetyl derivative $\text{C}_{12}\text{H}_4\text{Ac}_2\text{O}_2$. [237°].

p-OXY-BENZOPHENONE *o-CARBOXY-*

LIC ACID. *Methyl derivative* $\text{C}_{12}\text{H}_9\text{O}_4$, i.e. $\text{C}_6\text{H}_4(\text{OMe})\text{CO}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$. *Anisole-phthalic acid*. [148°]. Formed by the action of phthalic anhydride (50 g.) on anisole (150 g.) in presence of AlCl_3 (80 g.) (Nourisson, B. 19, 2103). Colourless crystals (from toluene). Split up by potash-fusion into benzoic and *p*-oxy-benzoic acid. Yields a bromo-derivative [196°]. Conc. H_2SO_4 forms *m*-oxy-anthraquinone. Distillation with zinc-dust gives anthracene.— NaA^+ — KHA^+ — CaA^+ , 2 aq.— BaA^+ , 4 aq.; white needles.— AgA^+ .

Di-oxy-benzophenone carboxylic acid

$\text{C}_6\text{H}_3(\text{OH})_3\text{CO}_2\text{C}_6\text{H}_3\text{CO}_2\text{H}$. [200°]. Got by fusing

pyrocatechol with NaOHAq (Baeyer, A. 188, 88). Crystals (containing aq.).

DI-OXY-BENZOPHENONE SULPHONIC ACID $\text{C}_6\text{H}_3(\text{OH})_3\text{CO}_2\text{C}_6\text{H}_3\text{SO}_3\text{H}$. Formed by heating $\text{C}_6\text{H}_3(\text{SO}_3\text{NH}_2)_2\text{CO}_2\text{H}$ with resorcin (Bemsen, *Ann.* 9, 5, 873; 11, 73). Small plates (containing 2 aq.).— BaA^+ — NH_4A^+ .

OXY-BENZOYL ACETIC ACID $\text{C}_6\text{H}_5\text{O}_4$, i.e. $\text{C}_6\text{H}_5\text{P}^+\text{O}-\text{CH}(\text{OH})\text{CO}_2\text{H}$. [125°]. Formed from nitroso-benzoyl-acetic ether $\text{BzO}(\text{NOH})\text{CO}_2\text{Et}$ and NaOHAq (Baeyer & Perkin, B. 16, 2188; C. J. 47, 245). Small prisms (from water).— AgA^+ .

OXY-BENZOYL BROMIDE. *Methyl derivative* $\text{C}_6\text{H}_5(\text{OMe})\text{COBr}$. Formed from anisic aldehyde by cautious treatment with bromine (Cahours, A. Ch. [3] 14, 486). Silky crystals, resolved by KOHaq into potassium anisate and potassium bromide.

p-OXY-BENZOYL CHLORIDE. *Methyl derivative* $\text{C}_6\text{H}_5(\text{OMe})\text{COCl}$. (262°). S.G. is 1.261. Formed from anisic acid and PCl_5 (Cahours, A. Ch. [3] 23, 851). Oil, converted by water into anisic acid.

OXY-BENZURIC ACID $\text{C}_6\text{H}_5\text{NO}_4$, i.e. $\text{C}_6\text{H}_5(\text{OH})\text{CO}_2\text{NH}_2\text{CO}_2\text{H}$. [c. 228°]. Occurs in the urine of dogs to which *p*-oxy-benzoic acid or hydro-*p*-coumaric acid has been administered (Baumann & Herter, H. 1, 260; Schotten, H. 7, 26). Prisms, al. sol. water.

OXY-DIBENZYL *o*. *OXY-DI-PHENYL-ETHANE*.

o-OXY-BENZYL ALCOHOL $\text{C}_6\text{H}_4\text{O}_2$, i.e. $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OH}$. *Saligenin*. Mol. w. 124. [82°]. S. 7 at 22° . S. (benzene) 1.9 at 18° . Formed by the hydrolysis of salicin (Piria, A. 56, 37), by reducing *o*-oxy-benzoic aldehyde with sodium-amalgam (Beilstein, A. 128, 179), and by heating phenol with CH_3Cl and aqueous NaOH at 100° (Greene, *Am.* 2, 19). Tables, v. s. sol. hot water. FeCl_3 gives a blue colour. Dilute H_2SO_4 forms saliretin $\text{C}_{12}\text{H}_{10}\text{O}_4$ or $\text{C}_{12}\text{H}_{12}\text{O}_4$, a yellowish powder, insol. water (Gerhardt, A. Ch. [3] 7, 215; Beilstein, A. 117, 24; Kraut, A. 156, 124). On heating with glycerin at 100° it forms saliretone $\text{C}_{12}\text{H}_{10}\text{O}_4$ [121.5°] crystallising from water (Giaccosa, J. pr. [2] 21, 221).

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{OH}$. (248°). S.G. is 1.120 (Cannizzaro & Körner, B. 5, 436).

Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{CH}_2\text{OH}$. (265°). Solidifies at 0° (Bötsch, M. 1, 621).

m-Oxy-benzyl alcohol [3:1] $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OH}$. [87°]. (c. 800°). A product of the action of sodium-amalgam on *m*-oxy-benzoic acid in acid solution (Van der Velden, J. pr. [2] 15, 168). White mass, v. sol. hot water. FeCl_3 gives a violet colour.

Acetyl derivative $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OAc}$. [55°]. (295°–302°). Crystalline, v. al. sol. water.

Di-acetyl derivative $\text{C}_6\text{H}_4(\text{OAc})\text{CH}_2\text{OAc}$. (c. 290°). Oil, sol. alcohol and ether.

p-Oxy-benzyl alcohol $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OH}$. [110°]. Prepared by slowly adding 40 pts. of 8 p.c. sodium-amalgam to a solution of 1 pt. para-oxy-benzaldehyde in 10 pts. water and 5 pts. alcohol, kept slightly acid with H_2SO_4 (Biedermann, B. 19, 2878). Thin white needles. Y. sol. water, alcohol, and ether, al. sol. benzene and chloroform, nearly insol. ligroin. Dissolved in conc. H_2SO_4 with a splendid violet colour.

Mono-acetyl derivative $C_6H_5(OH).CH_2.OAc$. [84°]; small yellowish needles; v. sol. alcohol and ether, al. sol. water.

Di-acetyl derivative $C_6H_5(OAc).CH_2.OAc$: [75°]; small needles; v. sol. alcohol and ether, nearly insol. water.

Methyl derivative $C_6H_5(OMe).CH_2.OH$. **Anisic alcohol**. Mol. w. 138. [45°]. Formed, together with anisic acid, by mixing anisic aldehyde with alcoholic potash (Cannizzaro & Bertagnini, A. 98, 188; 137, 248; C. 2, 61). Obtained also by methylation (Biedermann, B. 19, 2376). White needles. $HClAq$ forms oily $C_6H_5(OMe).CH_2.Cl$ whence $NaOMe$ forms the compound $C_6H_5(OMe).CH_2.OMe$ (226°).

Di-oxy-benzyl alcohol. Ethyl derivative $C_6H_4(OEt)(OH).CH_2.OH$ [5:2:1]. [41°]. Formed by adding 5 p.c. sodium-amalgam to the corresponding aldehyde suspended in water. The product is acidified and shaken with ether (Hantzsch, J. pr. [2] 22, 475). Large thick tablets, changing at 100° into a brown amorphous mass. Acids also resinify it.

Di-oxy-benzyl alcohol $C_6H_4(OH)_2.CH_2.OH$ [4:3:1]. **Methyl derivative** $C_6H_4(O_2Me)_2$, i.e. $C_6H_4(OH)(OMe).CH_2.OH$ [4:3:1]. **Vanillyl alcohol**. [115°]. Formed by the action of sodium-amalgam on vanillin (Tiemann, B. 8, 1125; 9, 415). Formed also by the action of emulsin on the glucoside $C_6H_4(OC_6H_4O_2)(OMe).CH_2.OH$ [120°], a crystalline body (containing aq) prepared by reduction of glucosyl-vanillin (Tiemann, B. 19, 1595). Prisms, v. sol. alcohol.

Methylene derivative $C_6H_4(O_2CH_3).CH_2.OH$. **Piperonyl alcohol**. [51°]. Got by reducing piperonal $C_6H_4(O_2CH_3).CHO$ with sodium-amalgam and hot-water (Fittig & Remsen, A. 159, 138). Long crystals, m. sol. hot water.

Reference.—CHLORO-OXY-BENZYL ALCOHOL.

o-OXY-BENZYL-AMINE $C_6H_4(OH).CH_2.NH_2$. [125°]. Formed by heating its methyl derivative with $HClAq$ at 150° (Goldschmidt & Ernst, B. 23, 2744) and by the action of dilute H_2SO_4 and zinc-dust on $C_6H_4(OH).CH.NH.C_6H_5.CO_2H$ (Tiemann, B. 23, 3017). Groups of white needles (from ether). Readily sublimes. Ferric chloride colours its solution deep violet-blue.— $B'HCl$.— $B'H.PtCl_2$, 2aq. [197°]. Golden needles.

Acetyl derivative $C_6H_4(OH).CH_2.NHAc$. [140°]. Colourless needles, sol. alkalis.

Methyl derivative $C_6H_4(OMe).CH_2.NH_2$. (224° at 724 mm.). Formed by reducing the oxim $C_6H_4(OMe).CH:NOH$ in alcoholic solution with sodium-amalgam and $HOAc$ (Goldschmidt & Ernst, B. 23, 2742). Liquid, v. sol. water. Yields $C_6H_4(OMe).CH.NHAc$. [97°].— $B'HCl$. [150°].— $B'H.PtCl_2$, 2aq. [187°]. Golden plates.

p-Oxy-benzylamine $C_6H_4(OH).CH_2.NH_2$, aq [95°]. Formed from p-amido-benzylamine, $NaNO_2$, and HCl (Salkowski, B. 22, 2143). Plates.— $B'HCl$.— $B'H.PtCl_2$, 2aq: flat needles.

Methyl derivative $C_6H_4(OMe).CH_2.NH_2$. (222°) (S.); (255°) (G. & P.). Formed by reducing hydroanisamide in alcoholic solution with sodium amalgam (Steinhart, A. 241, 835). Obtained also by reduction from the oxim $C_6H_4(OMe).CH:NOH$ (Goldschmidt & Polonowska, B. 20, 2407). Liquid, sol. water, volatile with steam.— $B'HCl$. [230°].— $B'HgCl$, aq. [200°]. Scales.— $B'H.PtCl_2$. [210°]. Bright

yellow needles. Absorbs CO_2 from the air, forming a compound crystallising in needles [110°] (cf. Cannizzaro, A. 117, 240).

Acetyl derivative $C_6H_4(OMe).CH_2.NHAc$. [98°].

Di-oxy-di-benzyl-amine $NH(CH_2.C_6H_5)_2$. [170°]. Formed by reducing hydrosalicylamide in alcoholic solution with sodium-amalgam (Emmerich, A. 241, 349). Needles, v. al. sol. water. Gives an oily nitrosamine.— $B'H.PtCl_2$.

Di-p-oxy-di-benzyl-amine. Di-methyl derivative $(C_6H_4(OMe).CH_2)_2.NH$. [84°]. Formed by the action of $C_6H_4(OMe).CH_2.Cl$ on alcoholic ammonia, and also by reducing $(C_6H_4(OMe).CH)_2.N_2$. White needles. Yields a nitrosamine [80°].— $B'HCl$. [243°]. Flat prisms.— $B'H.PtCl_2$, 2aq.

o-OXY-BENZYL-ANILINE

$C_6H_4(OH).CH_2.NPhH$. **Phenyl-o-amido-cresol** [106°]. Formed by reducing o-oxybenzylidene-aniline with sodium-amalgam (Emmerich, A. 241, 344). Needles or plates, al. sol. water. 10% nitrosamine is oily.— $B'HCl$. [131°].— $B'H.PtCl_2$. [184°]. M. sol. water.

p-Oxy-benzyl-aniline. [208°]. Formed in like manner (E.). White needles.— $B'H.PtCl_2$.

Methyl derivative $C_6H_4(OMe).CH_2.NPhH$. [65°]. Formed by reducing $C_6H_4(OMe).CH.NPh$ (Steinhart, A. 241, 337). Prisms. Gives a nitrosamine [104°].— $B'HCl$. [163°].— $B'H.PtCl_2$.

DI-OXY-DI-BENZYL-BENZENE

$C_6H_4(CHPh)_2$. [171°]. Formed by reducing $C_6H_4(COPh)_2$ with sodium-amalgam (Wehnen, B. 9, 310). Satiny needles (from dilute alcohol). Yields $C_6H_4.AcO_2$ [97°] and $C_6H_4.AcO_2$ [144°].

OXY-o-BENZYL-BENZOIC ACID $C_6H_4(O_2C).CH_2.OH$. **Benzhydryl carbonylic acid**.— KA' : amorphous.— BaA' . From the anhydride and baryta.

Anhydride $C_6H_4.CH_2.CO_2$. [115°].

Formed by reducing o-benzoyl-benzoic acid with zinc and HCl (Rotering, J. 1875, 596). White insoluble powder.

Exo-Oxy-m-benzyl-benzoic acid. [121°]. Formed by reducing m-benzoyl-benzoic acid with sodium-amalgam (Senff, A. 230, 242). Satiny needles in hemispherical groups (from hot water). Reduced by $HIAq$ (127°) at 170° to m-benzyl-benzoic acid.— NaA' , 4aq.— CaA' , 5aq.— AgA' , aq.

Oxy-p-benzyl-benzoic acid. [165°]. Formed by reducing p-benzoyl-benzoic acid (Zincke, A. 161, 102). Needles (from hot water).— NH_4A' .— NaA' .— KA' .— CaA' , 5aq.— BaA' .— AgA' : pp.

Methyl ether MeA' . [110°]. Prisms.

Ethyl ether EtA' . Oil.

Oxy-benzyl-benzoic acid $C_6H_4.CH_2.C_6H_4(OH).CO_2H$. [140°]. Formed from benzylphenol, sodium, and CO_2 (Paterno & Fileti, G. 8, 287). Needles (from water), al. sol. hot water.— AgA' : curdy pp. al. sol. hot water.

DI-OXY-BENZYL ETHYL KETONE CARBOXYLIC ACID. Methylene derivative $C_6H_4(O_2CH_3).CH_2.CO_2H.CO_2H$. **Piperoketonic acid**. [84°]. Formed by heating di-bromopiperhydronic acid with aqueous Na_2CO_3 (Weinstein, A. 227, 33). Silky needles (from CH_3).— CaA' .— AgA' : flocculent pp.

OXY-BENZYLIDENE-ACETONAMINE
ACETONAMINE.

o-OXY-BENZYLIDENE-m-AMIDO-BENZOIC ACID $C_9H_7(OH).CH.N.C_6H_4.CO_2H$. [190°]. Formed from salicylic aldehyde and aqueous *m*-amido-benzoic acid (Schiff, A. 210, 114). Yellowish needles, v. s. sol. alcohol.

Amide $C_{11}H_{11}N_2O_4$. [186°]. Converted by boiling benzoic aldehyde into crystalline $C_{11}H_{11}N_2O_4$, whence As_2O_3 yields $C_{11}H_{11}As_2N_2O_4$. [230°]. The glucosyl derivative of the amide $C_{11}H_{11}O_6C_6H_4.CH.N.C_6H_4.CONH_2$. [113°] is formed by the action of helicin on *m*-amido-benzamide.

Di-oxy-benzylidene-o-amido-benzoic acid $C_9H_7(OH).CH.N.C_6H_4(OH).CO_2H$ [5:2:1]. [245°]. Formed from oxy-amido-benzoic acid and salicylic aldehyde. Needles, v. s. sol. alcohol.

DI-OXY-BENZYLIDENE-DI-AMIDO-DI-PHENYL $C_{12}H_9[N.C_6H_4.C_6H_4(OH)]_2$. [145°]. Formed from di-o-amido-diphenyl and salicylic aldehyde (Reuland, B. 22, 3012). Yellow plates.

o-OXY-BENZYLIDENE-ANILINE $C_8H_7(OH).CH.NPh$. [51°]. **V. Oxy-benzoyl aldehyde.** The *p*-isomeride melts at 191°.

OXY-BENZYLIDENE-ANTHRONE. *Ethyl ether* $C_{14}H_9\langle\begin{smallmatrix} C(Ph.OEt) \\ CO \end{smallmatrix}\rangle C_6H_5$. [173°].

Formed from bromo-benzylidene-anthrone and $NaOEt$ (Bach, B. 23, 2529). Yellow plates, v. sol. ether.

OXY-BENZYLIDENE-DICARBAMIC ETHER. *Methyl derivative* $C_{11}H_{11}N_2O_4$, i.e. $C_6H_4(OMe).CH(NH.CO_2Et)_2$. [172°]. Formed from anisole aldehyde and carbamic ether (Bischoff, B. 7, 1078). Needles (from dil. alcohol).

DI-o-OXY-BENZYLIDENE-ETHYLENE-DIAMINE $C_{12}H_{11}N_2O_4$, i.e. $C_6H_4(N.CH.C_6H_4.OH)_2$. [126°]. Formed from ethylene-diamine and *o*-oxy-benzoic aldehyde (Mason, B. 20, 271). The dimethyl derivative [c. 118°] and its *p*-isomeride $C_6H_4(N.CH.C_6H_4.OMe)[1:4]$, [111°] are both crystalline.

o-OXY-BENZYLIDENE-MALONIC ACID. *Methyl derivatives* $C_9H_7(OMe).CH.CO_2CO_2H$. [178°]. Formed by heating a mixture of malonic acid, $C_6H_4(OMe).CHO$, and $HOAc$ at 100° (Stuart, C. J. 53, 142).

OXY-BENZYLIDENE-NAPHTHYLAMINE $C_{12}H_9(OH).CH.NC_{10}H_7$. The *o*- [121°] and *p*- [220°] compounds are formed from (*β*)-naphthylamine and the corresponding oxy-benzoic aldehydes (Emmerich, A. 241, 350).

o-OXY-BENZYLIDENE-DITHIOGLYCOLLIC ACID $C_9H_7(OH).CH(S.CH_2.CO_2H)_2$. [148°]. Formed from *o*-oxy-benzoic aldehyde, thioglycollic acid, and $ZnCl_2$ (Bongartz, B. 21, 478).

o-OXY-BENZYLIDENE-p-TOLUIDINE $C_9H_7(OH).CH.NC_6H_4$. [100°] (Jailard, J. 1865, 428; v. OXY-BENZOIC ALDEHYDE).

OXY-BENZYLIDENE-DI-UREA $C_9H_7(OH).CH(NH.CO.NH_2)_2$, v. **o-OXY-BENZYL ALDEHYDE**, DE.

OXY-BENZYL-MALONIC ACID. *Ethyl derivative* $C_9H_7.CH(OEt).CH(CO_2H)_2$. [c. 130°]. Formed from benzylidene-malonic acid and cold alcoholic KOH (Claisen & Crismer, A. 218, 141). Crystalline. Split up at 120° into alcohol and benzylidene-malonic acid [192°].— K_2A .— Ag_2A .

Isomeride γ, BENZYL-TARTARONIC ACID.

OXY-BENZYL-METHYL-ETHYL-PYRIMIDINE

INE $CH_2Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle CMe$. [193-5°].

Formed from phenyl-acetamidine hydrochloride, ethyl-acetoacetic ether, dilute (10 p.c.) $NaOH$, and alcohol (Pinner, B. 22, 1623). Needles, m. sol. water, v. s. sol. alcohol.

Di-oxy-benzyl-methyl-ethyl-pyrimidine

$CH(OH)Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle CMe$. [149°-152°].

Formed from oxy-phenyl-acetamidine, acetoacetic ether, and $NaOHAq$ (Pinner, B. 23, 2951).

OXY-BENZYL-METHYL-PYRIMIDINE

$CH_2Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle CH$. [175°]. Formed

from phenyl-acetamidine, acetoacetic ether, alcohol, and dilute (10 p.c.) $NaOH$ (Pinner, B. 22, 1622). Prisms, m. sol. hot water.

Oxy-benzyl-di-methyl-pyrimidine

$CH_2Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle CMe$. [181°]. Formed

from phenyl-acetamidine, methyl-acetoacetic ether, and $NaOHAq$ (P.). M. sol. water.

Oxy-di-benzyl-methyl-pyrimidine

$CH_2Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle C.C_6H_5$. [192°]. Formed

from phenyl-acetamidine, benzyl-acetoacetic ether, and $NaOHAq$ (P.). Needles, insol. water.

Di-oxy-benzyl-methyl-pyrimidine $C_{12}H_{11}N_2O_4$,

i.e. $CH(OH)Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle CH$. [216°].

Formed from oxy-phenyl-acetamidine, $NaOHAq$ and acetoacetic ether in the cold (Pinner, B. 23, 2949). Long needles, v. sl. sol. water, sl. sol. alcohol, sol. acids and alkalis. — $BHCl$. [217°]. Needles. — $B'C_6H_4(NO_2)_2.OH$. [175°].

$AgC_6H_4N_2O_4$: white pp.

Acetyl derivative

$CH(OAc)Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle CH$. [170°]. Formed

by boiling with As_2O_3 . Yields $AgC_6H_4N_2O_4$, $B'HCl$ [188°], and $B'C_6H_4(NO_2)_2.OH$ [160°].

Benzoyl derivative $C_{13}H_{11}BzN_2O_4$.

[205°-208°]. — $B'HCl$. [240°]. From the base and $BzCl$.

Di-oxy-benzyl-methyl-pyrimidine. [233°].

Got from potassium methyl-uracil and benzyl chloride (Hagen, A. 214, 1).

Di-oxy-benzyl-di-methyl-pyrimidine

$CH(OH)Ph.C\langle\begin{smallmatrix} N.CMe \\ N:C(OH) \end{smallmatrix}\rangle CMe$. [155°]. Formed

from oxy-phenyl-acetamidine, $NaOHAq$, and methyl-acetoacetic ether (Pinner, B. 23, 2951). — $B'HOAc$: needles. — $AgC_6H_4N_2O_4$: white pp.

OXY-BENZYL-(β)-NAPHTHYLAMINE.

The following compounds have been prepared by reducing the products of the action of (*β*)-naphthylamine on the corresponding aldehydes (Steinhart, A. 241, 341; Emmerich, A. 241, 852):—

1:2) $C_6H_4(OH).CH.NHC_6H_5$. [147°]. — $B'HCl$. [188°].

1:2) $C_6H_4(OH).CH.N(NO).C_6H_5$. [165°].

1:2) $C_6H_4(OMe).CH.NHC_6H_5$. [92°]. [223°].

1:4) $C_6H_4(OH).CH.NHC_6H_5$. [117°].

1:4) $C_6H_4(OH).CH.N(NO).C_6H_5$. [143°].

1:4) $C_6H_4(OMe).CH.NHC_6H_5$. [101°]. — $B'HCl$

[195°]. — $B'HCl$. — **Nitrosamine**

$C_6H_4(OMe).CH.N(NO).C_6H_5$. [185°].

OXY-BENZYL-ISOPHTHALIC ACID. *Benzyl*

hydrazyl-isophthalic acid, Anhydride.

$\text{C}_6\text{H}_5\text{OH} \left\langle \begin{smallmatrix} \text{C}_6\text{H}_4(\text{CO}_2\text{H}) \\ \text{O.CO} \end{smallmatrix} \right\rangle$ [207°]. Formed by the action of zinc and HClAq on benzoyl-isophthalic acid (Zincke, B. 9, 1768). Needles (from dilute alcohol).—BaA', 2aq.—AgA': pulverulent pp.—EtA'. [115°]. An isomeric acid, obtained by reduction of benzoyl-terephthalic acid, forms $\text{Ca}(\text{C}_{10}\text{H}_8\text{O}_4)_2$, 8aq (Weber, J., 1878, 408).

p-OXY-BENZYL-PHTHALIMIDINE

Formed from the amido-compound by the diazo-reaction (Hafner, B. 23, 844). Red needles. Converted by conc. HClAq at 150° into a base $\text{C}_6\text{H}_4\text{NO}_2$.

OXY-BENZYL-PYRIDINE TETRAHYDRIDE

Formed by distilling β -amido- α -benzyl-valeric acid (Aschan, B. 23, 8696). Pearly plates (from hot water). $\text{B}^+\text{O}_2\text{H}_2(\text{NO}_2)\text{OH}$. [97°]. Crystals, al. sol. water.

Nitrosamine $\text{C}_6\text{H}_5(\text{NO})\text{NO}$. [62-5°].

OXY-BENZYL-PYRIMIDINE CARBOXYLIC ACID $\text{CHPh.C} \left\langle \begin{smallmatrix} \text{N.C}(\text{CO}_2\text{H}) \\ \text{N.C}(\text{OH}) \end{smallmatrix} \right\rangle \text{CH}$ [280°].

Formed from phenyl-acetamidine, oxalacetic ether, and (10 p.c.) NaOHAq (Pinner, B. 22, 1627). Prisms, v. sl. sol. water.

OXY-BENZYL-PYROTARTARIC ACID

$\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CH}(\text{CO}_2\text{H})\text{CHMe.CO}_2\text{H}$. Phenylhomotartaric acid. Formed from benzoic aldehyde, sodium pyrotartrate, and Ac_2O at 125° (Pensfield, A. 216, 119; Fittig a. Liebmann, A. 255, 257). The acid splits up, at the moment of liberation, into water and anhydride. — $\text{CaC}_2\text{H}_3\text{O}_6$, 8aq.—BaA' 2aq.—AgA'.

Anhydride $\text{C}_{10}\text{H}_8\text{O}_4$. Phenylhomoparaconic acid. [177°]. Plates (from water).— $\text{AgC}_2\text{H}_3\text{O}_4$; crystals, m. sol. water.—BaA' 2aq.—CaA'.

Isomeride

$\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{OME}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$. Formed together with the preceding acid. Its salt $\text{BaC}_2\text{H}_3\text{O}_6$ is got by heating the anhydride with baryta-water. —CaA' 2aq.—AgA'; bulky flocculent pp.

Anhydride

$\text{CHPh} \left\langle \begin{smallmatrix} \text{CMe}(\text{CO}_2\text{H}) \\ \text{O.CO.CH}_2 \end{smallmatrix} \right\rangle$ (124-5°). Yields $\text{Ba}(\text{C}_{12}\text{H}_{11}\text{O}_6)_2$, CaA' 2aq, and AgA'.

DI-OXY-BENZYL-QUINOLINE CARBOXYLIC ACID. Ethyl derivative

$\text{C}_6\text{H}_4 \left\langle \begin{smallmatrix} \text{CO.C}(\text{C}_6\text{H}_5)(\text{CO}_2\text{H}) \\ \text{N.C}(\text{OEt}) \end{smallmatrix} \right\rangle$ [147°]. Formed by reducing benzyl-o-nitro-benzoyl-malonic ether (Bischoff, B. 22, 886).

OXY-BENZYL-SUCCINIC ACID $\text{C}_{10}\text{H}_8\text{O}_4$, i.e. $\text{PhCH}(\text{OH})\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$. Its salts are formed by warming the anhydride with bases.— $\text{CaC}_2\text{H}_3\text{O}_6$.—BaA' 2aq.—AgA'.

Ethyl ether

Anhydride $\text{C}_{10}\text{H}_8\text{CH} \left\langle \begin{smallmatrix} \text{CH}(\text{CO}_2\text{H}) \\ \text{O.CO} \end{smallmatrix} \right\rangle \text{CH}_2$

Phenyl-paraconic acid. [99°]. Formed by heating sodium succinate with benzoic aldehyde and Ac_2O (Fittig a. Jayne, A. 216, 108; 258, 68). Needles (from water); converted by NaOEt into

phenyllitaconic acid. Yields $\text{Ca}(\text{C}_{10}\text{H}_8\text{O}_4)_2$, 2aq, BaA', 8aq, and AgA', and the ether EtA' (262° at 25 mm.).

p-OXY-BENZYL-THIOCARBAMIDE

$\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{NCS}$. From p-oxy-benzylamine, CS_2 , and HgCl_2 (Salkowski, B. 22, 2144). Liquid, sol. alkalis.

p-OXY-BENZYL-THIO UREA. Methyl derivatives $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{NHCSNH}_2$. [95°]. (Goldschmidt a. Polonowska, B. 20, 2409).

Di-oxy-di-benzyl-thio-urea. Di-methyl derivative $(\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{NH})_2\text{CS}$. [150°].

o-OXY-BENZYL-p-TOLUIDINE $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{NH}_2$. [116°]. Formed by reducing o-oxy-benzylidene-p-toluidine in alcoholic solution with sodium-amalgam (Emmerich, A. 241, 346). Crystals. Yields the methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{NHC}_6\text{H}_4\text{Me}$ [110°] and a tetra-nitro-derivative [168°].—B'HCl. [147°].— $\text{B}^+\text{H}_2\text{PtCl}_6$; reddish-yellow needles.

p-Oxy-benzyl-p-toluidine [186°]. Yields $\text{B}^+\text{H}_2\text{PtCl}_6$ and $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{NHC}_6\text{H}_4\text{Me}$ [68°], whence B'HCl [160°], $\text{B}^+\text{H}_2\text{PtCl}_6$, and the nitrosamine $\text{C}_6\text{H}_4(\text{OMe})\text{CF}_3\text{N}(\text{NO})\text{C}_6\text{H}_4\text{Me}$ [108°].

p-Oxy-benzyl-o-toluidine. Methyl derivative. [55°]. Triangular plates (Steinhart, A. 241, 340). Yields an oily nitrosamine.

o-OXY-BENZYL-UREA $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$, i.e. $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{NH.CO.NH}_2$. [170°]. Formed by warming o-oxy-benzylamine hydrochloride with potassium cyanate (Goldschmidt a. Ernst, B. 23, 2745). Prisms, v. sol. hot water.

Methyl derivative

p-Oxy-benzyl-urea. Methyl derivative [167°]. Needles (Goldschmidt a. Polonowska, B. 20, 2409).

β -OXY- α -BENZYL-VALERIC ACID

$\text{CH}_2(\text{OH})\text{CH}_2\text{CH}_2\text{CH}(\text{CH}_2\text{Ph})\text{CO}_2\text{H}$. Formed from nitroso-oxy-benzyl-pyridine tetrahydride and NaOHAq (Aschan, B. 23, 8697). Liquid, m. sol. hot water.

γ -Oxy- β -benzyl-valeric acid

$\text{CH}_2\text{CH}(\text{OH})\text{CH}(\text{CH}_2\text{Ph})\text{CH}_2\text{CO}_2\text{H}$. [76°]. Formed by carefully adding dilute HCl to its Ca salt obtained from the lactone (Erdmann, A. 254, 217). Prisms (containing 5q). Melts at 56° when hydrated. HClAq converts it into the lactone.— $\text{Ca}(\text{C}_{12}\text{H}_{11}\text{O}_6)_2$, 4aq.—CaA', 6aq.

Lactone $\text{CH}_2\text{CH} \left\langle \begin{smallmatrix} \text{CH}(\text{CH}_2\text{Ph}) \\ \text{O.CO.CH}_2 \end{smallmatrix} \right\rangle$ [86°].

Got by reducing benzyl-acetyl-propionic acid [99°] with sodium-amalgam, and boiling the product with dilute H_2SO_4 . Large crystals.

DI-OXY-BUTANE $\text{CH}_2(\text{OH})\text{CHMe}(\text{OH})$.

n-Butylene glycol. Mol. w. 90. [122°]. S.G. 1.0439. Obtained from ω -di-bromo-n-butane by boiling with baryta-water (Grabowsky a. Gaytzeff, A. 179, 825). Liquid, v. sol. water. Yields glycollic and glyoxylic acids on oxidation.

Di-oxy-butane $\text{C}_4\text{H}_{10}\text{O}_2$, i.e. $\text{CH}_2(\text{OH})\text{OME}(\text{OH})$. **Isobutylene glycol.** (178°). S.G. 1.129. Formed from the bromide and K_2CO_3 (Nevollé, C. R. 83, 65, 146) and by the action of HClAq on isobutyl alcohol (Lwoff, B. [2] 43, 112). Formed also in the alcoholic fermentation of sugar (Henninger a. Sanson, C. R. 95, 94; 106, 208). Does not form an acetal with aldehyde (Locherer, A. Ch. [6] 16, 58).

Di-oxy-butane $\text{CHMe}(\text{OH})\cdot\text{CHMe}(\text{OH})$, (184°). Formed by heating *s*-butylene oxide with water at 100° (Elteloff, *J. R.* 14, 872). Liquid.

Di-oxy-butane $\text{OHMe}(\text{OH})\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$. (*β*-*Butylene glycol*, (207°). S.G. 2 1.0259. Formed by reduction of a dilute, slightly acid, solution of aldol by sodium-amalgam (Kekulé, *B.* 5, 56; *A.* 162, 819; Wurtz, *C. R.* 97, 473). Thick liquid, miscible with water. Ac_2O at 100° forms $\text{C}_4\text{H}_8(\text{OAc})_2$ (207°). S.G. 2 1.057. HIAg yields $\text{C}_4\text{H}_8\text{I}_2$ S.G. 2 2.291.

Di-oxy-butane $\text{C}_4\text{H}_8(\text{OH})_2$, (184°). S.G. 2 1.048. Obtained, *via* $\text{C}_4\text{H}_8(\text{OAc})_2$ (c. 200°), from the crude $\text{C}_4\text{H}_8\text{Br}_2$ got from fusel oil (Wurtz, *A. Ch.* [3] 55, 452). Liquid, miscible with water.

Di-oxy-butane $\text{CH}_2(\text{OH})\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CH}_2(\text{OH})$. *Tetramethylene glycol*. (204°). S.G. 1.011. Formed by the action of dilute H_2SO_4 on tetramethylene dinitramine $\text{C}_4\text{H}_8(\text{NH}_2\text{NO}_2)_2$ (Dekkers, *R. T. C.* 9, 101).

Tri-oxy-butane $\text{CH}_2\cdot\text{CH}(\text{OH})\cdot\text{CH}(\text{OH})\cdot\text{CH}_2(\text{OH})$. *Butenylglycerin*. (173° at 27 mm.). Formed from crotonic aldehyde by reduction, addition of bromine, and boiling the resulting $\text{CH}_2\cdot\text{CHBr}\cdot\text{CHBr}\cdot\text{CH}_2\text{OH}$ with water (Lieben & Zeisel, *M.* 1, 832). Thick liquid with sweet taste. Ac_2O yields $\text{C}_4\text{H}_8(\text{OAc})_3$ (262°). Yields $\text{C}_4\text{H}_8(\text{OH})\cdot\text{Cl}$, $\text{C}_4\text{H}_8(\text{OH})\text{Cl}_2$, and $\text{C}_4\text{H}_8\text{OCl}$ (Zikes, *M.* 6, 348).

Tri-oxy-butane $\text{C}_4\text{H}_8\text{O}_3$, (240° at 18 mm.). Formed from isobutyl iodide by chlorinating and heating the resulting tri-chloro-butane with water at 170° (Prunier, *Bl.* [3] 42, 261; *C. R.* 99, 193). Yields nearly solid $\text{C}_4\text{H}_8(\text{OAc})_3$.

Tetra-oxy-butane *v.* **ERYTHRIT**.

OXY-BUTANE TRICARBOXYLIC ACID $\text{CMe}(\text{OH})(\text{CO}_2\text{H})\cdot\text{CH}(\text{CO}_2\text{H})\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$.

Lactone $\text{C}_4\text{H}_6\text{O}_5$. Formed by heating acetosuccinic ether with KCy and HCl (Rach, *A.* 234, 35). At 180° it yields pyrocinnic anhydride. — BaA'' . — CaA'' . — $\text{Ca}_2(\text{C}_4\text{H}_6\text{O}_5)_2$ — $\text{Ba}_2(\text{C}_4\text{H}_6\text{O}_5)_2$.

Di-oxy-butane *tetra-carboxylic ether* $\text{CH}(\text{CO}_2\text{Et})\cdot\text{CH}(\text{OH})\cdot\text{CH}(\text{OH})\cdot\text{CH}(\text{CO}_2\text{Et})$. Formed by the action of malonic ether on glyoxal in presence of conc. ZnCl_2 Aq (Polonowsky, *A.* 246, 2). Oil, not volatile with steam.

Tetra-oxy-butane *tri-carboxylic acid* $\text{CO}_2\text{H}\cdot\text{CH}(\text{OH})\cdot\text{CH}(\text{OH})\cdot\text{CH}(\text{OH})\cdot\text{CO}_2\text{H}$, (147°). Formed by oxidation of levulose carboxylic acid by dilute HNO_3 (Düll, *B.* 24, 348). — $\text{K}_2\text{HA}''$. Large prisms. — $\text{Ca}_2\text{A}''$, 6aq. — $\text{Ba}_2\text{A}''$.

OXY-BUTANE-PHOSPHONIC ACID $\text{C}_4\text{H}_8\cdot\text{CH}(\text{OH})\cdot\text{PO}(\text{OH})_2$, (168°). Formed from isobutyric aldehyde by successive treatment with PCl_5 and water (Fossek, *M.* 5, 640). Trimetric crystals; *a:b:c* = 97:1:3.94.

OXY-ISOBUTANE SULPHONIC ACID $\text{CMe}(\text{OH})\cdot\text{CH}_2\text{SO}_3\text{H}$. Formed from ammonium sulphite solution and isobutylene bromide or $\text{CH}_3\text{Br}\cdot\text{CMe}_2\text{OH}$ (Guareschi & Garzino, *Ann. chim. farm.* [4] 6, 110; 9, 96). — BaA' , 1½ aq. — KAA' : plates (from alcohol).

DI-OXY-BUTYL-BENZENE $\text{C}_{10}\text{H}_{18}\text{O}_2$, *i.e.* $\text{C}_6\text{H}_5\cdot\text{CH}(\text{OH})\cdot\text{C}_4\text{H}_9$, (200°). Formed by action of sodium-amalgam on an alcoholic solution of $\text{C}_6\text{H}_5\cdot\text{CO}\cdot\text{C}_4\text{H}_9\cdot\text{CHO}$ which is got from phenyl propyl ketone by successive treatment with FeO_2 and water (Buroker, *C. R.* 94, 220). Syrup. Forms oily $\text{C}_{10}\text{H}_{18}(\text{OAc})_2$.

ISOBUTYL-o-OXY-BENZOIC ACID

$\text{C}_6\text{H}_5(\text{C}_4\text{H}_8)(\text{OH})\text{CO}_2\text{H}$ [4:2:1]. Formed from $\text{C}_6\text{H}_5(\text{C}_4\text{H}_8)\text{ONa}$ and CO_2 at 140° (Dobrzycki, *J. pr.* [2] 86, 891). Needles. — CaA' , 6aq. — BaA' , 2aq; needles, *v. sol.* water.

Ethers MeA' , [54°]. (266°). — EtA' , (276°). Oil. — $\text{C}_6\text{H}_5\text{A}'$, (68°). Formed from the acid, phenol, and POCl_3 . Converted by long boiling into $\text{C}_6\text{H}_5\text{O}_2$, [58°].

DI-OXY-BUTYLENE $\text{C}_4\text{H}_8(\text{OH})_2$. *Crotonylene glycol*. (197°). S.G. 2 1.0616; 2 1.0465. Obtained by the action of boiling baryta on its formyl derivative which is formed when erythrite is distilled with formic acid (Henninger, *B.* 5, 1060; *A. Ch.* [6] 7, 215). Liquid, *sol.* water. Yields $\text{C}_4\text{H}_8(\text{OAc})_2$ (203°).

DI-OXY-DI-BUTYL-DIKETONE.

Anhydride $\begin{array}{c} \text{CH}_2\cdot\text{CH}_2 \\ \text{CHMe}\cdot\text{O} \end{array} > \text{O} < \begin{array}{c} \text{O}\cdot\text{CHMe} \\ \text{CH}_2\cdot\text{CH}_2 \end{array}$. *Di-methyl-oxetone*, (169.5° i.v.). S.G. 2 .978. Formed, together with CO_2 , by heating its carb-

oxylic acid $\begin{array}{c} \text{CH}_2\cdot\text{CH}(\text{CO}_2\text{H}) \\ \text{CHMe}\cdot\text{O} \end{array} > \text{O} < \begin{array}{c} \text{O}\cdot\text{CHMe} \\ \text{CH}_2\cdot\text{CH}_2 \end{array}$ (dialonic acid) [130°] which is got by the action of NaOHAq at 90° on 'divalolactone,' the product of the action of NaOHAq on valerolactone (Fittig, 256, 128). Liquid. Volatile with steam.

OXY-BUTYL-MALEIC ACID. *Lactone*

$\text{CHPr} < \begin{array}{c} \text{C}(\text{CO}_2\text{H}) \\ \text{O}\cdot\text{CO} \end{array} > \text{CH}$. *Propaconic acid*, (124°). Formed by distilling the bromide of propyl-itaconic acid with steam; the acid remains behind and is extracted with ether (Fittig, *A.* 256, 108). — Needles. — BaA' .

OXY-ISOBUTYL-MALONIC ACID $\text{C}_6\text{H}_{12}\text{O}_4$, *i.e.* $\text{C}_6\text{H}_5\cdot\text{C}(\text{OH})(\text{CO}_2\text{H})_2$, [110°–114°]. Obtained from $\text{C}_6\text{H}_5\text{CCl}(\text{CO}_2\text{Et})_2$ and KOH Aq (Conrada, Bischoff, *B.* 13, 600; 14, 617; Guthzeit, *A.* 209, 237). Deliquescent mass, *v. e. sol.* water.

DI-OXY-ISOBUTYL-METAPYRAZOLE

$\text{C}_6\text{H}_5\cdot\text{CH} < \text{N} > \text{C}(\text{OH})$, (210°).

Obtained by boiling with dilute HCl the product $(\text{C}_6\text{H}_5\cdot\text{CH}(\text{CN})\cdot\text{NH}\cdot\text{CO}_2\text{NH}_2)$ of the action of urea upon valeric-aldehyde-cyanhydrin. Small white needles. *M. sol.* alcohol and hot water, *sl. sol.* cold water. Dissolves readily in alkalis (Pinner & Lifschutz, *B.* 20, 2356).

OXY-BUTYL-SUCCINIC ACID. The salts are got by the action of bases on the anhydride. $\text{Ca}(\text{C}_4\text{H}_7\text{O}_4)_2$ 5aq. — BaA'' 2aq. — AgA'' . *Anhydride* $\text{CHPr} < \begin{array}{c} \text{CH}(\text{CO}_2\text{H}) \\ \text{O}\cdot\text{CO} \end{array} > \text{CHPr}$. *Propyl-paraconic acid* [73.5°]. Formed by heating butyric aldehyde with sodium succinate and Ac_2O (Schmidt, *A.* 255, 68). Needles (from ligroin). Yields heptenoic acid and oxy-heptico lactone on distillation. — $\text{Ca}(\text{C}_4\text{H}_7\text{O}_4)_2$ 2aq. — BaA' . — AgA' .

Ethyl ether EtA' , (c. 314° at 96 mm.). **Oxy-isobutyl-succinic acid**. Salts. — $\text{Ba}(\text{C}_4\text{H}_7\text{O}_4)_2$ 2aq. — AgA'' .

Anhydride. Formed, like the preceding isomeride, using isobutyric aldehyde (Zanner, *A.* 255, 86). — $\text{Ba}(\text{C}_4\text{H}_7\text{O}_4)_2$ 2aq. — CaA' 2aq. — AgA' .

OXY-BUTYRAMIDE $\text{C}_4\text{H}_8\text{N}_2\text{O}$, *i.e.* $\text{CMe}_2(\text{OH})\cdot\text{C}(\text{NH})\cdot\text{NH}_2$. The crystalline hydrochloride is formed from oxy-butyrimido-ethyl ether and NH_3 (Pinner, *B.* 17, 2009). It is *v. e. sol.* water.

α -OXY-*n*-BUTYRIC ACID $C_4H_7O_3$, *s.e.* $CH_3CH(OH).CO_2H$. Mol. w. 104. [48°]. Formed by the action of moist Ag_2O upon bromo-*n*-butyric acid (Naumann, A. 119, 115; Friedel & Machuca, A. 120, 279), and by the action of HCl and HCl on propionic aldehyde (Peschibiteck, B. 9, 1812). Formed also by reduction of ethyl-glyoxylic acid. Deliquescent crystals. Yields propionic acid on oxidation (Markownikoff, A. 176, 309; Leya. Popoff, A. 174, 361).— CaA' , 6aq. ZnA' , 2aq. S. 2-35 at 18°.— AgA' : prisms.

Ethyl ether EtA' . (167° i. v.). S.G. 2 1.004; 12-995 (Schreiner, B. 12, 177; A. 197, 21). Yields ethyl-glyoxylic ether on oxidation (Aristoff & Demjanoff, C. C. 1887, 1157). Acetyl derivative $CH_3CH(OAc).CO_2Et$ (198°) (Gal, A. 142, 873). Butyryl derivative (215°).

Methyl derivative $CH_3CH(OMe).CO_2H$. Formed from its Me and Et ethers which are made by the action of $NaOMe$ on bromo-butyric ether (Duvillier, C. R. 86, 47, 1026; 87, 931; 88, 598; A. Ch. [5] 17, 528). Liquid, sol. water.— AgA' — MeA' . (150°–155° i. v.).— EtA' . (160°) (D.); (148° i. v.) (Schreiner, A. 197, 16).

Ethyl derivative $CH_3CH(OEt).CO_2H$. Formed from its ether, which is made from bromo-butyric ether and $NaOEt$. Liquid, v. sol. water.— KA' — BaA' — AgA' — MeA' . (167°)— EtA' . (168°–174°) (D.); (169° i. v.) (S).

Methyl derivative of the amide $CH_3CH(OMe).CONH_2$. [78°]. Formed from $CH_3CH(OMe).CO_2Me$ and alcoholic NH_3 (D.). Slender needles, v. sol. water.

Ethyl derivative of the amide $CH_3CH(OEt).CONH_2$. [69°]. Lamine, sol. water.

β -Oxy-*n*-butyric acid

$CH_3CH(OH).CH_2CO_2H$. Occurs in urine and blood of diabetic patients (Külz, Zeit. Biol. 20, 165; 23, 329; Minkowski, Fr. 24, 153; Stadelmann, Zeit. Biol. 32, 456; Wolpe, C. C. 1887, 277; Hugouenq, Bl. [2] 47, 545; Deichmüller, Szymanski, A. Tollens, A. 228, 92). Formed by reducing acetoacetic acid with sodium-amalgam (Wislicenus, A. 149, 205), and from propylene chlorhydrin by successive treatment with KCy and KOH (Markownikoff, A. 153, 287). Obtained also by oxidising aldol with moist Ag_2O (Wurtz, C. R. 76, 1165). Thick syrup, volatile with steam. Decomposes at 130° into water and (α)-crotonic acid. When prepared from urine it is levorotatory; $[\alpha]_D = -23.4$.— NaA' : very deliquescent needles.— ZnA' — CuA' — AgA' .

Ethyl derivative

$CH_3CH(OEt).CH_2CO_2H$. (c. 215°). Formed by the action of HCl on the nitrile, which is formed by combining allyl cyanide with alcohol (Pinner, B. 12, 2057).

Amide $CH_3CH(OEt).CH_2CONH_2$. [71°].

γ -Oxy-*n*-butyric acid

$CH_3CH(OH).CH_2CH_2CO_2H$. Obtained by the action of boiling lime- or baryta-water upon its lactones, which is formed by treating succinyl chloride, dissolved in $HOAc$ and ether, with sodium-amalgam (Saytzeff, B. 6, 1255; A. 171, 270; J. pr. [2] 25, 66; Bl. [2] 87, 540). Formed also from $CH_3Br.CH_2CH_2OH$ by successive treatment with alcoholic KCy and potash (Frühling, M. 8, 700), and by boiling oxy-ethyl-acetoacetic ether with conc. baryta-water (Ochanaroff, A. 235, 325). Liquid, which volatilises in the cold. Volatile with steam. Sol. water. Forms the

lactone slowly in the cold, more quickly on heating. Chromic acid mixture oxidises it to succinic acid.— KA' : deliquescent tufts.— NaA' .— ZnA' , (dried at 100°).— BaA' , (dried at 110°): dendritic mass (from alcohol).

Butyrolactone. Formed as above. Formed also by heating the lactonic acid of γ -oxy-ethyl-malonic acid at 120° (Röder, A. 227, 22), and by heating γ -chloro-butyric acid at 200° (Henry, C. R. 101, 1158). Mobile liquid, miscible with water, but separated therefrom by K_2CO_3 . May be converted into *n*-butyric acid by successive treatment with HI and sodium-amalgam.

α -Oxy-isobutyric acid $(CH_3)_2C(OH).CO_2H$. Acetonic acid. Butylactic acid. [79°]. (212°).

Formation.—1. From acetone, HCl , and $HClAq$ (Städeler, A. 111, 320).—2. From bromo-isobutyric acid and moist Ag_2O or Na_2CO_3 (Markownikoff, A. 146, 339; 153, 228, 251; Fittig, A. 200, 70).—3. From dimethyl oxalate by treatment with $ZnMe$, followed by water (Frankland & Dupon, A. 133, 80; 135, 25).—4. By oxidising isobutyric acid with alkaline $KMnO_4$ (R. Meyer, A. 219, 240).—5. By oxidising di-oxy-pentane (amylene glycol) with diluted HNO_3 (Wartz, A. 107, 197).—6. By heating acetone-chloroform with water at 180° (Willgerodt, B. 15, 2807; Bl. [2] 39, 157). Hygroscopic needles, v. e. sol. water, alcohol, and ether. Volatile with steam. Sublimes at 50°. Yields acetone and acetic acid on oxidation. Phenyl-hydrazine at 160° forms a ψ -phenyl-hydrazide [152°] converted by nitrous acid into α -nitrosamine [98°] (Reissert & Kayser, B. 22, 2926).

Salts.— BaA' .— ZnA' , 2aq: hexagonal plates, sl. sol. water. S. 6 at 15°.— AgA' : stellate groups of nacreous scales. S. 7.

Ethyl ether EtA' . (161°).

Ethyl derivative $(CH_3)_2C(OEt).CO_2H$. (180°). S.G. $\frac{1}{4}$ 1.0211; $\frac{1}{2}$ 1.0101. Formed from $CMe_2Br.CO_2H$ and $KOEt$ (Hell & Waldbauer, B. 10, 449).— BaA' , aq.— PbA' , aq.— ZnA' — AgA' : plates: m. sol. water.— EtA' (155°).

Isopropylidene derivative $C_3H_7O_3$, *s.e.* $CMe_2(O.CMe_2.CO_2H)_2$. (197° uncorr.). V.D. 120-3 (calc. 124). Formed by the action of KOH (8 mols.) on acetone-chloroform (2 mols.) and acetone (1 mol.), or upon a mixture of chloroform (2 mol.) and acetone (2 mols.) (Willgerodt, B. 20, 2445; Engel, C. R. 104, 688). Liquid, converted into oxy-isobutyric acid by heating with water.— CaA' , 1½ aq.— BaA' , ½ aq.— PbA' (W.); PbA' , 2aq (E.).— ZnA' , aq: small scales (W.); ZnA' , 2aq (E.).

Nitrile v. ACETONE CYANHYDRIN, vol. i. p. 31.

Anhydride $C_4H_6O_3$, *s.e.* $O(CMe_2.CO_2H)_2$. **Butylactic acid**. A product of the action of alcoholic potash on chloro-isobutyric acid (Balbiano, J. 1878, 704; 1880, 789). Amorphous, v. sol. water.— NaA' : deliquescent.

α -Di-oxy-butyric acid

$CH_3CH(OH).CH(OH).CO_2H$. [80°]. Formed by boiling bromo-oxy-butyric acid with water (O. Kolbe, J. pr. [2] 26, 390), and by heating β -methylglycidic acid with water at 100° in sealed tubes (Malikoff, J. R. 16, 526; B. 21, 2055). Mass of slender needles, v. e. sol. water, not volatile with

steam.—AgA': needles. Gives a silver mirror when boiled with water.

Ethyl ether EtA'. (c. 228°). Liquid.

Anhydride v. METHYL-GLYCIDIC ACID.

β-Di-oxy-butyric acid

$\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$. *Butylglyceric acid*. Formed from $\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{Cl}$ by successive treatment with KOy and dilute HNO_3 (Hanriot, *A. Ch.* [5] 17, 106). Formed also by warming its anhydride with water (Mejlikoff, *B.* 15, 2587). Thick liquid, v. sol. water, alcohol, and ether.—BaA': amorphous.

Anhydride $\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$. *Butylglycidic acid*. Formed from (β)-crotonic acid by successive treatment with HCl and alcoholic potash. Mobile liquid. Unites with HCl, forming chloro-oxy-butyric acid [99°]. The ether $\text{C}_4\text{H}_7\text{EtO}$, (145°–150°), S.G. d_4^{20} 0.9931 is formed by the action of sodium-amalgam on a mixture of epichlorhydrin and chloroformic acid (Kelly, *Ch.* 1, 2225).

Di-oxy-isobutyric acid

$\text{CH}_2(\text{OH})\text{CMe}(\text{OH})\text{CO}_2\text{H}$. [100°]. Formed from α-methyl-glycidic acid (q. v.) by warming with water at 100° (Melikoff, *J. R.* 16, 535). Prisms, v. sol. water.—KA' ½ aq: small prisms.

Tri-oxy-isobutyric acid

$\text{C}(\text{OH})_3\text{C}(\text{OH})\text{CO}_2\text{H}$. [116°]. Formed from glycerose by successive treatment with HCl and HCl (Fischer a. Tafel, *B.* 22, 106). Prisms (from alcohol), insol. benzene. HIAq followed by zinc-dust yields isobutyric acid.—CaA', 4 aq.—PbA', aq: needles, sl. sol. hot water.

A tri-oxy-butyric acid is also formed in the oxidation of gallic acid and tannin by dilute HNO_3 (Böttinger, *A.* 257, 248).

References.—Bromo- and Chloro-oxybutyric ACIDS.

α-OXY-*n*-BUTYRIC ALDEHYDE v. ALDOL

α-OXY-ISOBUTYRIC ALDEHYDE

$\text{CMe}_2(\text{OH})\text{CHO}$. (c. 90°). Obtained by boiling with HOAc the compound $\text{C}_4\text{H}_8\text{O}_3$ formed by the action of NaOOC_2H_5 on iodoform (Gorboff, *J. pr.* [2] 41, 243). Mobile liquid, oxidised by Ag_2O to oxy-isobutyric acid [79°]. Forms with water a hydrate (c. 70°). Polymerises on standing, forming prisms [c. 65°] v. sol. water.

Di-isobutyl derivative of oxyisobutyric orthoaldehyde $\text{CMe}_2(\text{OC}_2\text{H}_5)\text{CH}(\text{OH})(\text{OC}_2\text{H}_5)$. (125°). S.G. d_4^{20} 0.9041. One of the products of the action of iodoform (or iodine) on NaOOC_2H_5 . Oil, with bitter taste. Converted by HOAc into isobutyl acetate and oxyisobutyric aldehyde.

OXY-BUTYRIC IMIDO-ETHYL ETHER

$\text{CMe}_2(\text{OH})\text{C}(\text{NH})\text{OEt}$. The hydrochloride $\text{C}_4\text{H}_7\text{NO}_2\text{HCl}$ is formed from acetone, HCl, alcohol, and HCl (Pinner, *B.* 17, 2009). It is crystalline.

OXYBUTYROCYAMINE v. GUANIDO-BUTYRIC ACID.

OXY-CAFFEINE v. CAFFEINE.

OXY-CAMPHOR v. CAMPHOR and CAMPHORIC ACID.

OXY-CAMPHORAMIC ACID v. CAMPHORIC ACID.

OXY-CAMPHORIC ACID v. CAMPHORIC ACID.

OXY-CAMPHORIC ANHYDRIDE v. CAMPHORIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY-CAPROIC ACID v. OXY-HEXANOIC ACID.
OXYTRICARBALLYLIC ACID. *Methyl derivative* $\text{C}_6\text{H}_5(\text{OMe})(\text{CO}_2\text{H})_3$. Formed by heating $\text{C}_6\text{H}_5(\text{OMe})(\text{CO}_2\text{H})_3$ with dilute HNO_3 (Schatzky, *J. R.* 17, 85). Syrup.— $\text{CaH}_4\text{A}'''$, ½ aq.— $\text{BaH}_4\text{A}'''$, 2 aq.

OXY-CARBOSTYRIL v. DI-OXY-QUINOLINE.

OXY-CARBOXYLIC ACID v. BENZENE-TRIQUINONT.

OXY-*o*-CARBOXY-PHENYL-ACETIC ACID
 $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CH}(\text{OH})\text{CO}_2\text{H}$. Formed from $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ and sodium-amalgam (Scherka, *B.* 18, 381). Quickly changes, when set free, to the anhydride (phthalide carboxylic acid) [149–5°].

Oxy-carboxy-di-phenyl-acetic acid
 $\text{C}_6\text{H}_5(\text{CO}_2\text{H})\text{CPh}(\text{OH})\text{CO}_2\text{H}$. [c. 80°]. Formed by warming benzil *o*-carboxylic acid with alkalis (Graebe, *B.* 21, 2003).— $\text{K}_2\text{A}''$ 2 aq.

Di-oxy-di-carboxy-phenyl-acetic acid. *Tri-ethyl-ether* $\text{C}_6\text{H}_3(\text{OH})_2(\text{CO}_2\text{Et})_2\text{CH}_2\text{CO}_2\text{Et}$. [98°]. Formed from acetone dicarboxylic ether and sodium (Cornelius a. Pechmann, *B.* 19, 1448). Needles (from alcohol), insol. water.

γ-OXY-*o*-CARBOXY-PHENYL-BUTYRIC ACID. *Lactone* $\text{C}_{11}\text{H}_{10}\text{O}_5$. [121°]. Formed by reducing the anhydride of carboxy-benzoyl-propionic acid with sodium-amalgam (Roser, *B.* 17, 2773).— $\text{AgC}_{11}\text{H}_{10}\text{O}_5$.— $\text{AgC}_{11}\text{H}_{10}\text{O}_5$.

An isomeric lactone [140°] is obtained by reducing phthalyl-propionic acid (Gabriel a. Michael, *B.* 11, 1681).— $\text{BaC}_{11}\text{H}_{10}\text{O}_5$.— $\text{BaC}_{11}\text{H}_{10}\text{O}_5$.— $\text{AgC}_{11}\text{H}_{10}\text{O}_5$.

OXY-CARBOXY-PHENYL-PROPIONIC

ACID. *Lactone* $\text{C}_{12}\text{H}_{10}\text{O}_5$, &c.

$\text{C}_6\text{H}_5\text{CH}(\text{CO})\text{CH}_2\text{CO}_2\text{H}$. Formed by reducing

phthalyl-acetic acid with sodium-amalgam, and acidifying (Gabriel a. Michael, *B.* 10, 1558, 2200). Needles (containing aq). Yields $\text{AgC}_{12}\text{H}_{10}\text{O}_5$, $\text{AgC}_{12}\text{H}_{10}\text{O}_5$, and $\text{BaC}_{12}\text{H}_{10}\text{O}_5$, 2 aq.

Tri-oxy-carboxy-phenyl-propionic acid.

Lactone $[4:3:1]\text{C}_6\text{H}_3(\text{OH})_3\text{CH}(\text{CO})\text{CH}_2\text{CO}_2\text{H}$.

[228°]. Formed by reducing its di-methyl derivative (meconic-acetic acid) with HI and P (Liebermann a. Kleemann, *B.* 19, 2298). Tables. Gives a blue colour with FeCl_3 .

Ethyl ether EtA'. [c. 131°]. Crystalline.

OXYCHRYSOQUINONE v. CHRYSOQUINONE.

OXYCINCHENE v. CINCHENE.

OXYCINCHONIDINE v. CINCHONIDINE.

OXY-CINNAMIC ACID v. COUMARIC ACID.

α-Oxy-cinnamic acid. $\text{C}_6\text{H}_5\text{CH}(\text{CO}_2\text{H})\text{CO}_2\text{H}$.

Formed in small quantity in the preparation of the isomeric phenyl-glycidic acid by the action of alcoholic potash on $\text{C}_6\text{H}_5\text{CHBr}\text{CH}(\text{OH})\text{CO}_2\text{H}$ (Pfechl, *B.* 16, 2821). Readily decomposes, yielding phenyl-acetic aldehyde and di-oxy-phenyl-propionic acid.

Phenyl derivative

$\text{C}_6\text{H}_5\text{CH}(\text{CO}(\text{Ph}))\text{CO}_2\text{H}$. [180°]. Formed by heating sodium phenoxy-acetate with benzoic aldehyde and Ac_2O (Ogialoro, *O. J.* 40, 276). Prisms.—AgA': prisms (from water).

(3, 2, 1)-Di-oxy-cinnamic acid.

[3:2:1] $\text{C}_6\text{H}_3(\text{OH})_3\text{CH}(\text{CO}_2\text{H})\text{CO}_2\text{H}$.

Anhydride $\text{C}_6\text{H}_3(\text{OH})_3\text{CH}(\text{CO})\text{CO}_2\text{H}$. *m-Oxy*

coumarin. [280°-285°]. Formed by heating pyrocatechin with malic acid and H_2SO_4 (Bezzeri, G. 15, 34). Needles, sl. sol. cold water. Reduces salts of Au, Cu, and Ag.

(4, 8, 1)-Di-oxy-cinnamic acid v. **CAFFEIC ACID**.

(5, 2, 1)-Di-oxy-cinnamic acid

[5:2:1] $C_6H_3(OH)_2CH:CH.CO_2H$.

Anhydride $[5 \frac{1}{2}] C_6H_3(OH)_2 \begin{matrix} OH:CH \\ O.CO \end{matrix}$

[250°]. Formed by heating a mixture of hydroquinone, malic acid, and H_2SO_4 (Pechmann a. Welsh, B. 17, 1648). Needles, v. sol. alcohol. Yields an acetyl derivative [147°] crystallizing in needles. The methyl derivative [108°] is got from [5:2:1] $C_6H_3(OMe)_2(OH)CHO$ by boiling with Ac_2O and $NaOAc$ (Tiemann a. Müller, 14, 1996).

o-Methyl derivative

[5:2:1] $C_6H_3(OH)(OMe)CH:CH.CO_2H$. [180°]. Obtained from $C_6H_3(NH_2)(OMe)CH:CH.CO_2H$ by the diazo-reaction (Sehnell, B. 17, 1387). Crystals.

Di-methyl derivative

$C_6H_3(OMe)_2CH:CH.CO_2H$. [143°]. Obtained by methylating the *o*-methyl derivative. Needles. Yields di-methyl-gentisic aldehyde on oxidation with $KMnO_4$.

(4, 2, 1)-Di-oxy-cinnamic acid v. **UMBELLIC ACID**.

op-di-oxy-cinnamic acid. Phenyl-methyl derivative $C_6H_3(OMe)_2CH:C(OPh).CO_2H$ [200°]. A product of the action of anisic aldehyde and Ac_2O on sodium phenoxy-acetate (Valentini, G. 14, 147). Rectangular tablets, sol. hot alcohol.— MeA' . [100°]. Laminæ.

Anhydride of the phenyl derivative $C_{11}H_9O_5$. [113°]. Formed from salicylic aldehyde, Ac_2O , and sodium phenoxy-acetate (Ogliaro, C. C. 1887, 1164). Yellow prisms, v. sl. sol. hot water.

Tri-oxy-cinnamic acid v. **ESCOLETIC ACID** and **DAPHNETIN**.

Tetra-oxy-cinnamic acid. *Di-methyl methylene ether* $C_6H_3(O_2CH_3)_2CH:CH.CO_2H$. [196°]. Formed from apioic aldehyde, Ac_2O , and $NaOAc$ (Ciamician a. Silber, B. 23, 2485). Small yellow needles (from hot alcohol), sl. sol. ether and hot water.

OXY-CINNAMIC ALDEHYDE v. **COUMARIC ALDEHYDE**.

Di-oxy-cinnamic aldehyde. *Methyl derivative* v. **FERULIC ALDEHYDE**.

OXY-CINNOLINE

$C_6H_3N_2O$ i.e. $C_6H_3 \begin{matrix} C(OH):CH \\ N=N \end{matrix}$. [225°]. Formed by heating its carboxylic acid at 260° (Richter, B. 16, 681). Small prisms, v. sol. alcohol and ether, sl. sol. water. May be sublimed. Sol. Na_2CO_3 Aq.— $B'H_2PtCl_6$: small prisms.

Oxy-cinnoline carboxylic acid

$C_6H_3 \begin{matrix} C(OH):C.CO_2H \\ N=N \end{matrix}$. [c. 265°]. Formed from *o*-diazo-phenyl-propionic acid by heating with water at 70°. Colourless needles or scales, sol. HCl Aq. sl. sol. alcohol, nearly insol. water.

OXY-CITRAQUONIC ACID $C_6H_3O_4$ i.e.

$O \begin{matrix} OMe.CO_2H \\ CH.CO_2H \end{matrix}$. [162°]. Formed from citraconic acid by successive treatment with $HOCl$ and alkalis (Morawski, J. pr. [3] 10, 69; 11,

430; Scherko, A. 227, 233; Michael, J. pr. [2] 40, 171; Melikoff a. Feldmann, A. 253, 89). Prisms (containing aq). Hot water converts it into propionic aldehyde and CO_2 . With HBr it forms $C_6H_3BrO_3$ [156°]. HCl yields, in like manner, $CO_2H.CClMe.CH(OH).CO_2H$ [162°].

Salts.— $(NH_4)_2A'$.— $(NH_4)HA'$.— KHA' .— BaA' 4aq.— SrA' 4aq.— PbA' 4aq.

Ethyl ether Et_2A' (255°). S.G. 1.1876; 1.1167 C.E. (0°-22°) 0.008607.

OXY-CITRIC ACID $C_6H_3O_4$ i.e.

$C_6H_3(OH)_2(CO_2H)_2$. Occurs in beetroots (Lippmann, B. 16, 1078). Formed from aconitic acid by successive treatment with $HOCl$ and lime-water (Pawollek, A. 178, 160). Deliquescent mass, v. e. sol. water.—Salts: BaA' 5aq.— CaA' 9aq.— CaA''' 10aq.— $Cd(C_6H_3O_4)_2$ 6aq.— $Cu(C_6H_3O_4)_2$ 2aq.— Et_2A''' — Et_2A''' with bitter taste.

OXYCOBALTAMINES v. vol. ii, p. 224.

OXYCUMENIC ACID v. **CUMENIC ACID**.

OXY-CONICEINE v. **CONICINE**.

OXY-COPAIVIC ACID v. **COPAIIC ACID**.

OXY-COUMARIC ACID v. **DI-OXY-CINNAMIC ACID**.

OXY-COUMARILIC ACID v. **COUMARILIC ACID**.

OXY-COUMARIN v. *Anhydride of Di-oxy-cinnamic acid and Umbelliferone*.

Di-oxy-coumarin v. **DAPHNETIN**.

OXY-COUMARONE v. **COUMARONE**.

β -OXY-CROTONIC ACID. *Methyl derivative* $CH_3.C(OMe).CH.CO_2H$. [128-5°]. Formed from β -chloro-crotonic acid and $NaOMe$ (Friedrich, A. 219, 327, 334). Crystals, insol. water.

Ethyl derivative $CH_3.C(OEt).CH.CO_2H$. [137-5°]. Formed from $OH_2.CCl:CH.CO_2Et$ and alcoholic potash. Prisms, v. sol. alcohol and ether.— KA' : plates.— KA' 3aq: needles.— EtA' . [30°]. Decomposed by dilute H_2SO_4 into acetone, CO_2 , and alcohol.

Phenyl derivative $CH_3.C(OPh).CH.CO_2H$. [150°]. Formed by heating sodium β -chloro-crotonate or β -chloro-isocrotonate with $NaOPh$ (Autenrieth, A. 254, 240). Crystals, v. sl. sol. hot water. Yields $CH_3.C(OPh).CH_2$ (162°) on heating.

The above compounds may be viewed as derivatives of acetoacetic acid (q. v.).

β -Oxy-isocrotonic acid. This acid is not known in free state, for, like the preceding isomeride, it would at once change to acetoacetic acid.

Methyl ether of the methyl derivative $CH_3.C(OMe).CH_2.CO_2Me$. (175°). S.G. 1.0235. Formed from $CH_2.CCl.CH_2.CO_2Me$ and $NaOMe$ (Enke, A. 256, 206).

Methyl ether of the ethyl derivative $CH_3.C(OEt).CH_2.CO_2Me$. [12°]. (195°). S.G. 1.099.

Ethyl ether of the ethyl derivative $CH_3.C(OEt).CH_2.CO_2Et$. [29°]. (195° cor.). Formed from β -chloro-isocrotonic ether and $NaOEt$ (Koll, A. 249, 324). Plates.

Propyl derivative of the methyl ether $CH_3.C(OPr).CH_2.CO_2Me$. (230°). S.G. 0.981.

Isobutyl derivative of the methyl ether $CH_3.C(OObu).CH_2.CO_2Me$. (258°). S.G. 0.980.

α -Oxy-isocrotonic acid. *Nitrile* $CH_2:CH.CH(OH).CN$. Formed from acrolein

KCy, and HOAc (Lobry de Bruyn, R. T. *C.* 4, 223). Oil.

Isomerides *v.* OXY-METHACRYLIC ACID and ACETOACETIC ACID.

OXYCUMENE *v.* CUMENOL.

Di-oxy-cumene. Di-methyl derivative $C_6H_4(C_6H_5)(OMe)_2$ (246°). Formed by the action of sodium on an alcoholic solution of $C_6H_5(C_6H_5)(OMe)_2$ (263°), which is got by boiling the isomeric methyl ether of eug-nol with alcoholic potash (Giamician a. Silber, B. 28, 1164). Colourless oil.

m-Di-o-oxy-ψ-cumene $C_6H_4(CH_3)(CH_2OH)_2$ [4:3:1]. [77°]. Formed by boiling *m*-di-o-bromo-ψ-cumene with aqueous Na_2CO_3 . V. sol. water and alcohol, f. sol. ether (Hjelt a. Gadd, B. 19, 867).

Isomeride *v.* HYDRO-ψ-CUMOQUINONE.

Tri-oxy-cumene. Di-methyl derivative $C_6H_4(C_6H_5)(OMe)_3(OH)$ (278°). Formed by reduction of iso-apio. (Giamician a. Silber, B. 28, 2285). Thick liquid, sol. KOH aq.

Isomeride *v.* PROPYL-PYROGALLOL.

OXY-CUMIDINE *v.* AMIDO-CUMENOL.

OXY-ψ-CUMINIC ACID

$C_6H_4Pr(OH).CO_2H$ [3:2:1]. [94°]. Formed from *o*-propyl-phenol, Na, and CO_2 (Spica, J. 1878, 585).— BaA' , 2jaq.— PbA' , 2jaq.— AgA' : pp.

Oxy-*n*-cuminic acid

$C_6H_4Pr(OH).CO_2H$ [5:2:1]. [98°]. Formed from *p*-propyl-phenol, Na, and CO_2 (Spica). Coloured violet by $FeCl_3$.— BaA' , 3aq.— PbA' , 2aq.— AgA' .

Oxy-cuminic acid $C_6H_4Pr(OH).CO_2H$ [4:2:1]. [93°]. *Formation*.—1. By fusing carvacrol with potash (Jacobsen, B. 11, 1063).—2. By fusing isocymene sulphonic acid with potash (Jacobsen, B. 12, 432).—3. From amido-cuminic acid by the diazo-reaction (Widman, J. 19, 270).

Properties.—Flat needles or leaflets. Converted by HCl at 190° into *m*-propyl-phenol [26°] (228° i.v.). $FeCl_3$ gives a reddish-violet colour. Yields CaA' , and BaA' .

Oxy-cuminic acid $C_6H_4Pr(OH).CO_2H$ [4:3:1]. [141°]. *Formation*.—1. From amido-cuminic acid (Cahours, A. Ch. [3] 53, 338; Lippmann a. Lange, R. 13, 1462).—2. Among the products got from thymol by potash-fusion (Barth, B. 11, 1571).—3. By oxidation of potassium cumylsulphate $C_6H_5MePr.O.SO_3K$ [1:4:3] or cumylphosphate $C_6H_5MePr.O.PO_3K$ [1:4:3] with alkaline $KMnO_4$, and saponification of the resulting sulphate or phosphate (Heymann a. Kgnigs, B. 19, 3306).

Properties.—Slender, needles, * al. sol. cold water. Not attacked by conc. HCl aq at 200°.

Salts.— NaA' 2aq. = $Na_2O_3H_2O$, 1jaq.— BaA' , aq.— CdA' , aq.— AgA' : white pp.

Ethyl ether EtA'. [76°]. Prisms.

Ethyl derivative $C_6H_4Pr(OEt).CO_2H$ [140°]. Crystalline powder.— CdA' ,— AgA' .

*Oxy-*p*-cuminic acid* $C_6H_4Pr(OH).CO_2H$ [3:2:1] [72°]. Formed, together with $C_6H_4Pr(OH)(CO_2H)_2$ [295°], from isopropyl-phenol, Na, and CO_2 (Fieser, G. 16, 126). Colourless needles. $FeCl_3$ colours it violet.

*Oxy-*o*-cuminic acid* $C_6H_4Pr(OH).CO_2H$ [5:2:1]. [121°]. Obtained from *p*-isopropyl-phenol, sodium, and CO_2 (Patesco, J. 1878, 806). Formed also by fusing *m*-isocymenol with KOH (Jesurun, B. 19, 1415). Flat needles. $FeCl_3$ colours its solution, deep bluish-violet.— CaA' ,— BaA' ,— AgA' .

An isomeride [166°–170°] is got by fusing *β*-isocymene sulphonic acid with potash (Jacobsen, B. 12, 433).

Oxy-ψ-cuminic acid

$C_6HMe_3(OH).CO_2H$ [6:5:3:2:1]. [181°]. Formed from sodium ψ-cumenol and CO_2 (Krohn, B. 21, 884). Needles, v. sol. ether.

Oxy-ψ-cuminic acid

$C_6HMe_3(OH).CO_2H$ [1:3:4:5:6]. [148°]. Formed by fusing durenol with potash (Jacobsen a. Schnapauff, B. 18, 2844). Small needles, nearly insol. cold water. HCl aq at 200° yields ψ-cumenol [93°].— CaA' , 2aq; prisms, sl. sol. cold aq.

Di-oxy-ψ-cuminic acid

$C_6Me_3(OH).CO_2H$ [6:4:8:5:2:1]. [210°]. Formed by reducing ψ-cumoquinone carboxylic acid with zinc-dust and aqueous NaOH (Nef, B. 18, 3498; A. 237, 18; J. J. 53, 428). Needles, m. sol. hot water. Reduces ammoniacal $AgNO_3$. Its alkaline solution turns violet in air.

Ethyl ether EtA'. [109°]. Needles.

OXY-ψ-CUMINIC ALDEHYDE $C_{10}H_{12}O_2$, i.e. $C_6HMe_3(OH).CHO$ [6:5:3:2:1]. [106°]. A product of the action of chloroform and NaOH aq upon ψ-cumenol (Auwers, B. 17, 2976). Needles.

DI-OXY-DI-ψ-CUMYL $C_{10}H_{12}O_2$, i.e.

$C_6HMe_3(OH).C_6HMe_3(OH)$. [173°]. Formed in the preparation of ψ-cumenol from ψ-cumidine by the diazo-reaction, and also by oxidation of ψ-cumenol with dilute HNO_3 (Auwers, B. 17, 2982; 18, 2659). Crystals. Yields a di-bromo-derivative [187°] and a di-methyl derivative [126°].

α-OXY-CUMYL-ACETIC ACID $C_{11}H_{14}O_3$, i.e.

$C_6H_4Pr.CH(OH).CO_2H$. [158°]. Formed from cuminic aldehyde, Hcy, and HCl (Raab, B. 8, 1148). Needles.— BaA' , 4aq.— PbA' .

Oxy-di-cumyl-acetic acid

$(C_6H_5.C_6H_5).C(OH).CO_2H$. [120°]. Formed from $C_6H_5.C_6H_5.CO.CO.C_6H_5.C_6H_5$, by potash-fusion (Boesler, B. 14, 326). Needles.— BaA' .

OXY-CUMYL-ACRYLIC ACID $C_{12}H_{16}O_3$, i.e. $C_6H_5(C_6H_5)(OH).CH:CH.CO_2H$. The (4,2,1)-acid [176°] and the (4,3,1)-isomeride [206°] are formed by the diazo-reaction from the corresponding amido-acids. Both are crystalline (Widman, B. 19, 268, 417).

DI-OXY-DI-CUMYL-PYRAZINE DICARB-OXYLIC ACID

[1:4:3] $CO_2H.C_6H_4Pr.N \begin{matrix} C(OH).CH \\ C(OH) \end{matrix} > N.CO_2H.Pr.CO_2H$ [84:1].

Formed by boiling $CH_2Cl.CO.NH.C_6H_4Pr.CO_2Me$ with alcoholic potash (Abenius, J. pr. [2] 40, 440). Insoluble powder.— EtA' [193°].

OXYCYANCONINE *v.* CYANCONINE.

OXYCYANETHINE *v.* CYANETHINE.

OXY-CYCLOPIN $C_{10}H_{12}O_3$. A glucoside in Cape Tea split up by dilute acids into oxycyclopic acid $C_{10}H_{12}O_3$ and glucose (Greenish, Ph. [3] 11, 569).

DI-OXY-DICUMYL $C_{12}H_{16}O_3$, i.e.

$C_6H_5Me(C_6H_5)(OH).C_6H_5Me(C_6H_5)(OH)$. [165-5°]. Formed by oxidising thymol with iron-alum (Dianin, J. R. 14, 135). Prisms or tables (containing aq), v. sol. alcohol.

OXY-CUMYL-ACRYLIC ACID $C_{12}H_{16}O_3$, i.e. [2:5:6:1] $C_6H_5Me(C_6H_5)(OH).CH:CH.CO_2H$. The anhydride [58°] (220°–230°) is formed by heating thymol with malic acid and H_2SO_4 (Fechmann a. Walsh, B. 17, 1847).

The isomeride (2,5,4,1)-acid [980°] is formed from thymotic aldehyde, NaOAc, and Ac_2O

(Kotek, B. 16, 2104). It yields a crystalline methyl derivative [141°].

DI-OXY-DI-CYMYL-ETHANE $C_{10}H_{18}O_2$, *i.e.* $CH_3CH(C_6H_4OH)_2$. [185°]. Formed from thymol, paraldehyde, chloroform, and $SnCl_4$ (Steiner, B. 11, 287). Needles (from benzene). Yields $C_6H_5CH_2(OEt)_2$ and $C_6H_5(OAc)$, [100°].

DI-OXY-DI-CYMYL-ETHYLENE $CH_2C(C_6H_4OH)_2$. [171°]. Formed, together with the preceding body, from $CCl_4CH(C_6H_4OH)_2$ by boiling with alcohol and zinc-dust (Jaeger, B. 7, 1198; C. J. 81, 268). Oxidised by alkaline K_2FeO_4 to $C_{10}H_{16}O_2$ [215°] and $C_{10}H_{14}O_2$ [215°].

DI-OXY-DI-CYMYL SULPHIDE $(C_6H_4MePr(OH))_2S$. [153°] (Tassigari, G. 17, 83).

DI-OXY-DECANE $C_{10}H_{20}O_2$. *Decylene glycol*. *Diamylene glycol*. The diacetyl derivative, formed from di-bromo-decane and $AgOAc$, yields on saponification with KOH the anhydride $C_{10}H_{16}O$ (diamylene oxide) (Bauer, J. 1862, 450).

Di-oxy-decane $CMePr(OH).CMePr(OH)$. *Methyl propyl pinacone*. (c. 223°). Formed from methyl *n*-propyl ketone, water, and Na (Friedel, J. 1869, 513). Dilute H_2SO_4 converts it into the pinacol $C_{10}H_{20}O$ (185° uncor.) (Szymanski, B. 19, 1532). The isomeric $CEt(OH).CEt(OH)$ [28°] is formed in like manner from di-ethyl-ketone (Schramm, B. 16, 1584).

Tetra-oxy-decane. Anhydride $\langle CMe(OH).CH_2.CMe \rangle O$. (270°). Formed from $(CH_3CO)_2CH_2$ and sodium-amalgam in presence of a dilute acid (Combes, A. Ch. [6] 12, 230). Liquid, v. sl. sol. water.

γ-OXY-DECOIC ACID. Lactone $C_{10}H_{18}O_2$, *i.e.* $C_6H_{11}OH \langle \underset{CO}{CH_2CH_2} \rangle$. (281° uncor.). Formed from bromo-decoic acid and Na_2CO_3 (Schneegans, A. 227, 92). Yields $Ba(C_{10}H_{17}O_2)_2$ aq and $AgC_{10}H_{17}O_2$.

Oxy-decoic acid $CH_3Pr.CH(OH).CHPr.CO.H$. [120°]. Formed from isovaleric ether and Na (Wohlbrück, B. 20, 2332). Needles, v. sol. hot water.— BaA' — AgA' aq: amorphous.

Oxy-decoic acid $C_{10}H_{18}O_2$, *i.e.* $C_6H_5CH(OH).CH(C_6H_5).CO.H$. [120°]. Formed by the action of alcoholic potash at 110° on $C_6H_5CH(OEt).CH(C_6H_5).CO.Et$, which constitutes half the product of the action of sodium on isovaleric ether (Hantzsch, A. 249, 64).

DI-OXY-DECYLENE. Di-valeryl-derivative $C_6H_5CH(O.CO.C_6H_5).C(O.CO.C_6H_5).C_6H_5$. (155°–165° at 12 mm.) (Klinger a. Schmitz, B. 24, 1275).

DI-OXY-DODECANE $CEtPr(OH).CEtPr(OH)$. 255°. Formed from ethyl propyl ketone, water, and Na (Oechsner a. Coninck, B. [2] 25, 10). Liquid. The isomeric 'methyl butyl pinacones' $CHMeEt.CMe(OH).CMe(OH).CHMeEt$ (249°) and $CMe.CMe(OH).CMe(OH).CMe$ (69°) are prepared in like manner (Wislicenus, A. 219, 810; Friedel a. Silva, J. 1878, 340).

TRI-OXY-DODECINOIC ANHYDRIDE $C_{12}H_{20}O_3$, *i.e.* $CH_2CH_2 \rangle C \langle \underset{CO}{CH_2CH_2} \rangle$. *Di-hexolactone*. (above 300°). Formed from oxy-hexolic lactone and $NaOEt$ (Fittig, A. 256, 185). Liquid, sl. sol. water.

DI-OXY-DODECINENE $C_{12}H_{20}O_2$, *i.e.* $C_6H_5CH_2.CMe(OH).CMe(OH).CH_2C_6H_5$. (266°).

S.G. 963. **C.E.** (0°–24°) 00082. Formed from allyl-acetone (Kablukoff, J. R. 1887, 518).

OXY-DODECOIC ACID $(C_6H_{11})_2C(OH).CO.H$. *Dianthracic acid*. [122°]. Formed from oxalic ether, isoamyl iodide, and zinc (Frankland a. Duppa, A. 142, 8). Yields EtA' (262°) and $C_6H_{11}A'$ (280°–290°).

OXY-DURYL-ACETIC ACID [6:4:3:2:1] $C_6HMe_4CH(OH).CO.H$. [156°]. Formed from tetra-methyl-phenyl-glyoxylic acid, alcohol, and sodium-amalgam (Claus a. Foecking, B. 20, 8100; J. pr. [2] 38, 232). Prisms.— NaA' aq.— CaA' 8aq.— BaA' 3aq: v. sol. water. The isomer (5, 4, 3, 2, 1)-acid [160° uncor.] yields KA' 4aq, BaA' 3aq, and CaA' 2aq.

DI-OXY-ENNANE $C_9H_{18}O_2$, *i.e.* $Pr.CH(OH).CH(OH).CH_2Pr$. [80°]. (232°). Formed by the action of alcoholic potash on a mixture of isobutyric aldehyde and valeric aldehyde (Fossek, M. 5, 120°; Swoboda, M. 11, 800°). Prisms (from water). On boiling with dilute H_2SO_4 , it yields a pinacol $C_9H_{18}O_2$ (274°). Cold conc. H_2SO_4 forms $C_9H_{16}O$ (150°).

Di-acetyl derivative $C_{12}H_{20}O_4$. (240°).

OXY-ENNENOIC ACID $C_9H_{16}O_2$. *Oxy-vinyl-iso-heptoic acid*. Found among the products got by passing CO over $NaOAc$ mixed with sodic iso-amylate at 180° (Poetsch, A. 218, 78). Thick honey-yellow oil, not volatile with steam.— $C_6H_{11}Na_2O_8$ 8aq.

Methyl ether $C_9H_{16}MeO$. (c. 250°).

OXY-ENNOIC ACID $CP_r(OH).CH_2.CO.H$. Formed by oxidising $CP_r(OH).C_6H_5$ with $KMnO_4$ (Schirokoff, J. pr. [2] 23, 197). Syrup, sl. sol. hot water.— CaA' aq.— BaA' aq. 8. (of BaA') 9:3 at 20°.— PbA' . S. 1:6 at 19.5°.— AgA' : prisms.

Oxy-ennoic acid $Pr.CH_2CH_2.CEt(OH).CO_2H$. Crystalline.— BaA' — AgA' .

Ethyl ether EtA' . (225°). **S.G.** 12 940. A product of the action of isoamyl iodide and zinc on oxalic ether (Frankland a. Duppa, A. 142, 6; Beilstein, Bn. 1, 529).

OXY-ERUCIC ACID $C_{22}H_{42}O_2$. Formed from di-bromo-behenic acid $C_{22}H_{42}Br_2$ and moist Ag_2O (Haussknecht, A. 143, 51). Oil, forming amorphous salts.

OXY-ETHANE PHOSPHONIC ACID C_2H_5PO , *i.e.* $CH_3CH(OH).PO(OH)_2$. [76°]. Formed from aldehyde (40%) and PCl_3 (1 mol.), followed by cold water (Fossek, M. 7, 32). Crystals decomposing at 120°.— CaA' .

OXY-ETHANE SULPHONIC ACID v. ISETHIONIC ACID.

Oxy-ethane disulphonic acid $C_2H_5(OH)(SO_3H)_2$. Formed, together with ethane tri-sulphonic acid, by boiling tri-bromo-ethane with a saturated solution of ammonium sulphite (Monari, B. 18, 1347).— NaA' 8aq.— $(NH_4)A'$ 1aq.— BaA' 2aq: very soluble powder.

Oxy-ethane disulphonic acid $SO_3H.CH_2CH(OH).SO_3H$. Formed from isethionnic acid and H_2SO_4 at 100° (Meyer, A. 143, 196; Engelhardt a. Latschinoff, Z. 1868, 271).— KA' 1aq: needles v. e. sol. water.

OXY-ETHENYL-AMIDO-PHENYL-MERCAPTAN C_6H_5NSO , *i.e.* $C_6H_5 \langle \underset{N}{S} \rangle CO.OH.OH$

[175°]. Prepared by heating chloro-acetic acid with amido-phenyl-mercaptan (Hofmann, B. 13,

1934). Long fine needles. Insol. water, sol. alcohol and caustic alkalis.

DI-OXY-ETHENYL-o-PHENYLENE DI-AMINE $C_6H_4N_2O_2$. [above 280°]. Obtained by reduction of o-nitro-oxanilic acid with $SnCl_4$ (Aschan, B. 18, 2939). Sublimes in plates. Sol. acetic acid, sl. sol. water, alcohol, and ether, insol. benzene, ligroin, and chloroform. It has weak acid properties, forming unstable salts.— BaA' , 2aq: white crystalline pp.

OXY-ETHYL-ACETOACETIC ETHER $CH_3CO.OH(CO_2H).CH_2CH_2OEt$. Formed from acetoacetic ether, $NaOEt$, and glycol chlorhydrin (Chailaroff, A. 226, 826). Liquid, yielding γ -oxy-butyric acid on boiling with baryta and alcohol.

Oxy-di-ethyl-acetoacetic ether. *Methyl derivative* $CH_3(OMe).CO.CEt_2.CO_2Et$. (c. 188°). Formed, together with an oil $C_8H_{16}O_2$ (c. 181°) by the action of $NaOMe$ on chloro-di-ethyl-acetoacetic ether (James, A. 231, 240).

Di-oxy-di-ethyl-acetoacetic ether. *Dimethyl derivative* $CH(OMe)_2.CO.CEt_2.CO_2Et$. (c. 195°). Formed together with the compound $CH_3COMe_2.CO.CHEt_2$ (184°), by the action of $NaOMe$ on $CHCl_2.CO.CEt_2.CO_2Et$.

OXY-ETHYL-DI-ALLYL-AMINE $(C_2H_5)_2NCH_2CH_2OH$. (197°). Formed from di-allyl-amine and CH_3ClCH_2OH (Ladenburg, B. 14, 1879). Liquid base.

OXY-ETHYL-p-AMIDO-BENZOIC ACID $CH_3OH.CH_2NH_2C_6H_4.CO_2H$. [187°]. Formed from p-amido-benzoic acid and ethylene oxide (Ladenburg, B. 6, 129). Prisms, sl. sol. cold water.— $HA'HNO_2$: crystals.

OXY-ETHYL-o-AMIDO-PHENOL $CH_3(OH).CH_2NH_2C_6H_3(OH)$. (290°–310°). Formed from o-amido-phenol and glycol chlorhydrin (Knorr, B. 22, 2095). Liquid, sol. water. Successive treatment with fuming HCl and $NaOHAq$ forms the anhydride $C_6H_3<\begin{smallmatrix} O \\ NH.CH_2 \end{smallmatrix}>$ (268°).

Methyl derivative $CH_3(OH).CH_2NH_2C_6H_3(OMe)$. (305° i.v.). Formed from o-anisidine.

OXY-ETHYL-o-AMIDO-QUINOLINE DI-HYDRIDE v. **HYDRAZIDO-PHENYL-PROPIONIC ACID**.

OXY-ETHYL-AMINE $CH_3(OH).CH_2NH_2$. *Amido-ethyl alcohol*. Formed by the action of ammonia on ethylene oxide or on glycol chlorhydrin (Wurtz, C. R. 43, 898; 53, 338). Formed also by the action of conc. H_2SO_4 or bromo-ethyl-phthalimide, by the action of HNO_3 on vinylamine, and by the action of $AgNO_3$ (2 mols.) on bromo-ethylamine hydrobromide (1 mol.) (Gabriel, B. 21, 569, 2666).

Salts.— $B'HCl$ (below 100°).— $B'H.PtCl_5$.— $B'Br$: hygroscopic crystals.— $B'HNO_3$. [55°].— $B'C_6H_5(NO_2)_2.OH$. [259°]. Yellow needles (from alcohol).

Picrate of the acetyl derivative $CH_3(OH).CH_2NHAcC_6H_4(NO_2)_2.OH$. [169°]. (Gabriel, B. 22, 2222).

Benzoyl derivative $CH_3(OH).CH_2NH.Bz$.— $B'Br$. [143°].— $B'_2H.PtCl_5$.—*Picrate*. [195°]. Crystalline pp.

Phenyl derivative $CH_3(OPh).CH_2NH_2$. (229°). Formed from phenyl-oxyethyl-phthalamic acid and conc. $HClAq$ (Schmidt, B. 22, 2256). Yields an acetyl derivative [78°] and a

benzoyl derivative [98°] (Scheiber, B. 24, 189).— $B'HCl$. [215°].— $B'C_6H_5(NO_2)_2.OH$.—*Platinichloride* $B'_2H.PtCl_5$: golden needles.

p-Tolyl derivative (243°). Yields a benzoyl derivative [184°] and $B'HCl$ [240°], $B'_2H.PtCl_5$, and $B'C_6H_5.N_2O_2$.

Oxy-tri-ethyl-amine C_2H_5NO *is*. $NEt_3.CH_2CH_2OH$. (161°). Formed from NEt_3H and glycol chlorhydrin (Ladenburg, B. 14, 1878; 15, 1444). Liquid, miscible with water.

Cinnamoyl derivative $NEt_3.CH_2CH_2OCOCH_3$. Formed from the cinnamate of the base and dilute HCl . Yields $B'HAuCl_4$ and $B'C_6H_5(NO_2)_2.OH$.

Ethylchloride $NEt_3.ClCH_2CH_2OH$. Prisms (Wurtz, A. Suppl. 7, 88).—*Gold salt* $C_2H_5NO.AuCl_4$: golden plates.

Di-oxy-ethyl-amine. *Di-ethyl derivative* $CH_3(NH_2).CH(OEt)_2$. *Amido-acetal*. (162°). Formed from chloro-acetal and alcoholic NH_3 (Wohl, B. 21, 616; Wolff, B. 21, 1482). Colourless liquid, v. s. sol. water.— $B'_2H.PtCl_5$: hexagonal plates, sl. sol. cold alcohol.

Di-oxy-di-ethyl-amine $NH(CH_2CH_2OH)_2$. Formed from ethylene oxide or $ClCH_2CH_2OH$ and ammonia (Wurtz).— $B'_2H.PtCl_5$: tables.

Tri-oxy-tri-ethyl-amine $N(CH_2CH_2OH)_3$. A product of the action of ethylene oxide on ammonia (Wurtz). With glycol chlorhydrin it yields $N(OH)(CH_2CH_2OH)_2$. Both are syrupy.

Tetra-oxy-di-ethyl-amine. *Tetra-ethyl derivative* $NH(CH_2CH(OEt)_2)_2$. (260°). S. 14. Formed from chloro-acetal and NH_4Ag at 180° (Wolff, B. 21, 1484).— $B'_2H.PtCl_5$. [121°].

a-OXY-ETHYL-AMINE-*aux*-TRI-SULPHONIC ACID $C_2H_5NS_3O_{12}$ *is*.

$CH_3.C(HO)(SO_3H).CH(SO_3H).NH(SO_3H)$. The sodium salt $Na_3A'''3aq$ is formed by shaking nitroso-acetone $CH_3.CO.C(HO)NH$ with a 30 p.c. solution of sodium bisulphite, and crystallises out on standing as a crystalline powder consisting of white needles. It is v. sol. water, insol. alcohol. By warming with dilute acids it is split up into methyl-glyoxal (pyruvic aldehyde) $CH_3.CO.OHO$, sodium sulphate, NH_3 , and SO_2 (Pechmann, B. 20, 2543).

OXY-ETHYL-ANILINE $NHPh.CH_2CH_2OH$. (286°). S.G. 1.110. Formed from aniline and ethylene oxide (Demole, B. 6, 1024; Ladenburg, B. 6, 181; Knorr, B. 22, 2092). Liquid, with strong reducing properties.— $B'_2H.PtCl_5$: reddish-brown crystals.

a-Oxy-di-ethyl-aniline $C_2H_5NEt_2CH_2CH_2OH$. (268°). Formed from ethyl-aniline and ethylene chlorhydrin at 100° (Laun, B. 17, 677). Heavy oil.

Di-oxy-di-ethyl-aniline $NPh(CH_2CH_2OH)_2$. (above 350°). Formed from the preceding and glycol chlorhydrin. Treatment with $HClAq$ at 170°, followed by cold caustic soda solution, yields $NPh<\begin{smallmatrix} C_2H_5 \\ C_2H_5 \end{smallmatrix}>O$ [58°] (270°). The compound

$NPh<\begin{smallmatrix} C_2H_5 \\ C_2H_5 \end{smallmatrix}>O_2$ [67°] is formed by the action of alcoholic $AgNO_3$ on the corresponding sulphur compound (Holzmann, B. 20, 1640).

OXY-ETHYL-BENZENE v. ETHYL-PHENOL.

Di-oxy-ethyl-benzene $C_6H_5.CH(OH).CH_2OH$. *Styrolene alcohol*. [88°]. (273° i.v.). Formed from styrene dibromide and boiling aqueous K_2CO_3 (Zincke, A. 216, 298). Needles (from

Dl-acetyl derivative $C_8H_9AcO_2$ (274°
[V.]).

Di-oxy-ethyl-benzene $\text{C}_6\text{H}_4(\text{EtO})_2$ [1:3:4].
(295°). Formed from *p*-ethyl phenol sulphonic
acid by potash-fusion (Sempotowski, B. 22, 2667).
Coloured green by FeCl_3 .

Dioxy-tri-ethyl-benzene $\text{C}_6\text{H}_2(\text{OEt})_3$
[185°]. Formed by the action of HCl on $\text{C}_6\text{H}_2(\text{OEt})_3$ (165° uncor. at 20 mm.) which is a product of the action of alcoholic potassium and EtI on resorcin (Herzig a. Zeisel, M. 11, 806). White needles (from dilute alcohol). Yields $\text{C}_6\text{H}_2(\text{OEt})(\text{OAc})$ [65°] crystallising in monoclinic prisms.

OXY-ETHYL-BENZOIC ACID $C_9H_8O_4$, *is.*
 $C_9H_7Et(OH).CO_2H$. [120°]. Formed from sodium
o-ethyl-phenol and CO_2 (Beilstein a. Kuhlberg,
 4. 156, 213). Coloured violet by $FeCl_3$.

Oxy-ethyl-benzoic acid. [112°]. Formed in like manner from sodium-phlorol (Oliveri, *G.* 18, 267). Needles (from water).—BaA', aq: scales.

β -Oxy-ethyl-benzoic acid

$\text{CH}_3\text{CH}(\text{OH})\text{C}_6\text{H}_4\text{CO}_2\text{H}$ — AgA' : needles.
Anhydride $\text{C}_{10}\text{H}_8\text{O}_7$ (276°). V.D. 74 (obs.).
 Formed by reducing acetophenone carboxylic acid with sodium-amalgam and acidifying (Gabriel a. Michael, *B.* 10, 2205). Crystalline at 0°.

Tri-oxy-ethyl-benzole acid. Methylene
derivative $\text{CH}_2 \langle \text{O} \rangle \text{C}_6\text{H}_4 (\text{CH}_2\text{CH}_2\text{OH})\text{CO}_2\text{H}$

'*N*-Oxyethylpiperonylcarboxylic acid.' [146]. Formed from the corresponding amido-acid $\text{OH}_2\text{C}_2\text{C}_6\text{H}_4(\text{C}_6\text{H}_4\text{NH}_2)\text{CO}_2\text{H}$ (Perkin, jun., *C. J.* 57, 1021). Crystals. Converted at $120^\circ\text{--}180^\circ$ into the anhydride $\text{C}_{10}\text{H}_8\text{O}_4$, [127].— $\text{AgO}, \text{H}_2\text{O}$.— $\text{KA}'\text{--NH}_4\text{MeA}'$: crystals.

TRI-OXY-TRI-ETHYL BORATE
 $\text{B}(\text{OC}_2\text{H}_4\text{OH})_3$, [162?]. Formed from BCl_3 and glycol (Counciler, *J. pr.* [2] 18, 392). Deliquescent crystals.

DI-OXY-ETHYL-BUTYL GLYOXALINE
 $C_4H_7CH \begin{smallmatrix} CO.NEt \\ NH.CO \end{smallmatrix}$. [185°]. (295°). Formed from isobutyl-hydantoin, KOH, and EtBr (Pinner, B. 22, 685). Silky needles.

OXY-ETHYL-CARBAMIC ACID. *An.*
 $\text{hydride } \begin{array}{c} \text{CH}_2\text{O} \\ | \\ \text{CH}_2\text{NH} \end{array} > \text{CO}$. [91°]. Formed from
 β -bromo-ethyl-amine and Ag_2CO_3 (Gabriel, *B.*
 21, 568). Flat crystals (from alcohol), v. sol.
 water.

OXY-ETHYL-CONIINE v. CONIINE.

DI-OXY-ETHYLENE DIQUINOLINE OCTO-
HYDRIDE $C_{24}H_{24}N_2O_8$ p.s.

[288]. Formed by heating oxy-quinoline tetrahydride with ethylene bromide (Kohn, *C. J.* 49, 609). Small silky prisms.

DI-ETHYLIDENE-DI-NAPHTHOQUIN-
ONE $C_6H_5 \cdot \left\langle \begin{array}{cc} CO \cdot C(OH) & C(OH) \cdot CO \\ CO \cdot C(OH) & C(OH) \cdot CO \end{array} \right\rangle C_6H_5$

Phenyl hydrazide
 $[C_6H_4(OH)O(N_2HPh)]_2 \cdot OHMe$. [258°]. Got by heating the phenyl-hydrazide of oxy-(α)-naphthoquinone with alcohol and aldehyde at 100°

TETRA-OXYTETRA-ETHYLIDENE-PHOSPHONIUM CHLORIDE ($\text{CH}_3\text{C}(\text{OH})_2\text{PI}$) [112°]. Formed from aldehyde; PH_3 , and HCl (Messenger a. Engels, *B. Z.* 21, 328). Dimetric crystals, with unpleasant smell, v. sol. alcohol, insol. ether. Decomposed by water. The corresponding ($\text{CH}_3\text{C}(\text{OH})_2$) PBr [8°] is also, crystalline. The iodide ($\text{CH}_3\text{C}(\text{OH})_2\text{PI}$) [55°] is formed from aldehyde and phosphonium iodide (Girard, *A. Ch.* [6] 2, 11).

DI- OXY-ETHYLIDENE-METAPYRAZOLE
CH₂:CH:O-N₂

$$\text{C}_5\text{H}_8\text{N}_2\text{O}_2 \quad \text{i.e.} \quad \begin{array}{c} \text{CH}_3\text{CH}_2\text{C}=\text{N} \\ | \\ (\text{HO})\text{C}=\text{N} \end{array} \text{C}(\text{OH}) \quad \text{or}$$

$\text{CH}_3\text{CH}=\text{CH}-\text{NH}$
 $\text{OC}-\text{NH}$ CO . *Ethylidene-metapyrazol-*
one. Formed by heating chloro-crotonyl-urea,
 $\text{CH}_3\text{CH}=\text{CH}\cdot\text{CO}\cdot\text{NH}\cdot\text{CO}\cdot\text{NH}_2$, to its melting-
 point, HCl being evolved. *Needles, M. sol. Not
 water (Pinner a. Lifschütz, B. 20, 2350).

α -OXY-ETHYL-MALONIC ACID
 $\text{C}_4\text{H}_6\text{O}_5$ Ethyltartronic acid [98°]
 Prepared by saponification of chloro-ethyl-malonic ether with baryta-water (Conrad, B. 14618). Decomposes at 180° into α -oxy-butyric acid and CO_2 .

β -Oxy-ethyl-malonic acid
 $\text{CH}_3\text{CH}(\text{OH})\text{CH}(\text{CO}_2\text{H})_2$. Formed from ethyl-
 idene-malonic acid and baryta-water (Komnenos,
 4. 218, 163). Syrup.—Ag. A": amorphous.

γ -Oxy-ethyl-malonic acid
 $\text{CH}_2(\text{OH})\cdot\text{CH}_2\cdot\text{CH}(\text{CO}_2\text{H})_2$. — BaA'' 1½ aq. Got
 by boiling the lactonic acid with baryta. —
 $\text{Ag}_2\text{A}''$.

Lactonic acid $\text{CH}_2 \begin{matrix} \text{CH}_2 \cdot \text{CH}(\text{CO}_2\text{H}) \\ \diagup \quad \diagdown \\ \text{O} \quad \text{CO} \end{matrix}$.
Formed by boiling bromo-ethyl-malonic acid with water (Röder, A. 227, 19). Obtained also by boiling vinaconic acid with diluted H_2SO_4 .
BaA₂.

DI-OXY-DI-ETHYL OXIDE
*O(CH(OH).CH₃)₂. Alkoyl derivatives of this body are formed by the action of sodium salts on di-chloro-di-ethylether (Geuther, *J.* 226, 223; 245, 101).

Formyl derivative (c. 180°). S.G. 21
1.184.

Acetyl derivative $O(CH(OAc)_2)_r$ (192°). S.G. is 1.071; 1.067. Colourless liquid, slowly decomposed by water into aldehyde and acetic acid.

Propionyl derivative (c. 218°). S.G. 1.027.

Butyryl derivative (c. 238°). S.G. 1.027.
-994.

Benzoyl derivative $C_{15}H_{11}O_2$. Needles.
Succinyl derivative $O(CMeH), C_9H_7O_2$.

Di-methyl ether $O(CH(OMe).CH_3)_2$

(127°). S.G. $\frac{1}{4}$ -953. Formed from ac-di-chloro-diethyl oxide, MeOH, and NaOMe. Oil decomposing on standing into di-nethyl-acetaldehyde.

Di-ethyl ether. (153° cor.). S.G. 14.891

• *Di-propyl ether.* (184° cor.). S.G. 14.895

Di-isobutyl ether. (175° cor.). S.G. 11.879

Di-isoamyl ether. (227°). S.G. 11.874

DI-OXY-DI-ETHYL-DIPHENYL, Di-ethy

¹⁰ *Isot. J.* [3:4:1] C₆H₅Et(OEt).C₆H₅Et(OEt) [1:5:4]

[130° cor.]. Formed from di-amido-di-ethyl-diphenyl, alcohol, and nitrous acid. (Schulze, B. 17, 475). White plates, sl. sol. cold alcohol.

Tetra-oxy-ethyl-diphenyl. Tetra-acetyl derivative. $C_{16}H_8Et_4(OAc)_4$. [138°]. Formed from the tetra-ethyl derivative by successive treatment with $HIAq$ and Ac_2O (Herzig, M. 11, 418). Needles (from alcohol).

Tetra-ethyl derivative $C_{16}H_{16}Et_4(OEt)_4$. [92°]. A product of the action of EtI and alcoholic potash on tetra-oxy-diphenyl (Herzig, M. 11, 417). Plates, v. sol. alcohol.

OXY-ETHYL-PHTHALIMIDE $C_{10}H_8NO_2$ i.e. $C_6H_4(CO)_2N.C_2H_5.OH$. [127°]. Formed from bromo-ethyl-phthalimide and $KOHaq$ (Gabriel, B. 21, 571). Needles or plates, sol. hot water.

Phenyl derivative $C_6H_5(CO)_2N.C_2H_5.OPh$. [130°]. Formed from $PhOC_2H_4Br$ and potassium phthalimide (Schmidt, B. 22, 3255). On warming with potash it yields the acid $C_{10}H_8NO_2$ [125°].

Tolyl derivative [135°]. Crystals. Yields a di-nitro-derivative [88°] (Schreiber, B. 24, 190).

OXY-ETHYL-PIPERIDINE $C_8H_{11}NO$ i.e. $C_4H_8N.C_2H_5.OH$. (199°). Formed by heating piperidine with ethylene chlorhydrin (Ladenburg, B. 14, 1876). Liquid, sol. water.— $B^*H_2AuCl_4$: plates.

Phenyl-acetyl derivative $C_{11}H_{11}NO_2$. Oil, formed by heating phenylacetic acid with oxyethyl-piperidine and HCl — $B^*H_2AuCl_4$. [c. 100°].— B^*H_2L — B^*H_2L . Brown needles.

Benzoyl derivative $C_{11}H_{11}NO_2$ — B^*H_2L — $B^*H_2PtCl_4$: silky needles.

Oxy-ethyl-piperidine $C_8H_{11}(C_2H_5OH)N$. [32°]. (227°). Formed by reducing oxy- α -ethyl-pyridine with sodium-amalgam (Ladenburg, B. 22, 2586). Hygroscopic mass. Yields an oily nitrosamine.— $B^*H_2PtCl_4$. [158°]. Large crystals.

OXY-ETHYL-PYRIDINE $C_6H_5N.C_2H_5.OH$. (179° at 25 mm.). S.G. d_4^{20} 1.1111. Formed from (α)-methyl-pyridine and formic aldehyde (Ladenburg, B. 22, 2584). Syrup, v. sol. water, not volatile with steam. Yields vinyl-pyridine on distillation.— $B^*H_2PtCl_4$. [170°]: prisms, m. sol. cold water.

An isomeride $C_6H_5N.(CH(OH).CH_3)$ is got by distilling barium α -oxy-pyridyl-propionate (Hardy & Calmels, B. [2] 48, 230).

Oxy-di-ethyl-pyridine $NC_2H_5Et_2(C_2H_5OH)$. (148° at 18 mm.). Formed from methyl-ethyl-pyridine (aldehyde collidine) and formic aldehyde at 165° (Frausnitz, B. 23, 2725). Oil.— $B^*H_2PtCl_4$. [159°]. Red cubes.

OXY-ETHYL-PYRIDINE TETRAHYDRIDE $CH_3CH_2CO \begin{matrix} \diagup \\ CH_2 \end{matrix} \begin{matrix} \diagdown \\ CH_2 \end{matrix} NH$. [68°]. Formed by heating 8-amido-heptoic acid at 220° (Agghan, B. 23, 3694). Plates, smelling like coniine.

OXY-ETHYL-PYRIDINE CARBOXYLIC ACID $NC_2H_5Et_2(OH).CO_2H$. Formed from copranic acid and ethylamine (Ost, J. pr. [2] 29, 380). Prisms (containing 1/2 aq), v. sol. water.

Di-oxy-ethyl-pyridine carboxylic acid $NC_2H_5Et_2(OH).CO_2H$ [c. 210°]. Formed from ethylamine and comenamic acid (Meinel, J. pr. [2] 32, 178). Prisms (containing 2 aq). Coloured violet by $FeCl_3$. Reduces ammoniacal $AgNO_3$, Ag_2O at 160° forms acetyl-ethyl-pyromenamic

acid $C_{10}H_8NO_2$, whence boiling water forms $C_6H_5NO_2$ [168°].

Ethyl ether Et_4A' . [115°]. Needles (from water).— $Et_4A'HCl$ — $Ba(C_2H_5Et_2NO)_2$: needles.

OXY-ETHYL-QUINAZOLINE DIHYDRIDE $C_8H_8 \begin{matrix} \diagup \\ CH_2 \end{matrix} \begin{matrix} \diagdown \\ CH_2 \end{matrix} NEt_2$. Benzylene-ethyl-urea. [95°]

Formed from α -oxy-tolyl-ethyl-thio-urea, alcohol, and H_2O (Soderbaum & Widman, B. 22, 2937). Needles (from alcohol).— $B^*H_2PtCl_4$. [c. 205°].— $B^*H_2AuCl_4$: golden scales.

(Py. 3:4)-**OXY-ETHYL-QUINOLINE**

$CH_3CH_2CO \begin{matrix} \diagup \\ CH_2 \end{matrix} \begin{matrix} \diagdown \\ CH_2 \end{matrix} NEt_2$. Ethyl-pseudo-carbostyryl.

[55°]. Formed together with (Py. 3)-ethoxy quinoline by the ethylation of carbostyryl (Py. 3-oxy-quinoline) (Friedländer & Weinberg, B. 18, 1528). Glistening white needles. Sl. sol. water, v. sol. other solvents. Scarcely volatile with steam. Dissolves in strong HCl .

(Py. 1, 3), **Di-oxy** (Py. 2)-ethyl-quinoline. Formed from chloro-oxy-ethyl-quinoline and HCl (Rügheimer & Schramm, B. 21, 301). Prisms, v. e. sol. alcohol.

DI-OXY-ETHYL-ISOQUINOLINE

$C_8H_8 \begin{matrix} \diagup \\ CH_2 \end{matrix} \begin{matrix} \diagdown \\ CO \end{matrix} NEt_2$. [105°]. Formed by distilling α -carboxy-phenyl-acetic acid with ethylamine (Pulvermacher, B. 20, 2493). Needles, v. sol. alcohol. With diazobenzene chloride it yields $C_8H_8ONEt_2N.HPh$ [139°].

Di-oxy-di-ethyl-isoquinoline

$C_8H_8 \begin{matrix} \diagup \\ CO \end{matrix} \begin{matrix} \diagdown \\ CO \end{matrix} NH$. [144°]. Formed from di-oxy-isoquinoline (vol. i. p. 706). $NaOEt$ and EtI (P.). White plates. With alcoholic potash and EtI it produces di-oxy-tri-ethyl-isoquinoline $C_8H_8 \begin{matrix} \diagup \\ CO \end{matrix} \begin{matrix} \diagdown \\ CO \end{matrix} NEt_3$ [50°] (309°).

(Py. 3, 2)-**OXY-ETHYL-QUINOLINE DIHY-**

DRIDE $C_8H_8 \begin{matrix} \diagup \\ CH_2 \end{matrix} \begin{matrix} \diagdown \\ NH \end{matrix} CO$. Ethylhydrocarbostyryl. [88°]. Formed from phenyl-valeric acid by nitration and reduction (Baeyer & Jackson, B. 13, 119). Crystals. Occurs also in an unstable modification [76°]. PCl_5 gives chloro-ethyl-quinoline and C_8H_8NO [168°].

(B. 2)-**Oxy** (Py. 4)-ethyl-quinoline tetrahy-dride. **Methyl derivative** $C_8H_8NO_2$. **Ethyl-thalline**. (287°). Formed from thallin and EtI (Skraup, M. 6, 779). Thick liquid.— B^*HCl — B^*EtI . [133°].— $(B^*EtCl).PtCl_4$: orange needles.

(B. 4)-**Oxy** (Py. 4)-ethyl-quinoline tetrahy-dride $CH_3CH_2CO \begin{matrix} \diagup \\ CH_2 \end{matrix} \begin{matrix} \diagdown \\ CH_2 \end{matrix} CH_2$. [76°]. Pre-

pared by heating (B. 4)-oxy-quinoline tetra-hydrate with EtI or $EtBr$ (O. Fischer, B. 16, 717; Fischer & Renouf, B. 17, 756; Fischer & Kohn, B. 19, 1044; C. J. 49, 608). Monoclinic prisms or tables, sol. alcohol and ether, sl. sol. water. $FeCl_3$ colours its alcoholic solution brown.— B^*HCl . **Kairine A**. Trimetric prisms; $a:b:c = 595:1:957$, v. sol. water. Refractive.— B^*EtI . [160°]. Prisms (from alcohol).

Ethyl ether $C_{12}H_{16}NO$. [88°]. (270°). Formed from the ethyl ether of (B. 4)-oxy-quinoline tetrahydrate and $EtBr$ at 180°. Silky plates, insol. water.— B^*EtI . [137°]. Prisms.— $B^*EtPtCl_4$. [183°].

Acetyl derivative $C_{11}H_{14}AcNO$. [94°].

Formation.—The processes wherein O is formed may be divided into groups: I. *From air*.—1. BaO₂ is heated in air to dull redness, when BaO₂ is formed; the pressure is decreased, and the BaO₂ is heated, when O is evolved, and BaO remains.—2. Hg is heated in air at c. 300° when HgO is slowly formed, on strongly heating HgO, O and Hg are produced.—3. MnO₂ is heated with NaOH in air; Na₂MnO₄ and H₂O are produced ($4\text{NaOH} + 2\text{MnO}_2 + \text{O}_2 = 2\text{Na}_2\text{MnO}_4 + 2\text{H}_2\text{O}$); the product is heated to dull redness in steam, when NaOH, Mn₂O₃, and O are formed ($2\text{Na}_2\text{MnO}_4 + 2\text{H}_2\text{O} = 4\text{NaOH} + \text{Mn}_2\text{O}_3 + 2\text{O}$); by again passing air over the residue, Na₂MnO₄ is reformed (Tessié du Motay, *D. P. J.* 186, 230).—4. When air is pressed into water, more O than N is dissolved; by reducing pressure on the water O and N are evolved; by pressing the evolved gases again

into water, again reducing pressure, and preparing the gases into a fresh quantity of water, and repeating these processes eight times, nearly pure O (about 2.8 p.c. N) is obtained (Mallet, *D. P. J.* 199, 112). For details of the methods for obtaining Q from air *v. DICTIONARY OF APPLIED CHEMISTRY. II. From Oxides.*—5. Several metallic oxides give off O when heated; *e.g.* HgO , MnO_2 , PbO_2 , Au_2O_3 , Bi_2O_3 .—6. When water is electrolysed, O separates at the positive electrode.—7. O is obtained by passing a mixture of H_2O and Cl through a red-hot tube; the issuing gas is passed through NaOH aq to absorb HCl and excess of Cl.—8. When steam is passed over CuCl_2 at $100^\circ\text{--}200^\circ$ an oxychloride of Cu is formed which is reduced to CuCl_2 at $c. 400^\circ$, with evolution of O (Vogel, *W. J.* 1861, 177; Mallet, *C. R.* 64, 226; 66, 849).—9. O is obtained by the reaction of H_2O_2 aq with Ag_2O ($\text{Ag}_2\text{O} + \text{H}_2\text{O}_2 = \text{H}_2\text{O} + 2\text{Ag} + \text{O}_2$).—10. MnO_2 , PbO_2 , CrO_3 , BaO_2 , Bi_2O_3 , and other metallic peroxides yield sulphates, H_2O , and O when heated with conc. H_2SO_4 .—11. CO_2 is decomposed by fresh parsley, mint, and other green plants, when the plant is placed in water charged with CO_2 and exposed to direct sunlight. III. *From compounds other than oxides.*—12. KClO_3 is heated, either alone or mixed with MnO_2 or Fe_2O_3 .—13. CaClO_2 is heated, when CaCl_2 and O are formed; or dry Cl is passed over CaO heated to redness.—14. Conc. HNO_3 is dropped into a red-hot Pt flask; $2\text{HNO}_3 = \text{H}_2\text{O} + \text{O} + 2\text{NO}_2$.—15. Conc. H_2SO_4 is dropped on to red-hot Pt, or on to red-hot bricks; the gases produced are passed through milk of lime; $\text{H}_2\text{SO}_4 = \text{H}_2\text{O} + \text{SO}_2 + \text{O}$ (Deville & Debray, *C. R.* 51, 822).—16. By strongly heating dry ZnSO_4 , O and SO_2 are evolved and ZnO remains (D. & D., *l.c.*).—17. $\text{Ba}(\text{NO}_3)_2$ yields O, mixed with N, when strongly heated.—18. A mixture of O and N, containing about 60 p.c. O is obtained by heating NaNO_3 with two parts dry ZnO (*v. Pepper*, *C. N.* 6, 218).—19. Conc. H_2SO_4 is heated with $\text{K}_2\text{Cr}_2\text{O}_7$ or KMnO_4 ; sulphates of K and Cr (or Mn) and H_2O are formed and O is evolved.—20. A fairly conc. solution of bleaching powder is heated with addition of a small quantity of a salt of Co; Co_3O_4 is formed (by the action of the CaO on the Co salt), and this is probably oxidised to CoO_2 , which is again reduced to Co_3O_4 , with evolution of O (Vinkler, *J. pr.* 98, 840; Fleitmann, *A.* 134, 64; Reinsch, *Z.* [2] 2, 81; Böttger, *J. pr.* 95, 309, 375; Stolba, *J. pr.* 97, 309). A modification of this process consists in passing Cl into warm thick milk of lime containing a little Co_2NO_3 (W., *l.c.*).

Preparation.—1. Pure KClO_3 , which has been fused, is well mixed with c. half its weight of pure dry MnO_2 , and the mixture is heated in a flask of hard glass to $c. 210^\circ\text{--}220^\circ$. As the O thus obtained contains a little Cl, the gas is passed through NaOH aq or milk of lime. It is then dried by H_2SO_4 , and passed in a rapid stream through a glass tube heated to redness. After a time the stream of O may be allowed to slacken, and the glass tube need not be kept hot. The rapid stream of O, passing through the hot tube, washes out the last trace of air, which very obstinately adheres to glass at ordinary temperatures (Houssau, *C. R.* 70, 39). Any

ozone present is also decomposed. The small quantity of air which adheres to the glass may also be removed, according to Ilsva (*Bl.* [8] 2, 784), by passing the O over Pt foil at $280^\circ\text{--}250^\circ$, or Pt black at $c. 250^\circ$, whereby combination of O with the N present occurs, with formation of nitrites and nitrates, which may be absorbed in NaOH aq. The Pt loses the power of inducing the combination of N and O after a time, but regains this power when heated in a stream of H at $c. 250^\circ$ (L., *l.c.*). If the O is required quite dry, it is passed through conc. boiled H_2SO_4 , and then over a long layer of P_2O_5 . Regarding the part played by MnO_2 and other substances in causing O to be evolved from KClO_3 at temperatures lower than that at which this salt gives off O when heated alone, *v. Hornsby*, *Ph.* 15, 352; Witt, *ibid.* 411, 503; Brown, *ibid.* 469; Wiederhold, *P.* 116, 171; 118, 186; Baudrimont, *J. Ph.* [4] 14, 81, 161; Krebs, *Z.* 6, 243; Mills & Donald, *C. J.* 41, 18; Mills & Stevenson, *C. J.* 41, 23.—2. Pure MnO_2 is heated to full redness in a hard glass tube; the gas is passed through milk of lime to absorb CO_2 , then over Pt black at $c. 250^\circ$ to cause combination of N (which is generally present) with O, then through NaOH aq to absorb nitrites and nitrates produced, and the O is then dried by conc. H_2SO_4 , CaCl_2 , and P_2O_5 . It is difficult to obtain O by this method quite free from every impurity.—3. Böttger (*J. pr.* 103, 313; 107, 48) says that pure O is obtained by gently heating KMnO_4 , or by the reaction of dilute HNO_3 aq, S.G. 1.064, with a mixture of PbO_2 and BaO_2 .—4. Fairly pure O may be obtained in a regular stream, at the ordinary temperature, by compressing into small cylinders a mixture of two parts BaO_2 , one part MnO_2 , and one part CaSO_4 , and acting on these, in a Kipp's apparatus, with HCl aq, S.G. 1.2, diluted with an equal volume of water (Neumann, *B.* 20, 3058).

Properties.—A colourless, odourless, tasteless gas. Condensed to a liquid at very low temperatures and great pressures. Liquid O is bright blue when viewed in layers 80–40 mm. thick (Olszewski, *W.* 42, 663). Pictet supposed that O was solidified when pressure was suddenly reduced, and the liquid was allowed to issue into the air (*C. R.* 86, 37); but, according to more recent experiments by Wroblewski & Olszewski (*C. R.* 100, 350, 979), solid O has not been obtained. Light appears bluish when observed through liquid O, or through a column of the gas very strongly compressed (Lievain & Dewar, *P. M.* [5] 26, 286). One litre O at 0° and 760 mm. weighs 1.424488 grms. at the latitude of 45° , multiplying mean result of Regnault *Acad.* 21, 158 and Jolly (*W.* 6, 520) for weight of one litre H by mean S.G. of O, referred to H, obtained by Scott and Rayleigh (*W.* N. 37, 418). The atomic volume of O

(*At. weight*
(S.G. of liquid)) is $c. 14$ (*v. Wroblewski*, *C. R.*

102, 1010). The atomic volume of O in compounds varies according to the number of atoms with which the O is directly united, and perhaps to a small extent according to the nature of these atoms. Kopp gives 12.2 for O and 7.8 for O⁺ (*v. Smolurig* volumes, vol. iv. p. 498). The effect of the atom of O on the magnetic rotatory

power of O compounds is not yet determined with certainty (Perkin, *C. J.* 45, 558; v. PHYSICAL METHODS, section *Optical*). O is absorbed by molten Ag or Pt, and given off again as the metal solidifies. O is also absorbed by charcoal. One vol. cocoa-nut charcoal absorbs c. 18 vols. O at 0° and 760 mm. (Hunter, *P. M.* [3] 29, 116; v. also Saussure, *G. A.* 47, 113). According to Angus Smith (*Pr.* 28, 322), the vol. of O absorbed by C is eight times that of H under the same conditions. O absorbed by charcoal brings about oxidation of H_2S , PH_3 , $\text{C}_2\text{H}_2\text{O}$, &c., fairly rapidly (Calvert, *C. J.* [2] 5, 293; cf. CARBON, vol. i. p. 686).

O is the most negative of the elements except F. It combines directly with all elements except F, Cl, Br, I, Au, and Pt. At least one binary compound of O with each element, except F and Br, is known. Compounds containing O exhibit the same diverse properties. The oxides of the positive elements, as a class, are basic, and those of the negative elements are acidic (v. OXIDES, p. 658; ANHYDRIDES, vol. i. p. 267; BASE, vol. 2, p. 445). O is a constituent of the greater number of acids; the compounds of O with ls and non-metallic elements are acids. When H is combined with one of the less positive metals and a relatively large quantity of O, the compound so produced is generally an acid (v. ACIDS, vol. i. p. 47). The process of combining O with another element or with a compound is called oxidation (v. OXIDATION, p. 657; cf. DEOXIDATION, vol. ii. p. 777). When the process is attended with the production of so much heat that the products become self-luminous, it is called combustion (v. COMBUSTION, vol. ii. p. 241; cf. FLAME, vol. ii. p. 549). O is more closely related chemically to S, Se, and Te than to the other elements. It belongs to Group VI., which contains the even-series elements O, Cr, Mo, W, and U, and the odd-series elements S, Se, and Te (v. CHROMIUM GROUP OF ELEMENTS, vol. ii. p. 168, and OXYGEN GROUP OF ELEMENTS, this vol. *infra*). O exhibits allotropy; the allotropic modification is called *Ozone* (v. art. OZONE).

Atomic weight of oxygen.—The value 16.01 was obtained by Berzelius and Dulong in 1819, by burning H by CuO and weighing the water formed (*A. Ch.* 15, 386). In 1842 Dumas, by the same method, arrived at the number 15.98 (*A. Ch.* [3] 8, 189). In the same year, Erdmann & Marchand conducted very carefully a series of five experiments by the same method; their mean result was 16.005. Ostwald (*Lehrbuch der Allgemeinen Chemie*, 1, 43) shows that the value 15.84 is obtained from Stas's experiments on the p.pn. of NH_4Cl by Ag. In 1805 Gay-Lussac & Humboldt (*G. A.* 20, 38) determined the ratio in which H and O combine, by volume, to be 2:1. Using the values for S.G. of these gases obtained by Biot & Arago, the atomic weight of O became 15.1. If Regnault's more accurate determinations of S.G. of H and O are made use of, and it is assumed that H and O combine in the ratio 2:1 by volume, then the atomic weight of O becomes 15.964. In recent years Scott has made a series of direct determinations of the relative densities of H and H_2O (*Pr.* 1887, 898; *B. A.* 1887, 668; *Pr.* 42, 896; *N.* 87, 489). Keiser (*B.* 20, 2328; *Am.* 10, 240) caused Pd to occlude H, and then drove out the

H over hot CuO, and weighed the water produced. In this way a direct weighing of the H burnt was obtained. Keiser's final value for O was 15.9492. Cooke & Richards (*Am.* 10, 81) weighed H in a large balloon, and then burnt it to H_2O ; they obtained $\text{O} = 15.958$. Lord Rayleigh, in 1888, pointed out a source of error in all experiments wherein a gas is weighed by pumping the air out of a glass globe, and thus allowing the gas to enter (the error is due to the shrinkage of the globe when evacuated). From his own experiments, Rayleigh gave $\text{O} = 15.884$ (*Pr.* 43, 356); and applying his correction to Scott's most carefully determined values (*Pr.* 42, 896), he obtained the value $\text{O} = 15.912$. Cooke & Richards applied Rayleigh's correction to their experimental data, and arrived at the conclusion that $\text{O} = 15.869$ (*Am.* 10, 191). The mean of the results obtained by directly weighing H and then burning it to H_2O is 15.888. The most probable value obtained by weighing H by occluding it in Pd, driving out by heat, and weighing Pd before and after, is 15.9492. The mean of the values obtained by burning H to H_2O , weighing O by loss of weight of CuO, and determining H by difference between weights of H_2O and O, is 15.992. For a criticism of the methods and results up to 1885, v. Ostwald's *Lehrbuch der Allgemeinen Chemie*, 1, 41. As the atomic weights of many elements are determined by directly referring them to O, some chemists take the atomic weight of O as 16 (H thus becomes a little more than 1). Most chemists at present take $\text{O} = 15.96$, which is the value used in this Dictionary.

Reactions and Combinations.—The reactions and combinations of O are too many to be described here; it must suffice to indicate them in a general way. Reference should be made to the various elements and compounds for details. 1. All non-metals, except F, Br, Cl, and I, combine directly with O; compounds of all, except F and Br, with O are known.—2. All metals, except Au and Pt, combine directly with O; compounds of all with O are known.—3. Many lower oxides are changed to higher oxides by heating in O, e.g. BaO , Bi_2O_3 , NO , P_2O_3 , PbO , FeO ; many other lower oxides form higher oxides when O is produced in contact with the lower oxides (cf. OXIDATION, p. 657, and OXIDES, p. 658).—4. Innumerable compounds are decomposed by O, with formation of more oxidised compounds, e.g. NH_4Aq , H_2S , PbS , and N_2O Aq; with many compounds O combines directly, e.g. P_2O_3 , HNO_3 Aq, SO_3 Aq, NO.

Certain oxidations do not occur when very dry O is heated with the substance to be oxidised after it has been thoroughly dried (v. CARBON, vol. i. p. 687; Carbon monoxide, vol. i. p. 690; v. also PHOSPHORUS; SULPHUR).

Detection of free oxygen.—Uncombined O changes an alkaline pyrogallol solution to dark brown; white indigo becomes blue; NO combines with O to form red-brown NO_2 , easily soluble in water; CrCl_3 Aq rapidly absorbs O, changing from blue to green (for preparation of CrCl_3 Aq, v. NITROGEN, Preparation No. 1, p. 357). M. M. P. M.

OXYGENATED WATER. An older name for HYDROGEN DIOXIDE (q. v., vol. ii. p. 722).

OXYGEN GROUP OF ELEMENTS. Oxygen, sulphur, selenium, and tellurium. Oxygen was 2 Z

prepared by Priestley in 1774; sulphur has been known from early times; selenion was discovered by Berzelius in 1817; tellurium was found by Klaproth, in 1798, in gold-ore from the *Siebengebirge*. The name oxygen was given by Lavoisier to express the fact that many compounds of this element are acidic; the word sulphur is supposed to be derived from *sal* = salt and *fur* = fire (burning salt or stone); the name tellurium is derived from *tellus* = the earth; selenion received its name from *σεληνη* = the moon, because of its association with and likeness to tellurium. The following table presents some of the chief properties of the four elements:—

The elements S, Se, and Te show very distinct resemblances in their chemical properties. All form hydrides MH_2 , which are gases at ordinary temperatures; SH_2 and SeH_2 in water reddens litmus, and react as very weak acids. TeH_2 is not acidic; these hydrides are decomposed by heat, stability in this respect decreasing as at. w. of M increases. These hydrides are produced by passing H over molten S, Se, or Te; also by reacting on various sulphides, selenides, and tellurides, with dilute acids. The hydride of O, viz. OH_2 , is analogous in composition, and is formed similarly to those of S, Se, and Te; OH_2 is neutral. H_2O , and H_2S , are also similar in composition and many pro-

	OXYGEN	SULPHUR	SELENIUM	TELLURIUM
Atomic weights	15.96	31.98	78.8	125
Molecular weights	31.92 (47.88 as ozone)	63.96 (? 191.88 at lower temps.)	157.6 (? 236.4 at c. 800°)	250

One or more compounds of each element have been gasified; specific heats of solid S, Se, and Te have been determined directly.

Melting points (approx.)	(not solidified)	112°-117°	c. 200°	455°
Boiling points (approx.)	-181.4° at 760 mm.	440°	680°	below 1400°
Spec. grav. (approx.)	1.12 (liquid at B.P.)	1.96-2.05	4.3-4.8	6.2
Atom. weight	15.8	16	17.5	20
Spec. grav. (approx.)				
Occurrence and preparation	Very large quantities of O occur uncombined in air; O is a constituent of almost all rocks and minerals, and also of all living organisms; it forms 1/3 of water. By heating various compounds, chiefly oxides of metals, and in many other ways.	In large quantities in Sicily, Spain, &c.; sulphides and other S compounds are common minerals; S compounds are found in many living organisms. Prepared by refining crude sulphur, also by roasting various sulphides in absence of air.	Uncombined in very small quantities; compounds of Se with S, Fe, Cd, Hg, Pb, &c., occur very sparingly. By passing SO_2 into H_2SeO_3 aq.; also by adding HCl aq. to $KSeCN$ aq.	Uncombined, also in combination with Au, Pb, S, Sb, Bi, &c., but in very small quantities. From solution of a salt of H_2TeO_3 , by passing in SO_2 , or by Zn.
Physical properties	A colourless, odourless gas, bluish when much compressed; condensed to a colourless liquid, appearing blue in thick layers, at great pressures and low temperatures; has not been solidified.	A yellow, brittle crystalline, solid; also a plastic semi-fluid, amorphous mass. Very bad conductor of electricity.	A red-grey, lustrous crystalline, solid; also an amorphous, vitreous, grey-black solid. The amorphous form is a very bad conductor of electricity; the crystalline form conducts fairly, and conductivity increases when exposed to sunlight.	A lustrous, white, metal-like, crystalline, brittle, solid; also as an amorphous powder. Bad conductor of electricity.

	OXYGEN	SULPHUR	SELENIUM	TELLURIUM
Chemical properties	Combines directly with all elements except F, Cl, Br, I, Au, and Pt; oxides are known of all elements except F and Br. Compounds exhibit very different properties. O is a constituent of most acids, and of all alkalis. Compound with H, OH_2 , is a neutral oxide; H_2O_2 is a peroxide.	Combines directly with most elements. Sulphides are basic, or acidic, or neutral, according to nature and relative quantity of element combined with S. S is a constituent of several acids. H_2S is feebly acidic.	Compounds with several elements are known; they resemble sulphides. H_2Se is very feebly acidic. H_2SeO_3 and H_2SeO_4 are much weaker acids than H_2SO_3 and H_2SO_4 .	Combines with several elements (compounds not studied very fully). Binary compounds resemble those of Se. H_2Te is not acidic. TeO_2 and TeO_3 do not form acids by acting with water; but these oxides are obtained by heating the acids H_2TeO_3 and H_2TeO_4 .

perties. Se_2H_2 and Te_2H_2 have not been prepared. Binary compounds of S, Se, and Te with metals are analogous in composition to the metallic oxides. Chlorides of the form MCl_x are known, $\text{M} = \text{O}, \text{S}, \text{Se}, \text{Te}$; no compound of S, Se, or Te analogous to OCl_2 is known, nor has a compound of O and Cl analogous to SCl_2 , SeCl_2 , and TeCl_2 , been obtained. The stability of the chlorides towards heat increases in passing from O to Te. The oxides of S, Se, and Te— MO_2 and MO_3 —are acidic (SeO_2 is not known). Acidity decreasing rapidly as at. w. of M increases; TeO_2 is scarcely acidic, but a corresponding acid H_2TeO_3 exists; TeO_3 combines with some strong anhydrides to form compounds of the type of salts. The oxyacids H_2MO_3 and H_2MO_4 are analogous in composition, but the acids of S are very much stronger than those of Se or Te; those acids yield oxychlorides, MOCl_2 and MO_2Cl_2 , by reacting with PCl_5 . Many other oxyacids of S are known.

The elements of the O family exhibit allotropy; O and S in a very marked way, Se less markedly, and Te only slightly. The allotropic forms of O exist as gases; their molecular formulas are O_2 and O_3 ; the allotropic forms of S, Se, and Te are known with certainty only as solids. It is doubtful whether molecules of S or Se, other than S_2 and Se_2 , exist as gases through any considerable range of temperature; the only molecule of Te existing as a gas is Te_2 . The mol. w. of S in solution is certainly greater than S_2 , and probably varies according to the solvent.

The elements S, Se, and Te form the odd-series members of Group VI., of which group O forms the first even-series member; the other even-series members are Cr, Mo, W, and U. All the members of Group VI. are characterised by forming acidic oxides MO_3 ; as the at. w. increases these oxides become less acidic. Only the odd-series members, and O, form hydrides. All form chlorides MCl_x , the stability of which towards heat increases from O to U; the higher members also form several other stable chlorides. Group VI. falls into two families, (i.) S, Se, Te; (ii.) Cr, Mo, W, U; O is the typical element of the group. (cf. CHROMIUM GROUP OF ELEMENTS, vol. II, p. 163; v. also OXYGEN, SULPHUR, SELENIUM, TELLURIUM).

M. M. F. M.

α -OXY-GLUTARIC ACID

$\text{CO}_2\text{H}.\text{CH}(\text{OH}).\text{CH}_2.\text{CH}_2.\text{CO}_2\text{H}$. *Glutaric acid*. [73°] ? (M.). Formed from amido-glutaric acid and HNO_3 (Ritthausen, J. pr. 103, 239; Markownikoff, A. 182, 348). Occurs in beetroot molasses (Lippmann, B. 15, 1156). Readily yields the lactic acid. — CaA'' 2aq. — MgA'' 4aq. — PbA'' 3aq. — ZnA'' 2aq. — AgA'' 3aq.

Lactic acid $\text{C}_3\text{H}_5\text{O}_3$, i.e.

$\text{CH}_2 < \begin{matrix} \text{CO}_2\text{O} \\ \text{CH}_2.\text{CH}.\text{CO}_2\text{H} \end{matrix}$ [50°]. Very hygroscopic needles (Wolf, A. 260, 126). — CaA' 2aq. — BaA' 2aq. — ZnA' 2aq. Yields glutaric acid [98°] on reduction by HI.

β -oxy-glutaric acid. *Methyl derivative*

$\text{CO}_2\text{H}.\text{CH}_2.\text{CH}(\text{OMe}).\text{CH}_2.\text{CO}_2\text{H}$. Formed by oxidising di-allyl-carbinol with 5 p.c. solution of KMnO_4 (Rabinin, J. pr. [2] 23, 274). Extracted with ether (v. OXYPYROTANTARIC ACID).

Salts.— CaA'' (at 100°). Syrup, covered by crystalline crusts.— BaA'' .— AgA'' . Prisms.

$\alpha\beta$ -Di-oxy-glutaric acid

$\text{CO}_2\text{H}.\text{CH}_2.\text{CH}(\text{OH}).\text{CH}(\text{OH}).\text{CO}_2\text{H}$ [156°]. Formed by boiling glutaric acid-di-bromide with water and CaCO_3 . Needles (from water), or six-sided tables (from alcohol). V. s. sol. water, v. sol. alcohol. Its Ca salt is easily soluble (Kiliani, B. 18, 2517).

$\alpha\gamma$ -Di-oxy-glutaric acid

$\text{CO}_2\text{H}.\text{CH}(\text{OH}).\text{CH}_2.\text{CH}(\text{OH}).\text{CO}_2\text{H}$. Formed by heating the di-oxy-propiontri-carboxylic acid, which is obtained by oxidising isosaccharic acid with HNO_3 . Colourless prisms. V. s. sol. water, v. sol. alcohol, sl. sol. ether. Its Ca salt is sparingly soluble (Kiliani, B. 18, 2516).

• Tri-oxy-glutaric acid $\text{C}_5\text{H}_6\text{O}_9$. [127°].

Formed from arabinose or sorbin by oxidation with HNO_3 (S.G. 1.2) (Kiliani, B. 21, 8006, 8276).— KA'' . monoclinic plates.

OXYGUANIDINE. Obtained by boiling cyanamide with alcoholic hydroxylamine hydrochloride (Prætorius a. Seidler, J. pr. [2] 19, 899). — $(\text{CN}.\text{H}_2\text{O}).\text{H}.\text{PtCl}_4$. ruby-red prisms.

OXY-HEMOGLOBIN v. HEMOGLOBIN.

OXYHALOID COMPOUNDS. Compounds of F, Cl, Br, or I, with O and another element. Oxyhaloid compounds of non-metals are often formed by reacting with PCl_5 , PBr_5 , or PI_5 on oxyacids, e.g. SO_2Cl_2 from $\text{SO}_2(\text{OH})_2$; they are also produced sometimes by heating together an

oxide and chloride, e.g. BOCl by heating B_2O_3 with BCl_3 ; sometimes the halogen is directly combined with an oxide, e.g. COCl_2 and NOCl by combining CO and NO with Cl , and BOCl by heating Cl with B_2O_3 mixed with C . Metallic oxyhaloid compounds are formed by decomposing the haloid compounds of the metals by water or steam; by heating together oxides and haloid compounds; and in many cases by the incomplete pyrolysis of haloid compounds in solution by alkali. Non-metallic oxyhaloid compounds are decomposed by water to haloid acids and other oxides or oxyacids of the non-metal present. Some metallic oxyhaloid compounds are also decomposed by hot water to haloid acids and metallic oxides; in this respect the oxyfluorides are the most stable, and the oxybromides, as a class, are more stable than the oxybromides and oxychlorides. The oxyhaloid compounds of H are acids. All elements form one or more oxyhaloid compounds. A metal which readily forms many oxyhaloid compounds generally forms one or more oxides with acidic reactions, and is otherwise more or less non-metallic in its chemical properties.

M. M. P. M.,

DI-OXY-HENDECENOIC ACID $\text{C}_{11}\text{H}_{20}(\text{OH})_2\text{O}_2$. [85°]. Formed by the oxidation, in alkaline solution, of hendecenoic acid derived from castor oil (Hazura, A. Grüssner, M. 9, 952). Needles, sol. hot water.

OXY-HENICOSOIC ACID $\text{C}_{12}\text{H}_{22}(\text{CH}_2\text{OH})(\text{CO}_2\text{H})$. [103-5°]. Occurs in the soda soap from carnauba wax (g. v.). Crystalline powder (from petroleum), sl. sol. alcohol, m. sol. isobutyl alcohol (whence it separates as a jelly) (Stärcke, A. 223, 310). As its alcoholic solution is not pptd. by acetate of Mg , Cu , or Pb , it is possibly a lactone $\text{C}_{10}\text{H}_{18} < \text{CH}_2 > \text{O}$. Heated with soda lime it splits off H_2 , forming a dibasic acid $\text{C}_{10}\text{H}_{16}(\text{CO}_2\text{H})_2$ [90°].

PENTA-OXY-HEPTANE. The oily anhydride $\text{C}_7\text{H}_{11}(\text{OH})_5\text{O}$ is formed by the action of HOCl followed by KOH on di-allyl-carbinol (Reformatsky, J. R. 21, 295). The acetyl derivative $\text{C}_7\text{H}_{11}(\text{OAc})_5$ (169-5°) S.G. 2.919 is described by Saytzeff (A. 185, 129).

OXY-HEPTANE PHOSPHONIC ACID $\text{C}_7\text{H}_{13}\text{PO}$, i.e. $\text{C}_7\text{H}_{13}\text{CH}(\text{OH})\text{PO}(\text{OH})_2$. [185°]. Formed from cepanthol and PCl_3 followed by water (Fossek, M. 4, 67). Monoclinic tables: $a:b:c = 1.844:1.1:1.957$; $\beta = 74^\circ$. — CaA' .

The compound $(\text{C}_7\text{H}_{13}\text{CH}(\text{OH}))_2\text{PO}_2\text{H}$ [160°] is formed by heating cepanthol with hypophosphorous acid (Ville, C. R. 109, 72). It yields the salts BaA'_2 , 3aq , PbA'_2 , 3aq , KA' , 4aq , and $(\text{C}_7\text{H}_{13}\text{CH}(\text{OAc}))_2\text{PO}_2\text{H}$ [94°].

OXY-HEPTENOIC ACID $\text{CHMe}(\text{OH})\text{CH}(\text{C}_2\text{H}_5)\text{CO}_2\text{H}$. Formed from allyl-acetoacetic ether and sodium-amalgam (Zeidler, A. 187, 45). Syrup, miscible with water. — BaA'_2 — $\text{Zn}(\text{OH})\text{A}'$.

Oxy-heptenoic acid. Nitrile $\text{CHEt:OMe.CH}(\text{OH})\text{CN}$. Formed from methyl-ethyl-acrolein and HCy (Johanny, M. 11, 401). Converted by hydrochloric acid into the amide $\text{CHEt:OMe.CH}(\text{OH})\text{CONH}_2$ [101°]. The nitrile yields an oily acetyl derivative (114° at 22 mm.), v. sol. ether.

Oxy-heptenoic lactone v. MESEITONIC ACID.

OXYHEPTIC ACID $\text{C}_7\text{H}_{12}\text{O}_4$, aq ? [185°]. A product of the action of bromine, followed by alcoholic potash on isobutyl-acetoacetic ether (Demarçay, C. R. 86, 1185). Pearly scales (from water). Yields $\text{C}_7\text{H}_{11}\text{Q}(\text{OEt})\text{NH}_2$? [87°].

α -OXY-HEPTIC ACID $\text{C}_7\text{H}_{12}\text{O}_4$, i.e. $\text{Pr.CH}_2\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. [80°] (Helms, B. 8, 1187); [65°] (Ley, J. R. 9, 141). Formed by heating aqueous potassium bromo-heptate at 140°. Prisms. — MeA' . [160°-165°].

Amide [147°]. Hexagonal tables.

α -Oxy-heptic acid $\text{C}_7\text{H}_{11}\text{CH}(\text{OH})\text{CO}_2\text{H}$. [60-5°]. Formed from its ether, EtA' (203°), which is produced, as well as the ethyl derivative thereof $\text{C}_7\text{H}_{11}\text{CH}(\text{OEt})\text{CO}_2\text{Et}$ (c. 224°) by the action on oxalic ether of zinc and isomyl iodide at 100°, followed by water (Frankland & Duppa, Fr. 14, 191). Scales. — BaA'_2 — CuA'_2 .

β -Oxy-heptic acid $\text{CHMe}_2\text{CH}(\text{OH})\text{CMe}_2\text{CO}_2\text{H}$. [112°]. The chief product of the action of sodium on isobutyric ether (Hantzsch, A. 249, 607). Silky needles, m. sol. water, volatile with steam. — BaA'_2 , 4aq .

Ethyl derivatives of the ethyl ether $\text{Pr.Cu}(\text{OEt})\text{CMe}_2\text{CO}_2\text{Et}$. (181° cor.). Oil.

β -Oxy-heptic acid $\text{CHMe}(\text{OH})\text{CMe}_2\text{CO}_2\text{H}$. Formed by reducing $\text{CH}_3\text{CO.CMeEt.CO}_2\text{Et}$ with sodium-amalgam (Saur, A. 188, 266). Syrup, v. e. sol. water. — $\text{CuC}_7\text{H}_{12}\text{O}_4$ — $\text{AgC}_7\text{H}_{12}\text{O}_4$: plates, m. sol. hot water.

β -Oxy-heptic acid $\text{CMePr}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$. Formed by oxidising $\text{CMePr}(\text{OH})\text{C}_2\text{H}_5$ with KMnO_4 (Somlanitzin, J. pr. [2] 23, 20, 21. Syrup. — CaA'_2 (at 100°). — BaA'_2 — AgA' : prisms.

β -Oxy-heptic acid $\text{CEt}_2(\text{OH})\text{CH}_2\text{CO}_2\text{H}$. [39°]. Formed by oxidising $\text{CEt}_2(\text{OH})\text{C}_2\text{H}_5$ with KMnO_4 (Schirokoff, J. pr. [2] 23, 201). Thin needles. — LiA' , aq . — CaA'_2 , aq . — BaA'_2 , 2aq . — PbA'_2 , 2aq . S. 6 at 19°. — CuA'_2 , 5aq . — AgA' .

γ -Oxy-heptic acid $\text{CHPr}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. Syrup. — BaA'_2 — AgA' : curdy pp.

Lactone $\text{Pr.CH} < \text{CH}_2\text{CH}_2 > \text{O}$. (235° i.v.).

Formed by the action of HI and P on the hexa-oxy-heptic acid obtained from dextrose (Kiliani, B. 18, 3066; 19, 1128). Obtained also from propyl-paraconic acid $\text{Pr.CH} < \text{CH}(\text{CO}_2\text{H}) > \text{CH}_2$ by distilling, converting the resulting $\text{CHPr:CH.CH}_2\text{CO}_2\text{H}$ into γ -bromo-heptic acid, and boiling this with water (Fittig, B. 20, 3180; A. 255, 76).

An isomeric lactone (220° cor.) is obtained in like manner from levulose.

γ -Oxy-isheptic acid $\text{CHPr}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. Very unstable. — BaA'_2 — AgA' .

Lactone $\text{C}_7\text{H}_{12}\text{O}_4$. (235° uncor.). S. 8 in the cold. Formed from γ -bromo-isheptic acid and also by distilling isopropyl-paraconic acid (Fittig & Zanner, A. 255, 94). Liquid, volatile with steam.

γ -Oxy-heptic acid. — BaA'_2 — AgA' .

Lactone $\text{C}_7\text{H}_{12}\text{O}_4$. [112°]. (220° i.v.). S. 8-8 at 0°. Formed from tetracrylic acid and cold HBrAq (Fittig & Kraft, A. 208, 86). Liquid.

γ -Oxy-heptic acid. Lactone

$\text{CHMe} < \text{CH}_2\text{CMe} > \text{O}$. [52°]. (86° at 15 mm.). Formed by reducing β -acetyl-valeric acid with

sodium-amalgam (Anschoütz, A. 247, 107). Large crystals.

γ -Oxy-heptoleic acid

$\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. Formed by reducing β -acetyl-valeric acid with sodium-amalgam (Young, C. J. 43, 173; A. 216, 88). The free acid changes quickly, especially on boiling, to the lactone.— BaA'' — AgA'' : curdy pp.

Lactone $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CO}$ (219.5°

i.v.). S.G. 1.992. Liquid, m. sol. water. A solution saturated at 0° becomes turbid at 17° and clear again at 95°.

Hexa-oxy-heptoleic acids are formed from levulose, dextrose, and galactose by successive treatment with HCl and alkalis (Kiliani, B. 18, 8066; 19, 767; 22, 521). The free acids change to lactones $\text{C}_6\text{H}_{12}\text{O}_6$. The hexa-oxy-heptoleic acid from galactose crystallises in needles [145°] and forms the salt KA' aq.

DI-OXY-HEPTYLENE $\text{C}_7\text{H}_{12}(\text{OH})_2$. [89.5°]. (195.6° cor.). V.D. 63.6. A product of the distillation of resin (Morris, C. J. 41, 169). White mass. Forms a hydrate $\text{C}_7\text{H}_{12}\text{O}_2$ aq [c. 106°].

Acetyl derivative $\text{C}_7\text{H}_{12}(\text{OAc})_2$. [69°].

TETRA-OXY-TETRA-HEPTYL-PHOSPHONIUM IODIDE $(\text{C}_7\text{H}_{11}\text{CH}(\text{OH}))_4\text{PI}$. [122°]. Formed from PII_3 and heptoleic aldehyde (De Girard, A. Ch. [6] 2, 40). Lumps.

OXY-HEPTYL-PYROTARTARIC ACID *Lactonic acid* $\text{C}_{11}\text{H}_{18}\text{O}_6$. *Methylhexylparaconic acid*. [107°]. Formed from α -naphthol, pyrotartaric acid, and Ac_2O (Riechelmann, A. 255, 132). Plates, v. sol. ether.— BaA' 3aq.— CaA' 2aq.— AgA' : needles (from water).

β -OXY-HEPTYL-SUCCINIC ACID $\text{C}_{11}\text{H}_{18}\text{O}_6$, i.e. $\text{C}_6\text{H}_{13}\text{CH}(\text{OH})\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$. *Hexitamalic acid*. The salts are got by boiling the lactonic acid with bases.— CaA'' (at 100°).— BaA'' (at 130°).— $\text{Ag}_2\text{A}''$.

Lactonic acid

$\text{C}_6\text{H}_{13}\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$. *Heptyl paraconic acid*. [89°]. Formed from α -naphthol, Ac_2O , and barium succinate at 120° (Schneegans, A. 227, 85). Needles, sl. sol. water.— CaA' 2aq.— AgA' : flocculent pp.

DI-OXY-HEXADECANE $\text{C}_{16}\text{H}_{32}(\text{OH})_2$. Formed from $\text{C}_{16}\text{H}_{32}\text{Br}_2$ and AgOAc followed by KOH (Krafft a. Grosjean, B. 23, 2352).

Di-acetyl derivative $\text{C}_{16}\text{H}_{32}(\text{OAc})_2$. [56°].

DI-OXY-HEXANE $\text{C}_6\text{H}_{12}(\text{OH})_2$, i.e. $\text{CHMe}(\text{OH})\text{CH}_2\text{CH}_2\text{CHMe}(\text{OH})$. (220° i.v.). S.G. 0.976; $\frac{1}{4}$ 0.961. C.E. (0°-24°) 0.0064 (Sorkin, J. pr. [2] 23, 18). Formed from diallyl by successive treatment with HI, AgOAc , and KOH (Wurtz, A. Ch. [4] 3, 162). Liquid, sol. water.

Mono-acetyl derivative (210°).

Di-acetyl derivative $\text{C}_6\text{H}_{12}(\text{OAc})_2$. (225°).

DI-OXY-HEXANE (207°). S.G. 0.9669. Obtained from hexylene derived from mannite (Wurtz; Hecht, B. 11, 1154). The corresponding oxide, $\text{C}_6\text{H}_{12}\text{O}$ (110°), is formed from $\text{C}_6\text{H}_5\text{OCl}$ and KOH (Eltekoff, J. R. 1882, 355).

Di-acetyl derivative (215°-220°). S.G. 1.014.

Di-oxy-hexane

$\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}(\text{OH})$. *Hexylene 3-glycol*. (235° at 710 mm.). S.G. at 0° = 0.9809. Prepared by reduction of aceto-butyl alcohol $\text{CH}_3\text{COCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$ with sodium-

amalgam (Lipp, B. 19, 3282). Thick colourless fluid of slight smell and bitter taste. V. sol. water and alcohol, more sparingly in anhydrous ether. By heating with HCl it is converted into hexylene-5-chlorohydrin, and by prolonged action into hexylene-di-chloride. By heating with H_2SO_4 (65 p.c.) it splits off H_2O , forming hexylene-5-oxide.

Di-oxy-hexane $\text{CHMe}(\text{OH})\text{CHMe}(\text{OH})$.

[c. 0°]. (207°). Formed from aldehyde, isobutyric aldehyde, and alcoholic potash (Fossek, M. 5, 119; Swoboda, M. 11, 389). Thick liquid, sol. water. Dilute H_2SO_4 forms, on heating, (8)-pinacolin $\text{C}_{12}\text{H}_{22}\text{O}_2$ (210°).

Isomeric v. PINACONE.

Tri-oxy-hexane $\text{C}_6\text{H}_{10}(\text{OH})_3$, i.e.

$\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{CMe}_2(\text{OH})$. *Heptyl-glycerin*. (190° at 50 mm.). S.G. 1.0936.

Formation.—1. By addition of bromine to $\text{CMe}_2(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2$ and decomposition of the product with baryta (Orloff, Bl. [2] 47, 167).

2. From di-methyl-allyl-carbinol by successive treatment with HOCl and aqueous KOH, or with Br and baryta (Orloff, Bl. [2] 45, 253; A. 233, 351; Reformatsky, J. pr. [2] 31, 318; 40, 308).

Properties.—Syrup, sol. water and alcohol, insol. ether.

Tri-acetyl derivative. Oil.

Tri-oxy-hexane

$\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CMe}_2(\text{OH})$. (181° at 10 mm.). S.G. 1.1012. Formed by heating its tri-acetyl derivative with PbO. Liquid, sol. water.

Tri-acetyl derivative $\text{C}_6\text{H}_{10}(\text{OAc})_3$. (c. 233°). S.G. 1.109. C.E. 0.00873. Formed by heating methyl-butenyl-carbinol (from allyl-acetone) with Ac_2O (Markownikoff a. Kabloukoff, Bl. [2] 34, 347; 37, 346; 43, 111). Heavy oil. Yields an oxide $\text{C}_6\text{H}_{10}\text{O}_2$ (178°).

Tri-oxy-hexane

$\text{CHMe}(\text{OH})\text{CMe}(\text{OH})\text{CH}_2\text{OH}$. (170°-176° at 53 mm.). Formed by boiling the dibromide of methyl-ethyl-allyl-carbinol with water (Lieben a. Zeisel, M. 4, 41). Liquid.

Tri-acetyl derivative (c. 270°). Oil.

Tetra-oxy-hexane $\text{C}_6\text{H}_8(\text{OH})_4$. [95°]. Formed by oxidising diallyl with KMnO_4 (Wagner, B. 21, 3343). Plates, v. sol. water, m. sol. cold alcohol, insol. ether.

OXY-HEXANE DISULPHONIC ACID

$\text{C}_6\text{H}_8\text{O}(\text{SO}_3\text{H})_2$. Formed from methyl-ethyl-acrolein and SO_2 at 80° (Ludwig, M. 9, 667).— BaA'' 2aq converted by sodium-amalgam in presence of acids to hygroscopic sodium oxy-hexane sulphonate $\text{C}_6\text{H}_8\text{O}(\text{SO}_3\text{Na})_2$.

OXY-HEXENOIC ACID $\text{C}_6\text{H}_8\text{O}_3$. A product of the action of boiling water on the dibromide of hydrosorbic acid (Fittig, A. 200, 57). Liquid.— CaA' 1aq plates.

OXY-HEXIC ACID $\text{C}_6\text{H}_{10}\text{O}_3$ aq or $\text{C}_6\text{H}_{10}\text{O}_3$.

(174°). Formed from propyl-acetoacetic ether by successive treatment with Br and alcoholic potash (Demarcay, C. R. 88, 289). Small pearly plates, v. e. sol. hot water. Is perhaps identical with terebic acid (Gorboff, J. R. 1887, 605). Reduced by Zn and H_2SO_4 to $\text{C}_6\text{H}_{12}\text{O}_3$ (?) [98°]. Yields an amide $\text{C}_6\text{H}_{10}\text{O}_3(\text{NH}_2)$ (?) [215°] and an amic ether $\text{C}_6\text{H}_{10}\text{NO}_3$ (?) [79°].

Iso-oxy-hexic acid. [187°]. Formed in like manner from isopropyl-acetoacetic ether (D.). Reduced by Zn and H_2SO_4 to $\text{C}_6\text{H}_{12}\text{O}_3$ (?) [118°].

Yields $C_6H_9O_4(NH_2)_2$ (?) [216°] and another amide $C_6H_9O_4(NH_2)(OEt)_2$ (?) [95°].

DI-OXY-HEXINENE v. DI-OXY-HEXYLENE.

α -OXY-HEXICOIC ACID $C_6H_{11}O_4$, *i.e.* $CH_2Pr.CH(OH).CO_2H$. *Leucic acid*. Mol. w. 182. [73°]. Formed by the action of nitrous acid on leucine (Strecker, A. 68, 55; Thudichum, C. J. 14, 807; Waage, A. 118, 297). Needles, v. sol. water, alcohol, and ether. — BaA'_2 : silky laminae (from hot alcohol). — CaA'_2 — CoA'_2 — CuA'_2 — ZnA'_2 , aq. S. 33 at 16°; 5 at 100°. — ZnA'_2 , 2aq (Körner, G. 13, 356). — AgA' : crystalline pp.

An isomeric or identical oxy-hexicoic acid [62°] is formed by the action of Na_2CO_3 on bromohexicoic acid got from fermentation of hexicoic acid (Jeliasoff, J. R. 12, 367; Bn. 1, 523). It yields the salts CaA'_2 , BaA'_2 , MgA'_2 , 2aq, ZnA'_2 , 2aq (S. 14 at 16°; 21 at 100°), CuA'_2 , and AgA' . It forms a crystalline amide [142°].

β -OXY-HEXICOIC ACID $CEt_2(OH).CO_2H$. [80°]. S. 85 at 17.5°. Formed from its ether which is got from oxalic ether by the action of $ZnEt_2$ followed by water (Frankland, Pr. 12, 396; Frankland & Ruppel, Pr. 13, 140; A. 135, 26; Geuther, Z. 1867, 705; Fittig, A. 200, 21). Triclinic crystals, v. sol. water, alcohol, and ether. Yields di-ethyl ketone on oxidation. — NH_4A' — BaA'_2 — BaA'_2 , 5aq. — ZnA'_2 . S. 33 at 16°. — CuA'_2 — AgA' , aq: needles.

Methyl ether MeA' . (165°). S.G. 1.05. 987.

Ethyl ether EtA' . (175°). V.D. 5.24 (calc. 5.53). S.G. 1.01. 961. Oil. Formed from $COCl.CO_2Et$ and $ZnEt_2$ (Henry, B. 6, 949).

Isoamyl ether (225°). S.G. 1.033.

Nitrile $CEt_2(OH).CN$. Formed from $COEt_2$ and Hcy (Tiemann & Friedländer, B. 14, 1974). Oil.

α -OXY-HEXICOIC ACID $CH_2Pr.CH(OH).CO_2H$. [56°]. Got by saponification of its nitrile, which is formed from isovaleric aldehyde and Hcy (Erlenmeyer & Sigel, B. 7, 1109; Ley, B. 10, 231). Formed also by heating isobutyl-tartronic acid at 180° (Guthzeit, A. 209, 239). Plates. — ZnA'_2 , 2aq. S. 12 at 16°.

Nitrile. Oil, lighter than water.

β -OXY-HEXICOIC ACID $CHMe(OH).CHEt.CO_2H$. Formed from ethyl-acetoacetic ether and sodium-amalgam (Waldschmidt, A. 188, 240). Syrup. — NaA' — CuA'_2 — AgA' : plates.

α -OXY-HEXICOIC ACID $CHMe.CH(OH).CO_2H$. [88°]. Formed by reducing tri-methyl-pyruvic acid with sodium-amalgam (Glücksman, M. 10, 780). Monoclinic crystals. — AgA' .

β -OXY-HEXICOIC ACID $CHEt(OH).CHMe.CO_2H$. Formed by reducing propionyl-propionic acid (Hantzsch & Wohlbrück, B. 20, 1320). — NaA' .

γ -OXY-*n*-HEXICOIC ACID
 $CHEt(OH).CH_2CH_2.CO_2H$. The salts are formed by the action of bases on the lactone. The free acid quickly changes to lactone. — CaA'_2 — BaA'_2 — AgA' .

Lactone $C_6H_9O_4$, *i.e.* $CHEt \begin{smallmatrix} \diagup CH_2CH_2 \\ \diagdown O-CO \end{smallmatrix}$ (220°). **Formation.**—**f.** By boiling with water the bromo-hexicoic acid formed by the union of hydrosorbic acid with HBr (Fittig, B. 13, 955; A. 208, 67).—**2.** By heating glutaric acid with HI and P (Kiliani & Kleeman, B. 17, 1300).—**3.** By reduction of metasaccharin with HI

(Kiliani, B. 18, 642).—**4.** By warming hydrosorbic acid with dilute (1:1) H_2SO_4 (Fittig, A. 250, 134).

Properties.—Liquid, m. sol. water. Volatile with steam. Its aqueous solution becomes turbid when heated to 40°, but clear again at 80°. K_2CO_3 separates it from the solution. HI and P reduce it to *n*-hexicoic acid.

Amide $CHEt(OH).CH_2CH_2.CONH_2$. [74°]. Formed by heating the lactone with alcoholic NH_3 at 100°. Prisms, v. sol. water and alcohol, sl. sol. ether.

γ -Oxy-*iso*hexicoic acid
 $CHMe(OH).CH_2CH_2.CO_2H$. Crystalline, but very unstable. — BaA'_2 (at 100°). — AgA' .

Lactone $C_6H_9O_4$. (207° i. V.). Formed from terebic acid by distillation, by successive treatment with HBr and water, or by boiling with dilute H_2SO_4 (Fittig & A. 200, 58, 259; Geisler, A. 208, 43; Erdmann, A. 223, 181). Formed also by oxidising *iso*hexicoic acid with $KMnO_4$ (Bredt, A. 208, 59). Liquid, v. sol. water. Neutral in reaction. Its aqueous solution becomes turbid at 35°, clear again at 80°. Yields on oxidation with HNO_3 the acid $C_6H_9O_4$ [68°], whence $CaC_6H_9O_4$, 7aq and $AgC_6H_9O_4$. Boiling $NaOEt$ forms an anhydride $C_6H_8O_3$ [106°], whence $HClAq$ forms $C_6H_9O_4$ (209°).

γ -Oxy-hexicoic acid $CH_2(OH).CH_2CH_2.CO_2H$. Formed from $CH_2CO.COEt(CH_2CH_2OH).CO_2Et$ by boiling with baryta-water (Chanlaroff, A. 226, 235). Thick liquid, changing to the lactone on boiling its solution. $Ba(C_6H_9O_4)_2$: crystals (from alcohol). — CaA'_2 — AgA' : needles (from water).

Lactone $CH_2 \begin{smallmatrix} \diagup CH_2CH_2 \\ \diagdown O-CO \end{smallmatrix}$ (215°). S.G. 1.035. Liquid, m. sol. cold water.

γ -Oxy-hexicoic acid
 $CHMe(OH).CH_2CHMe.CO_2H$. Formed by reduction with sodium-amalgam from β -acetyl-isobutyric acid derived from α -bromo-propionic ether and sodium acetoacetic ether (Fittig & Gottstein, A. 216, 30). Formed also by reducing saccharin or isosaccharin with HI and P (Liebmann & Scheibler, B. 16, 1821; Kiliani, B. 18, 635). — BaA'_2 .

Lactone. (206°). Liquid, sol. 20-25 volumes of water. An isomeric anhydride [137°] is also formed by reducing isosaccharin.

γ -Oxy-hexicoic acid
 $CHMe(OH).CHMe.CH_2.CO_2H$. Formed by reducing β -acetyl-*n*-butyric acid (Gottstein, A. 216, 36). Yields a lactone (210°).

δ -Oxy-hexicoic acid
 $CHMe(OH).CH_2CH_2CH_2.CO_2H$. Obtained by reducing γ -acetyl-*n*-butyric acid with sodium-amalgam at 30° (Fittig & Wolff, A. 216, 133). When boiled with water it is partly converted into the lactone. When the lactone is boiled with water it is partly converted into the acid. Equilibrium occurs with 65 p.c. lactone and 35 p.c. acid. — AgA' .

Lactone. [19°]. (c. 231° i. V.). Colourless liquid, solidifying below 0°. Miscible with water but separated by K_2CO_3 .

Oxy-hexicoic acid $C_6H_9O_4$. [108°]. Formed by oxidising oil of millet with $KMnO_4$ (Kassner, A. Ph. [3] 25, 1081). Plates, v. sol. water. Yields an acetyl derivative [71°].

Di-oxy-hexicoic acid. [141°]. Formed from ethyl-crotonic acid by successive treatment with

bromine and with water at 100° (Fittig a. Howe, A. 200, 89). Trimetric prisms, $a:b:c = 96:1:35$. V. sol. water and alcohol.— CaA' , 3aq; bright-blue needles.

Di-oxy-hexoic acid

$\text{OHEt(OH).CMe(OH).CO}_2\text{H}$. [96°]. Formed by oxidising ethyl-crotonic acid with KMnO_4 (Fittig, B. 21, 920).

Di-oxy-hexoic acid

$\text{CHEt(OH).CMe(OH).CO}_2\text{H}$ [152° cor.]. Formed by oxidation of methyl-ethyl-acrolein (Lieben a. Zeisel, M. 4, 65). Needles or prisms.— CaA' , 3aq; crystalline mass.

Hexa-oxy-hexoic acid $\text{C}_6\text{H}_{10}\text{O}_8$. *Arabinose-carboxylic acid*. Formed from arabinose by the action of aqueous HCl , followed by saponification (Kilian, B. 29, 3033; 20, 339). When liberated from its salts it immediately forms the lactone.— CaA' ; amorphous.

Amide. Minute needles.

Lactone $\text{C}_6\text{H}_{10}\text{O}_6$. [145°–150°]. $[\alpha]_D = -54.8$. Needles or prisms. Yields metacharic acid dilactone $\text{C}_6\text{H}_8\text{O}_6$ on oxidation by HNO_3 and n -hexoic acid on reduction by HI and P .

DI-OXY-HEXYLENE $\text{C}_6\text{H}_{12}\text{O}_2$. *Hexinene glycol*. (218°–225°). Formed from epichlorhydrin and Na (Hübner a. Miller, A. 159, 186). Is perhaps di-oxy-hexinene (Cläus, B. 10, 556).

OXY-HIPPURIC ACID $\text{C}_8\text{H}_8\text{NO}_4$ *i.e.*

$\text{C}_6\text{H}_4(\text{OH}).\text{CO.NH.CH}_2.\text{CO}_2\text{H}$. Formed from m -amido-hippuric acid by the diazo-reaction (Griess, B. 1, 190; Conrad, J. pr. [2] 15, 259). Needles, v. sol. hot water.

OXY-HYDRASTININE *v.* **HYDRASTINE**.

OXYHYDROANTHRANOL *v.* **OXYANTHRANOL HYDRIDE**.

TRI-OXY-HYDROBENZAMIDE *v.* **OXY-BENZOIC ALDEHYDE**.

OXYHYDROBENZOIC ACID $\text{C}_7\text{H}_6\text{O}_5$. [275° cor.]. Formed from oxy-uvitic acid and aqueous KMnO_4 (Oppenheim a. Emmerling, B. 9, 327). Needles. Yields benzoic acid by potash-fusion.— CaA' , 3aq.— AgA' ; v. sl. sol. water.

OXY-HYDRO-COUMARILIC ACID *v.* **COUMARILIC ACID**.

OXY-HYDRONAPHTHOQUINONE *v.* **HYDROJUGLONE**.

OXY-HYDROQUINOLINE *v.* **OXY-QUINOLINE HYDRIDE**.

OXY-HYDROQUINONE *v.* **TRI-OXY-BENZENE**.

OXY-DIHYDROQUINOXALINES *v.* **OXY-QUINOXALINE DIHYDRIDE**.

OXYHYPOGEIC ACID $\text{C}_{16}\text{H}_{30}\text{O}_6$. [84°]. Formed from di-bromopalmitic acid and Ag_2O (Schröder, A. 143, 36). White mass.

OXY-DIIMIDODIAMIDOLASTIN *v.* **ISATIN**.

OXY-IMIDO-METHYL-PYRIMIDINE DI-HYDRIDE $\text{C(NH)}\langle\text{NH.CMe}\rangle\text{CH}$. *Imido-*

methyl-uracil. [270°]. Formed from guanidine, alcohol, and acetoacetic ether (Jaeger, A. 208, 365). Prisms, v. sol. hot water. Yields a dibromide [160°]. MeI forms $\text{C}_4\text{H}_5\text{MeN}_2\text{O}$ [312°], whence $\text{B}'\text{HI}$ [212°], $\text{B}'\text{HClAq}$, and $\text{B}'\text{H}_2\text{SO}_4$ [270°].

Salts.— $\text{B}'\text{HCl}$. [295°].— $\text{B}'\text{H}_2\text{SO}_4$. [180°].— $\text{B}'\text{HNO}_3$; needles.

Oxyimido-di-methyl-pyrimidine dihydride

$\text{C(NH)}\langle\text{NH.CMe}\rangle\text{OMe}$. [320°]. Formed

from guanidine and methyl-acetoacetic ether.— $\text{B}'\text{H}_2\text{SO}_4$. [265°].— $\text{B}'\text{HNO}_3$. [200°]. Plates.

OXY-IMIDO-PHENYL-PYRIMIDINE DI-

HYDRIDE $\text{C(NH)}\langle\text{NH.CPh}\rangle\text{CH}$. *Imido-*

phenyl-uracil. [294°]. Formed from guanidine and benzyl-acetic ether (Jaeger, A. 262, 872). Amorphous powder, insol. water and alcohol.

OXY-IMIDO-DIPHENYL SULPHIDE

$\text{NH}\langle\text{C}_6\text{H}_4(\text{OH})\rangle\text{S}$. Formed from oxydi-

phenylamine by heating with S (Bernthsen, A. 230, 182). Colourless mass, v. sol. alcohol and ether. FeCl_3 forms a chocolate pp. of

$\text{N}\langle\text{C}_6\text{H}_4(\text{OH})\rangle\text{S}$, insol. water.

DI-OXY-IMIDO-DIPHENYL SULPHIDE

$\text{NH}\langle\text{C}_6\text{H}_4(\text{OH})\rangle\text{S}$. Formed by reducing

thionol $\text{N}\langle\text{C}_6\text{H}_4(\text{OH})\rangle\text{S}$ which is itself got

by the action of conc. H_2SO_4 on imido-phenyl sulphide (Bernthsen, A. 230, 188). Colourless needles, v. sl. sol. water. Yields a tri-acetyl derivative [156°].

DI-OXY-IMIDO-PYRIDINE DIHYDRIDE *v.*

DI-OXY-AMIDO-PYRIDINE.

DI-OXY-DI-IMIDO-QUINONE

$\text{C}_6(\text{NH})_2(\text{OH})_2\text{O}_2$. Formed by oxidising tetra-oxy-di-amido-benzene by FeCl_3 (Nietzki, B. 16, 2094; 18, 503). Plates, v. sl. sol. alcohol.

OXY-INDAZOLE $\text{C}_8\text{H}_6(\text{OH})\text{N}_2$. [155°–266°(?)].

Formed by boiling diazo-indazole with water (Witt, Noeltling, a. Grandmougin, B. 23, 3642). Needles, sl. sol. cold water.

OXY-INDONE *v.* **OXINDOLE**.

(a)-**OXY-INDONAPHTHENE** $\text{C}_{15}\text{H}_8\text{O}$ *i.e.*

$\text{C}_6\text{H}_4\langle\text{CO}\rangle\text{CH}_2$. (a)-*Hydrindone*. [40°]. (214°).

Formed by heating *o*-cyano-benzyl-acetic ether with conc. HClAq (Gabriel a. Hausmann, B. 22, 2018). Colourless tables. Conc. HClAq at 100° forms $(\text{C}_6\text{H}_5)_n$, not melted at 280°.

Oxim $\text{C}_8\text{H}_6(\text{NOH})$. [146°]. White needles (from alcohol), sol. alkalis.

Phenyl-hydrazide $\text{C}_8\text{H}_5(\text{N.HPh})$. [c. 120°]. White prisms, converted by conc. HClAq into $\text{C}_{15}\text{H}_{11}\text{N}$ [235°].

References.—**DI-BROMO-** and **CHLORO-DI-OXY-INDONAPHTHENE**.

OXY-ITACONIC ACID $\text{C}_6\text{H}_6\text{O}_5$. Formed by boiling acetic acid with baryta-water (Meilly, A. 171, 153). Oil.— BaA'' (at 160°).— AgA'' : flocculent pp.

OXY-JUGLONE *v.* **JUGLONE**.

OXY-LEPIDINE *v.* **OXY-METHYL-QUINOLINE**.

OXY-LEUCOTIN *v.* **COTOIN**.

OXY-LUTIDINE *v.* **OXY-DI-METHYL-PYRIMIDINE**.

OXY-MALONIC ACID *v.* **TARTROIC ACID**.

OXY-MARGARIC ACID $\text{C}_{17}\text{H}_{34}\text{O}_2$. [80°].

Occurs in apicocere (Ebert, B. 8, 775).— AgA' : amorphous.

OXY-TRIMELLITIC ACID $\text{C}_6\text{H}_4\text{O}_5$ *i.e.*

$\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})_2$. [5:4:2:1]. [c. 245°]. Formed by fusing sulpho-trimellitic acid with potash (Jacobsen a. Meyer, B. 16, 192). Prisms (containing 2aq). With HClAq at 240° it yields m -oxy-benzoic acid.— $\text{Ba}_2\text{A}'''$, 5aq; small prisms.

OXY-TRIMESIC ACID $C_6H_3O_7$, i.e. $C_6H_3(OH)(CO_2H)_4$ [2:5:3:1]. S. 5 at 10°. Formed by heating [2:1] $C_6H_3(ONa)CO_2Na$ in a current of CO_2 (Ost, *J. pr.* [2] 14, 95; 16, 802; 17, 284), and by fusing $C_6H_3(SO_3NH_2)(CO_2H)_2$ with potash (Jacobsen, *A.* 206, 204). Nodules (containing aq) or needles (containing 2aq). Decomposes at 180°. — Ca_2A'' , 8aq. — $Ca(H_2A'')$, 8aq. — Ag_2A'' , 8aq.

Ethers Et_2HA'' aq. [148°]. — Et_2NaA'' aq. — Et_2A'' . [84°]. — $Et_2NaC_6H_3O_7$: prisms, insol. water.

OXY-MESITENE CARBOXYLIC ACID v. ACETO-ACETIC ACID.

ω-OXY-MESITYLENE $C_6H_3Me_3CO_2H$. (220°). Heavy oil (Wispek, *B.* 16, 1577).

Acetyl derivative $C_6H_3Me_3CO_2CH_3$. S.G. 1.09. Formed from ω-bromo-mesitylene and KOAc.

Isomeride v. MESITOL.

Di-ω-oxy-mesitylene $C_6H_3Me_2(CH_2OH)_2$. *Mesitylene glycol*. (280°). S.G. 1.23. S. 5.

Ethers 60°. Obtained by prolonged boiling of ω-di-chloro-mesitylene [41:5°] with water and lead carbonate (Robinet a. Colson, *C. R.* 96, 1869). Liquid, with bitter taste, v. sol. alcohol.

Di-acetyl derivative $C_6H_3Me_2(CH_2COCH_3)_2$. [244° at 120 mm.]. S.G. 1.12. Oil.

Isomeride v. TRI-METHYL-RESORCIN.

Tri-ω-oxy-mesitylene $C_6H_3O_7$, i.e.

$C_6H_3(CH_2OH)_3$. *Mesicerin*. Obtained by boiling tri-ω-bromo-mesitylene with water (40 pts.) and lead carbonate (Colson, *A. Ch.* [6] 6, 95). Syrup, gradually crystallising in a desiccator. Sol. alcohol, insol. chloroform and ether.

o-OXY-MESITYLENE CARBOXYLIC ACID $C_6H_3O_7$, i.e.

$C_6H_3Me_2(OH)CO_2H$ [5:3:2:1]. [179°]. Formed by potash-fusion from mesitylene sulphonic acid (Fittig a. Hoogewerf, *A.* 150, 333), from mesitol (Jacobsen, *A.* 195, 274), (a)-sulpho-mesitylenic acid (Remsen, *Am.* 3, 220), and mesitylene di-sulphonic acid (Barth a. Herzig, *M.* 1, 812). Formed also from o-amido-mesitylenic acid (Jacobsen, *B.* 11, 2055). Prepared from m-xyleneol, Na, and CO_2 (Jacobsen, *B.* 14, 44). Needles (from dilute alcohol). $FeCl_3$ colours its solution blue. — NH_4A' . — KA' . — CaA' , 5aq. — BaA' , 5aq. — ZnA' , 2aq: four-sided prisms. — MeA' . Oil.

p-Oxy-mesitylenic acid

$C_6H_3Me_2(OH)CO_2H$ [5:3:4:1]. [223°]. Formed from p-sulphamido-mesitylenic acid by potash-fusion (Jacobsen, *B.* 12, 606; *A.* 206, 197). Formed also from p-amido-mesitylenic acid (Emerson, *Am.* 8, 268). Needles insol. cold water. Yields c-xyleneol on heating with $HClAq$ at 200°. — BaA' . — AgA' . — MeA' . [180°]. — EtA' . [118°]. Needles or prisms, volatile with steam.

OXY-METHACRYLIC ACID. Appears to be a product of the action of KCO_3 followed by potash on $CH_3 \cdot CCl \cdot CH_2 \cdot CO_2H$ (Claus, *A.* 170, 126). *Methyl derivative* $CH_3 \cdot C(CH_3)(OMe) \cdot CO_2H$. (c. 238°). Formed by heating $C(OMe)_2(CO_2H)_2$ at 140° (Kleber, *A.* 246, 103). Liquid, miscible with water. With HI and P it yields MeI and isobutyric acid.

OXY-METHANE v. METHYL ALCOHOL.

Di-oxy-methane v. FORMIC ALDEHYDE.

Tri-oxy-methane v. FORMIC ACID.

OXY-METHANE SULPHONIC ACID

$CH_3(OH)SO_3H$. Formed from methyl alcohol, H_2SO_4 and SO_3 (Max Müller, *B.* 6, 1081). Cry-

stalline, not decomposed by boiling water or acids. Yields sodium sulphide on warming with soda and spongy platinum (Loew, *B.* 23, 8125).

Oxy-methane disulphonic acid CH_3SO_3H , i.e. $CH(OH)(SO_3H)_2$. Formed from methyl alcohol and SO_3 . — KA'' : needles.

Oxy-methane tri-sulphonic acid

$C(OH)(SO_3H)_3$. Formed from $C(SH)(SO_3K)_2$ and bromine-water (Albrecht, *A.* 161, 129). Deliquescent mass. — KA'' aq: needles. S. 1.2 at 21°. — $(NH_4)_2A''$. — Ba_2A'' , 8aq. — Hg_2O_4A'' , 15aq. — PbK_2A'' , (OH) 5aq. — PbA'' , Ac, 8aq. — Ag_2A'' aq: needles, v. sol. warm water.

OXY-METHENYL-DI-AMIDO-DIBENZOIC ACID. *Ethyl derivative*

$C(OEt) \cdot \begin{smallmatrix} N \\ \diagup \diagdown \\ NH.C_6H_4.CO_2H \end{smallmatrix} \cdot C_6H_4.CO_2H$. [228°]. Formed from o-amido-benzoic acid hydrochloride and $NH_2C(OEt)_2$ (Sandmeyer, *B.* 19, 2656). Needles, v. sl. sol. hot water. — $AgHA''$: white pp.

OXY-METHENYL-AMIDO-PHENOL

$C_6H_4 \cdot \begin{smallmatrix} N \\ \diagup \diagdown \\ COH \end{smallmatrix} \cdot COH$ or $C_6H_4 \cdot \begin{smallmatrix} N \\ \diagup \diagdown \\ CO \end{smallmatrix}$. [137°].

Formed by heating oxy-phenyl-urea made by the action of $ClCO_2Et$ on o-amido-phenol (Grönviok, *Bl.* [2] 25, 177; Kalkhoff, *B.* 16, 1828), and by heating o-amido-phenyl ethyl carbonate (Bender, *B.* 19, 2265, 2950). Plates. EtI and $KOEt$ form $C_6H_4 \cdot \begin{smallmatrix} N \\ \diagup \diagdown \\ CO \end{smallmatrix}$. [29°].

Ethyl derivative $C_6H_4 \cdot \begin{smallmatrix} N \\ \diagup \diagdown \\ COEt \end{smallmatrix}$.

(225°-230°). Formed from $C_6H_4(OH) \cdot NH_2Cl$ and $NH_2C(OEt)_2$ (Sandmeyer, *B.* 19, 2655). Oil, insol. alkalis.

OXYMETHENYL-AMIDO-PHENYL-MER-

CAPTAN C_6H_4NOS i.e. $C_6H_4 \cdot \begin{smallmatrix} N \\ \diagup \diagdown \\ S \end{smallmatrix} \cdot CO(OH)$.

[136°]. Formed by the action of hot water or alcohol on C_6H_4ClSN which is got by heating phenyl thiocarbimide with PCl_5 (Hofmann, *B.* 12, 1128; 13, 10). Crystals (from alcohol), sl. sol. water.

Ethyl derivative $C_6H_4NS(COEt)$. [25°]. From C_6H_4ClSN and $NaOEt$. — $B^+H_4PtCl_6$.

Acetyl derivative $C_6H_4NS(COAc)$. [60°].

OXY-TETRAMETHENYL DIHYDRIDE

CARBOXYLIC ACID $CH_2 \cdot CH \cdot CO_2H$. [188°].

Formed by heating inactive amido-glutaric acid (Wolff, *A.* 260, 125). Prisms, v. sol. hot water.

OXY-METHENYL-PHENYLENE-DIAMINE

v. PHENYLENE-UREA.

OXY-METHYL-ACETOACETIC ETHER.

Ethyl derivative

$CH_3(OEt) \cdot CO \cdot CHMe \cdot CO_2Et$. (190°-195°). S.G. 2.976. Formed from chloro-methyl-acetoacetic ether and $NaOEt$ (Isbert, *A.* 234, 194). Liquid.

ω-OXY-METHYL-AMIDO-BENZOIC ACID

$C_6H_4(CH_2OH)(NH_2) \cdot CO_2H$ [2:4:1]. Formed by dissolving amido-phthalide [178°] in hot aqueous potash (Hönig, *B.* 18, 3452). — CuA' : dark-grey pp.

Oxy-dimethylamido-benzoic acid. *Anhydride of the methylo-hydrazide* C_6H_4NO , i.e. $C_6H_4(OH) \cdot \begin{smallmatrix} NMe_2 \\ \diagup \diagdown \\ CO \end{smallmatrix}$.

Formed by the action of MeI and KOH on amido-salicylic acid (Griess, *B.* 12, 2307). White needles (containing 4aq), v. sol. water. Tastes bitter. Gives a violet colour with $FeCl_3$. Converted on heating into

crystalline* $C_8H_7(OH)(NMe_2)CO_2Me$.—B'HCl—
B'HI.—B'H.PtCl₄ 4aq: small yellow prisms.

Oxy-methyl-amido-benzoic acid. *Methyl derivative* $C_8H_7(OMe)(NHMe)CO_2H$ [above 200°]. Formed from potassium amido-anisate and MeI (Griess, B. 5, 1042; 6, 588). Slender needles, v. sl. sol. hot water. Yields B'HClAq. Further treatment with MeI and KOH forms

$C_8H_7\langle\begin{smallmatrix} NMe_2 \\ CO \end{smallmatrix}\rangle O_2H$ which gives the salts B'H.PtCl₄ and B'HIaq. and on distillation yields $C_8H_7(NMe_2)(OMe)CO_2H$ (288°).

β -OXY-METHYL- α -AMIDO-BUTYRIC ACID $OHMe(OH).CH(NHMe).C_2H_5$. S. 56 at 12°. Formed from β -methyl-glycidic acid and methylamine at 100° (Selinsky, *Bl.* [2] 43, 247). Crystals.

O-OXY-TETRA-METHYL-DI-*p*-AMIDO-TRI-PHENYL CARBINOL $C_{22}H_{29}N_4O_2$. i.e. $C_6H_4(OH).C(OH)(C_6H_4NMe_2)_2$. Formed by oxidising the leuco-base obtained by condensation of salicylic aldehyde with dimethylaniline (O. Fischer, B. 14, 2522). Dyes yellowish-green.

O-OXY-TETRA-METHYL-DI-*p*-AMIDO-TRI-PHENYL-METHANE $C_{22}H_{29}N_4O$ i.e.

$C_6H_4(OH).CH(C_6H_4NMe_2)_2$. *Leuco-base of salicylaldehyde-green*. [128°]. Prepared by heating a mixture of dimethylaniline (24 pts.), salicylic aldehyde (10 pts.), and ZnCl₂ (20 pts.) to 100° for 7 or 8 hours; the yield being nearly theoretical (Fischer, B. 14, 2522). Colourless rosettes. Sol. hot alcohol and benzene, nearly insol. water. Combines with both acids and bases. On gentle oxidation it gives a green of yellow shade.

Acetyl derivative $C_{22}H_{29}N_4(OAc)$. Iridescent plates. [144°].

The isomeride [163°] from *p*-oxybenzoic aldehyde yields a green dye and forms an acetyl derivative [146°] crystallising in prisms.

Di-oxy-tetra-methyl-di-amido-tri-phenyl-methane. *Methyl derivative* $C_8H_7(OH)(OMe).CH(C_6H_4NMe_2)_2$. [136°]. Formed from vanillin, PhNMe₂, and ZnCl₂ (O. Fischer a. Schmidt, B. 17, 1895). Crystals, v. sol. alcohol.

OXY-TETRA-METHYL-AMMONIUM HYDROXIDE $CH_3(OH).NMe_3.OH$. Formed from $CH_3I.NMe_3$ and moist Ag_2O (Hofmann, J. 1859, 377). Yields $(CH_3OH.NMe_3)_2PtCl_4$ crystallising in octahedra.

DI-OXY-METHYL-AMYL-KETONE. *Di-methyl derivative*. $CH(OMe)_2.CO.CHEt_2$. (134°). S.G. 15-886. Formed as one of the products of the action of NaOMe upon $CHCl.CO.CHEt.CO.Et$ (James, A. 231, 243; C. J. 49, 57). Oil. Miscible with alcohol and with ether, burns with pale flame. Does not combine with NaHSO₄ or react with AcO.

OXY-METHYL-AMYL-PYRROLE OARB-OXYLIC ETHER $C_8H_7\langle\begin{smallmatrix} N.CMe \\ CO.CH \end{smallmatrix}\rangle CO.CO.Et$. [52°].

(188° at 16 mm.). Formed from acetosuccinic ether, amylamine, and alcohol in the cold (Emery, A. 260, 150). White plates (from CS₂).

DI-OXY-DI-METHYL-ANILINE v. TETRA-METHYL-DI-AMIDO-DI-PHENYL-DI-OXIDE.

OXY-METHYL-ANTHRANOL. *Acetyl derivatives* $C_8H_7\langle\begin{smallmatrix} OAc \\ CO.OAc \end{smallmatrix}\rangle C_6H_4Me$. [217°].

Formed from methyl-anthraquinone [177°], Ac₂O, NaOAc, and zinc-dust (Liebmann, B. 31, 1172). Plates.

OXY-METHYL-ANTHRAQUINONE $C_{14}H_8O_2$, i.e. $C_6H_4\langle\begin{smallmatrix} CO \\ CO \end{smallmatrix}\rangle C_6H_4Me(OH)$ [148°].

[262°]. Formed by heating *p*-cresol-phthalate or a mixture of phthalic anhydride, *o*-cresol, and H₂SO₄ at 160° (Baeyer a. Fraude, B. 12, 241; A. 202, 163). Yellow leaflets.

Bromo-derivative [205°].

Oxy-methyl-anthraquinone $C_8H_7.C_6O_2.C_6H_4Me(OH)$ [1:6:2:5]. [170°]. Formed in like manner from *p*-cresol (Drewson, A. 212, 346; Birukoff, B. 20, 2069). Orange needles (by sublimation).

Acetyl derivative [180°]. Needles.

Oxy-methyl-anthraquinone $C_8H_7.MeO_2(OH)$. [178°]. Formed from amido-methyl-anthraquinone [202°] by the diazo-reaction (Römer a. Link, B. 16, 699). Yellow needles (by sublimation).

Acetyl derivative [177°]. Plates.

Di-oxy-methyl-anthraquinone $C_8H_7(OH).C_6O_2.C_6H_4Me(OH)$. [162°]. Mol. w. 254. S. (boiling 86 p.c. alcohol) 45. The yellow colouring matter of rhubarb, the wall-lichen (*Parmelia parietina*), and of the root of *Rumex obtusifolius* (Rocheleder a. Heldt, A. 48, 12; Döpping a. Schlossberger, A. 50, 215; De la Rue a. Müller, C. J. 10, 298; Thann, A. 107, 324). It occurs also in the root of *Rheum pyramidalis*, *Rumex palustris*, and of other varieties of *Rumex* (Grothe, P. 113, 190) and in senna leaves (Batka, C. C. 1864, 622). Formed by passing air through an alkaline solution of chrysarobin (Liebmann a. Seidler, A. 212, 36). Golden plates (from alcohol), forming a cherry-red solution in NaOHaq. Insol. Na₂CO₃Aq. Conc. H₂SO₄ forms a red solution. Conc. HNO₃ forms a tetra-nitro-derivative. Yields methyl-anthracene on distilling with zinc-dust. Does not form mordants. Zinc, HOAc, and HClAq form $C_{14}H_8O_2$ [200°-206°] whence $C_{30}H_{20}Ac_2O_7$ [231°] (Liebmann, B. 21, 437).

Di-acetyl derivative [200°]. Plates.

Di-benzoyl derivative [c. 201°].

Di-oxy-methyl-anthraquinone $C_8H_7.C_6O_2.C_6H_4Me(OH)_2$ [1:6:3:2:5]. *Methyl-quinizarin*. [160°]. Formed from hydrotoluquinone, phthalic anhydride, and H₂SO₄ at 140° (Nietzki, B. 10, 2011). Red needles (from alcohol). Yields methyl-anthracene when distilled with zinc-dust.

Acetyl derivative [185°]. Needles.

Di-oxy-methyl-anthraquinone $C_8H_7.C_6O_2.C_6H_4Me(OH)_2$ [1:6:4:3:2]. *Methyl-alizarin*. [252°]. Formed by potash-fusion from bromo- or oxy-methyl-anthraquinone (O. Fischer, B. 8, 675; Fraude, B. 12, 241). Orange needles, which may be sublimed. Dyes mordants like alizarin.

Alkannin (vol. i. 125) is probably a di-oxy-methyl-anthraquinone as it yields methyl-anthracene on distillation with zinc-dust (Liebmann a. Römer, B. 20, 2428).

Di-oxy-di-methyl-anthraquinone $C_8H_7.MeO_2.C_6O_2.C_6H_4Me(OH)$. *Di-methyl-anthrarin*. [300°]. Got, together with the two following isomerides, by the action of H₂SO₄ on *o*-oxy-toluic acid (Kostanecki a. Niementowski, B. 18, 255, 2140; A. 240, 276). Yellow needles

(from benzene). Its alkaline solutions are yellow. Does not dye mordants.

Di-acetyl derivative [237°]. Tables.

Di-oxy-di-methyl-anthraquinone

$C_{12}H_8Me_2(OH)_2O_2$. *Di-methyl-anthraflavic acid*. Needles or small yellow plates (by sublimation); not solid at 360°. Does not dye mordants.

Di-acetyl derivative [223°]. Needles.

Di-oxy-di-methyl-anthraquinone (benz-). [213°]. Yellow needles, yielding $C_{12}H_8Ac_2O_2$. [188°].

Tri-oxy-methyl-anthraquinone $C_{12}H_{10}O_6$.

Emodin. [254°]. Occurs in rhubarb root (Warren de la Rue a. Hugo Müller, *C. J.* 10, 304), in the bark and berries of *Rhamnus frangula* (Liebermann a. Waldstein, *B.* 8, 970; 9, 1775; Schwabe, *Ar. Ph.* [3] 26, 569), and in the lichen *Nephroma Lusitanica* (Bachmann, *E. C.* 1888, 47). Orange-red monoclinic prisms (containing aq.). Yields methyl-anthracene on distilling with zinc dust. Its alkaline solution is dark cherry-red.

Mono-acetyl derivative [180°].

Tri-acetyl derivative [190°].

Tri-oxy-methyl-anthraquinone

$C_{12}H_8Me_2CO_2CH(OH)_2$. [1:6:2:3:4]. *Methyl-anthragallol*. [c. 375°]. Made by heating gallic acid with *p*-toluic acid at 130° for 15 hours (Cahn, *B.* 19, 2335; *A.* 240, 284). Orange-red needles (by sublimation). Its solution in conc. KOH aq. is green, becoming violet on dilution. Hot NH_3 aq. forms a blue solution. Conc. H_2SO_4 forms a red liquid turned green by a trace of HNO_3 , decolourised by more HNO_3 .

Tri-acetyl derivative [204°].

Tri-oxy-methyl-anthraquinone

[2:1:6] $C_{12}H_8Me_2CO_2CH(OH)_2$. [1:6:2:3:4]. *Methyl-anthragallol*. [298°]. Formed by heating gallic acid with *o*-toluic acid (C.). Minute yellow needles. Forms a green solution in conc. KOH aq. turned violet on dilution. Dyes like anthragallol. Conc. H_2SO_4 gives a red solution turned green by HNO_3 .

Tri-acetyl derivative [210°]. Tables.

(2, 8, 4)-**Tri-oxy-3' and 5'-methyl-anthraquinones** (*methyl-anthragallols*). These two isomerides are formed simultaneously by heating gallic acid with *m*-toluic acid at 130°-135°. The one melts at 312° and gives an acetyl derivative which forms needles melting at 190°. The other isomeride melts at 235°-240°, and its acetyl derivative, which crystallises in small prisms, melts at 218°. Their other properties are almost the same as those of the other methyl-anthragallols (Cahn, *B.* 19, 2336).

Tri-oxy-methyl-anthraquinone

[3:2:1:6] $C_{12}H_8(OH)_2CO_2CH_2Me(OH)$ [1:6:2:5']. *Methyl-oxy-alizarin*. Formed by saponifying its di-methyl ether which is produced by heating hemipic acid with *p*-xylol and H_2SO_4 (Liebermann a. Kostanecki, *A.* 240, 303). Brownish-yellow flakes, v. sol. alcohol. Dyes like alizarin.

Di-methyl ether $C_{12}H_{10}O_4$. Flakes.

Tri-oxy-di-methyl-anthraquinone

[4:2:1:6] $C_{12}H_8Me_2CO_2CH(OH)_2$. [1:6:2:3:4]. Formed by heating (4,2,1)-di-methyl-benzoic acid with gallic acid and H_2SO_4 (Birakoff, *B.* 20, 871; *A.* 240, 287). Yellowish-red needles. Forms a red solution in conc. H_2SO_4 . Yields di-methyl-anthracene [224°], when distilled with zinc dust.

Tri-oxy-tri-methyl-anthraquinone

[4:3:2:1:6] $C_{12}H_8Me_3CO_2CH(OH)_2$. [1:6:2:3:4]. *Tri-methyl-anthragallol*. [244°]. Formed from tri-methyl-benzoic (durylic) acid, gallic acid, and H_2SO_4 (Wende, *B.* 20, 867). Brown needles. Yields tri-methyl-anthracene [236°].

Acetyl derivative [174°]. Plates.

Tetra-oxy-di-methyl-anthraquinone

[2:4:5:4:6] $C_{12}H_8Me_2(OH)_2CO_2CH_2Me(OH)_2$. [1:6:2:3:4]. *Tetra-methyl-anthrachrysons*. [above 860°]. Formed by heating di-oxy-*o*-toluic acid with H_2SO_4 (10 pts.) at 100° (Cahn, *B.* 19, 755). Reddish-yellow plates (by sublimation). Does not dye mordants.

Tetra-acetyl derivative [234°].

OXY-METHYL-BENZOIC ACID v. OXY-TOLUIC ACID.

Oxy-di-methyl-benzoic acid

$C_{12}H_8Me_2(OH)_2CO_2H$ [6:3:2:1]. *Oxy-isoxyllylic acid*. [142°]. Formed by fusing ethyl-*p*-xylene sulphonic acid with potash (Stahl, *B.* 23, 991). Needles. Gives a bluish-violet colour with $FeCl_3$.

Oxy-di-methyl-benzoic acid.

$C_{12}H_8Me_2(OH)_2CO_2H$ [5:4:2:1]. *Oxy-p-xyllylic acid*. [199°]. Formed from ψ -cumenol by potash-fusion (Reuter, *B.* 11, 30; Jacobsen, *B.* 12, 436). Needles, volatile with steam. Gives a bluish-violet colour with $FeCl_3$. $HClAq$ at 220° gives xylolol [61°].— BaA' . S. 1:1 at 0°.

Oxy-di-methyl-benzoic acid

$C_{12}H_8Me_2(OH)_2CO_2H$ [4:2:5:1] ? [170°]. Formed by fusing $C_{12}H_8Me_2BrCO_2H$ (Gunter, *B.* 17, 1608). Scarcely volatile with steam. Gives no colour with $FeCl_3$.

Oxy-di-methyl-benzoic acid [137°]. Formed from *p*-xylolol, Na, and CO_2 at 180° (Oliveri, *G.* 12, 166). Needles, coloured violet by $FeCl_3$.— BaA' , 4aq.

Oxy-di-methyl-benzoic acid

$C_{12}H_8Me_2(OH)_2CO_2H$ [6:3:4:1]. [153°]. Got from $C_{12}H_8Me_2BrCO_2H$ and KOH. Not coloured blue by $FeCl_3$.

Oxy-di-methyl-benzoic acid. Xylletic acid. [155°]. Formed from crude xylolol, Na, and CO_2 (Wroblewsky, *Z.* 1868, 233).— CaA' , 2aq.— BaA' , aq.: needles.

Di-oxy-di-methyl-benzoic acid

$C_{12}H_8Me_2(OH)_2CO_2H$ [5:3:6:2:1]. [196°]. Formed from betorein, $NaHCO_3$, and water at 130° (Kostanecki, *B.* 19, 2323). Prisms. Coloured blue by $FeCl_3$.

Oxy-tri-methyl-benzoic acid

$C_{12}H_8Me_3(OH)_2CO_2H$ [6:4:3:2:1]. *Oxydurylic acid*. [148°]. Formed by fusing duronol with potash (Jacobsen a. Schnapfaff, *B.* 18, 2844). Needles.— CaA' , aq.: prisms, m. sol. water.

Oxy-tetra-methyl-benzoic acid. Tetra-

hydride of the methylene derivative $CH_2O.C_{12}H_8Me_2CO_2H$. *Piperhydrynic acid*. [96°]. Formed from (8)-hydropiperic acid and sodium-amalgam (Buri, *A.* 216, 178).— CaA' , aq.: crystals (from water).

OXY-TRI-METHYL-BENZOIC ALDEHYDE

$C_{12}H_8Me_3(OH)CHO$ [1:3:4:6:5]. [106°]. Formed by the action of chloroform on an alkaline solution of ψ -cumenol (Aubert, *B.* 17, 2976). Needles. $FeCl_3$ gives a blue colour.

OXY-METHYL-BUTYL-PYRROLE CARB-

OXYLIC ETHER $C_8H_7N \begin{smallmatrix} OMe:CO_2Et \\ CO_2OH \end{smallmatrix}$ [68°].

(175° at 15 mm.). Formed from aceto-succinic ether (10g.) and isobutylamine (3.4g.) in the cold (Emery, A. 260, 149). Needles (from CS₂).

OXY-METHYL-CINNAMIC ACID. *Anhydride* $[6:4:2] \text{C}_6\text{H}_4\text{Me}(\text{OH}) \begin{smallmatrix} \text{CH}:\text{CH} \\ \text{O}-\text{CO} \end{smallmatrix} \dots [248^\circ]$.

Homocoumestroliferon. Formed by heating orcin with malic acid and H₂SO₄ (Pechmann a. Welsh, B. 17, 1649). Tables, sol. alcohol and aqueous alkalis. Conc. H₂SO₄ forms a solution with blue fluorescence. Potash-fusion gives orcyl aldehyde and KOAc.

Acetyl derivative [127°]. Formed by heating orcyl aldehyde with Ac₂O and NaOAc (Tiemann a. Helkenberg, B. 12, 1002). Needles.

OXY-METHYL-COUMARILIC ACID C₁₀H₈O₄, i.e. $[4:2] \text{C}_6\text{H}_2(\text{OH}) \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \gg \text{C.CO}_2\text{H} \dots [226^\circ]$.

Formed by saponification of its ethyl-ether, which is obtained by boiling chloro-acetoacetic ether (1 mol.) with a conc. alcoholic solution of monosodium resorcin C₆H₃(OH)(ONa). Needles (containing $\frac{1}{2}$ aq.). V. sol. hot water. On distillation it loses carbonic acid, giving oxy-methyl-coumarone C₉H₆(OH) $\begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \gg \text{CH} [97^\circ]$.

Ethyl ether A'Et. [178°]; white needles; v. sol. ether; its dilute solutions have a blue fluorescence (Hantzsch, B. 19, 2938).

Di-oxy-methyl-coumarilic acid C₁₀H₈O₅, i.e. $[6:4:2] \text{C}_6\text{H}_2(\text{OH}) \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \gg \text{C.CO}_2\text{H} \dots [281^\circ]$.

Formed by saponification of its ethyl ether, which is obtained by boiling chloro-acetoacetic ether (1 mol.) with a conc. alcoholic solution of monosodium-phloroglucin C₆H₃(OH)₂(ONa) (1 mol.). Crystals (containing $\frac{1}{2}$ aq.). The acid and its ether give an indigo-blue colour with warm conc. H₂SO₄.

Ethyl ether A'Et. [242°]; small white needles; the alkaline solution is fluorescent (Lang, B. 19, 2934).

OXY-METHYL-COUMARONE v. COUMARONE.

OXYMETHYLENE v. FORMYL ALDEHYDE.

OXY-TRIMETHYLENE-DIAMINE

CH(OH)(CH₂NH₂)₂. Formed by heating with HClAq the compound got by the action of epichlorhydrin or (α)-dichlorhydrin on potassium phthalimide (Goedeckemeyer, B. 21, 2689; Gabriel, B. 22, 225). —B''H₂Cl. [184°]. Hygroscopic mass. —B''H₂PtCl₆. [240°]. —B''H₂Br. [200°]. Needles. —B''2C₂H₅(NO₂)OH: yellow needles. [230°].

OXY-TRIMETHYLENE-DIPHTHALMIC ACID CH(OH)(CH₂NH₂COCH₂CO₂H)₂. [c. 120°]. Formed by boiling oxytrimethylene-diphthalimide with potash (Goedeckemeyer, B. 21, 2690). Hygroscopic needles. Yields oxy-trimethylene-diamine on evaporating with HClAq.

OXYMETHYLENE-PHTHALIDE? C₈H₆O₄. [146°]. A crystalline body formed in the action of Br and HOAc on acetophenone carboxylic acid (Gabriel a. Michael, B. 11, 1010).

Phenyl derivative C₆H₅ $\begin{smallmatrix} \text{C}:\text{CH}:\text{OPh} \\ \text{CO.O} \end{smallmatrix} \dots$

[144°]. Made by heating phthalic anhydride with phenoxy-acetic acid and NaOAc (Gabriel, B. 14, 922). Needles. The homologous *p*-tolyl derivative [174°] is also crystalline.

OXYTRIMETHYLENE-DIPHTHALIMIDE

CH(OH)(CH₂NH₂CO₂H)₂. [205°]. Formed from potassium phthalimide and (α)-dichlorhydrin at 150° (Goedeckemeyer, B. 21, 2689; Gabriel, B. 22, 224). Needles (from HOAc). Fuming HBr at 200° converts it into CHBr(CH₂NH₂)₂.

OXY-METHYL-ETHYL-BENZOIC ACID C₈H₈MeEt(OH).CO₂H. [149°]. Made by fusing *s*-di-methyl-ethyl-benzene-sulphonic acid with potash (Jacobsen, A. 195, 284). Long needles from dilute alcohol. Turned blue by FeCl₃.

OXY-METHYL-ETHYL-KETONE. *Ethyl derivative* CH₃(OEt).CO.Et. (100°-105°). (Formed from CH₃(OEt).CO.CHMe.CO₂Et and alcoholic KOH at 120° (Isbert, A. 234, 196).

OXY-METHYL-ETHYL-PYRIMIDINE C₇H₁₀N₂O i.e. CEt $\begin{smallmatrix} \text{N.CMe} \\ \text{N:C(OH)} \end{smallmatrix} \gg \text{CH} [160^\circ]$.

Formed by the action of a 10 p.c. solution of NaOH (1 mol.) upon a mixture of propionamide hydrochloride (1 mol.) and acetoacetic ether (1 mol.) (Pinner, B. 18, 2847; B. 22, 1619). Fine white needles. V. sol. water and alcohol. Reduced by zinc-dust to methyl-ethyl-pyrimidine.

Salts. —B'HCl: [210°-246°]; very soluble thick prisms. —B'H₂Cl₂PtCl₄: [236°]; thick yellow prisms.

Oxy-methyl-di-ethyl-pyrimidine

CEt $\begin{smallmatrix} \text{N.CMe} \\ \text{N:C(OH)} \end{smallmatrix} \gg \text{CEt} [185^\circ]$. Formed from propionamide hydrochloride, ethyl-acetoacetic ether, and dilute (10 p.c.) NaOH_{aq} (Pinner, B. 22, 1621). Needles, v. sol. water.

Oxy-methyl-di-ethyl-pyrimidine C₇H₁₂N₂O i.e. CEt $\begin{smallmatrix} \text{N.CEt} \\ \text{N:C(OH)} \end{smallmatrix} \gg \text{CMe} [155^\circ]$

Formed from propionamide hydrochloride, propionyl-propionic ether, and KOH (Meyer, J. pr. [2] 89, 264). When warmed with a solution of nitrous acid in HOAc it yields C₇H₁₂N₂O₂ and a little C₇H₁₂N₂O₂ [205°].

Oxy-di-methyl-ethyl-pyrimidine

CMe $\begin{smallmatrix} \text{N.CMe} \\ \text{N:C(OH)} \end{smallmatrix} \gg \text{CEt} [146^\circ]$. Formed from acetamide and ethyl-acetoacetic ether (Pinner, B. 22, 1619). Needles, v. sol. water.

Oxy-di-methyl-ethyl-pyrimidine

CEt $\begin{smallmatrix} \text{N.CMe} \\ \text{N:C(OH)} \end{smallmatrix} \gg \text{CMe} [165^\circ]$. Formed from propionamide and methyl-acetoacetic ether (P.). Needles, v. sol. water and alcohol.

Oxy-di-methyl-ethyl-pyrimidine

CMe $\begin{smallmatrix} \text{N.CEt} \\ \text{N:C(OH)} \end{smallmatrix} \gg \text{CMe} [168^\circ]$. Formed from acetamide and propionyl-propionic ether (E. von Meyer, J. pr. [2] 40, 304).

Di-oxy-methyl-ethyl-pyrimiding

C₇H₁₀MeEt(OH)₂N₂ i.e. CO $\begin{smallmatrix} \text{NH.CMe} \\ \text{NET.CO} \end{smallmatrix} \gg \text{CH} [195^\circ]$.

Methyl-ethyl-uracil. [195°]. Formed, together with di-oxy-methyl-di-ethyl-pyrimidine [153°], by heating potassium methyl-uracil with EtBr at 155° (Hoffmann, A. 253, 68). Prisms (from EtBr) or needles (from alcohol).

OXY-METHYL-ETHYL-PYRROLE CARB.

OXYLIC ETHER CO₂.CH₂ $\begin{smallmatrix} \text{NET.CMe} \\ \text{CO} \end{smallmatrix} \gg \text{C.CO}_2\text{Et} [76^\circ]$. (165° at 14 mm.). Formed from acetyl-succinic ether and cold aqueous ethylamine (Emery, A. 260, 148). Needles.

OXY-METHYL-(α)-NAPHTHOQUINOLINE
 $C_{12}H_{11}NO$ i.e. $C_{12}H_9 \cdot \begin{matrix} C(OH):OH \\ N= \\ CMe_3 \end{matrix}$ [292°]. (K);
 [over 800°] (C. a. L.). Formed by boiling with

HCl α -naphthyl- β -imido-butyric ether, which is formed by condensation of acetoacetic ether with (α)-naphthylamine (Knorr, B. 17, 543; Conrad, Limpach, B. 21, 531). Needles (from alcohol). —B'H₂PtCl₄ · v. sl. sol. hot water.

The isomeride derived from (β)-naphthylamine crystallises in flat needles [286°] (K.) or [above 300°] (C. a. L.) decomposed by distillation.

OXY-DI-METHYL-(β)-NAPHTHOQUINOLINE DISULPHONIC ACID
C₁₂H₁₁(OH)(SO₃H)N 1/2 aq. Formed by potash-fusion from the disulphonic acid of di-methyl-(β)-naphthoquinoline (Reed, J. pr. [2] 35, 309): small needles, insol. water and alcohol.

DI-OXY-METHYL-NAPHTHOQUINONE (?)
C₁₂H₈O₄. [170°]. Extracted from tubers of *Drosera Whittakeri* (Rennie, C. J. 51, 376). Forms a deep-red solution in KOH aq.

Tri-oxy-methyl-naphthoquinone (?) C₁₁H₆O₄. [c. 193°]. A substance of this empirical composition may be extracted from tubers of *Drosera Whittakeri* (Rennie, C. J. 51, 371). Red plates (from alcohol or glacial HOAc). V. sl. sol. water. Gives a violet solution in KOH aq. or NH₃ aq. Reduced by SnCl₂ to C₁₁H₁₀O₄. [217°].

OXY-METHYL-ISO-OXAZOLE

CMc<CH₂CO
N—O. [170°]. Formed from acetoacetic ether, hydroxylamine hydrochloride, and NaOH at 50° (Hantzsch, B. 24, 497). Satiny needles, sl. sol. cold water, sol. HCl aq.—Ac₂O forms on heating a compound [130°] possibly N—O—CMeCH<C(OAc).O—NH₂A'. [207°]. —BaA', 2aq.—CuA', —AgA': gelatinous.

Di-oxy-di-methyl-di-iso-oxazol

O.CO>CH.CH<CO.O
N:CMc>CMe:N. Formed by warming isocarbopyrrolidic ether with hydroxylamine and HOAc on the water-bath (Knorr, B. 22, 161). Hair-like needles which explode at 190°.

OXY-TETRA-METHYL-PHENYL-ACETIC ACID [6:5:3:2:1] C₆HMe₄.CH(OH).CO₂H. [146°]. Formed from tetra-methyl-phenyl-glyoxylic acid by reduction with sodium-amalgam (Claus, A. Focking, B. 20, 3102). Nodules.—BaA', 2aq.—CaA', 8aq: needles.

Oxy-tetra-methyl-phenyl-acetic acid [6:5:4:3:1] C₆HMe₄.CH(OH).CO₂H. [160°]. Formed in like manner (Claus, J. pr. [2] 38, 383). Hexahedra, m. sol. hot water.

Oxy-tetra-methyl-phenyl-acetic acid [6:4:3:2:1] C₆HMe₄.CH(OH).CO₂H. [156°]. Prisms, v. sol. alcohol and ether.—NaA' 1/2 aq.—CaA', 8aq.—BaA', 3aq: small crystals.

OXY-TRI-METHYL-PHENYL-METHYL-PYRAZOLE C₁₂H₁₀N₂O 1/2 a. [155°]. Formed by heating the ψ -cumyl-hydrazide of acetoacetic ether at 140° for two hours (Haller, B. 18, 706).

Glistening crystals, v. sol. alcohol. Yields a nitrosamine C₁₂H₁₀N₂O₂ [156°] and a methyl derivative C₁₂H₁₁N₂O [108°].

OXY-TETRA-METHYL-PHENYL-DI-METHYL-PYRIDINE CARBOXYLIC ACID

C₆HMe₄N<CMe:CO(OH)>. [145°]. Made by

heating tetramethyl phenyl-amido-crotonic ether at 280° (Conrad, A. Limpach, B. 21, 1655).

OXY-METHYL-ISOPHTHALIC ACID

C₆H₄Me(OH)(CO₂H)₂ [4:5:3:1]. [c. 270°]. Formed by heating C₆H₄Me(SO₃H)(CO₂H), with conc. HCl aq at 220° (Jacobsen, B. 14, 2115). Needles (from hot water). Not coloured by FeCl₃.

OXY-DI-METHYL-PROPIONAMIDINE

CH₃.CH(OH).C(NHMe).NMe. The crystalline hydrochloride B'HCl [215°], formed by the action of methylamine on the hydrochloride of CH₃.CH(OH).C(O₂C₂H₅).NH, is v. sol. water and m. sol. alcohol (Pinner, B. 23, 2948).

OXY-METHYL-PROPYL-BENZOIC ACID. Methyl derivative C₆H₄MePr(OMe)CO₂H [3:6:1:4]. [139°]. Formed from its amide [149°], which is made by the action of ClCONH₂ on C₆H₄MePr(OMe) in CS₂ in presence of AlCl₃ (Gattermann, A. 244, 68). The ethyl derivative [159°] and its amide C₆H₄MePr(OEt).CONH₂ [127°] are got in like manner.

Oxy-methyl-isopropyl-benzoic acid

C₆H₄MePr(OH)CO₂H [3:5:2:1]. Cymenotic acid. [147°]. Formed from (4,2,1)-cymenol, sodium, and CO₂ (Jesurun, B. 19, 1414). Slender needles (from water).—BaA', 4aq.—AgA'.—MeA'. [143°]. Isomeric acids v. CARVACROTIC ACID and THYMOTIC ACID.

OXY-METHYL-PROPYL-CINNAMIC ACID

[1:4:3:6] C₆H₄(CH₃)(C₂H₅)(OH).C₆H₄.CO₂H. Thymo-acrylic acid. [280°]. Prepared by heating *p*-thymotic aldehyde with acetic anhydride and sodium acetate (Kobek, B. 16, 2104). White microscopic crystals.

Methyl derivative

C₆H₄(CH₃)(C₂H₅)(OMe).C₆H₄.CO₂H. [141°]. Needles, v. sol. alcohol, sl. sol. water.

OXY-METHYL-PROPYL-CINNAMIC ANHYDRIDE v. METHYL-PROPYL-COUMARIN.

OXY-METHYL-PROPYL KETONE. Ethyl ether EtO.CH₂.CO.Pr. (112°–115°). Formed from EtO.CH₂.CO.CHET.CO₂Et and alcoholic KOH at 120° (Isbert, A. 234, 195). Lighter than water; smells like a ketone.

DI-OXY-METHYL-ISOPROPYL-PYRIMIDINE

CMc(OH).C<N:CMc
N.C(OH)>CH. [98°].

Formed from oxy-isobutyramidine hydrochloride, acetoacetic ether, and NaOH in equivalent proportions (Pinner, B. 22, 2625). Needles (from acetone), v. sol. most solvents.

OXY-METHYL-PROPYL-PYRROLE CARB.

OXYLIC ETHER C₆H₄N—CMe
CO.CH₂>C.CO₂Et. [50°].

(172° at 15 mm). Formed from aceto-succinic ether and propylamine in the cold (Emery, A. 269, 148). Needles.

OXY-METHYL-PURIN

C₆H₄Me(OH)N, i.e. CO<NH—C.CH:N>CH. [238°]. Made by

heating di-chloro-oxy-methyl-purin with HI (Fischer, B. 17, 332). Prisms, v. sol. water. Alkaline in reaction.—B'HI.—B'H₂PtCl₄.

Oxy-di-methyl-purin C₆H₄Me(OMe)N, [112°]. Formed from di-chloro-oxy-di-methyl-purin and HIAq (Fischer, B. 17, 334). Slender needles, v. sol. water, insol. alkalis.

Di-oxy-di-methyl-purin C₆H₄N₂O₂. Formed by reducing the ethyl derivative of chloro-di-oxy-di-methyl-purin with HI. Sparingly soluble crystals.

Di-ethyl derivative $C_7H_{11}N_3O_2$, *i.e.*
 $O(OC_2H_5) \langle \begin{smallmatrix} N: C(OC_2H_5) \cdot C \cdot NMe \\ \backslash \quad \quad \quad / \\ C \cdot NMe \end{smallmatrix} \rangle CO$ [127°]. Formed
 from di-chloro-oxy-di-methyl-purin and alco-
 holic NaOH. Fine plates, sol. HClAq, insol.
 alkalis.

Tri-oxy-methyl-purin v. METHYL-URIC ACID.
OXY-METHYL-PYRAZOLE $C_4H_5N_3O$ *i.e.*
 $OMe \langle \begin{smallmatrix} CH_2 \cdot CO \\ \backslash \quad \quad / \\ N \cdot NH \end{smallmatrix} \rangle$ [15°]. Formed by warming
 acetoacetic ether with hydrazine and water (Cur-
 tius a. Jay, *J. pr.* [2] 39, 52). Prisms (from
 water), sl. sol. hot alcohol. Has a sweet taste.

OXY-DI-METHYL-PYRIDINE. *Ethyl deri-*
vative C_7H_9NO *i.e.* $N \langle \begin{smallmatrix} CMe \\ \backslash \quad \quad / \\ C(OC_2H_5) \cdot CH \end{smallmatrix} \rangle CMe$.
 (246°). Formed from acetoacetic ether and am-
 monia-zinc chloride (Canzoneri & Spica, *G.* 16,
 449). Oil.

Oxy-di-methyl-pyridine. *Methyl deriva-*
tive $N \langle \begin{smallmatrix} CMe \cdot CH \\ \backslash \quad \quad / \\ CMe \cdot CH \end{smallmatrix} \rangle CMe$. (203°). S.G. $\frac{1}{2}$
 1.011. Formed from chloro-di-methyl-pyridino-
 NaOMe, and MeOH at 160° (Conrad a. Eck-
 hardt, *B.* 22, 81). Oil.— $B'H_2PtCl_6$ — $B'Me$.
 [204°]. Prisms (from water).

Ethyl derivative C_7H_9EtNO . (215°).—
 $B'Mel$. [196°]. Crystals (from water).

Oxy-di-methyl-pyridine C_7H_9NO *i.e.*
 $NH \langle \begin{smallmatrix} CMe \cdot CH \\ \backslash \quad \quad / \\ CO \cdot CH \end{smallmatrix} \rangle CMe$. ψ -*Lutidostyryl*. [176°].
 (304°). Formed by heating oxy-tri-methyl-py-
 ridine (methyl- ψ -lutidostyryl) in a current of
 HCl (Hantzsch, *B.* 17, 2904). Formed also by
 distilling its carboxylic acids (Collie, *B.* 20, 446;
 Nieme & Schmann, *A.* 261, 205), and by passing
 dry NH_3 over mesitene-lactone at 160° (Anschütz,
A. 259, 169). Needles (from alcohol).— $B'HC^22aq$:
 prisms.— $B'H_2PtCl_6$ — C_4H_5KNO : silvery
 spangles, sl. sol. KOHAq.

Oxy-di-methyl-pyridine C_7H_9NO *i.e.*
 $CO \langle \begin{smallmatrix} CH \cdot CMe \\ \backslash \quad \quad / \\ CH \cdot CMe \end{smallmatrix} \rangle NH$. *Lutidone*. [231°] (Collie,
C. J. 59, 177). (350°). Formed by heating its
 carboxylic or dicarboxylic acid at 280°; and
 also by heating dehydracetic acid with NH_3 at
 100° (Hajtinger, *B.* 18, 452; Conrad a. Guthzeit,
B. 20, 156). Formed also from di-acetyl-acetone
 and NH_4Aq (Feist, *B.* 22, 1571). Monoclinic
 pyramids (containing 3aq). PCl_5 gives chloro-di-
 methyl-pyridine (178°). $FeCl_3$ gives a brownish-
 red colour.— $B'H_2PtCl_6$ (at 100°). [231° cor.].—
 $B'H_2CrO_4$. [125°].— $B'O_4H_2(OH)(NO_2)$. [220°].

Oxy-tri-methyl-pyridine $C_8H_{11}NO$ *i.e.*
 $CO \langle \begin{smallmatrix} CH \cdot CMe \\ \backslash \quad \quad / \\ CH \cdot CMe \end{smallmatrix} \rangle NMe$. *Methyl-lutidone*. [245°].
 Formed by heating its dicarboxylic acid (Conrad
 a. Guthzeit, *B.* 20, 159). Needles (containing
 3aq) [111°], v. sol. water.— $B'HL$. [242°]. Formed
 by heating lutidone with Mel and $MeOH$ at 140°
 (Conrad a. Eckhardt, *Z.* 22, 80). Crystals.

Oxy-tri-methyl-pyridine $C_8H_{11}NO$ *i.e.*
 $NMe \langle \begin{smallmatrix} CMe \cdot CH \\ \backslash \quad \quad / \\ CO \cdot CH \end{smallmatrix} \rangle CMe$. *Methyl- ψ -lutidostyryl*.
 [92°]. (202°). Formed by heating 'dicarbo-
 collidylum dehydride' with H_2SO_4 or HCl at
 150°–180° (Hantzsch, *B.* 17, 1025, 2903). Formed
 also by methylation of ψ -lutidostyryl. Very
 hygroscopic crystals, not volatile with steam.
 V. sol. water, v. sl. sol. ether.— $B'HC^22aq$.—

$B'HL$ — $B'H_2PtCl_6$ 2aq.— $B'H_2PtCl_6$ 2EtOH.—
 $B'H_2PtCl_6$: long yellowish-red needles.

Di-oxy-tri-methyl-pyridine. *Di-ethyl-deri-*
vative $N \langle \begin{smallmatrix} CMe \cdot C(OC_2H_5) \\ \backslash \quad \quad / \\ CMe \cdot C(OC_2H_5) \end{smallmatrix} \rangle CMe$. (218°) at
 726 mm. Formed from di-bromo-collidine and
 NaOH (Pfeiffer, *B.* 20, 1350). Oil.— $B'H_2PtCl_6$.
OXY-DI-METHYL-PYRIDINE CARB.

OXYLIC ACID $CMe \cdot NH \cdot CMe$
 $CH \cdot CO \cdot C \cdot CO \cdot H$. *Lutidone carb-*
oxylic acid. [258° cor.]. Got by saponifying
 its ether. Crystals (containing aq).— BaA_2 —
 CuA_2 — AgA_2 : amorphous. *Ethyl ether*.
 [164° cor.]. (240°–250°). Formed in small
 quantity in distilling β -amido-crotonic ether
 under reduced pressure (Collie, *A.* 226, 310;
C. J. 59, 174). Needles, sol. water, sl. sol.
 alcohol. Does not react with Ag_2O or phenyl-
 hydrazine. Yields a bromo-derivative C_8H_9BrNO ,
 [250°]. PCl_5 forms C_8H_9ClNO , [264° cor.] which
 yields a chloro-di-methyl-pyridine (177°–180°) on
 heating.

Oxy-di-methyl-pyridine carboxylic acid
 $CO \langle \begin{smallmatrix} CH \cdot CMe \\ \backslash \quad \quad / \\ NH \cdot CMe \end{smallmatrix} \rangle C \cdot CO_2H$. [258°]. Formed from
 isodehydracetic acid and ammonia (Nieme a.
 Peckmann, *A.* 261, 206).

Oxy-methyl-pyridine dicarboxylic acid v.
METHYL-CHRELIDAMIC ACID, vol. i. p. 729.

Oxy-di-methyl-pyridine dicarboxylic acid
 $CO \langle \begin{smallmatrix} CH \cdot C(CH_3 \cdot CO_2H) \\ \backslash \quad \quad / \\ NH \cdot CMe \cdot C(CH_3 \cdot CO_2H) \end{smallmatrix} \rangle$. ψ -*Lutidostyryl di-*
carboxylic acid. [201°]. Formed from citra-
 cumalic acid and NH_4Aq (N. a. P.). Needles, v.
 sl. sol. cold water and alcohol.

Oxy-di-methyl-pyridine carboxylic acid
 $CO \langle \begin{smallmatrix} CH \cdot CMe \\ \backslash \quad \quad / \\ NH \cdot CMe \end{smallmatrix} \rangle C \cdot CO_2H$. *Ethyl ether EtA'*.
 ψ -*Lutidostyryl-carboxylic ether*. [137°]. Formed
 by passing dry NH_3 through mesitene carboxylic
 acid lactone at 160° (Anschütz, *A.* 259, 173). It
 is also a product of the condensation of amido-
 acetoacetic ether and of β -amido-crotonic ether
 (Collie, *B.* 20, 445). Needles (from hot water).
 The corresponding acid is an insoluble crystal-
 line powder [300°].

Oxy-di-methyl-pyridine dicarboxylic acid
 $CO \langle \begin{smallmatrix} C(CO_2H) \cdot CMe \\ \backslash \quad \quad / \\ C(CO_2H) \cdot CMe \end{smallmatrix} \rangle NH$. [267°]. Made by
 saponifying its ether. Prisms (from water).—
 KA' .— CaA' 2aq.— CuA' 1 $\frac{1}{2}$ aq (dried at 100°).

Ethyl ether EtA'. [221°]. S. (alcohol) 1
 at 20°. Formed by adding NH_4Aq to an alcoholic
 solution of $CO \langle \begin{smallmatrix} C(CO_2Et) \cdot CM_3 \\ \backslash \quad \quad / \\ C(CO_2Et) \cdot CMe \end{smallmatrix} \rangle O$ obtained
 from cupric acetoacetic ether and $COCl_2$ (Conrad
 a. Guthzeit, *B.* 19, 24; 20, 154). Forms an
 acetyl derivative C_8H_9NO , [65°].— $B'H_2PtCl_6$.
 [196°]. Orange pp.

Oxy-tri-methyl-pyridine dicarboxylic acid
 $CO \langle \begin{smallmatrix} C(CO_2H) \cdot CMe \\ \backslash \quad \quad / \\ C(CO_2H) \cdot CMe \end{smallmatrix} \rangle NMe$. [245°]. Formed by
 saponifying its ether (O. a. G.).— Na_2A' : crys-
 talline, v. sol. water.— EtA' . [193°]. Formed
 by the action of methylamine on dimethyl
 pyrone dicarboxylic ether, which is obtained from
 cupric acetoacetic ether and $COCl_2$. Needles
 (Berichten, *B.* 19, 25; Conrad a. Eckhardt, *B.*
 22, 80).

OXY-METHYL-PYRIDYL-PROPIONIC ACID
 v. EGCGXIII.

OXY-DI-METHYL-PYRIMIDINE

$\text{O} \begin{smallmatrix} \text{N.CMe} \\ \text{C}(\text{OH}) \end{smallmatrix} \text{CH} \begin{smallmatrix} \text{N.CMe} \\ \text{C}(\text{OH}) \end{smallmatrix}$ [192°]. Formed from acetamidine hydrochloride, acetoacetic ether, and dilute (10 p.c.) NaOHaq (Pinner, B. 18, 2845; 22, 1616). Needles, v. s. sol. ordinary solvents.

Ethyl derivative. [55°]. (250°). Prisms.

Oxy-tri-methyl-pyrimidine

$\text{O} \begin{smallmatrix} \text{N.CMe} \\ \text{C}(\text{OH}) \end{smallmatrix} \text{CMe} \begin{smallmatrix} \text{N.CMe} \\ \text{C}(\text{OH}) \end{smallmatrix} \text{CMe} \begin{smallmatrix} \text{N.CMe} \\ \text{C}(\text{OH}) \end{smallmatrix} \text{CMe}$ Formed from acetamidine hydrochloride, methylacetoacetic ether, and dilute NaOHaq (Pinner, B. 22, 1617). Needles, v. sol. water.

Di-oxy-tri-methyl-pyrimidine

$\text{CO} \begin{smallmatrix} \text{NH.CMe} \\ \text{NH.CO} \end{smallmatrix} \text{CH} \begin{smallmatrix} \text{NH.CMe} \\ \text{NH.CO} \end{smallmatrix} \text{CH} \begin{smallmatrix} \text{NH.CMe} \\ \text{NH.CO} \end{smallmatrix} \text{CH}$ *Methyluracil*. Formed by boiling β -uramido-crotonic acid with acids (Behrend, A. 229, 8; 231, 256). Needles (from alcohol). Decomposes at 270°-280°. By heating with potash it is converted into $\text{C}_{10}\text{H}_{12}\text{I}_2\text{N}_4\text{O}_2$. Potash and MeI at 140° forms a dihydride $\text{C}_8\text{H}_8\text{N}_4\text{O}_2$ [219°] and di-oxy-tri-methyl-pyrimidine. A mixture of PCl_5 and POCl_3 at 125° forms oily $\text{C}_8\text{H}_8\text{Cl}_2\text{N}_4$ (240°), S.G. $\frac{22.5}{22.6}$ 1.273. Yields deep-violet coffin-like crystals of di-iodide $\text{C}_8\text{H}_8\text{N}_4\text{O}_2\text{I}_2$ (Hoffmann, A. 253, 74).

Di-oxy-tri-methyl-pyrimidine

$\text{CO} \begin{smallmatrix} \text{NMe.CMe} \\ \text{NMe.CO} \end{smallmatrix} \text{CH} \begin{smallmatrix} \text{NMe.CMe} \\ \text{NMe.CO} \end{smallmatrix} \text{CH} \begin{smallmatrix} \text{NMe.CMe} \\ \text{NMe.CO} \end{smallmatrix} \text{CH}$ [109°]. Formed by methylation of the preceding body (Behrend; Hagen, A. 244, 2). Plates, v. sol. water and alcohol, sl. sol. ether. Yields methylamine on heating with baryta-water at 200°. Dry Br forms $\text{C}_8\text{H}_8\text{NO}_2\text{Br}_2$, aqueous bromine yields $\text{CO} \begin{smallmatrix} \text{NMe.CMe}(\text{OH}) \\ \text{NMe.CO} \end{smallmatrix} \text{CBr}_2$ [163°], whence boiling alcohol gives bromo-oxy-tri-methyl-pyrimidine [126°], converted by conc. aqueous ammonia into oxy-amido-tri-methyl-pyrimidine $\text{CO} \begin{smallmatrix} \text{NMe.CMe} \\ \text{NMe.CO} \end{smallmatrix} \text{C.NH}_2$ [167°], a body that is changed by potassium cyanate and HCl into crystalline $\text{CO} \begin{smallmatrix} \text{NMe.CMe} \\ \text{NMe.CO} \end{smallmatrix} \text{C.NH.CO.NH}_2$.

OXY-METHYL-PYRROLE. Dihydrate

$\text{CH}_2\text{CO} \begin{smallmatrix} \text{CH} \\ \text{CHMe} \end{smallmatrix} \text{NH}$ *γ -Amido-valeric lactam*. [37°]. Formed by heating γ -amido-valeric acid and by the action of sodium-amalgam and HOAc at 280° on the phenyl-hydrazide of levulinic acid (Tafel, B. 20, 250; 22, 1862). Yields an oily nitrosamine, which produces valerolactone on distillation. —B'HCl. [140°]. Needles, v. sol. water. —B'H₂PtCl₄.

 γ -Oxy-di-methyl-pyrrole $\text{C}_8\text{H}_8\text{NO}$ i.e.

$\text{CH}_2\text{CMe} \begin{smallmatrix} \text{C}(\text{OH})\text{N} \\ \text{CH.CMe} \end{smallmatrix} \text{NOH}$ Made by heating its carboxylic acid (Knorr, A. 236, 302). Reduces silver solution in the cold and Fehling's solution on boiling. Gives a red substance with acids, and exhibits the pine-wood reaction.

Oxy-tri-methyl-pyrrole $\text{C}_9\text{H}_{11}\text{NO}$. *Tri-methyl-pyrrolone*. (175°). S.G. $\frac{2}{2.945}$. Formed from sodio-ethyl cyanide and MeI (Hanriot & Bouvesault, B. 18, 1, 178).

Di-oxy-tri-methyl-pyrrole v. ACETONAMINES, vol. i. p. 27.

OXY-METHYL-PYRROLE CARBOXYLIC

$\text{ACIN} \begin{smallmatrix} \text{NH.CMe} \\ \text{CO} \end{smallmatrix} \begin{smallmatrix} \text{CH}_2\text{C.CO} \\ \text{C.CO.H} \end{smallmatrix}$ *Ethyl ether EtA'*. [134°]. Formed by heating α -amido-ethylidene-succinic ether at 150° (Emery, A. 260, 144). Needles, v. sol. alcohol. Yields an acetyl derivative [142°].

Oxy-di-methyl-pyrrole carboxylic acid.

Ethyl ether $\text{CO} \begin{smallmatrix} \text{NH.CMe} \\ \text{CH}_2\text{C.CO} \end{smallmatrix} \text{Et}$ [127°]. Formed from methyl-acetosuccinic ether and alcoholic NH_3 at 0° (Emery, A. 260, 151). Small white prisms (from HOAc).

Oxy-di-methyl-pyrrole carboxylic acid.

Ethyl ether $\text{CO} \begin{smallmatrix} \text{NMe.CMe} \\ \text{CH}_2\text{C.CO} \end{smallmatrix} \text{Et}$ [42°]. (160° at 11 mm.). Formed from acetosuccinic ether and alcoholic methylamine (E.). Bunches of needles, v. sol. ether.

Oxy-di-methyl-pyrrole carboxylic acid

$\text{C}_8\text{H}_8\text{NO}_2$ i.e. $\text{N}(\text{OH})\text{CMe} \begin{smallmatrix} \text{CH} \\ \text{CMe} \end{smallmatrix} \text{C.CO.H}$ Formed by boiling oxy-di-methyl-pyrrole dicarboxylic ether with NaOHaq (Knorr, A. 236, 561). Slender needles, v. sol. alcohol. Gives off CO_2 at 138°.

Oxy-di-methyl-pyrrole dicarboxylic acid

$\text{N}(\text{OH}) \begin{smallmatrix} \text{CMe} \end{smallmatrix} \begin{smallmatrix} \text{C.CO.H} \\ \text{CMe} \end{smallmatrix} \begin{smallmatrix} \text{C.CO.H} \\ \text{CMe} \end{smallmatrix}$ *Mono-ethyl ether EtHA''*. Formed by boiling the di-ethyl ether with alcoholic potash (Knorr, A. 236, 299). Crystals (from alcohol). Decomposes at 185° into CO_2 and oxy-dimethyl-pyrrole carboxylic ether.

Di-ethyl ether EtA''. [99°]. Formed by heating di-acetyl-succinic ether with hydroxylamine hydrochloride, NaOAc, and HOAc (Knorr). Yields the salt $\text{C}_{10}\text{H}_{10}\text{KNO}_5$.

OXY-METHYL-PYRROLE DIHYDRIDE

CARBOXYLIC ACID. Nitrile

$\text{CH}_2\text{CH} \begin{smallmatrix} \text{CH} \\ \text{NH} \end{smallmatrix} \text{CMe.CN}$ [141°]. Formed by heating $\text{CH}_2\text{CO.CH}_2\text{CH}_2\text{CO.Et}$ with HCN and ammonia in a closed tube (Kühling, B. 22, 2369; 23, 708). Octahedra (from hot alcohol). Successive treatment with cold H_2SO_4 and water converts it into the corresponding amide [161°]. Hydroxylamine yields the amidoxim [156°].

OXY-METHYL-PYRROLE DIHYDRIDE

THIOCARBOXYLIC AMIDE

$\text{CH}_2\text{CH} \begin{smallmatrix} \text{CH} \\ \text{NH} \end{smallmatrix} \text{CMe.CS.NH}_2$ [220°]. Formed by passing H_2S through an ammoniacal solution of the nitrile of oxy-methyl-pyrrole dihydride carboxylic acid (Kühling, B. 22, 2370). Prisms (from hot water), almost insol. alcohol.

OXY-METHYL-QUINAZOLINE

$\text{C}_8\text{H}_8 \begin{smallmatrix} \text{C}(\text{OH})\text{N} \\ \text{N} \end{smallmatrix} \text{CMe}$ *Anhydro-acetyl-o-amido-benzamide*. [233°]. Formed from acetyl-o-amido-benzamide by the action of heat, alkalis, or boiling water (Weddige, J. pr. [2] 36, 143). Silky needles (containing aq.), v. sol. hot alcohol. MeI and KOH yield the methyl derivative $\text{C}_8\text{H}_8\text{N}_2(\text{OMe})$ [109°]. —B'HCl. —B'H₂PtCl₄.

Oxy-methyl-quinazoline

$\text{CH} \begin{smallmatrix} \text{CH} \end{smallmatrix} \begin{smallmatrix} \text{C}(\text{OH})\text{N} \\ \text{CMe} \end{smallmatrix} \begin{smallmatrix} \text{C}(\text{OH})\text{N} \\ \text{CMe} \end{smallmatrix} \text{CH}$ [238°]. Formed from o-amido-p-toluic amide and formic acid (Niementowski, J. pr. [2] 40, 12). Crystals, insol. water.

Oxy-di-methyl-quinazoline $C_{10}H_{12}N_2O$ *is.*
 $C_6H_4Me \begin{smallmatrix} \text{CO.NH} \\ \text{N:CMe} \end{smallmatrix}$ [255°]. Formed by boiling
o-amido-*p*-toluic amide with Ac_2O (Niemen-
 towski, *B.* 21, 1534; *J. pr.* [2] 40, 13). Needles
 (from boiling water), sol. acids and alkalis.

Oxy-di-methyl-quinazoline
 $C_6H_4 \begin{smallmatrix} \text{CO-N} \\ \text{NMe.CMe} \end{smallmatrix}$ [199°]. Formed by heating
 acetyl-*o*-amido-benzamide above its melting-
 point (Weddige, *J. pr.* [2] 36, 154). Crystals
 (containing 3aq), v. s. sol. alcohol.— B^+HCl .

Di-oxy-methyl-quinazoline
 $CH:OH \begin{smallmatrix} \text{C.CO.NH} \\ \text{CH:CMe.C.NH.CO} \end{smallmatrix}$ (?) Formed by heating
 amido-*m*-toluic acid with urea at 180° (Niemen-
 towski, *J. pr.* [2] 40, 21). White needles (from
 amyl alcohol), insol. benzene. Not melted at
 300°. HI and P yield *o*-toluidine.

Di-oxy-methyl-quinazoline $C_6H_4 \begin{smallmatrix} \text{CO.NMe} \\ \text{NH.CO} \end{smallmatrix}$
 [234°]. Formed by heating
 $C_6H_4(NHMe).CO.NHMe$ with urea at 220° (Abt,
J. pr. [2] 39, 147). Long white needles, sl. sol.
 hot water.

Di-oxy-methyl-quinazoline $C_6H_4 \begin{smallmatrix} \text{CO.NH} \\ \text{NMe.CO} \end{smallmatrix}$
 [146°]. Formed by heating
 $C_6H_4(NHMe).CO.NHCO_2H$ with urea (Abt).

Di-oxy-di-methyl-quinazoline
 $C_6H_4 \begin{smallmatrix} \text{CO.NMe} \\ \text{NMe.CO} \end{smallmatrix}$ [151°]. Formed by the ac-
 tion of MeI and NaOH on either of the two
 preceding bodies or on di-oxy-quinazoline (Abt,
J. pr. [2] 39, 145). White needles (from water),
 v. sol. alcohol.

Oxy-methyl-quinazoline dihydride
 $C_6H_4 \begin{smallmatrix} \text{CH}_2.NMe \\ \text{NH.CO} \end{smallmatrix}$ [120°]. Formed by boiling *o*-
 oxy-tolyl-methyl-thio-urea with yellow FeO
 Söderbaum a. Widman, *B.* 22, 2936). Needles,
 v. s. sol. methyl alcohol.— $B^+H_2PtCl_6$ [203°].
 $B^+H_2AuCl_6$ [185°]. Yellow prisms.

OXY-METHYL-QUINIZINE *v.* **OXY-PHENYL-
 METHYL-PYRAZOLE.**

(B. 1, 4)-OXY-METHYL-QUINOLINE
 $CH:CH(OH) \begin{smallmatrix} \text{C.CO.NH} \\ \text{CH:CMe} \end{smallmatrix} > C_6H_4N$ [263°]. Formed from the
 amido-compound and HNO_2 (Noelting a. Traut-
 mann, *B.* [3] 4, 244), and by fusing (B. 4)-
 methyl-quinoline (B. 1)-sulphonic acid with
 $NaOH$ (Herzfeld, *B.* 17, 905, 1551). Needles
 (from dilute alcohol). Yield a nitroso-deriva-
 tive— $C_6H_4Me(NOH)(O.I)N$ [200°]. By KOH ,
 MeI, and MeOH it is converted into the methyl
 derivative $C_6H_4(OMe)N$ (c. 230°), whence
 $B^+H_2PtCl_6$.

(B. 4, 1)-Oxy-methyl-quinoline
 $CH:CMe \begin{smallmatrix} \text{CH} \\ \text{CH:C(OH)} \end{smallmatrix} > C_6H_4N$ [124°]. Formed by heat-
 ing amido-*p*-cresol (10 g.) with glycerin (24 g.),
 H_2SO_4 (20 g.), and picric acid (2 g.) (N. r. T.).
 Needles—v. sl. sol. cold water. Dyes fabrics
 mordanted with alumina, yellow.

(B. 4, 2)-Oxy-methyl-quinoline
 $CMe:OH \begin{smallmatrix} \text{CH} \\ \text{CH:C(OH)} \end{smallmatrix} > C_6H_4N$ [96°]. Formed from the
 amido-compound by the diazo-reaction (N. a.
 T.). Formed also by fusing the sulphonic acid
 with $NaOH$ (O. Fischer a. Willmack, *B.* 17, 441;
 Herzfeld, *B.* 17, 1552). Needles (from chloro-

form). Smells like vanilla. Its alcoholic solu-
 tion is coloured green by $FeCl_3$. Yields a nitroso-
 derivative [200°].— $B^+H_2PtCl_6$ 2aq: orange
 needles.

Methyl derivative C_6H_4NO . Oil.—
 $B^+H_2PtCl_6$ 4aq: brown crystalline pp.

Tetrahydride $C_6H_4Me(OH) \begin{smallmatrix} \text{CH}_2\text{CH}_2 \\ \text{NH.OH} \end{smallmatrix}$
 Formed by reduction with tin and HCl . Needles
 or plates, sl. sol. water. Yields a nitrosamine
 $C_6H_4(NO)NO$ crystallising in small yellow
 needles.

(B. 4, 3)-Oxy-methyl-quinoline
 $CH:OH \begin{smallmatrix} \text{C(OH)} \\ \text{CMe:C(OH)} \end{smallmatrix} > C_6H_4N$ [74°]. Formed from
 amido-*o*-cresol hydrochloride (10 g.), glycerin
 (24 g.), H_2SO_4 (20 g.), and picric acid (2 g.)
 (Noelting a. Trautmann, *B.* 23, 8663). Needles
 (from dilute alcohol), volatile with steam. $FeCl_3$
 gives a dark-green colour. Mixed with CuO it
 colours a flame green. Yields a crystalline p-
 nitroso-derivative decomposing at 200° without
 melting.

(B. 2, 4)-Oxy-methyl-quinoline
 $C(OH):CH \begin{smallmatrix} \text{CH} \\ \text{CH:CMe} \end{smallmatrix} > C_6H_4N$ [200°]. Formed by soda-
 fusion from *o*-toluquinoline sulphonio acid
 (Herzfeld, *B.* 17, 903). Needles. Not volatile
 with steam. $FeCl_3$ colours its alcoholic solution
 brownish-red.

(B. 1, 2)-Oxy-methyl-quinoline
 $CMe:C(OH) \begin{smallmatrix} \text{CH} \\ \text{CH:CH} \end{smallmatrix} > C_6H_4N$. *Ana-oxy-paratoluquinol-
 ine*. [230°]. Formed from the amido-com-
 pound, and also from para-toluquinoline by sul-
 phonation (with 25 p.c. SO_3 extra) at 90° and
 potash-fusion (Noelting a. Trautmann, *B.* 23,
 8658). Needles, v. sl. sol. hot water. Not vola-
 tile with steam.

(Py. 3, 1)-Oxy-methyl-quinoline
 $C_6H_4 \begin{smallmatrix} \text{CMe:CH} \\ \text{N=C(OH)} \end{smallmatrix}$ [224° cor.] (above 360°).
 Formed by heating the anilide of acetacetic
 acid with H_2SO_4 (Knorr, *A.* 236, 83; *C. J.* 46,
 334; Roos, *B.* 21, 624; Reissert, *B.* 24, 865).
 Small needles (from water). Reduced by sodium-
 amalgam to $C_{10}H_{12}N_2O_2$ [280°]. Sodium added
 to its alcoholic solution reduces it to a dihydride
 $C_{10}H_{12}NO$ [101°] and methyl-quinoline tetrahy-
 dide $C_{10}H_{12}N$ (253°). $NaOEt$ and MeI form oxy-
 di-methyl-quinoline [132°] and the methyl deriva-
 tive $C_6H_4(OMe)N$ [276° cor.], whence $B^+H_2PtCl_6$.
 The ethyl derivative $C_6H_4(OEt)N$ [51°] (250°)
 is formed from chloro-lepidine and $KOEt$.

Salts.— B^+HCl [187°].— $B^+H_2PtCl_6$ aq.—
 $B^+H_2SO_4$: needles.— B^+HNO_3 : prisms.— B^+HI .—
 Picrate: [166°]. Needles.— $Ba(C_{10}H_8NO)_2$ aq.

(Py. 8, 4)-Oxy-methyl-quinoline
 $C_6H_4 \begin{smallmatrix} \text{CH} \\ \text{CH:CH} \end{smallmatrix} \begin{smallmatrix} \text{CH} \\ \text{NMe:CO} \end{smallmatrix}$ *Methy- ψ -carbostyryl*. [72°].

Formed by digesting carbostyryl with $MeOH$ and
 MeI, adding $NaOH$ as required to neutralise the
 HI formed (Friedländer a. Müller, *B.* 20, 2010).
 Slender needles. Weak base. Sodium-amalgam
 forms $C_{10}H_{12}NO$ [276°].— $B^+H_2PtCl_6$ 2aq.—
 B^+HgCl_2 [189°]. Small pyramids.

Methylotolide B^+MeI . Bronzed needles.
 (Py. 1, 3)-Oxy-methyl-quinoline

$C_6H_4 \begin{smallmatrix} \text{C(OH):CH} \\ \text{N=CMe} \end{smallmatrix}$ [281°] (above 360°). S. 1
 in the cold; 10 at 100°. Formed by heating

phenylamido-crotonic ether rapidly to 240° (Conrad a. Limpach, B. 20, 947). Prisms (containing 2aq), v. sol. alcohol. Tastes bitter. FeCl₃ colours its solution yellowish-red. KMnO₄ oxidises it to acetyl-anthranilic acid. Yields quinaldine on distillation with zinc dust. — B'HCl. — B'H₂PtCl₄ [215°]. — B'H₂CrO₄. [108°]. — B'O₂H₂(NO₂)₂OH. [200°]. Yellow needles.

Methyl derivative C₁₀H₉(OMe)NO. [82°]. (296°). Formed from chloro-methyl-quinoline, MeOH, and NaOMe at 135°. Needles, sl. sol. water.

Methylchloride C₁₀H₉NO.MeCl aq. [217°]. Formed from the methyl iodide and AgCl (Conrada. Eckhardt, B. 22, 74). — B'H₂PtCl₄. [240°]. Yellow crystalline pp.

Methyl iodide C₁₀H₉NO.MeI aq. [201°]. Formed from the base and MeI at 100°. Satiny needles (from hot water).

Sulphonic acid C₁₀H₉NO(SO₃H). [283°]. Long prisms (containing 2aq). — BaA₂ 4aq.

(B. 2)-Oxy-(Py. 1)-methyl-quinoline C(OH):CH.C.Me:CH [218°]. Formed by fusing lepidine sulphonic acid with NaOH (Busch a. Koenigs, B. 23, 2684). Obtained also by boiling with HBrAq the methyl derivative which is produced by heating quinine sulphate (40 g.) with KOH (95 g.) and water (45 c.c.) at 220° in a current of superheated steam (Koenigs, B. 23, 2674). Groups of slender needles, v. sol. warm alcohol and acetone. Gives no colour with FeCl₃.

Methyl derivative C₁₁H₁₁NO. [52°]. Formed as above, and also by heating quinine zinc chloride with water at 200°. Slender needles (containing aq). Its solution fluoresces like quinine. Gives a bluish-green colour with ammonia and chlorine-water. — B'H₂PtCl₄. [237°]. Orange powder.

Oxy-(Py. 1)-methyl-quinoline [141°]. Formed from a sulphonic acid of lepidine prepared by mixing lepidine with H₂SO₄ and heating to 300° (Busch a. Koenigs, B. 23, 2686). Greenish needles, v. sol. benzene. — B'H₂PtCl₄ 2aq: orange-yellow needles.

(B. 2)-Oxy-(Py. 3)-methyl-quinoline C(OH):CH.C:CH:CH p-Oxy-quinaldine. CH=CH.C.N:Me [213°]. Formed by the action of paraldehyde and HCl upon p-amido-phenol, and also by fusing (Py. 3)-methyl-quinoline sulphonic acid with potash (Doebner a. Miller, B. 17, 1703). Crystals, not volatile with steam, v. sl. sol. cold water. — B'H₂PtCl₄ 2aq: yellow needles.

(B. 2)-Oxy-(Py. 3)-methyl-quinoline C₁₀H₈Me(OH)N. [234°]. Formed by fusing quinaldine (B)-sulphonic acid with potash (D. a. M.). Silvery plates, sol. ether and hot alcohol, nearly insol. hot water. — B'HCl 2aq. — B'H₂PtCl₄ 2aq: small yellow needles.

(B. 4)-Oxy-(Py. 3)-methyl-quinoline CH:CH—C:CH:CH C(OH):O.N:Me o-Oxy-quinaldine. [74°]. (266°). Formed by fusing (Py. 3)-methyl-quinoline (B. 4)-sulphonic acid with potash, and also by the action of paraldehyde and HCl on o-amido-phenol (Doebner a. Miller, B. 17, 1705). Trimetric prisms, easily volatile with steam. — B'H₂PtCl₄ 2aq: yellow needles.

VOL. III.

Methyl derivative C₁₀H₈Me(OMe)N [125°]. (282°). Formed from o-anisidine, paraldehyde, and HCl. — B'H₂PtCl₄: yellow needles.

Tetrahydride C₁₀H₈Me(OH)N. [280°]. Formed by reducing o-oxy-quinaldine with tin and HCl (Doebner a. Miller, B. 17, 1706). Yields C₁₀H₈Me(OMe)N. (270°), whence B'HCl and C₁₀H₈Me(OMe)NMe (261°), whence B'H₂PtCl₄: yellow needles.

(B. 2)-Oxy-(Py. 4)-methyl-quinoline tetrahydride. **Methyl derivative** C₁₀H₈Me(OMe). **Methyl-thallin**. (278°). Formed by methylation of thallin (Skraup, M. 6, 776). Oil. — B'HSO₄. — B'MeI aq. [224°]. — B'Me₂PtCl₄. Orange plates.

(B. 4)-Oxy-(Py. 4)-methyl-quinoline.

Tetrahydride C₁₀H₈NO i.e. CH:CH—C:CH:CH. [114°]. Formed from CH:C(OH).C.NMe.CH₂.

(B. 4)-oxy-quinoline tetrahydride and MeI (O. Fischer, B. 16, 714). Trimetric tables (from ether) a:b:c = 631:11:538. Its alcoholic solution is coloured brown by FeCl₃. — B'HSO₄ aq. **Kairine**, a febrifuge. — B'MeI. [216°]. Prisms (from MeOH). — B'C₂H₄Cl. (312°). Oil (Fischer a. Kohn, B. 19, 1040; C. J. 49, 503).

Methyl derivative C₁₀H₈(OMe)NMe. (257°). Formed by means of MeI and MeOH. Pale-yellow oil. Gives a crimson colour with NaNO₂ and a little acid. — B'H₂PtCl₄. [199°]. — B'HSO₄: prisms, v. sol. water.

Methyl derivative of the methyl iodide C₁₀H₈(OMe)NMe.I. [175°]. Prisms (from MeOH). Moist Ag₂O converts it into strongly alkaline crystalline C₁₀H₈(OMe)NMe.OH, whence {C₁₀H₈(OMe)NMe.Cl} PtCl₄ [200°].

Ethyl derivative C₁₀H₈(OEt)NMe. (270°) at 716 mm. Oil.

(Py. 3)-Oxy-(B. 2)-methyl-quinoline CMe:CH.C:CH:CH. **Methyl-carbostyryl**. [228°]. CH:CH.C.NH.CO

Formed by boiling chloro-methyl-carbostyryl with NaOH aq (Finhorn a. Lauch, A. 243, 359). Crystalline, v. sol. alcohol.

(B. 1,2,4)-Oxy-di-methyl-quinoline CMe:C(OH).C:CH:CH CH:CMe.C.N:CH [198°]. Formed by the action of nitrous acid on (B. 1,2,4)-amido-di-methyl-quinoline (Noetting a. Trautmann, B. 23, 8683). Plates (from chloroform), v. sol. alcohol.

(Py. 3,1,4)-Oxy-di-methyl-quinoline C₁₀H₈NO i.e. C₁₀H₈Me:CH:CH:CH. **Methyl-lepidone**. **Di-methyl-carbostyryl**. [135°]. (290° at 250 mm.).

Formed by heating (Py. 3,1)-oxy-methyl-quinoline with KOH and MeI, or by heating the isomeric methoxy-lepidine above its boiling point (200°). Formed also by heating methylaniline with acetoacetic ether, and treating the product with H₂SO₄ (Knorr, B. 17, 2876; 19, 3301; A. 236, 104). Needles, sl. sol. water and ether, v. sol. alcohol, insol. alkalis. Sodium-amalgam reduces it to (C₁₀H₈NO)₂ [268°]. — B'H₂PtCl₄ 8aq [214°]. Slender needles.

(Py. 1,3,4)-Oxy-di-methyl-quinoline

C₁₀H₈Me:CO:CH [175°]. Formed from methoxy-methyl-quinoline by heating at 315° in a sealed tube, or by heating oxy-quinaldine methyl iodide with NaHCO₃ (Conrad, B. 20, 956; 22, 75). Needles, v. sol. water. — B'HHgCl₂.

[187°]. Needles.— $B_2H_4PtCl_6$. [240°].— $B'MeI$. [210°]. Sl. sol. cold water.

(Py. 3, 2, 1). Oxy-di-methyl-quinoline

$O_2H_4 \begin{smallmatrix} CMe:CMe \\ \diagdown \quad \diagup \\ N=COH \end{smallmatrix}$ [262°]. Formed from methyl-acetoacetic anilide and H_2SO_4 in the cold (Knorr, A. 245, 367). Yields a sulphonic acid, which forms a crystalline Ba salt $Ba(C_{11}H_9NSO_3)_2$.— $B'HCl$. Long silky needles.

(B. 2). Oxy-(Py. 1, 3)-di-methyl-quinoline

$O(OH):CH.C.CMe:CH$ $CH=CH.C.N=CMe$. [214°]. (abov. 360°). Formed by heating *p*-amido-phenol hydrochloride (1 vol.) with acetone (3 vols.) for some days at 175° (Engler a. Bauer, B. 22, 213). Prisms or tables, v. sl. sol. water. $FeCl_3$ colours its alcoholic solution brown.— $B'HCl$.— $B'_2H_4PtCl_6$ 2aq.— $B'_2H_4SO_4$.— $B'_2H_4CrO_4$.— $B'_2C_4H_4(NO_2)_2OH$. [225°]. Yellow plates or prisms.

(B. 4). Oxy-(Py. 1, 3)-di-methyl-quinoline

$CH:CH—C.CMe:CH$
 $CH:C(OH).C.N=CMe$: [65°]. (231° uncor.). Formed in like manner from *o*-amido-phenol. Prepared by saturating a mixture of acetone (3 mols.) and paraldehyde (3 mols.) with dry HCl , adding, after 3 days, *o*-amido-phenol (2 mols.) dissolved in conc. $HClAq$. and heating on the water-bath. Crystals, v. sol. alcohol; ether, and benzene. $FeCl_3$ colours its alcoholic solution green.— $B'_2H_4SO_4$.— $B'HCl$.— $B'_2H_4PtCl_6$ 2aq.— $B'_2H_4CrO_4$.— $B'_2C_4H_4N_2O_4$. [207°]. Plates or prisms, sl. sol. hot alcohol.

(Py. 3). Oxy-(B. 2 Py. 1)-di-methyl-quinoline

$CMe:CH.C.CMe:CH$
 $CH:CH.C.N=C.OH$. [250°]. Formed from acetoacetic ether by successive treatment with *p*-toluidine and H_2SO_4 (Knorr, A. 245, 365). Flat prisms, sl. sol. hot water, dilute acids, and alkalis. Yields (B. 2; Py. 1)-di-methyl-quinoline on distillation with zinc-dust.

(Py. 3). Oxy-(B. 3; Py. 1)-di-methyl-quinoline

$CH:CH.C.CMe:CH$
 $CMe:CH.C.N=C.OH$. [220°]. Formed in like manner from *m*-toluidine (K.). V. sl. sol. hot water. Yields (B. 3, Py. 1)-di-methyl-quinoline on distillation with zinc-dust.—Platinochloride. [254°]. The hydrochloride is crystalline, and is decomposed by water.

(Py. 3). Oxy-(B. 4; Py. 1)-dimethyl-quinoline

$CH:CH.C.CMe:CH$
 $CH:CMe.C.N=C.OH$. Formed in like manner from *o*-toluidine (Knorr, A. 245, 368). Slender needles (from water); Yield (B. 4, a Py. 1)-di-methyl-quinoline on distillation.— $B'_2H_4PtCl_6$ 2aq. [220°].— NaC_4H_4NO . Plates.

(Py. 1). Oxy-(B. 2; Py. 3)-di-methyl-quinoline

$CMe:CH.C.C(OH):CH$
 $CH=CH.C.N=CMe$. [275°]. Formed by heating *p*-tolyl-amido-crotonic ether $C_6H_4NH.CMe:CH.CO.Et$ at 250° (Conrad a. Limpach, B. 21, 525; cf. Knorr, B. 17, 542). Needles (containing aq).— $B'HCl$. Needles (from hot water).— $B'_2H_4PtCl_6$. [228°]. Prisms (from hot water).

(Py. 1). Oxy-(B. 4, Py. 3)-di-methyl-quinoline

$CH:CH—C.C(OH):CH$
 $CH:CMe.C.N=CMe$ [201°]. Formed by distilling *o*-tolyl-amido-crotonic ether (C. a. L.). Plates (containing aq).— $B'_2H_4PtCl_6$. Needles.

Oxy-(Py. 1, 3)-di-methyl-quinoline

$C_{11}H_9N(OH)$. [44°]. Made from (Py. 1, 3)-di-

methyl-quinoline by conversion into the sulphonic acid and fusing this with $NaOH$ (Beyer, J. pr. [2] 83, 409).— $(B'HCl)_2PtCl_6$ 2aq.

Oxy-tri-methyl-quinoline

$CMe:CH.C.C(OH):CH$
 $CH:CMe.C.N=CMe$. [264°]. Formed by heating *m*-xylyl- β -amido-crotonic ether (Conrad a. Limpach, B. 21, 526). Needles (containing aq).—Platinochloride. [282°]. Needles.

Oxy-tetra-methyl-quinoline $C_{13}H_{15}NO$ i.e.

$C_4HMe_2 \begin{smallmatrix} C(OH):CH \\ \diagdown \quad \diagup \\ N=CMe \end{smallmatrix}$ Formed by quickly heating ψ -cumyl-amido-crotonic ether at 250° (Conrad a. Limpach, B. 21, 529). Prisms (from alcohol). Sublimes at 285°, without previous fusion.— $B'_2H_4PtCl_6$. Prisms (from alcohol).

(Py. 1, 3, 4). Di-oxy-methyl-quinoline

$O_2H_4 \begin{smallmatrix} C(OH):CH \\ \diagdown \quad \diagup \\ NMe.CO \end{smallmatrix}$ [260°]. Formed by heating its methyl derivative with $HClAq$ at 120°. Small needles, sol. alkalis. Yields a nitrosamine $C_{10}H_9NO_2(NO)$ crystallising in red needles [o. 188°].

Methyl derivative $C_6H_4 \begin{smallmatrix} C(OMe):CH \\ \diagdown \quad \diagup \\ NMe.CO \end{smallmatrix}$

[68°]. Formed by heating (Py. 1, 3, 4)-chloro-oxy-methyl-quinoline with $NaOMe$ (Friedländer a. Müller, B. 20, 2014). Slender white needles, v. sol. alcohol.— $B'_2H_4PtCl_6$: pyramids.

Ethyl derivative $C_6H_4(OEt)NO$. [87-5°].

Slender white needles.

(B. 4; Py. 1). Di-oxy-(Py. 3)-methyl-quinoline.

Methyl derivative

$CH:CH—C.C(OH):CH$
 $CH:C(OMe).C.N=CMe$. [229°]. Formed by heating *o*-methoxy-phenyl-amido-crotonic ether at 260° (Conrad a. Limpach, B. 21, 1654). Long silky needles (containing aq).— $B'_2H_4PtCl_6$ [239°]. Tables.

(B. 2; Py. 1). Di-oxy-(Py. 3)-methyl-quinoline.

Methyl derivative

$C(OMe):CH.C.C(OH):CH$
 $CH=CH.C.N=CMe$. [259°]. Formed by the action of heat on *p*-methoxy-phenyl-amido-crotonic ether which is made from *p*-anisidine and acetoacetic ether (C. a. L.).— $B'HCl$.— $B'_2H_4PtCl_6$.— $B'_2H_4SO_4$. S. 6 in the cold.— $B'MeCl$. [231°]. Needles.— $B'_2MePtCl_6$ 4aq.— $B'MeI$. Converted by moist Ag_2O into $C_{13}H_{15}NO$, [149°].

Di-methyl derivative $C_6H_4Me_2(OMe)_2N$.

[94°]. Formed from the methyl derivative, $NaOMe$ and MeI . Needles or prisms.

(B. 2, 3). Di-oxy-(Py. 3)-methyl-quinoline.

Methylene derivative

$CH_2 \begin{smallmatrix} O.C:CH.C:CH:CH \\ \diagdown \quad \diagup \quad \diagdown \quad \diagup \\ O.C:CH.C.N:CMe \end{smallmatrix}$ [152°]. Formed on reduction of $OH.O_2.C_6H_4(NO_2).CH:CH.CMe:N.HPh$ (Haber, B. 24, 623). Silvery needles, m. sol. ether.— $B'_2H_4PtCl_6$.— $B'_2H_4CrO_4$. Detonates at 210°.—Picrate. [175°]. Yellow crystals.

(Py. 1, 2, 3, 4). Tri-oxy-methyl-quinoline

$C_6H_4 \begin{smallmatrix} C(OH).C(OH) \\ \diagdown \quad \diagup \\ NMe.CO \end{smallmatrix}$ Di-oxy-methyl-pseudo-carbostryl. Formed by warming the nitroso-derivative of (Py. 1, 3, 4)-di-oxy-methyl-quinoline with $SnCl_4$. White needles; sl. sol. water, benzene, and $CHCl_3$. By $FeCl_3$ it is oxidised to methyl-pseudo-quinisatin

$C_6H_4 \begin{matrix} \diagup CO \cdot CO \\ | \\ \diagdown NMe \cdot CO \end{matrix}$ [182°] (Friedländer a. Müller, B. 20, 1215).

References. — BROMO-, CHLORO-, and DI-CHLORO-DI-NITRO-OXY-METHYL-QUINOLINES.

(B. 4)-OXY-(Py. 4)-METHYL-QUINOLINE CARBOXYLIC ACID. *Tetrandride*

$C_6H_4Me(OH)(CO_2H)N$. [216°] (S. a. E.). Formed by heating oxy-quinoline carboxylic acid tetrahydride with MeI and MeOH at 120° (Schmitt a. Engelmann, B. 20, 1219; Krolkovsky a. Nencki, M. 9, 208). Prisms (containing 2aq), v. sol. hot water and alcohol. Has no toxic action. After administration to dogs the urine contains the acid $C_6H_4Me(OH)(CO_2H)N$ [255], insol. water.

(B. 4)-Oxy-(Py. 3)-methyl-quinoline carboxylic acid $NC_6H_4Me(OH)(CO_2H)$. [207°]. Formed by heating potassium oxy-quinoline with liquid CO_2 at 190° (König, B. 21, 883). Yellow needles (containing aq), sl. sol. cold water. Gives a cherry-red colour with $FeCl_3$.

(Py. 1)-Oxy-(Py. 3)-methyl-quinoline (Py. 2)-carboxylic acid $C_6H_4 \begin{matrix} \diagup C(OH) \cdot C(OH) \\ | \\ \diagdown N = CMe \end{matrix}$. [245°].

Formed by oxidising the corresponding aldehyde with alkaline $KMnO_4$ (Conrad a. Limpach, B. 21, 1975). Crystals (from alcohol).— MgA' (dried at 100°). Crystalline pp.

(Py. 3, 1)-Oxy-methyl-quinoline (B. 4)-carboxylic acid. [312°]. Formed by oxidising (a)-oxy-(γ)-methyl-julole dihydride with $KMnO_4$ in acid solution (Leissert, B. 24, 853). Needles, m. sol. alcohol, sl. sol. hot water.

(Py. 1)-OXY-(Py. 3)-METHYL-QUINOLINE (Py. 2)-CARBOXYLIC ALDEHYDE

$C_6H_4 \begin{matrix} \diagup C(OH) \cdot CHO \\ | \\ \diagdown N = CMe \end{matrix}$. [273°]. Formed, together with $C_6H_4H_2N_2O_4$ [192°], by boiling (Py. 1, 3)-oxy-methyl-quinoline with chloroform and KOHAq (Conrad a. Limpach, B. 21, 1972). Yellow plates (from alcohol), sol. acids and alkalis.— $B'HCl$.— $B' \cdot H \cdot P'Cl_2$. [215°–220°].

Phenyl-hydrazide $C_6H_4H_2N_2O_4$.— $B'HCl$: yellow needles, sl. sol. hot water.

(Py. 1)-Oxy-(B. 1, 2, 4; Py. 3)-tetra-methyl-quinoline (Py. 2)-carboxylic aldehyde $OMe \cdot CMe \cdot C(OH) \cdot C \cdot CHO$. Formed by the action of caustic soda and chloroform on the corresponding oxy-tri-methyl-quinoline (C. a. L.). Yields, with phenyl-hydrazine hydrochloride, crystalline $C_6H_4H_2N_2O_4$.

OXY-METHYL-QUINOXALINE

CH : CH.CN:CN • *Oxytoluinoxaline*.

Formed by oxidation of its dihydride by the air or by ammoniacal $AgNO_3$ (Hinsberg, B. 19, 483; A. 248, 75). Feebly basic plates. PCl_5 yields chloro-methyl-quinoxaline [77°].— NaA' aq: plates, sol. water.

Methyl derivative [71°]. Ethyl derivative [67°]. From the chloro-methyl-quinoxaline and $NaOEt$. Satiny needles.

Dihydride $C_6H_4H_2N_2O$. [95°–124°]. Formed by reducing o-nitro-tolyl-amido-acetic acid with tin and HCl (Pilschl, B. 19, 10; Leuckart a. Hermann, B. 20, 27). Formed also from chloro-acetic ether and tolylene-o-diamine (Hinsberg, B. 18, 2870). Very oxidisable.

Oxy-di-methyl-quinoxaline

$C_6H_4Me \begin{matrix} \diagup N \cdot CMe \\ | \\ \diagdown N \cdot COH \end{matrix}$ [288°]. Formed by passing air through an alkaline solution of the dihydride, which is obtained by condensing tolylene-o-diamine with α-bromo-propionic or pyruvic acid (Hinsberg, A. 237, 351; 248, 78). Thin crystals (from alcohol), v. sl. sol. water. Is perhaps a mixture of isomerides.

Dihydride $C_6H_4H_2Me \begin{matrix} \diagup NH \cdot CHMe \\ | \\ \diagdown NH \cdot CO \end{matrix}$ [c. 135°]. Crystallises from alcohol.

Oxy-tri-methyl-quinoxaline. Dihydride

$C_6H_4Me \begin{matrix} \diagup NH \cdot CMe_2 \\ | \\ \diagdown NH \cdot CO \end{matrix}$ [227°]. Formed by heating tolylene-o-diamine with bromo-isobutyric ether (Hinsberg, A. 248, 79). Plates, v. sl. sol. water. Yields an acetyl derivative [206°], a nitrosamine [154°], and a di-nitro-compound [above 280°].

Di-oxy-di-methyl-quinoxaline. Di-ethyl derivative $CH_3C(OEt) \cdot C(N \cdot CMe) \cdot C(N \cdot CMe) \cdot C(OEt) \cdot C(N \cdot CMe) \cdot C(N \cdot CMe)$ [127°].

Formed by the action of di-methyl-diketone (diacetyl) on the hydrochloride of the di-ethyl derivative of (a)-di-amido-hydroquinone (Nietzki a. Reehberg, B. 23, 1212). Long yellow needles.

Di-oxy-di-methyl-diquinoxaline, so-called.

$CMe \cdot N \cdot C \cdot CH \cdot C \cdot N \cdot CMe$ Formed by the action of $NaOAc$ and pyruvic acid in excess on a solution of the hydrochloride of tetra-amido-benzene (Nietzki a. Müller, B. 23, 445). Dissolves in alkalis with greenish-yellow fluorescence.

OXY-METHYL-QUINOXALINE CARBOXYLIC ACID

$C_6H_4H_2N_2O$, i.e. $C_6H_4(CO_2H) \begin{matrix} \diagup N \cdot CMe \\ | \\ \diagdown N \cdot COH \end{matrix}$

Formed by adding pyruvic acid in slight excess to an aqueous solution of di-amido-benzoic acid (Zehra, B. 23, 3629). Pale-yellow needles, m. sol. hot alcohol. Blackens above 800° without melting.— BaA' 3aq: yellowish-white needles.

Oxy-methyl-quinoxaline carboxylic acid

$C_6H_4Me \begin{matrix} \diagup N \cdot C \cdot CO_2H \\ | \\ \diagdown N \cdot COH \end{matrix}$ Formed by the action of

boiling potash on $C_6H_4H_2N_2O$ [258°], which is made by mixing aqueous solutions of alloxan and tolylene-o-diamine (Hinsberg, A. 237, 356). Yellow needles (from dilute alcohol). Gives off CO_2 at 214°.

OXY-METHYL-SUCCINIC ACID v. OXYPYRO-TARTARIC ACID.

Oxy-di-methyl-succinic acid v. Oxy-adipic acid.

Di-oxy-di-methyl-succinic acid $CO_2H \cdot CMe(OH) \cdot CMe(OH) \cdot CO_2H$.

Di-methyl-pyruvic acid. [179°]. Formed by saponifying its nitrile with $HClAq$. Crystals (containing aq).— KHA' . Plates, m. sol. hot water.— CaA' 1 1/2 aq.— BaA' 2 aq: small needles.

Nitrile $CN \cdot CMe(OH) \cdot CMe(OH) \cdot CN$.

m. 120°. Formed from di-methyl-di-ketone (diacetyl) and HCO_2H (Fittig, A. 249, 205). Very hygroscopic needles, sl. sol. chloroform.

Isomeride.—DI-METHYL-TARTARIC ACID.

OXY-METHYL-TEREPHTHALIC ACID

$C_6H_4Me(OH)(CO_2H)_2$ [254–1]. [285°–290°].

Formed by fusing $C_6H_4Me(SO_2NH_2)(CO_2H)$ with potash (Jacobsen a. H. Meyer, B. 16, 191). Minute prisms (from very dilute alcohol), decomposed on fusion.

OXY-METHYL-THIAZOLE $\begin{matrix} \text{S.C(OH)} \\ \text{CH:CMC} \end{matrix} \cdot \text{N} \cdot$

Thiocyanacetone. [102°]. Formed by heating the carboxylic acid (Wohmann, A. 259, 298), or by heating with dilute HCl aq the compound $\text{CH}_3\text{CO.ClH.SCy}$, formed from chloro-acetone and a sulphocyanide (Tscherniak a. Norton, C. J. 44, 568; Hantzsch, B. 20, 3127, 8337; 21, 941; A. 249, 20). Needles. Yields methyl-thiazole on distilling with zinc-dust. With phenylene *m*-diamine it forms $\text{C}_6\text{H}_4(\text{NH.C}_6\text{H}_4\text{SN})_2$ [152°]. Reacts with hydroxylamine.

Di-oxy-methyl-thiazole $\begin{matrix} \text{S} - \text{CO} \\ \text{CH}_2\text{CO} \end{matrix} \cdot \text{NMe}$.

Formed from di-oxy-thiazole, NaOMe, and MeI (Arapides, A. 249, 28). Liquid, v. c. sol. water. Decomposed by boiling NaOH aq into methylamine and thioglycollic acid. PCl₅ yields $\text{C}_6\text{H}_4\text{Cl}_2\text{NOS}$ [161°].

OXY-METHYL-THIAZOLE CARBOXYLIC

ACID $\begin{matrix} \text{S.C(OH).N} \\ \text{C(CO}_2\text{H).CMc} \end{matrix}$ [222°]. Formed from its ether, and also by heating chloro-methyl-thiazole carboxylic acid with conc. KQHAq (Zürcher, A. 250, 286; Wohmann, A. 259, 296). Plates or needles (containing 2aq), v. sol. water. — $\text{NH}_4\text{A} \cdot 5\frac{1}{2}\text{aq}$. Prisms, decomposing at 138°.

Ethyl ether EtA. [129°]. Formed together with $\text{SC}_2\text{Me(CO.Et)N}_2\text{O}$ [142°] from chloro-acetoacetic ether and ammonium or barium sulphocyanide (Hantzsch a. Weber, B. 20, 3132). Silky plates. Hydroxylamine forms $\text{C}_{10}\text{H}_{10}\text{O}_2\text{N}_2\text{S}_2$ [c. 217°].

OXY-METHYL-THIOPHENE $\begin{matrix} \text{S} < \text{CMc} \\ \text{C(OH).CH} \end{matrix}$

Formed from levulic acid and P.S. (Kues, B. 19, 555). Oil, sl. sol. water. — B^{HIOAc} . (210°). Yellow oil.

OXY-METHYL-UREA. Di-ethyl derivative of the glycollyl derivative

$\text{CH}_2(\text{OEt})_2\text{C.NH.CO.NH.CO.CH}_2\text{OEt}$. [80°]. Formed from $\text{CH}_2(\text{OEt})_2\text{CONH}_2$, bromine, and potash (Hofmann, B. 10, 2736). Needles (from water).

OXY-METHYL-XANTHINE $\text{C}_8\text{H}_8\text{N}_4\text{O}_2$ S.

16 at 16°. Formed by the action of potassium cyanate on the hydrochloride of di-oxy-amidomethyl-pyrimidine $\text{CO} < \text{NMe.CH} \cdot \text{NH.CO} > \text{C.NH}_2$ (Behrend, A. 231, 252; Lehmann, A. 253, 80). Needles or prisms (containing 2aq), sl. sol. water. Does not reduce alkaline AgNO_3 .

OXY-MYRISTIC ACID $\text{C}_{14}\text{H}_{26}\text{O}_4$ [51°].

Occurs in the essential oil from the fruit of *Angelica archangelica* (Müller, B. 14, 2480). Pearly plates (from alcohol). — KA^+ aq. — CuA^+ . AgA^+ : bulky pp. Benzoyl derivative [68°]. — AgA^+ .

(1,2)-DI-OXY-NAPHTHALENE

$\text{C}_{10}\text{H}_6(\text{OH})_2$ [1.2]. [60°]. v. (β)-HYDRONAPHTHOQUINONE, vol. II. p. 728.

(1,4)-DI-OXY-NAPHTHALENE [176°] v. (α)-HYDRONAPHTHOQUINONE.

(1,4')-Di-oxy-naphthalene. [260°]. Formed by potash-fusion from (α)-naphthol sulphonic acid and from naphthalene (1,4')-disulphonic acid (Erdmann, A. 247, 356; Bernthsen, B. 20, 938; Armstrong a. Wynne, C. J. Proc. 3, 49). Scales, v. sol. hot alcohol, sl. sol. water. Yields crystalline $\text{C}_{10}\text{H}_6(\text{OAc})_2$ [160°].

Peri-di-oxy-naphthalene $\text{C}_{10}\text{H}_6(\text{OH})_2$ [1.1']. [140°]. Formed by potash-fusion from the anhydride got by boiling naphthylamine *peri*-sulphonic acid with water (Erdmann, A. 247, 357). Needles or plates, sl. sol. water. Yields $\text{C}_{10}\text{H}_6(\text{OAc})_2$ [148°] crystallising in white plates.

Di-oxy-naphthalene. Made by reducing *peri*-naphthoquinone with HOAc and zinc-dust (Mel-dola a. Hughes, C. J. 57, 631). Minute needles which blacken at 205°. Yields $\text{C}_{10}\text{H}_6(\text{OAc})_2$ [227°]. According to theory, this body should be identical with the preceding.

(1,2')-Dioxynaphthalene [178°]. Formed by fusing (β)-naphthol (α)-sulphonic acid (Bayer, B. 15, 1351) with potash (Emmert, A. 241, 371). Needles, v. e. sol. alcohol, m. sol. water. Its alkaline solution blackens quickly. FeCl₃ gives a blue pp. Yields $\text{C}_{10}\text{H}_6(\text{OAc})_2$ [108°] and $\text{C}_{10}\text{H}_6(\text{OEt})_2$ [67°].

(1,3')-Di-oxy-naphthalene [135°]. Made by potash-fusion from naphthalene (1,3')-disulphonic acid (Ewer a. Pick, G. P. 45,229 [1887]) or (β)-naphthol (α)-sulphonic acid (Claus, J. pr. [2] 39, 315). White prisms (from benzene). Turns red in air. FeCl₃ gives a blue colour. Yields $\text{C}_{10}\text{H}_6(\text{OAc})_2$ [73°].

(2,3')-Di-oxy-naphthalene [216°]. Formed by potash-fusion from naphthalene (2,3')-disulphonic acid (Dusart, B. [2] 8, 200; Darmstädter a. Wichelhaus, A. 152, 306) and from (β)-naphthol (β)-sulphonic acid (Schäffer, A. 152, 298; Armstrong a. Graham, C. J. 39, 140; Emmert, A. 241, 369). Thin plates, v. sol. alcohol, sl. sol. cold water. Gives a yellowish-white pp. with FeCl₃. Yields $\text{C}_{10}\text{H}_6(\text{OAc})_2$ [175°] and $\text{C}_{10}\text{H}_6(\text{OEt})_2$ [162°]. Forms a disulphonic acid which gives $\text{BaC}_{10}\text{H}_6\text{S}_2\text{O}_4$ 2aq (Griss, B. 13, 1959).

(2,2')-Di-oxy-naphthalene. [190°]. Formed by potash-fusion from naphthalene (2,2')-disulphonic acid (Ebert a. Merz, B. 9, 609; Weber, B. 10, 1233; 14, 2206; Clausius, B. 23, 619). Needles (from hot water). Its alkaline solution blackens in air. Yields $\text{C}_{10}\text{H}_6(\text{OAc})_2$ [136°], $\text{C}_{10}\text{H}_6(\text{OBz})_2$ [139°], $\text{C}_{10}\text{H}_6(\text{OMe})_2$ [184°], and $\text{C}_{10}\text{H}_6(\text{OEt})_2$ [104°] (Liebermann, B. 15, 1428).

Dioxynaphthalene [161°]. Got by fusing (β)-naphthol (R)-disulphonic acid (1 pt.) with NaOH (4 pts.) at 310°, or by heating with dilute (25 p. c.) H_2SO_4 at 200° (E. P. 15,803). Crystals (from water). FeCl₃ gives an intense blue colour. Combines with diazo-compounds.

Tri-oxy-naphthalene $\text{C}_{10}\text{H}_4\text{O}_3$. Got by reducing oxy-(α)-naphthoquinone (Graebe, A. 154, 824). Yellow needles (from ether). Very readily oxidised.

DI-OXY-NAPHTHALENE DICARBOXYLIC

ACID $\text{C}_{10}\text{H}_4(\text{OH})_2(\text{CO}_2\text{H})_2$ [162°]. Formed by heating naphthoic acid (Claus a. Meixner, J. pr. [2] 37, 1). White needles, v. sol. ether. Yields $\text{C}_{10}\text{H}_4(\text{CO}_2\text{H})_2$ [253°] on reduction. — NaA^+ 6aq. — NaHA^+ 5aq; small needles. — BaA^+ 2aq. — AgA^+ .

DIOXYNAPHTHALIC ACID $\text{C}_{10}\text{H}_4\text{O}_2$

[126°]. Made by boiling chloro-oxy-naphthalic acid (v. NAPHTHALENE) with baryta (Hermann, A. 151, 67). Prisms. — KHA^+ aq. — BaA^+ 8aq. — $\text{Ba}(\text{HA}^+)_2$. — $\text{Ba}(\text{NH}_4\text{A}^+)_2$ 2aq. — $\text{Ca}(\text{NH}_4\text{A}^+)_2$. — $\text{Cu}(\text{NH}_4\text{A}^+)_2$; blue prisms.

DI-OXY-NAPHTHAZINE $\text{C}_8\text{H}_8\text{N}_2\text{O}_2$ [c.

800°]. Formed from di-oxy-naphthoquinone and naphthylene-(1,2)-diamine in alcohol (Nielski

a. Hasterik, B. 24, 1839). Reddish-brown needles, sl. sol. alcohol.

(a)-OXY-(β)-NAPHTHOIC ACID

$C_{10}H_7(OH)CO_2H$ [1:2]. *Naphthol carboxylic acid*. [187°]. S. 0.58 at 17°. Formed by passing CO_2 over sodium- α -naphthol at 100° (Feller, A. 152, 277; Schäffer, A. 152, 291; Nietzka, Gattermann, B. 20, 1274), or by heating sodium-(α)-naphthol with liquid CO_2 at 130° (Schmitt a. Burkard, B. 20, 2699). Stalate groups of needles (from alcohol). $FeCl_3$ colours its solution blue. PCl_5 forms $C_{10}H_6(OPOCl_2)_2.CCl_4$ [115°], whence moist air forms $C_{10}H_6(OPO(OH)_2)_2.CO_2H$, while alcohol yields $C_{10}H_6(O.P(OEt)_2)_2.CO_2H$ [63°] (Wolffenstein, B. 21, 1186).— NaA' 3aq.— NaA' — $SH.A'$ — PhA' . [96°].

Acetyl derivative $C_{10}H_6(OAc)_2.CO_2H$. [158°].

Methyl ether MeA' . [78°]. Converted by hydroxylamine into $C_{10}H_6(OH).CO.NH(OH)$ [174°].

Ethyl ether EtA' . [49°].

Phenyl ether PhA' . [90°].

Methyl derivative of the anilide $C_{10}H_6(OMe).CONHPh$. [248°]. Made from methyl (α)-naphthol, phenyl cyanate, and $AlCl_3$ (Leuchart a. Schmitt, B. 20, 2340). Prisms.

(β)-Oxy-(α)-naphthoic acid $C_{10}H_6(OH)(CO_2H)$ [2:1]. [157°]. Formed, in like manner, from (β)-naphthol (S. a. B.; cf. Kauffmann, B. 15, 804). Slender needles, decomposing at 125° when slowly heated. Completely decomposed by boiling water into CO_2 and (β)-naphthol. $FeCl_3$ gives a blue colour. PCl_5 yields $C_{10}H_6(OPOCl_2)COCl$ [38°], whence moist air forms $C_{10}H_6(OPO(OH)_2)_2.CO_2H$ [156°], while dilute alcohol produces $C_{10}H_6(OPO(OEt)_2)_2.CO_2H$ [113°] (Rabe, B. 22, 392).— NH_4A' : yellow needles, m. sol. cold water.

Methyl ether MeA' . [76°]. Converted by hydroxylamine into amorphous $C_{10}H_6(OH).CO.NH(OH)$ [178°] (Jeaurenaud, B. 22, 1277).

Ethyl ether EtA' . [55°].

Methyl derivative of the amide $C_{10}H_6(OMe).CONH_2$. [186°]. Form from methyl (β)-naphthol, $AlCl_3$, and $ClCONH_2$ (Gattermann, A. 244, 75). Crystals (from alcohol).

Ethyl derivative of the amide $C_{10}H_6(OEt).CONH_2$. [161°]. Plates (from alcohol).

Methyl derivative of the anilide $C_{10}H_6(OMe).CONHPh$. [169°]. Made from methyl (β)-naphthol and phenyl cyanate in presence of $AlCl_3$ (L. a. S.). Needles.

(β)-Oxy-naphthoic acid

$C_{10}H_7(OH)CO_2H$ [2:5?]. [216°]. Formed in small quantity from sodium(β)-naphthol and CO_2 at 290° (Schmitt a. Burkard, B. 20, 2702). Plates, v. sol. alcohol. Very stable. $FeCl_3$ colours its solution blue. Its methyl ether does not react with hydroxylamine.

Peri-Oxy-naphthoic acid

$C_{10}H_6(OH)CO_2H$ [1:1?]. [169°]. Made by heating its internal anhydride for a long time with dilute KOH aq (Ekstrand, B. 19, 1188; J. p. [3] 88, 378). Small needles (from ether), v. sol. water. Solutions of its salts are coloured violet by $FeCl_3$.— CaA' 3aq: decomposed on boiling.

Anhydride $C_{10}H_6<\overset{CO}{O}$. *Naphtholactone*.

[108°]. Made from amido-(α)-naphthoic acid by the diazo-reaction. Needles (from alcohol) or tables (from ether), insol. cold aqueous alkalis.

(α)-Oxy-naphthoic acid

$C_{10}H_7(OH)CO_2H$ [1:4?].

Ethyl derivative $C_{10}H_6(OEt)CO_2H$. [214°]. Formed by the action of alcoholic potash on the amide $C_{10}H_6(OEt)CONH_2$ [244°], which is made from $C_{10}H_7OEt$ and $ClCONH_2$ in presence of $AlCl_3$ (Gattermann, B. 23, 1193; A. 244, 73). Needles, m. sol. alcohol.— NaA' 3aq: plates.— CaA' 3aq: needles, sl. sol. water.

Methyl derivative $C_{10}H_6(OMe)CO_2H$. [232°]. Formed, in like manner, from $C_{10}H_6(OMe)CONH_2$ [234°] which is prepared from $C_{10}H_7OMe$.

(α)-Oxy-(α)-naphthoic acid. [234°-237°]. Formed by fusing (α)-sulpho-(α)-naphthoic acid [235°] with potash (Battershall, A. 168, 114). Needles (from water), v. sol. alcohol. Aqueous solutions of its salts blacken on boiling. $FeCl_3$ gives a dirty violet pp.

(α)-Oxy-(β)-naphthoic acid. [213°]. Made by potash-fusion from sulpho-(β)-naphthoic acid. Needles (from boiling water). Its salts are unstable. $FeCl_3$ gives a dirty red pp.

(β)-Oxy-(α)-naphthoic acid. [247°]. Made by potash-fusion from the sulpho-naphthoic acid [218°-222°] (Stumpf, A. 188, 6). Mass of needles (from water). $FeCl_3$ has no effect in the cold, but gives a brown pp. on warming.

(β)-Oxy-(α)-naphthoic acid. [187°]. Made by potash-fusion from sulpho-naphthoic acid [182°-185°] (Stumpf). Branching needles (from water). Gives a chocolate colour with $FeCl_3$. Yields (β)-naphthol on distilling with lime.

(β)-OXY-NAPHTHOL ALDEHYDE

$C_{10}H_6(OH)CHO$. *Aldehyde-naphthol*. [76°]. Formed from (β)-naphthol, chloroform, and aqueous $NaOH$ (Kauffmann, B. 15, 805; 16, 683). Prisms (from alcohol), almost insol. water. $FeCl_3$ colours its solution brown. Reduces warm ammoniacal $AgNO_3$, forming a mirror. With Ac_2O and $NaOAc$ it forms $C_{10}H_6(OAc).CH(OAc)$ [124°]. Yields, on oxidation, oxy-naphthoic acid [150°].— $C_{10}H_6(ONa).CHO$: yellow plates.

(α)-OXY-(α)-NAPHTHOPHENAZINE

$C_{10}H_6N_2O$ i.e. $C_6H_5:N_2:C_{10}H_6OH$ [4:3:1]. Formed by heating (α)-amido- or diethylamido-(α)-naphthophenazine with conc. $HClAq$ for 5 hours at 180° (Fischer a. Hopf, B. 23, 845; Ecker, B. 23, 8805). Reddish-yellow needles (from alcohol). The hydrochloride forms red prisms with green lustre.

• OXY-(β)-NAPHTHOQUINOLINE $C_{10}H_7NO$.

Formed by fusing (β)-naphthoquinoline sulphonic acid with potash (Gentil, B. 18, 202). Does not melt below 250°.

(α)-OXY-(α)-NAPHTHOQUINONE v. Juelow.

(β)-Oxy-(α)-naphthoquinone $C_{10}H_6(OH)O_2$. *Naphthalic acid*. [150°]. Formed by heating amido- or oxy-naphthoquinonimide or oximide-naphthol with $HClAq$ or alkalis (Martius a. Griess, A. 134, 377; Gräbe a. Ludwig, A. 154, 821; B. 4, 970; Merz a. Diehl, B. 11, 1814; Kehrman, B. 23, 2458). Formed also in like manner from phenyl-amido-(α)-naphthoquinone and from phenyl-amido-(β)-naphthoquinone (Baltzer, B. 14, 1900; Zincke, B. 14, 1498).

bermann & Jacobson, *A.* 211, 80). Yellow needles, v. sl. sol. cold water. May be sublimed.

Reactions.—1. Reduced by tin and HCl to tri-oxy-naphthalene.—2. The Na salt heated with *o*-phenylenediamine forms (α)-naphthoeurhodol (Kehrmann, *B.* 23, 2453).—3. *Benzoic aldehyde* forms $\text{CHPh}(\text{C}_6\text{H}_4(\text{OH})\text{O})_2$ [211°–214°] (Zincke, *B.* 21, 2203).—4. *Phenyl-hydrazine* yields $\text{C}_6\text{H}_5(\text{OH})\text{Q}(\text{NHPh})$ [230°] which forms the salts CaA' , BaA' and BaA' , 10aq, the ethers MeA' [175°] and EtA' [173°], and the acetyl-derivative $\text{C}_6\text{H}_5\text{AcN}_2\text{O}_2$ [178°]. It reacts with aldehyde, benzoic aldehyde, and acetone, forming $\text{C}_6\text{H}_5\text{N}_2\text{O}_4$ [c. 258°], $\text{C}_{10}\text{H}_8\text{N}_2\text{O}_4$, and $\text{C}_8\text{H}_8\text{N}_2\text{O}_4$ [215°–250°] respectively (Zincke & Thelen, *B.* 17, 1812; 21, 2205).— $\text{AgC}_6\text{H}_5\text{O}_3$: scarlet needles (from hot water).

Ethyl ether $\text{EtC}_6\text{H}_5\text{O}_3$ [127°]. Needles.

Imide v. Amido-naphthoquinone.

Anilide v. Phenyl-amido-naphthoquinone.

Oxim $\text{C}_{10}\text{H}_7(\text{NOH})(\text{OH})\text{O}$ [1:2:4]. *Nitroso-naphtharescin*. Formed from oxy-naphthoquinone and hydroxylamine (Kostanecki, *B.* 22, 1349). Needles, decomposing at 180°. Gives with ferrous salts a green, and with ferric salts a dark-brown lake. The hydrochloride forms yellow needles. Nitrous acid forms $\text{C}_6\text{H}_5(\text{NO})\text{O}_2$ crystallising in plates (containing aq), decomposing at 165°.

Oxy-(β)-naphthoquinone $\text{C}_{10}\text{H}_6(\text{OH})\text{O}_2$ [2:1:2]. Formed by oxidising its oxim with FeCl_3 . Reddish-brown, amorphous pp., v. sol. alcohol.

Oxim $\text{C}_{10}\text{H}_7(\text{OH})(\text{NOH})\text{O}$ [2:1:2]. [235°]. Formed from (2,2')-di-oxy-naphthalene and nitrous acid (Clausius, *B.* 23, 521). Brownish-yellow needles.

Di-oxy-naphthoquinone $\text{C}_{10}\text{H}_6(\text{OH})_2\text{O}_2$. *Naphthazarin*. Formed by heating di-nitro-naphthalene [214°] with zinc and H_2SO_4 at 200° (Roussin; De Aguiar & Beyer, *B.* 4, 251, 438; Liebermann, *B.* 3, 905; *A.* 162, 330). Reddish-brown needles with green lustre, v. sl. sol. boiling water, v. sol. alcohol. Its alkaline solution is blue. Its solution in H_2SO_4 is crimson. Baryta- and lime- waters give violet-blue pps.

Isomeride v. Oxy-naphthoquinone, p. 101.

Di-oxy-naphthoquinone $\text{C}_{10}\text{H}_6(\text{OH})_2\text{O}_2$. Formed by heating oxy-amido-naphthoquinone with HClAq at 176° (Merz & Diehl, *B.* 11, 1322). Reddish-brown needles (from alcohol). Its alkaline solution is brownish-violet. Dyes violet with alumina mordant and dark-blue with iron mordants. Dyes silk brownish-violet with metallic lustre. It forms a crystalline di-acetyl derivative.— BaA'' .— PbA'' .— AgA'' : greenish-blue pp.

Tri-oxy-naphthoquinone. A black by-product in preparing naphthazarin (Aguiar, *B.* 4, 439).

References.—Bromo- and Chloro-oxy-naphthoquinone.

OXY-NAPHTHOQUINONE SULPHONIC ACID $\text{C}_{10}\text{H}_6(\text{OH})\text{O}_2\text{SO}_3\text{H}$. Formed by the action of alkalis on the acid $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})(\text{SO}_3\text{H})_2$ got by dissolving dichloro-naphthoquinone in aqueous KHSO_3 (Graebe, *A.* 149, 9).— KA'' (dried at 140°): orange crystals.

References.—Bromo- and Chloro-oxy-naphthoquinone sulphonic acid.

(β)-OXY-α-NAPHTHOYL-BENZOIC ACID $\text{C}_{10}\text{H}_6(\text{OH})\text{CO}_2\text{C}_6\text{H}_5$. *Phenyl-oxy-naphthyl-keto-α-carboxylic acid*. [256°]. Pre-

pared by oxidising an alkaline solution of (ββ)-dioxy-dinaphthyl with KMnO_4 (Walder, *B.* 16, 299). Silky prisms. Sol. alcohol, ether, and acetic acid, nearly insol. water.

Reactions.—1. On fusion, with KOH it gives (β)-naphthol and phthalic acid.—2. Heated with HI it is reduced to (β)-oxy-α-naphthyl-*o*-toluic acid ($\text{C}_{10}\text{H}_6(\text{OH})\text{CH}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$).—3. Heated with ZnCl_2 to 220° it yields a substance $\text{C}_{10}\text{H}_8\text{O}$, which forms colourless crystals [146°], easily soluble in alcohol.—4. Heated with resorcin it gives a red colouring-matter, and with dimethylaniline and ZnCl_2 a green.

Salts.— $\text{A}''\text{Na}$: white crystalline powder, sl. sol. cold water and alcohol.— $\text{A}''\text{Ag}$: insoluble pp.— $\text{A}''\text{Ba}$ 2aq: slightly soluble white pp.

Methyl ether $\text{A}''\text{Me}$: [199°]; prisms.

Ethyl ether $\text{A}''\text{Et}$: [206°]; needles.

Acetyl derivative $\text{C}_{10}\text{H}_6(\text{OAc})$. [170°].

DI-(α)-OXY-DINAPHTHYL

$\text{C}_{10}\text{H}_6(\text{OH})\text{C}_{10}\text{H}_6(\text{OH})$. *Dinaphthol*. [800°]. Formed by adding FeCl_3 to a conc. solution of (α)-naphthol (Dianin, *B.* 6, 1252; 7, 125, 487; Julius, *Chem. Ind.* 10, 97). Silvery plates (from alcohol), insol. water. Its alcoholic solution is coloured red by FeCl_3 .

Benzoyle derivative $\text{C}_{20}\text{H}_{12}(\text{OBz})_2$. [253°].

Di-methylether $\text{C}_{20}\text{H}_{12}(\text{OMe})_2$. [251°].

Di-ethylether $\text{C}_{20}\text{H}_{12}(\text{OEt})_2$. [211°]. Pearly plates (Ostermayer & Rosenhek, *B.* 17, 2453).

Di-(β)-oxy-(αα)-dinaphthyl. [218° cor.]. V.D. 9.52 (obs.). Prepared by oxidation of an ethereal solution of (β)-naphthol with FeCl_3 , the yield being 60 p.c. of the theoretical amount (Dianin; Walder, *B.* 15, 2166). Needles or plates. Gives with FeCl_3 a greenish colour, becoming red on heating. On heating with ZnCl_2 it gives (β)-dinaphthylene oxide. H_2SO_4 forms $\text{C}_{20}\text{H}_{12}(\text{OH})(\text{SO}_3\text{H})_2$, whence BaA'' 6aq; $\text{C}_{20}\text{H}_{12}(\text{OH})(\text{SO}_3\text{H})_2$ is also formed. ZnCl_2 and NH_3 at 330° form $\text{C}_{20}\text{H}_{12}\text{N}$ [157°], which forms a picrate [217°] and an acetyl derivative [144°].—Picrate $\text{C}_{20}\text{H}_{12}\text{O}_2\text{C}_6\text{H}_4(\text{NO}_2)_3\text{OH}$. [174°]. White crystals, sol. alcohol.

Benzoyle derivative $\text{C}_{20}\text{H}_{12}(\text{OBz})_2$. [204°].

Di-benzoyle derivative $\text{C}_{20}\text{H}_{12}(\text{OBz})_2$. [160°].

Di-methylether $\text{C}_{20}\text{H}_{12}(\text{OMe})_2$. [190°].

Di-ethylether $\text{C}_{20}\text{H}_{12}(\text{OEt})_2$. [90°].

Di-oxy-dinaphthyl. [195°]. A product of the action of melted potash on (β)-naphthoic aldehyde (Kauffmann, *B.* 15, 807). Silky needles (from alcohol).

Tetra-oxy-dinaphthyl $\text{C}_{20}\text{H}_{10}(\text{OH})_4$. *Tetra-naphthyl dihydroquinone*. [178°]. Formed by reduction of the quinone $\text{C}_{20}\text{H}_8\text{O}_4$ (Stenhouse & Groves, *O. J.* 33, 415), and by the action of tin and HCl on (β)-naphthoquinone (Korn, *B.* 17, 3021). Colourless needles, darkening by oxidation in air, insol. water, v. sol. HOAc. The quinone $\text{C}_{20}\text{H}_8\text{O}_4$ is oxidised in alkaline solution by the air to [4:3:2:1] $\text{C}_{10}\text{H}_6\text{O}_2(\text{OH})\text{C}_{10}\text{H}_6\text{O}_2(\text{QH})$ [1:4:3:2] [215°–250°].

Acetyl derivative $\text{C}_{20}\text{H}_{10}(\text{OAc})_4$. [166°].

α-OXY-(α)-NAPHTHYL-ACETIC ACID

$\text{C}_{10}\text{H}_7\text{O}_2$, i.e. $\text{C}_{10}\text{H}_6\text{CH}_2(\text{OH})\text{CO}_2\text{H}$. (α)-*Naphthyl-alcolic acid*. [93°]. Formed by reducing (α)-naphthyl-glyoxylic acid with sodium-amalgam (Boessneck, *B.* 16, 640). Formed also by saponifying its nitrile (Brandis, *B.* 22, 2158), and

from (a)-naphthyl methyl ketone by successive treatment with bromine and potash (Schweizer, B. 24, 549). Rosettes of needles (from water). Yields (a)-naphthoic aldehyde on oxidation with dilute HNO_3 .— BaA^+ .— AgA^+ : pulverulent pp. •

Methyl ether MeA^+ . [79°]. Needles.

Nitrile $\text{C}_{10}\text{H}_7\text{CH}(\text{OH})\text{CN}$. Formed from (a)-naphthoic aldehyde, KCN , and cold HClAc . Oil, v. sol. alcohol.

α -Oxy-(β)-naphthyl-acetic acid. [158°] (S.); [o. 176°] (C. a. T.). Prepared in the same way as its isomeride (Claus a. Tersteegen, J. pr. [2] 42, 518; Schweizer, B. 24, 547). Small needles (from water). Reduced by HIAg to $\text{C}_{10}\text{H}_7\text{CH}_2\text{CO}_2\text{H}$ [o. 142°].

Methyl ether MeA^+ . [75°]. Needles.

Ethyl ether EtA^+ . [87°]. Needles.

Acetyl derivative $\text{C}_{10}\text{H}_7\text{CH}(\text{OAc})\text{CO}_2\text{H}$. [150°].

Amide $\text{C}_{10}\text{H}_7\text{CH}(\text{OH})\text{CONH}_2$. [228°].

Oxy-di-naphthyl-acetic acid $\text{C}_{20}\text{H}_{14}\text{O}_4$, i.e. $(\text{C}_{10}\text{H}_7)_2\text{C}(\text{OH})\text{CO}_2\text{H}$. Yellowish-green tables, decomposing about 100°.

Anhydride $\text{C}_{20}\text{H}_{12}\text{O}_4$. Formed by heating (a)-naphthol with oxalic acid and H_2SO_4 (Hoewig, M. 1, 251). Pale-red plates, sl. sol. chloroform.

(β)-OXY-NAPHTHYL-ACRYLIC ACID

$\text{C}_{10}\text{H}_7(\text{OH})\text{CH}:\text{CH}\text{CO}_2\text{H}$. [170°]. Formed by heating its anhydride with aqueous potash at 170°. Crystalline powder, sol. alcohol.

Anhydride $\text{C}_{10}\text{H}_7\text{CH}(\text{O}-\text{CO})\text{CH}(\text{O}-\text{CO})$. (β)-Naphthocoumarin. [118°]. Prepared by heating (β)-oxy-naphthoic aldehyde (2 pts.) with Ac_2O (10 pts.) and NaOAc (2 pts.) at 180° (Kauffmann, B. 16, 685). Needles, v. sol. alcohol, sl. sol. hot water.

An isomeride of this anhydride [141°] is got by heating (β)-naphthol with malic acid and H_2SO_4 (Pechmann a. Velsch, B. 17, 1651).

OXY-DINAPHTHYLAMINE v. IMIDO-DI-NAPHTHYL OXIDE •

Tri-oxy-(β)-naphthylamine

$\text{C}_{10}\text{H}_7(\text{OH})_3(\text{NH}_2)$ [1:3:4:2]. Formed from nitro-oxy-quinone, SnCl_2 , and HCl (Kehrmann a. Weichardt, J. pr. [2] 40, 181). Brownish-violet needles.— B^+HCl : monoclinic prisms.

Tetra-acetyl derivative. [145°].

(β)-OXY-NAPHTHYL-CROTONIC ACID

Anhydride $\text{C}_{10}\text{H}_7\text{CH}(\text{OME})\text{CH}(\text{OME})\text{CO}$. [162°]. Formed by the action of H_2SO_4 on a mixture of acetoacetic ether and (β)-naphthol (Pechmann a. Cohen, B. 17, 2190). Needles, sol. alcohol. Its solution in H_2SO_4 exhibits green fluorescence.

DI-OXY-NAPHTHYLENE-DIAMINE

$\text{C}_{10}\text{H}_7(\text{OH})_2(\text{NH}_2)$ [1:3:2:4]. Formed by the action of SnCl_2 and HCl on the oxim of oxy-amido-naphthoquinone (Kehrmann a. Weichardt, J. pr. [2] 40, 186). Its alkaline solutions become crimson on oxidation, and then blue on boiling.— B^+HCl : white needles.

TRI-OXY-TRI-NAPHTHYL-ETHANE

$\text{C}_{10}\text{H}_7(\text{OH})_3\text{CH}_2\text{CH}(\text{C}_{10}\text{H}_7\text{OH})_2$. Formed from di-chloro-di-ethyl oxide and (a)-naphthol (Willems, A. 243, 165). White amorphous powder, insol. water, sol. alcohol.

(a)-OXY-NAPHTHYL ETHYL KETONE

$\text{C}_{10}\text{H}_7(\text{OH})\text{CO}\text{C}_2\text{H}_5$. [81°]. Formed by heating (a)-naphthol with propionic acid and ZnCl_2 at 173°. Pale-yellow plates (from ether or alcohol).

Phenyl hydrazide [128°].

Methyl ether [58°]. Formed from propionyl chloride, $\text{C}_{10}\text{H}_7\text{OMe}$, and AlCl_3 (Gattermann, B. 23, 1209). Prisms (from ether). Yields an oxim $\text{C}_{10}\text{H}_7(\text{OMe})\text{C}(\text{NOH})\text{C}_2\text{H}_5$ [172°].

OXY-NAPHTHYL METHYL KETONE

$[1:3]\text{C}_{10}\text{H}_7(\text{OH})\text{CO}\text{CH}_3$. 'Ketonnaphthol' [168°]. Formed by the rapid distillation of phenyl-acetoisocrotonic acid (Erdmann, A. 254, 197). Crystals (from dilute alcohol).

Acetyl derivative $\text{C}_{10}\text{H}_7\text{O}_2$. [1093°].

Oxim $\text{C}_{10}\text{H}_7\text{NO}_2$. [174°].

Oxy-naphthyl methyl ketone [103°]. Formed by heating (a)-naphthol with HOAc and ZnCl_2 (Witt, B. 21, 321). Pale-green six-sided prisms (from benzene). Its alkaline salts are yellow. Alcoholic NH_3 at 200° forms $\text{C}_{10}\text{H}_7(\text{OH})\text{C}(\text{NH}_2)\text{CH}_3$. [203°].

Oxim $\text{C}_{10}\text{H}_7(\text{OH})\text{C}(\text{NOH})\text{CH}_3$. [170°].

(a)-Oxy-naphthyl methyl ketone. Probably identical with the preceding isomeride. **Methyl ether** $\text{C}_{10}\text{H}_7(\text{OMe})\text{CO}\text{CH}_3$. [72°]. Above 350°. Formed from $\text{C}_{10}\text{H}_7(\text{OMe})$, AcCl , and AlCl_3 (Gattermann, B. 23, 1208). Six-sided tables.

Ethyl ether $\text{C}_{10}\text{H}_7(\text{OMe})\text{Ac}$. [79°].

(β)-Oxy-naphthyl methyl ketone. **Methyl ether** $\text{C}_{10}\text{H}_7(\text{OMe})\text{CO}\text{CH}_3$. [58°]. Formed from $\text{C}_{10}\text{H}_7\text{OMe}$, AcCl , and AlCl_3 (Gattermann). Slender needles.

Ethyl ether. [63°]. Compact tables.

OXY-(a)-NAPHTHYL-METHYL-PYRAZOLE

$\text{C}_{10}\text{H}_7\text{N}_2\text{O}$ i.e. $\text{C}_{10}\text{H}_7\text{N} < \begin{smallmatrix} \text{C}(\text{OH})\text{CH} \\ \text{N}-\text{OMe} \end{smallmatrix}$. [o. 190°].

Formed by heating (a)-naphthyl-hydrazine with acetoacetic ether at 130° (Knorr, J. pr. [17] 551). Yields a methyl derivative [129°]. (a)-Naphthyl-hydrazine and thio-acetoacetic ether form $\text{C}_{10}\text{H}_7\text{N}_2\text{O}$ [220°] (Sprague, C. J. 59, 343).

Oxy-(β)-naphthyl-methyl-pyrazole. [190°].

Formed in the same way. Yields a methyl derivative [129°].

(a)-OXY-NAPHTHYL PROPYL KETONE

$\text{C}_{10}\text{H}_7(\text{OH})\text{CO}\text{C}_3\text{H}_7$. [78°]. Formed by heating butyric acid with (a)-naphthol and ZnCl_2 (Goldzweig, J. pr. [2] 43, 97). Silky needles (from ether), m. sol. hot water.

DI-OXY-DI-(a)-NAPHTHYL-PYRAZINE

HEXAHYDRIDE

$\text{C}_{10}\text{H}_7\text{N} < \begin{smallmatrix} \text{C}(\text{OH})\text{CH} \\ \text{CH} \end{smallmatrix} \text{C}(\text{OH}) > \text{NC}_6\text{H}_5$. [275°].

Formed by boiling the acetyl derivative of chloro-(a)-naphthylamine with alcoholic potash (Abenius, J. pr. [2] 40, 437). Formed also by heating (a)-naphthylamido-acetic acid with Ac_2O at 200° (Bischoff, B. 22, 1807; 23, 2003). Plates (from HOAc), insol. alkalis.

Di-oxy-di-(β)-naphthyl-pyrazine hexahydrate [above 360°]. Formed by heating (β)-naphthyl-amido-acetic acid at 220° in hydrogen, and by the action of chloro-acetic ether on the naphthalide of (β)-naphthylamido-acetic acid (Bischoff). Plates, s. sol. aniline. Converted by boiling alcoholic potash into

$\text{C}_{10}\text{H}_7\text{NH}\text{CH}_2\text{CO}\text{N}(\text{C}_{10}\text{H}_7)\text{CH}_2\text{CO}_2\text{H}$ [105°].

DI-OXY-DI-(β)-NAPHTHYL SULPHIDE

$\text{S}(\text{C}_{10}\text{H}_7\text{OH})_2$. **Naphthol sulphide**. [215°]. Formed, together with the di- and tri-sulphides, by the action of sulphur at 180° in presence of PbO , or of S_2Cl_2 in benzene, upon (β)-naphthol (Tassinari, G. 17, 94; Onufrovitch, B. 21, 3559; or 2055).

benzene, m. sol. hot alcohol. Yields di-oxy-di-naphthyl on heating with powdered copper. NH_4Aq forms, on heating, (β)-naphthylamine. Alcoholic and ammoniacal AgNO_3 forms $\text{C}_{10}\text{H}_7\text{SO}_3$. [164°]. — Na_2A 6aq: needles.

Acetyl derivative $\text{SC}_6\text{H}_4(\text{OAc})_2$. [164°].

Benzoyl derivative [208°]. Plates.

Ethyl ether $\text{SC}_6\text{H}_4(\text{OEt})_2$. [189°]. Yields a di-nitro-derivative [235°].

Di-oxy-di-(β)-naphthyl disulphide $\text{S}_2(\text{C}_{10}\text{H}_7\text{OH})_2$. [169°]. Formed as above. Thin yellow needles, m. sol. benzene. Yields di-oxy-dinaphthyl on heating with Cu at 240°.

Di-acetyl derivative $\text{S}_2\text{C}_{10}\text{H}_7(\text{OAc})_2$. [140°]. Yellowish crystalline mass.

Di-benzoyl derivative [187°]. Prisms.

Di-ethyl ether [158-6°]. Needles.

Di-oxy-di-naphthyl disulphide $\text{S}_2(\text{C}_{10}\text{H}_7\text{OH})_2$. [210°]. Formed by heating (β)-naphthol with NaOHAq and S (Lange, B. 21, 260). Needles, insol. water, v. sol. HOAc . It is accompanied by the preceding isomeride [170°].

Di-oxy-di-(β)-naphthyl trisulphide $\text{S}_3(\text{C}_{10}\text{H}_7\text{OH})_3$. Formed as above (Onufrovitch). Powder. Yields a dibenzoyl derivative [194°].

α-OXY-(α)-NAPHTHYL-THIO-UREA $\text{C}_{10}\text{H}_7\text{NH.CS.NH(OH)}$. [116°]. Formed from (α)-naphthyl thiocarbimide and hydroxylamine (Tiemann, B. 22, 1939; Voltmer, B. 24, 382).

Pearly plates (from alcohol), insol. water. Hot alcohol converts it into (α)-naphthyl-cyanamido. *Benzyl ether* $\text{C}_{10}\text{H}_7\text{NH.CS.NH(OCH}_2\text{Ph)}$. [133°]. Formed by using benzyl-hydroxylamine.

(β)-OXY-α-NAPHTHYL-α-TOLUIC ACID $\text{C}_{10}\text{H}_7(\text{OH})-\text{CH}_2-\text{C}_6\text{H}_4\text{CO}_2\text{H}$. [261°]. Formed by reduction of oxy-naphthoyl-benzoic acid by heating with HI and P to 200° (Waldner, B. 16, 304). Small colourless prisms. Nearly insol. water, sl. sol. alcohol and ether. — A^+Ag : flocculent pp.

α-OXY-NITRO-α-NITRO-OXY-

DI-OXY-OCTANE $\text{C}_8\text{H}_{17}\text{O}_2$, i.e. CPrH(OH).CPrH(OH) . Mol. w. 146. [51-5°]. (228°). Formed by the action of alcoholic potash on isobutyric aldehyde (Fossek, M. 4, 664; 11, 397). Monoclinic tables, v. sol. alcohol. Combines with CaCl_2 . Yields isobutyric and oxalic acids on oxidation by HNO_3 . Boiling dilute H_2SO_4 forms a (β)-pinacolin $\text{C}_{10}\text{H}_{19}\text{O}_2$ (162°). Conc. H_2SO_4 in the cold forms an (α)-pinacolin $\text{C}_8\text{H}_{17}\text{O}_2$ (122°) smelling like camphor.

Acetyl derivative $\text{C}_8\text{H}_{15}(\text{OAc})_2$. (235°).

Di-oxy-octane $\text{C}_8\text{H}_{17}(\text{OH})_2$. *Octylene glycol*. (235°-240°). S.G. 0.932. Obtained from octylene bromide by successive treatment with AgOAc and solid KOH (De Clermont, C. R. 59, 80). Oil, sol. alcohol.

Acetyl derivative $\text{C}_8\text{H}_{15}(\text{OAc})_2$. (245°-250°).

Di-oxy-octane $\text{CMeEt(OH).CMeEt(OH)}$. *Methyl-ethyl-pinacone*. [α. 28°]. (200°-205°).

A product of the action of sodium-amalgam on methyl ethyl ketone (Lavrinovitch, A. 185, 124). Crystalline mass, m. sol. water.

Tri-oxy-octane

$\text{CMePr(OH).CH}_2\text{CH(OH).CH}_2\text{OH}$. (210° at 60 mm.). Formed by the action of HOCl followed by KOH upon methyl-allyl-propyl-carbonyl (Reformatsky, J. pr. [2] 40, 412). Thick

liquid, v. sol. water and alcohol, sl. sol. alcohol. Yields a liquid tri-acetyl derivative.

Tetra-oxy-octane $\text{C}_8\text{H}_{13}(\text{OH})_4$, i.e. $\text{CH}_2(\text{OH).CMe(OH).CH}_2\text{CH}_2\text{CMe(OH).CH}_2\text{OH}$. [151°]. Formed by the action of water on the liquid $\text{C}_8\text{H}_{13}\text{O}_4$ (170°-180° at 125 mm.) which is produced by the action of potash on $\text{C}_8\text{H}_{13}\text{Cl(OH)}$, a body formed by the addition of oxygen and HOCl to $\text{CH}_2\text{CMe.CH}_2\text{CH}_2\text{CMe.CH}_2$ (Przybytek, B. 20, 3242).

DI-OXY-OCTENOIC LACTONE

$\text{CH}_2\text{CH.CH}_2\text{C(OH).CH}_2\text{CHMe}$. Formed by the action of conc. H_2SO_4 on $(\text{C}_2\text{H}_5)_2\text{C(OH).CO}_2\text{H}$ [48°] (Bultsch, J. pr. [2] 33, 94). Yellow syrup. Yields amorphous $\text{Ba}(\text{C}_8\text{H}_{13}\text{O}_4)_2$.

OXY-OCTENOIC ACID $\text{C}_8\text{H}_{13}\text{O}_4$, i.e. $\text{C}(\text{C}_2\text{H}_5)_2(\text{OH).CO}_2\text{H}$. 'Diallyloxalic acid'. [48°]. Formed by saponifying its ether, which is made by the action of zinc and allyl iodide on oxalic ether (Saytzeff, A. 185, 183; Schatzky, J. pr. [2] 34, 485; Bl. [2] 45, 183). Needles, m. sol. water, v. sol. alcohol and ether. — $\text{NaA}^+ 2\text{aq}$. — $\text{LiA}^+ \text{aq}$. — $\text{CaA}^+ 2\text{aq}$. — $\text{ZnA}^+ 1\frac{1}{2}\text{aq}$. S. (of ZnA^+) 28 at 22° — $\text{CdA}^+ \text{aq}$. — $\text{PbA}^+ 2\text{aq}$. — CuA^+ : minute green needles.

Ethyl ether EtA^+ . (213-6° cor.). S.G. 0.9873; d_4^{20} 0.9718.

Methyl derivative $\text{C}(\text{C}_2\text{H}_5)_2(\text{OMe).CO}_2\text{H}$. Yields the salts $\text{BaA}^+ 2\text{aq}$. — $\text{PbA}^+ 6\text{aq}$. — $\text{CuA}^+ \text{aq}$ and the ether EtA^+ (216°). S. d_4^{20} 0.9607. $\mu_D = 1.4556$. $n_D = 89.52$ (Barataeff, J. pr. [2] 35, 1).

Heptic acid [151°], obtained by the action of bromine and potash on isobutyl-acetoacetic ether (Demarcay, A. Ch. [5] 20, 472), is perhaps an oxyoctenoic acid. It yields $\text{CaA}^+ 6\text{aq}$, crystallising in needles.

α-OXY-OCTOIC ACID $\text{C}_8\text{H}_{15}\text{O}_4$, i.e. $\text{CPr}_2(\text{OH).CO}_2\text{H}$. [73°] (K. a. S.); [81°] (R.). Formed by the action of zinc and propyl iodide on oxalic ether (Rafalsky, B. 14, 2068; Bn. 1, 527). Formed also by heating butyrolin with conc. KOHAq (Klinger a. Schmitz, B. 24, 1273). Needles. — KA^+ . — BaA^+ : scales.

Ethyl ether EtA^+ . (209° cor.). Oil.

α-Oxy-octoic acid $\text{CPr}_2(\text{OH).CO}_2\text{H}$. [111°]. Formed from its ether, which is made from oxalic acid, isopropyl iodide, and zinc (Markownikoff, Z. [2] 6, 516). Needles (from water), volatile with steam. — $\text{BaA}^+ 3\text{aq}$; small efflorescent needles.

Ethyl ether EtA^+ . (203° cor.). Oil.

α-Oxy-octoic acid

$\text{CH}_2\text{Pr.CH}_2\text{CH}_2\text{CH(OH).CO}_2\text{H}$. [69-5°]. Formed from cenanthol and HCy , followed by boiling HClAq (Erlenmeyer a. Sigel, B. 7, 697, 1108; A. 177, 102). Plates, v. sl. sol. water. Split up by HClAq at 120° into cenanthol and formic acid. — AgA^+ .

Ethyl ether EtA^+ . (230°) at 715 mm.

Amide [150°]. Satiny plates.

Nitrile $\text{C}_8\text{H}_{13}\text{CH(OH).CN}$. S.G. 1.905. Formed from cenanthol and anhydrous HCy in the cold. Liquid, sl. sol. water.

α-Oxy-octoic acid $\text{CMe}_2\text{CH}_2\text{CMe(OH).CO}_2\text{H}$. [107°]. A product of the oxidation of 'isodibutylene' with KMnO_4 (Butlerov, J. R. 1882, 190; C. J. 42, 936; Bk. [2] 38, 554). Needles or prisms, v. sol. hot water. — AgA^+ : needles.

β -Oxy-octoic acid $\text{CH}_3\text{CH}(\text{OH})\text{C}(\text{OEt})\text{CO}_2\text{H}$. Formed by reducing di-ethyl-acetoacetic ether with sodium-amalgam and water (Schnapp, A. 201, 62). Hygroscopic syrup, v. sol. alcohol, m. sol. water. Decomposed on distillation into aldehyde and di-ethyl-acetic acid.— NaA , 6aq.— $\text{CuCl}_2\cdot\text{H}_2\text{O}$.— AgA : flocculent pp.

β -Oxy-octoic acid $\text{CH}_3\text{CH}(\text{OH})\text{C}(\text{Me})\text{CO}_2\text{H}$. Formed by reducing methyl-propyl-acetoacetic ether (Jones, A. 226, 288). Split up on distillation into aldehyde and methyl-propyl-acetic acid.— ZnA : crusts.

β -Oxy-octoic acid $\text{C}_2\text{H}_5\text{CH}(\text{OH})\text{C}(\text{Me})\text{CO}_2\text{H}$ [108°]. Formed by reducing isobutyl-ethyl-acetoacetic ether (Wohlbrück, B. 20, 2334; Hantzsch, A. 249, 54). Prisms, v. sol. ether.— BaA , 3aq.

γ -Oxy-octoic acid $\text{C}_2\text{H}_5\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. Formed from succinyl chloride and ZnEt_2 (Wischin, A. 143, 262).— CaA , 2aq.— BaA .

Lactone $\text{C}_8\text{H}_{14}\text{O}_2$. (228°–233°) (Emmert, B. 15, 1852). Oil, v. sol. alcohol and ether.

γ -Oxy-octoic acid $\text{CH}_3\text{CH}(\text{OH})\text{C}(\text{Me})\text{CH}_2\text{CO}_2\text{H}$. Formed by reducing acetyl-hexoic acid (Young, C. J. 43, 177; A. 216, 43).— BaA : amorphous.

Lactone $\text{C}_8\text{H}_{14}\text{O}_2$. (227°).

γ -Oxy-octoic acid. **Lactone** $\text{C}_8\text{H}_{14}\text{O}_2$. (134° at 36 mm.). A product of the action of iodoform or iodine on NaOCH_2Pr (Gorboff, J. pr. [2] 41, 236, 261). Liquid.

Oxy-octoic acid [92°]. A product of the action of alcoholic potash on isobutyric aldehyde (Fossek, M. 4, 676). Crystals.— CaA : sol. water.

Di-oxy-octoic acid $\text{CHMe}(\text{OH})\text{C}(\text{CH}_2\text{Pr})(\text{OH})\text{CO}_2\text{H}$. A product of the action of alcoholic potash on bromo-isobutyl-acetoacetic ether (Demarcay, C. R. 86, 1135). Liquid, m. sol. water.— BaA : needles.— CaA .

Di-oxy-octoic acid $\text{CHMe}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. Formed by boiling barium di-oxy-di-propyl malonate with water (Hjelt, A. 216, 70). **Anhydride** $\text{C}_8\text{H}_{14}\text{O}_2$. Liquid, v. e. sol. water.

Tri-oxy-octoic acid. **Lactone** $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{C}(\text{OH})\text{CH}_2\text{CHMe}$. Formed by the action of H_2SO_4 on α -oxy-octoic acid [47°] (Bulitsch, J. pr. [2] 33, 83). Syrup, sol. alcohol.— $\text{Ba}(\text{C}_2\text{H}_5\text{O})_2$.

Tetra-oxy-octoic acid $\text{C}_8\text{H}_{14}\text{O}_4$, i. e. $(\text{OH})_2\text{CHCH}_2(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. Formed by boiling tetra-oxy-di-propyl-malonic acid with baryta-water (H.). Readily changes to the oily anhydride $\text{C}_8\text{H}_{14}\text{O}_4$.

Penta-oxy-octoic acid $(\text{OH})_2\text{CHCH}(\text{OH})\text{CH}_2\text{C}(\text{OH})\text{CO}_2\text{H}$. **Lactone** $\text{C}_8\text{H}_{14}\text{O}_5$. Formed by heating α -oxy-octoic ("diallyl-oxalic") acid with nitric acid on a water-bath (Bulitsch, J. pr. [2] 39, 65). Yellow liquid, v. sol. water and alcohol, insol. ether.

• **References**.—Bromo- and Di-chloro-oxy-octoic acid.

DI-OXY-OCTYLENE $\text{C}_8\text{H}_{14}(\text{OH})_2$. **Conylene-glycol**. **Acetyl derivative** $\text{C}_8\text{H}_{14}(\text{OAc})_2$. (225°). S.G. 1.987. Formed by conylene bromide and AgOAc (Wertheim, A. 130, 298). Oil.

OXY-OLEIC ACID $\text{C}_{18}\text{H}_{34}\text{O}_2$. An oily product of the action of Ag_2O on dibromostearic acid (Burg a. Overbeck, A. 140, 69). An isomeric acid 1750°

is formed by the action of H_2SO_4 on oleic acid (Liechti a. Suida, B. 16, 2455).

OXY-OXALACETIC ETHER. **Ethyl derivative** $\text{CO}_2\text{Et}.\text{CH}(\text{OEt})\text{CO}_2\text{CO}_2\text{Et}$. (155° at 17 mm.). Formed by the action of sodium ethylate on a mixture of oxalic ether and $\text{CH}_2(\text{OEt})\text{CO}_2\text{Et}$ in ether (Wstlicenus a. Scheidt, B. 24, 432). Thick liquid, miscible with alcohol and ether.

α -OXY-PALMITIC ACID $\text{C}_{16}\text{H}_{32}\text{O}_2$. [83°]. Formed by boiling α -bromo-palmitic acid with alcoholic potash (Hell a. Jordanoff, B. 24, 939). Small crystals (from alcohol).

Acetyl derivative [62–5°]. Scales.

• **OXYPARACONIC ACID** $\text{C}_8\text{H}_{10}\text{O}_4$. An acid formed by boiling calcium chloroformate with water (Mowinski, J. pr. [2] 11, 450). Thick liquid.— CaA , 2aq: rhombohedra.

TETRA-OXY-PENTAMETHENYL HYDRIDE

$\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})$. Formed by the action of HOAc on the Ba -salt of its carboxylic acid (Hantzsch, B. 20, 2792). Oil.— BaA 3aq: amorphous powder, almost insol. water.

• **Carboxylic acid** $\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$. Formed from ammonium tri-chloro-di-oxy-hexenoic acid and baryta-water at 60°.— BaA , 4aq: bulky pp., insol. water.

OXY-PENTANE v. AMYL ALCOHOL.

Di-oxy-pentane $\text{CH}_3(\text{CH}_2)_3\text{CH}_2(\text{OH})_2$. Mol. w. 104. (260°). Formed from pentamethylene-diamine by HNO_2 (Gustavson, J. pr. [2] 39, 542).

Di-oxy-pentane $\text{CHMe}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2(\text{OH})_2$. (240°) at 713 mm. S.G. 1.0003. Formed by reducing acetopropyl alcohol by sodium-amalgam (Freer a. Perkin, C. J. 61, 836; B. 19, 2568; Lipp, B. 22, 2567). Liquid, miscible with water, decomposing at 236°. HBrAq at 100° forms an anhydride (78° at 716 mm.), and finally $\text{C}_5\text{H}_8\text{Br}_2$ (201°).

Di-oxy-pentane $\text{CHEt}(\text{OH})\text{CHMe}(\text{OH})$. (187°). S.G. 0.9945; d_4^{20} 0.9800. Formed from the corresponding di-bromo-pentane by successive treatment with AgOAc and baryta-water (Wagnel a. Saytzeff, A. 179, 308). Formed also by heating the oxide $\text{O} < \text{CHEt} < \text{CHMe}$ with water at 100° (Eltekoff, J. R. 1882, 355). Yields α -oxy-butyric acid on oxidation.

Di-oxy-pentane $\text{CH}_2(\text{OH})\text{CH}_2(\text{OH})$. (206°). S.G. 0.999. Formed from the corresponding di-bromo-pentane (Flavitzky, B. 10, 230, 2240; A. 179, 351). Yields oxy-valeric acid on oxidation. P_2O_5 forms valeric aldehyde and methyl isopropyl ketone.

Di-oxy-pentane $\text{CMe}_2(\text{OH})\text{CHMe}(\text{OH})$. (177°). S.G. 0.987. Made from the corresponding di-bromo-pentane (Wurtz, A. Ch. [3] 54, 458). Formed also by heating methyl-isopropenyl-carbinol with dilute H_2SO_4 (Kondakoff, J. R. 20, 32). Syrup, with bitter taste. Miscible with water, alcohol, and ether. Yields oxy-isobutyric acid on oxidation. Yields methyl-isopropyl ketone when heated at 220°.

Acetyl derivative $\text{C}_5\text{H}_{10}(\text{OAc})_2$ (above 200°). Oil, readily saponified.

Benzoyl derivative $\text{C}_5\text{H}_{10}(\text{OBz})_2$. [125°]. Lamine, sol. alcohol and ether (Mayer, C. B. 59, 444).

Di-oxy-pentane

$\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CH}_3$. (177°). Formed by reducing methylene-di-methyl-diketone (acetyl-acetone) with sodium-amalgam (Combes, *A. Ch.* [6] 12, 229). Liquid, sol. water.

Tri-oxy-pentane

$\text{CHMe}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CH}_2(\text{OH})$. (180° at 27 mm.). S.G. $\frac{3}{4}$ 1.135; $\frac{2}{3}$ 1.120. Got by oxidising $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CHMe}(\text{OH})$ with KMnO_4 . The yield is 82 p.c. (Wagner, *B.* 21, 3351). Syrup not volatile with steam.

Tri-acetyl derivative $\text{C}_8\text{H}_{10}(\text{OAc})_3$. (270°) at 740 mm. S.G. $\frac{3}{4}$ 1.120; $\frac{2}{3}$ 1.101.

Tri-oxy-pentane

$\text{CHEt}(\text{OH})\text{CH}(\text{OH})\text{CH}_2(\text{OH})$. (192° at 63 mm.). S.G. $\frac{3}{4}$ 1.0851. Made by oxidising $\text{CHEt}(\text{OH})\text{CH}_2\text{CH}_2$ (114°) with KMnO_4 (Wagner, *B.* 21, 3349). The yield is 63 p.c. Thick, sweet syrup, miscible with water, alcohol, and ether.

Tri-acetyl derivative. (265°). S.G. $\frac{3}{4}$ 1.122; $\frac{2}{3}$ 1.163. Smells like onions.

Tri-oxy-pentane

$\text{CHMe}(\text{OH})\text{CHMe}(\text{OH})\text{CH}_2(\text{OH})$. **Pentenyl glycerin**. (158° at 24 mm.). Formed from tiglio alcohol by addition of bromine and subsequent distillation (Lieben a. Zeisel, *M.* 7, 68). Thick liquid.

Tri-acetyl derivative. (149° at 18 mm.).

Tetra-oxy-pentane $\text{C}_5\text{H}_8\text{O}_4$. (253°). S. 6 at 15°. Formed by the action of lime on a solution of formic and acetic aldehydes (Tollens a. Wigand, *A.* 265, 316). Prisms. Inactive to light. HI and P form $\text{C}_5\text{H}_8\text{I}_2(\text{OH})_2$ [180°] and $\text{C}_5\text{H}_8\text{I}_4(\text{OH})$ [62°].

Tetra-acetyl derivative. [84°].

Pentia-oxy-pentane

$\{\text{CH}_2(\text{OH})\text{CH}(\text{OH})\}_2\text{CH}(\text{OH})$. [102°]. Formed by reducing arabinose with sodium-amalgam, the liquid being kept neutral with H_2SO_4 (Kilian, *B.* 20, 1233). Prisms or needles, v. e. sol. water, v. sl. sol. cold alcohol.

OXY-PENTANE TRICARBOXYLIC ACID

$\text{C}_5\text{H}_2(\text{OH})_3\text{C}(\text{CO}_2\text{H})_3$. Formed from $\text{C}_5\text{H}_2\text{C}(\text{CO}_2\text{H})_3\text{CH}_2\text{CO}_2\text{H}$ by successive treatment with HBr and KOH (Hjelt, *B.* 16, 1258).

Anhydride $\text{C}_5\text{H}_2\text{O}_6$. **Dicarbocaprolactonic acid**. [153°]. Triclinic crystals (from water).— $\text{BaC}_5\text{H}_2\text{O}_6$.— $\text{Ag}_2\text{C}_5\text{H}_2\text{O}_6$: pulverulent pp.

OXY-PENTANE PHOSPHONIC ACID

$\text{C}_5\text{H}_7(\text{OH})\text{PO}(\text{OH})_2$. [184°]. Formed from isovaleric aldehyde and PCl_5 followed by water (Fossek, *M.* 5, 627; 7, 100). Monoclinic scales.

Yields isovaleric aldehyde on distillation and on treatment with KMnO_4 . PCl_5 forms $\text{C}_5\text{H}_7\text{Cl}_2\text{POCl}_2$ (184°–140° at 22 mm.). Reduced by HI and P to isopentane phosphonic acid $\text{C}_5\text{H}_{11}\text{PO}_3$ [161°].— $\text{BaA}''2\text{aq}$.— $\text{Ba}(\text{HA}')_2$.— $\text{Ag}_2\text{A}'$: amorphous pp.

OXY-PENTANE SULPHONIC ACID

$\text{C}_5\text{H}_{10}(\text{OH})\text{SO}_3\text{H}$. **Amylene isethionic acid**. Formed from chloro-amyl alcohol (amylenic chlorhydrin) and Na_2SO_3 (Falk, *J. pr.* [2] 2, 312). Decomposes on evaporation of its solution.— NaA' .— CaA'_2 .— $\text{CuA}'_22\text{aq}$: pale-blue laminae.

An isomeric acid is formed by the action of SO_3 on isomyl alcohol (Schwarz, *B.* 3, 691).— BaA'_2 : crystalline.

OXYPENTIC ACID $\text{C}_5\text{H}_8\text{O}_4\text{aq}$ or $\text{C}_5\text{H}_8\text{O}_4$. [198°]. Formed from ethyl-acetoacetic ether, bromine, and alcoholic potash (Demarçay, *C. R.* 88, 289). Crystals, m. sol. cold water. Ammonia converts its ether into a substance [77°].

And its chloride into another body [204°]. Zn and H_2SO_4 yield $\text{C}_5\text{H}_8\text{O}_4$ [95°]. Oxypentic acid is perhaps Δ^2 -hydromuconic acid (Gorboff, *J. B.* 1887, 605; this vol. p. 443).

OXYPENTINOIC ACID $\text{C}_5\text{H}_6\text{O}_5$, i.e.

$\text{OH}_2\text{CO}_2\text{CH}(\text{CH}_2\text{CO}_2\text{H})_2$. **Aceto-acrylic acid**. [125°]. Prepared by boiling an aqueous solution sodium β -bromo-lavulate for a few minutes, neutralising with Na_2CO_3 , again boiling, neutralising again, and so on till the solution finally remains alkaline after boiling (Wolff, *B.* 20, 426). Glistening plates. V. sol. alcohol and ether, less sol. cold water and chloroform.

Salts.— CaA'_2 .— ZnA'_2 : amorphous.— AgA' : needles.

OXY-PHENANTHRAQUINONE v. PHENANTHRAQUINONE

DI-OXY-PHENAZINE $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_2$. Formed by heating di-amido-phenazine with conc. HClAq at 200° (Fischer a. Hepp, *B.* 23, 843; Nietzki a. Hasterlik, 24, 1337). Reddish-yellow needles (containing aq).— $\text{B}'\cdot\text{H}_2\text{SO}_42\text{aq}$.

Di-acetyl derivative [230°] (F. a. H.); [226°] (N. a. H.). Pale-yellow tables.

Dioxytriphenazine,

fluorindin. Formed by heating di-o-nitro-diphenyl-quinone with alcoholic ammonium sulphide at 100°, the product being oxidised by exposure to air (Jeicester, *B.* 23, 2794). Dark-green crystals, yielding a violet powder. Its solution in HOAc exhibits brownish-red fluorescence.

OXYDIPHENYLS. All these compounds yield diphenyl when distilled with zinc-dust.

p-Oxy-diphenyl $\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{OH}$. [165°]. (c. 307°). Formed by fusing diphenyl sulphonic acid with potash (Latschinoff, *B.* 6, 194; Osten, *B.* 7, 170), by warming diazobenzene chloride with phenol, and in small quantity in the decomposition of diazobenzene chloride by water (Hirsch, *B.* 23, 3705). Plates, volatile with steam. Yields a mono-nitro-derivative [67°] and a di-nitro-derivative [154°].

Acetyl derivative. [89°]. Plates, v. sol. alcohol and ether (Kaiser, *A.* 257, 101).

Benzoyl derivative. [152°]. Tables.

An isomeric or identical oxydiphenyl [152°] is obtained from p-amido-diphenyl by the diazo-reaction (Hübner, *A.* 209, 348).

oo-Di-oxy-diphenyl $\text{C}_6\text{H}_4(\text{OH})_2\text{C}_6\text{H}_4(\text{OH})_2$. [99°]. Formed by potash-fusion from diphenyl disulphonic acid (Limprieh, *A.* 261, 331), and by dropping fluorene into fused KOH at 400° (Hodgkinson a. Matthews, *C. J.* 43, 168). Crystals (from benzene-ligroin).

pp-Di-oxy-diphenyl. [272°]. (above 360°). Formed from benzidine by the diazo-reaction (Griess, *J.* 1866, 461; Hirsch, *B.* 22, 338), and by potash-fusion from diphenyl di-p-sulphonic acid (Engelhardt a. Latschinoff, *Z.* 1871, 261; Doebner, *B.* 9, 180). Got also by distilling di-oxy-phenyl-benzoic acid with lime (Schmidt a. Schultz, *A.* 207, 834; *B.* 12, 490). Obtained also by passing a rapidly alternating electric current through a solution of phenol (Drechsel, *J. pr.* [2] 29, 237). Laminae (from alcohol).

Di-acetyl derivative [160°].

Ethyl ether [176°] (Hirsch).

o-Di-oxy-diphenyl [161°]. (842°). Formed in small quantity by potash-fusion from phenol *o*- and *p*-sulphonic acids (Lincke, *J. pr.* [2] 8, 43; Herzog, *B.* 18, 2234), and by the action of nitrous acid on *op*-di-amido-diphenyl (Schmidt, *A.* 207, 257; *B.* 12, 497). Yields a di-acetyl derivative [94°].

By fusing phenol with potash two more di-oxy-diphenyls [123°] and [190°] have been obtained (Barth a. Schreder, *A.* 156, 93; *B.* 11, 1336). The one melting at 123° yields $C_{12}H_8(OMe)_2$ (310°-320°) and $C_{12}H_8O_2(SO_3H)_2$, whence NaA' , 2aq and KA' aq.

Tri-oxy-diphenyl $C_6H_4(OH).C_6H_3(OH)_2$. Two isomerides of this formula [180°] and [205°] are formed by fusing fluorene sulphonic acid with potash at a little above 400° (Hodgkinson a. Matthews, *C. J.* 43, 167). Neither gives any colour with $FeCl_3$. The compound [180°] forms an acetyl derivative [100°].

Tetra-oxy-diphenyl $C_6H_3(OH)_2.C_6H_3(OH)_2$. *Dipyrrocatechin*. [84°]. Formed from diphenyl *di*-disulphonic acid by potash-fusion (Barth, *B.* 11, 1336). Needles. $FeCl_3$ colours its solution green.

Tetra-oxy-diphenyl $C_{12}H_{10}O_4$. *Diresorcin*. [310°]. Formed in small quantity by fusing resorcin or phenol with $NaOH$ (Barth, *B.* 12, 503; Benedikt, *M.* 1, 355; 5, 177; Herzog, *M.* 11, 419). Needles (containing 2aq). Gives a blue colour with $FeCl_3$. Phthalic anhydride and H_2SO_4 at 120° form $C_8H_{10}O_4$, 4aq, which gives blue solutions with alkalis.

Acetyl derivative $C_{12}H_{10}(OAc)_2$. [159°]. **Benzoyl derivative** $C_{12}H_{10}(OBz)_2$. [199°]. Formed from phloroglucin, $BzCl$, and $NaOH$ (Skraup, *M.* 10, 721; Pukall, *B.* 20, 1143).

Ethyl ether $C_{12}H_{10}(OEt)_2$. [114°]. Plates.

Tetra-oxy-diphenyl $C_6H_4(OH).C_6H_3(OH)_2$. *Dihydroquinone*. [237°]. Formed by fusing hydroquinone with $NaOH$ (Barth, *M.* 5, 600). Plates. Tastes sweet. $FeCl_3$ colours it red, and then forms diquinhydrone $C_{12}H_8O_4$ and diquinone $C_{12}H_8O_4$. [187°].

Hexa-oxy-diphenyl $C_6H_3(OH)_2.C_6H_3(OH)_2$. Formed by heating hydrocærulignone with $HClAq$ at 200° (Liebermann, *A.* 169, 239; *B.* 9, 1887). Plates, m. sol. water. $FeCl_3$ gives a bluish-grey pp. Iodine yields $C_{12}H_8O_6$, crystallising in blue needles.

Tri-methyl ether $C_{12}H_8(OMe)_3(OH)$. Formed from cærulignone and H_2SO_4 (Fischer, *B.* 8, 158).

Tetra-methyl ether $C_{12}H_8(OMe)_4(OH)_2$. *Hydrocærulignone*. [190°]. Formed by reduction of cærulignone (Liebermann, *A.* 169, 226). Monoclinic prisms (from alcohol). $FeCl_3$ oxidises it to cærulignone. Yields $C_{12}H_8(OMe)_4(OAc)_2$ [217°-225°].— $Na_2C_{12}H_{10}O_6$.— K_2A' 4aq (Ewald, *B.* 11, 1623).

Hexa-methyl ether $C_{12}H_8(OMe)_6$. [126°].

Tetra-ethyl ether $C_{12}H_8(OEt)_4(OEt)_2$. [176°]. Crystals (from alcohol) (Hofmann, *B.* 11, 802).

Hexa-acetyl derivative $C_{12}H_8(OAc)_6$. [145°].

Hexa-propionyl derivative. Needles.

Di-bromo-hexa-oxy-diphenyl. **Tetra-methyl derivative** $C_{12}H_8Br_4(OH)_2(OMe)_2$. [262°]. Formed from $C_{12}H_8Br_4(OAc)_2(OMe)_2$, [178°], which is got from di-acetyl-cærulignone,

$HOAc$, and bromine (Hayduck, *B.* 9, 929). It yields $C_{12}H_8Br_4(OMe)_2$, [140°].

References.—**Di-bromo- and Di-chloro-hexa-oxy-diphenyl.**

(8)-Hexa-oxy-diphenyl. Formed by fusing ellagic acid with potash (Barth a. Goldschmidt, *B.* 12, 124). Needles, blackening at 250°, and melting at a higher temperature. Its alkaline solution is blue, changing in air to red.

(7)-Hexa-oxy-diphenyl. Formed from ellagic acid by fusion with $NaOH$ (B. a. G.), or by treatment with sodium-amalgam (Cobenz, *M.* 1, 672). Needles, blackening at 230°. Its alkaline solution is red, changing in air to green.

(8)-Hexa-oxy-diphenyl. Formed by fusing hydroquinone with $NaOH$ (Barth a. Schreder, *M.* 5, 597). Plates, blackening and melting near 290°. Its alkaline solution is red.

Acetyl derivative [172°]. Needles.

OXY-PHENYL-ACETAMIDINE $C_6H_5N_2O$ i.e. $CHPh(OH).C(NH)(NH_2)$. [110°]. Formed from mandelic imido-ether and aliphatic NH_2 (Bayer, *J. pr.* [2] 28, 191). Needles (from ether).— $B'HCl$. [214°]. Prisms (from water).

Di-acetyl derivative

$CHPh(OAc).C(NH).NHAc$. [210°] (Pinner, *B.* 23, 2948).

OXY-PHENYL-ACETAMIDOXIM

$C_6H_5.CH(OH).C(NH)(NOH)$. [159°]. Formed from the nitrile of mandelic acid and alcoholic hydroxylamine (Tiemann, *B.* 17, 126; Gross, *B.* 18, 1074). Crystals (from alcohol). Yields the derivatives $C_6H_5.Na.N_2O_2$, $B'HCl$, $C_6H_5Et.N_2O_2$, [89°], and $C_6H_5(CH_2)_3N_2O_2$, [108°].

Reactions.—1. $COCl_2$ forms the compound $(CHPh(OH).C(NH_2).NO).CO$ [121°].—2. N_2 hydrochloride reacts with potassium cyanate, forming $CHPh(OH).C(NOH).NH.CO.NH_2$ [127°].—3. Phenyl cyanate forms the compound $CHPh(OH).C(NH).NH.CO.NHPh$ [165°].—4. $ClCO_2Et$ yields $CHPh(OH).C(NH_2).NOCO_2Et$ [107°].

Acetyl derivative

$CHPh(OH).C(NH_2).NOAc$. [140°]. Crystals (from alcohol).

Di-acetyl derivative [113°]. Plates.

Benzoyl derivative $C_6H_5N_2O$. [149°].

Acetyl-benzoyl derivative [165°].

o-OXY-PHENYL-ACETIC ACID

[2:1] $C_6H_4(OH).CH_2.CO.H$. [137°]. Formed from *o*-oxy-phenyl-glyoxylic acid by reduction with sodium-amalgam to $CH_2(OH).CH(OH).CO.H$, and further reduction of this acid with HI (Bayer a. Fritsch, *B.* 17, 975). Needles, v. sol. water. Gives a violet colour with $FeCl_3$. On heating it yields the lactone

$C_6H_4 \begin{smallmatrix} \diagup CH_2 \\ \diagdown O \end{smallmatrix} CO$, crystallising in tables [49°] (237°).

o-Oxy-phenyl-acetic acid [129°]. Formed by saponification of its nitrile and from *m*-amido-phenyl-acetic acid by the diazo reaction (H. Salkowski, *B.* 17, 507). Needles, v. sol. water. Coloured violet by $FeCl_3$.

Nitrile. [3:1] $C_6H_4(OH).CH_2.CN$. [58°]. Formed from $C_6H_4(NH_2).CH_2.CN$ and nitrous acid. Triometric tables, v. sol. alcohol and hot water.

p-Oxy-phenyl-acetic acid. [148°]. Formed by the action of nitrous acid on *p*-amido-phenyl-acetic acid (Salkowski, *B.* 12, 1490) and by

saponifying its nitrile, which is a product of the action of AgNO_3 on sinalbin (Will a. Laubenheimer, A. 199, 156; Salkowski, B. 22, 2137). Occurs in human urine (Baumann, B. 13, 280). Prismatic needles, sol. water and alcohol. FeCl_3 gives a dark colouration. $-\text{NH}_4\text{A}'$. $-\text{CaA}'$, 4aq. $-\text{PbA}'$. $-\text{AgA}'$: minute needles.

Methyl ether $\text{C}_6\text{H}_5(\text{OH})\text{CH}_2\text{CO}_2\text{Me}$. (310° i.v.). S.G. $\frac{1}{4}$ 1.4948; $\frac{20}{4}$ 1.1786. Oil.

Ethyl ether EtA'. (314° i.v.), S.G. $\frac{1}{4}$ 1.1886; $\frac{15}{4}$ 1.1226.

Nitrile. [70°]. (330.5° i.v.). Made like its isomeride (Salkowski, B. 22, 2137). Triclinic crystals. Yields $\text{C}_6\text{H}_5(\text{OMe})\text{CH}_2\text{CN}$ (287° i.v.). S.G. $\frac{1}{4}$ 1.1001.

Methyl derivative $\text{C}_6\text{H}_5(\text{OMe})\text{CH}_2\text{CO}_2\text{H}$. [86°]. Formed from $\text{C}_6\text{H}_5(\text{OMe})\text{CH}_2\text{Cl}$ and KCO_2 , the product being saponified (Cannizzaro, A. 171, 243). Pearly plates. $-\text{AgA}'$.

Ethyl derivative. [88°]. Plates.

Amide $\text{C}_6\text{H}_5(\text{OH})\text{CH}_2\text{CONH}_2$. [175°].

Methyl derivative of the amide $\text{C}_6\text{H}_5(\text{OMe})\text{CH}_2\text{CONH}_2$. [189°]. Scales.

o-Oxy-phenyl-acetic acid v. MANDELIC ACID.

o-Di-oxy-phenyl-acetic acid $\text{C}_6\text{H}_3(\text{OH})_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. Formed from salicylic aldehyde, HCy , and HCl (Pöschl, B. 14, 1817), and also by reducing oxy-phenyl-glyoxylic acid (Bayer a. Fritsch, B. 17, 974). Syrup. Yields a crystalline anhydride.

Methyl derivative of the nitrile $\text{C}_6\text{H}_5(\text{OMe})\text{CH}(\text{OH})\text{CN}$. [71°]. Formed from methyl-salicylic aldehyde and HCy (Voswinckel, B. 15, 2025). Colourless crystals.

Di-oxy-phenyl-acetic acid $\text{C}_6\text{H}_3(\text{OH})_2\text{CH}_2\text{CO}_2\text{H}$. [54°]. Formed from $\text{C}_6\text{H}_3(\text{OH})_2(\text{CO}_2\text{Et})_2$, $\text{CH}_2\text{CO}_2\text{Et}$ and alcoholic potash (Pechmann, B. 19, 1449). Crystals (containing aq.). $-\text{PbA}'$, 2aq: needles (from water).

o-Di-oxy-phenyl-acetic acid. *Methyl derivative* $\text{C}_6\text{H}_3(\text{OMe})_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. [93°]. Formed from anisic aldehyde, HCy , and HCl (Tiemann a. Köhler, B. 14, 1976). Needles. $-\text{CaA}'$. $-\text{AgA}'$: amorphous pp.

Amide $\text{C}_6\text{H}_3(\text{OMe})_2\text{CH}(\text{OH})\text{CONH}_2$. [159°].

Nitrile $\text{C}_6\text{H}_3(\text{OMe})_2\text{CH}(\text{OH})\text{CN}$. [63°].

Di-oxy-phenyl-acetic acid

$\text{C}_6\text{H}_3(\text{OH})_2\text{CH}_2\text{CO}_2\text{H}$ [4:3:1]. *Homoprotocatechuic acid*. [27°]. Formed by heating its methyl derivative with HClAq at 175° (Tiemann a. Nagai, B. 10, 207). $\frac{1}{4}$ Slender needles (from benzene). FeCl_3 gives green colour.

Di-acetyl derivative

$\text{C}_6\text{H}_3(\text{O}^t\text{C})_2\text{CH}_2\text{CO}_2\text{H}$. [90°] (Nagai, B. 11, 658).

Methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})_2\text{CH}_2\text{CO}_2\text{H}$ [3:4:1]. *Homovanillic acid*. [143°]. Made from its acetyl derivative [140°], which is got by oxidising acetyl-eugenol.

Di-methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})_3\text{CH}_2\text{CO}_2\text{H}$. *Homovanillic acid*. [99°] (Tiemann a. Matsumoto, B. 11, 143). Needles (containing aq.).

Methyl derivative

$\text{C}_6\text{H}_3(\text{O}^t\text{CH}_3)_2\text{CH}_2\text{CO}_2\text{H}$. [128°]. Got from sakol, KMnO_4 and dilute HOAc (Tiemann, B. 24, 2882). Yields MeA' (279°), EtA' (231°), and an amide [173°].

A di-oxy-phenyl-acetic acid [168°] occurs in urine after poisoning by phosphorus (Baumann, U. 6, 192). It crystallises in small needles.

Tri-oxy-phenyl-acetic acid. Methylene derivative [4:3:1] $\text{C}_6\text{H}_3(\text{O}^t\text{CH}_3)_3\text{CH}(\text{OH})\text{CO}_2\text{H}$. [153°]. Made from piperonal by treatment with HCy and saponification (Lorenz, B. 14, 793).

Hexa-oxy-di-phenyl-acetic acid. Hexa-methyl derivative $(\text{C}_6\text{H}_3(\text{OMe})_6)_2\text{C}(\text{OH})\text{CO}_2\text{H}$. [175°]. Formed by boiling the hexa-methyl derivative of hexa-oxy-benzil with potash (Marx, A. 263, 255). Prisms, v. sol. alcohol, s, sol. water.

o-Oxy-di-phenyl-acetic acid v. BENZILIC ACID.

Tri-oxy-di-phenyl-acetic acid. Di-methyl derivative v. ANISILIC ACID.

(B. 2)-OXY-(A)-PHENYL-ACRIDINE

$\text{C}_6\text{H}_3\text{C}(\text{N})\text{Ph} > \text{C}_6\text{H}_4(\text{OH})$. [c. 275°-280°]. Formed by heating *p*-oxy-di-phenylamine with benzoic acid and ZnCl_2 . Formed also by heating (B. 2)-amido-(A)-phenyl-acridine with HCl at 200°-220° (Hess a. Bernthsen, B. 18, 695). Thin yellow crystals. V. sol. alcohol and acetic acid; less sol. ether. Dissolves in caustic alkalis and in acids. The ethereal and alcoholic solutions have a slight bluish-violet fluorescence. The salts are all rather sparingly soluble, and have a tendency to separate in a gelatinous form.

Acetyl derivative $\text{C}_{10}\text{H}_{13}\text{N}(\text{OAc})$ [174°]; glistening four-sided prisms.

OXY-PHENYL-ACRYLIC ACID v. OXY-CINNAMIC ACID and COUMARIC ACID.

Oxy-di-phenyl-acrylic acid. Methyl derivative $\text{C}_6\text{H}_5(\text{OMe})\text{CH}:\text{CPh}:\text{CO}_2\text{H}$. [189°]. Made from anisic aldehyde, sodium phenylacetate, and Ac_2O at 160° (Ogialoro, G. 9, 533). Prisms, yielding $\text{C}_6\text{H}_5(\text{OMe})\text{CH}:\text{CHPh}$ when heated.

Methyl derivative of the nitrile $\text{C}_6\text{H}_5(\text{OMe})\text{CH}:\text{CPh}:\text{CN}$. [98°]. Formed from anisic aldehyde, benzyl cyanide, and alcoholic NaOEt (Frost, A. 250, 159). White needles.

Reference.—PHENYL-COUMARIN.

TRI-OXY-PHENYL ALLYL KETONE. According to Schiff (A. 253, 336), δ -icic acid (vol. ii. p. 548) is the isobutyl derivative of this ketone [5:3:1:2] $\text{C}_6\text{H}_3(\text{OH})_3(\text{O}^t\text{COPr})\text{CO}_2\text{C}_4\text{H}_9$.

OXY-TRI-PHENYL-ALLYL-PYRROLE

$\text{N}(\text{C}_6\text{H}_5)_2\text{C}(\text{CPh}:\text{CH})\text{CO}:\text{CPh}_2$. [112°]. Formed by heating anhydrazotophenone - benzil $\text{PhCB}::\text{OHBz}$ with alcoholic allylamine at 100° (Japp a. Klingemann, C. J. 57, 707). Monoclinic prisms (from alcohol); $\alpha:b:c = 1.665:1.1844; \beta = 89^\circ 53'$.

o-OXY-PHENYL-ALLYL-THIO-UREA $\text{C}_6\text{H}_3(\text{OH})_2\text{NH}:\text{CS}:\text{NHC}_2\text{H}_5$. [99°]. Formed from *o*-amido-phenol and allyl thiocarbimide in alcoholic solution (Von Chodnicki, J. pr. [2] 42, 442). V. sl. sol. cold, v. sol. hot, water.

o-OXY-PHENYL-AMIDO-ACETIC ACID $\text{C}_6\text{H}_3(\text{OH})_2\text{CH}_2\text{CO}_2\text{H}$. *Oxy-phenyl-glycoic acid*. Formed by boiling chloro-acetic acid (1 mol.) with *o*-amido-phenol (2 mols.) and water (Vater, J. pr. [2] 29, 289). Plates (containing aq.), sl. sol. water, v. sol. alcohol. FeCl_3 colours its solutions red. At 105° it yields an anhydride which crystallises from alcohol in cubes.

Methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})_2\text{NH}:\text{CH}_2\text{CO}_2\text{H}$. [142°]. Formed from *o*-anisidine and chloro-acetic acid. Rectangular plates. $-\text{PbH}_2\text{A}'$. $-\text{BHCl}$: crystals.

Ethyl derivative $\text{C}_6\text{H}_3(\text{OEt})_2\text{NH}:\text{CH}_2\text{CO}_2\text{H}$. [120°]. Formed from chloro-acetic acid and

$\text{C}_6\text{H}_5(\text{OEt})\text{NH}_2$.—EtA': long waxy needles.—EtA'HCl.

p-Oxy-phenyl-amido-acetic acid
 $\text{C}_6\text{H}_4(\text{OH})\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$. Formed from chloroacetic acid and *p*-amido-phenol (V.). Plates, sl. sol. water and alcohol. FeCl_3 colours its solutions red.—NaA'.

Methyl derivative
 $\text{C}_6\text{H}_4(\text{OMe})\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$. Formed in like manner from *p*-anisidine (V.), and also by saponifying its nitrile, which is got by heating anisaldehyde-cyanhydrin with alcoholic NH_3 (Tiemann & Köhler, B. 14, 1976).—Needles, sol. hot water.—CuA'—HA'HCl.

Ethyl derivative
 $\text{C}_6\text{H}_4(\text{OEt})\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ [163°]. Crystals (containing 2aq). Yields, on heating, $\text{C}_6\text{H}_4(\text{OEt})\text{NH}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{NHC}_6\text{H}_5(\text{OEt})$ [140°] and other bodies (Bischoff & a. Nastvogel, B. 22, 1788).

p-OXY-PHENYL-AMIDO-BENZENE SULPHONIC ACID $\text{C}_6\text{H}_4(\text{OH})(\text{NHPh})\text{SO}_3\text{H}$. Formed from $\text{C}_6\text{H}_4(\text{OH})\text{NHPh}$ [1:4] and conc. H_2SO_4 at 100° (Limpriecht, B. 22, 2910). Small grey prisms. Does not melt below 260°.

OXY-PHENYL-AMIDO-CROTONIC ETHER
Methyl derivative $\text{C}_{11}\text{H}_{13}\text{NO}_3$. [46°]. Formed from *p*-anisidine and acetoacetic ether (Conrad & Limpach, B. 21, 1619).

DI-OXY-PHENYLAMIDOETHYL-BENZOIC ACID. Methylene derivative of the anhydride $\text{C}_{14}\text{H}_{13}\text{NO}_5$, &c.

$\text{CH}_2\langle\text{O}\rangle\text{C}_6\text{H}_4\langle\text{CO}\cdot\text{NPh}\rangle\text{CH}_2\langle\text{O}\rangle\text{C}_6\text{H}_4\langle\text{CO}\cdot\text{NPh}\rangle$ [157°]. Formed from $\text{CH}_3\text{O}\cdot\text{C}_6\text{H}_4(\text{C}_2\text{H}_5\text{Cl})\text{CO}_2\text{Me}$ and alcoholic aniline (Perkin, jun., C. J. 57, 1036). Prisms, v. sl. sol. hot alcohol.

OXY-PHENYL-AMIDO-NAPHTHOQUINONE
 $\text{C}_{17}\text{H}_9\text{O}_4(\text{OH})(\text{NHPh})$. *Oxy-naphthoquinone anilide*. [210°]. Formed from $\text{C}_{10}\text{H}_6\text{ClO}_2(\text{NPh}\cdot\text{NO})$ and boiling KOHAq (Plagemann, B. 16, 896). Deep-blue needles with metallic lustre; sol. alkalis.

o-OXY-PHENYLAMIDO-PHENYL-ACETO-NITRILE. **Methyl derivative**
 $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{NHPh})\text{CN}$. [61°]. Formed by the action of aniline on $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{OH})\text{CN}$ (Voswinckel, B. 15, 2027). Six-sided tables, sol. alcohol.

OXY-PHENYL-AMIDO-QUINONE ANILIDE
 $\text{C}_6\text{H}_4(\text{OH})(\text{NHPh})\text{O}(\text{NPh})$. Formed by heating its ethers with alcoholic potash (Zincke & Hagen, B. 18, 788). Small scales, sl. sol. alcohol. Cold, very dilute potash, converts it into the quinone $\text{C}_6\text{H}_4(\text{OH})(\text{NHPh})\text{O}_2$, a blue crystalline pp. decomposing above 200°.

Methyl ether $\text{C}_6\text{H}_4(\text{OMe})(\text{NHPh})\langle\text{O}\rangle\text{NPh}$ [194°]. Formed by warming the compound $\text{C}_6\text{H}_4(\text{NHPh})_2\text{O}(\text{NPh})$ with MeOH and H_2SO_4 (Z. s. H.), and also from azophenine, MeOH, and H_2SO_4 (Fischer & Hepp, B. 21, 677; A. 262, 258). Brownish-red plates, forming blue salts with acids, $\text{C}_6\text{H}_4(\text{OMe})(\text{NHPh})\text{O}_2$ [189°].

Ethyl ether $\text{C}_6\text{H}_4(\text{OEt})(\text{NHPh})\text{O}(\text{NPh})$ [187°]. Formed in like manner, using EtOH.

Isobutyl ether [188°]. Needles.
OXY-PHENYL-AMIDO-THYMOQUINONE
 $\text{C}_6\text{Me}(\text{C}_6\text{H}_4)(\text{OH})(\text{NHPh})\text{O}_2$. [185°]. Formed by boiling oxy-thymoquinone with aniline and alcohol (Schulz, B. 16, 902). Lustrous, dark-

violet needles (from alcohol), forming a violet solution in NH_4Aq .

OXY-PHENYL-AMIDO-TOLUQUINONE
 $\text{C}_6\text{HMeO}(\text{OH})(\text{NHPh})$. Formed from di-phenyldi-amido-toluquinone by boiling with alcoholic H_2SO_4 (Hagen & Zincke, B. 16, 1560). Deep-blue needles (from alcohol), decomposing at 250°.

Anilide $\text{C}_{11}\text{HMe}(\text{OH})(\text{NHPh})\langle\text{O}\rangle\text{NPh}$. Formed by treating its ethers with acids or alkalis. Brown needles (from HOAc). The others $\text{C}_{11}\text{HMe}(\text{MeN}\cdot\text{O}_2)$ [131°], $\text{C}_{11}\text{HMe}(\text{EtN}\cdot\text{O}_2)$ [116°] and $\text{C}_{11}\text{HMe}(\text{C}_2\text{H}_5\text{N}\cdot\text{O}_2)$ [117°] are crystalline.

o-OXY-PHENYL-AMIDO-TOLYL GLYCOL-LIC ACID $\text{NHPh}\cdot\text{CH}(\text{OH})\cdot\text{C}_6\text{H}_4\cdot\text{O}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$. Formed from *o*-aldehyde-phenoxy-acetic acid and aniline (Rossing, B. 17, 2092). Very unstable in alkaline solution.—HA'HCl. [191°].—HA'H $_2$ SO $_4$. [186°]. Yellow needles, v. sol. hot water.

m-OXY-DIPHENYLAMINE
 $\text{C}_6\text{H}_5\text{NH}\cdot\text{C}_6\text{H}_4(\text{OH})$. *Benzyl-amido-phenol*. [82°] (c. 340°). Formed by heating resorcin (1 mol.) with aniline (4 mols.) and CaCl_2 (2 mols.) for eight hours at 230°; the yield being 85 p.c. of the theoretical (Calm, B. 16, 2766; Köhler, B. 21, 908). White pearly plates, v. sol. alcohol. Yields a crystalline nitrosamine $\text{NPh}(\text{NO})\cdot\text{C}_6\text{H}_4\cdot\text{OH}$ [115°].—HA'HCl: needles.— $\text{H}_2\text{A}'\cdot\text{H}_2\text{SO}_4$: needles.—BaA', 5aq: colourless plates, sol. water.

p-Oxy-diphenylamine $\text{C}_6\text{H}_5\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{OH}$. [70°]. (330°). Prepared by heating hydroquinone (1 mol.) with aniline (4 mols.) and CaCl_2 (2 mols.) for ten hours at 250°; the yield being 90 p.c. (Calm, B. 16, 2799; F. 2, 31). Formed also by heating hydroquinone with aniline for sixteen hours at 300° (the yield being 85 p.c.), and by the action of aniline on quinone phenylimide (Baudrowski, M. 9, 133, 416). Plates, v. sol. aqueous alkalis and acids; sl. sol. water. Yields a nitrosamine [95°]. On oxidation with HgO in benzene it yields $\text{C}_{12}\text{H}_9\text{NO}$ [97°] (B.).—HA'HCl: slender needles, decomposed by water.—HA'HB: needles.

Isobutyl ether $\text{C}_6\text{H}_4\text{A}'$. [68°].
Formyl derivative $\text{C}_{12}\text{H}_9\text{NO}(\text{CHO})$. [178°]. White needles, sol. alcohol.

Di-acetyl derivative $\text{NPhAc}\cdot\text{C}_6\text{H}_4\cdot\text{OAc}$. [120°]. Monoclinic prisms.

Di-benzoyl derivative [175°]. **Prisma**. **Di-oxy-diphenylamine** $\text{NH}(\text{C}_6\text{H}_4\text{OH})_2$. Formed by heating resorcin with ammoniacal CaCl_2 at 200° (Seyewitz, C. R. 109, 946). Minute crystals (from dilute alcohol).

o-OXY-PHENYL-ANGELIC ACID
 $\text{C}_{11}\text{H}_{13}\text{O}_3$, i.e. $\text{C}_6\text{H}_4(\text{OH})\text{CH}\cdot\text{CO}_2\text{Me}\cdot\text{CO}_2\text{H}$ [78°]. Formed from salicylic aldehyde, sodium pyrosulphate, and As_2O_3 (Pittig & Brown, A. 255, 230). Large plates, v. sol. chloroform.—BaA', 4aq.—AgA' flocculent pp.

o-Oxy-phenyl-angelic acid
 $\text{C}_6\text{H}_4(\text{OMe})\text{CH}\cdot\text{CEt}\cdot\text{CO}_2\text{H}$. [174°]. Formed by boiling its anhydride with potash (Perkin, A. 150, 84; C. J. 21, 472). Flat prisms (from dilute alcohol), sl. sol. water and chloroform.—AgA': yellowish pp.

Anhydride $\text{C}_6\text{H}_4\langle\text{CH}\cdot\text{CEt}\rangle\text{O}\cdot\text{C}_6\text{H}_4\langle\text{CH}\cdot\text{CEt}\rangle$ [71°] (399°). Formed by boiling sodium salicylic aldehyde

with butyric anhydride (Perkin, A. 147, 233; O. J. 21, 53, 472; Fletcher, O. J. 39, 447). Formed also by distilling coumaryl-propionic acid (Fittig, A. 255, 288). Monoclinic crystals, $a:b:c = 1.192:1:0.94$; $\beta = 67^\circ 28'$.

(a) *Methyl derivative*

$C_6H_5(OMe).CH:CH:Et.CO_2H$ [89°]. Formed from the anhydride NaOH, and MeI, the resulting $C_6H_5(OMe).CH:CH:Et.CO_2Me$ (282°) being saponified, (Perkin, O. J. 39, 435). Monoclinic crystals.

(b) *Methyl derivative*

$C_6H_5(OMe).CH:CH:Et.CO_2H$ [105°]. Formed from methyl-salicylic aldehyde, butyric anhydride, and sodium butyrate. Needles (from alcohol). Yields $C_6H_5Br_2(OMe).C_6H_5Br_2.CO_2H$ [163°] and $C_6H_5(OMe).CH:CH:Et.CO_2Me$ (292°). HI forms a compound whence Na_2CO_3 produces *o*-butenyl-phenol.

p-Oxy-phenyl-angelic acid
 $C_6H_4(OH).CH:CH:Et.CO_2H$

Methyl derivative. [124°]. Formed from this aldehyde, butyric anhydride, and sodium butyrate (Perkin). Needles (from alcohol).

γ-Oxy-phenyl-angelic acid. *Anhydride*

$C_6H_4(OH).CH:CH:Me.CO_2O$ [53°]. Made by distilling

α-phenylglutvic acid (Erdmann, A. 254, 219). Plates (from CS_2 and ligroin).

Di-oxy-phenyl-angelic acid. Methylene derivative

$OH_2<O>C_6H_4.CH_2.CH:CH.CO_2H$. *Hydropiperic acid*. [78°]. Formed by reducing piperic acid with sodium-amalgam (Foster, A. 124, 117; Bunz, A. 216, 172; Weinstein, A. 227, 32). Needles (from hot water). Changes on heating with NaOHaq into a less soluble isomeric acid [181°]. Both acids combine with bromine. — NH_4A' — KHA — BaA — AgA' : crystalline pp.

Di-oxy-phenyl-angelic acid. Methylene derivative $OH_2<O>C_6H_4.C_6H_4.CO_2H$ [c. 160°]. Prepared by heating piperonal with butyric anhydride and NaOAc (Lorenz, B. 14, 786). Long felted needles (from dilute alcohol), sl. sol. water. — AgA' : curdy pp.

Di-p-oxy-di-phenyl-angelic acid. Dimethyl derivative

$C_6H_4(OMe).CH:CH:CH(CO_2H).CH_2.C_6H_4(OMe)$ [111°]. Made by reducing $C_6H_4(OMe).CH_2.C_6H_4.CO_2H$ with sodium-amalgam (Fittig a. Politz, A. 255, 302). Hard needles (from CS_2), sl. sol. water, v. sol. alcohol. Yields a dibromide $C_6H_4Br_2.CO_2H$ — CaA' , 2aq. — AgA' : flocculent pp.

DI-OXY-DI-PHENYL-ANTETRAZINE DI-HYDRIDE $N=C(OH).C_6H_4.O=N:CPh.N=C(OH).C_6H_4.O=N:CPh.N=C(OH).C_6H_4.O=N:CPh.N=C(OH).C_6H_4.O=N:CPh$

Formed from dioxyphephthalic ether, benzamidine hydrochloride, and dilute (10 p.c.) NaOHaq (Pinner, B. 22, 2624). Crystalline powder, insol. water and alcohol. — $C_{22}H_{11}N_4O_2.4aq$: white needles.

OXY-PHENYL-ANTHRANOL $C_{12}H_9O_2$ i.e.

$C_6H_4<C(OH)>C_6H_4$. Formed by the action of H_2SO_4 on oxy-triphenyl-methane carboxylic acid (Pechmann, B. 18, 1616). Exhibits green fluorescence in ethereal solution.

Di-oxy-phenyl-anthranol $C_{12}H_9O_2$ i.e.

$C_6H_4<C(OH)>C_6H_4$. *Bhenolphthalidin*. A sticky mass got by dissolving phenol-phthalin in H_2SO_4 and pouring into water (Baeyer, A. 202, 51). Its ethereal solution fluoresces green. Water at 170° converts it into phenol-phthalin. Potash-fusion gives di-oxy-benzophenone.

OXY-PHENYL-ARABINE v. ARABINE

DI-OXY-PHENYL-TRIAZOLE $C_8H_6N_4O_2$ i.e.

$C_6H_4.N=C(OH)>N$ or $C_6H_4.N.CO>N$. *Phenylurazol*. [263°].

Formation. — 1. By heating phenyl-hydrazine hydrochloride (1 pt.) with urea (2 pts.) for 4 or 5 hours at 160°, the yield is 70–80 p.c. of the hydrazine hydrochloride used. — 2. By heating phenyl-semicarbazide (1 pt.) with urea (2 pts.) for 4 hours at about 160°.

Properties. — Colourless glistening plates. M. sol. hot water, sl. sol. cold water, v. sol. hot alcohol, sl. sol. ether. Dissolves in cold aqueous alkalis and ammonia, and is reprecipitated by acids unaltered. It does not reduce alkaline solutions of Ag or Cu. It is not affected by boiling with alkalis or acids (Pinner, B. 20, 2359).

TETRA-OXY-PHENYL-BENZOPYRAZOLE

$NPh.CO>C(OH).C=N$
 $NPh.CO>C(OH).C.CO>NPh$ [c. 150°].

Formed by the action of PCl_5 on the phenyl-hydrazide which is made by warming di-oxy-quinone dicarboxylic ether with alcohol and phenyl-hydrazine (Böniger, B. 22, 1291). Begins to decompose at 125°. — $(NH_4)_2A'$: ochre-yellow powder, sol. water.

OXY-DI-PHENYL-BENZYLIDENE-PYRAZOLE $NPh.CO>C:CHPh$ [147°]. Formed from oxy-di-phenyl-pyrazole and benzoic aldehyde (Knorr a. Klotz, B. 20, 2548). Needles.

Di-oxy-tetra-phenyl-benzylidene-dipyrazole $(NPh.CO>C:CHPh)_2$ [c. 220°]. Formed from benzoic aldehyde and excess of oxy-di-phenyl-pyrazole.

Ezo-OXY-PHENYL-BENZYL-KETONE v. BENZOIN

Tri-oxy-phenyl-benzyl-ketone. Dimethyl derivative v. Anisoin

Hexa-oxy-phenyl-benzyl-ketone. Hexamethyl derivative

$C_6H_4(OMe)_3.CO.CH_2.C_6H_4(OMe)_3$ [162°]. Formed from hexamethoxy-benzil, HOAc, and zinc-dust (Marx, A. 263, 255). Needles, insol. cold water.

OXY-PHENYL-BENZYL-METHYL-PYRIMIDINE

INDINE $CPh<N.COMe>C_6H_4$ [243°].

Formed from benzamidine hydrochloride, benzyl-acetoacetic ether, and dilute (10 p.c.) NaOHaq (Pinner, B. 22, 1626). Needles, insol. water, v. sl. sol. alcohol.

Di-oxy-phenyl-benzyl-methyl-pyrimidine. Ethyl derivative

$C_6H_4(OEt).C<N.COMe>C(OH)$ [242°]. Formed from *p*-ethoxy-benzamidine hydrochloride, benzyl-acetoacetic ether, and NaOHaq (Pinner, B. 23, 2955). Needles, v. sl. sol. hot alcohol.

OXY-PHENYL-BENZYL-PYRIMIDINE

$\text{CH}_2\text{Ph.C} \begin{smallmatrix} \text{N.CPh} \\ \text{N:C(OH)} \end{smallmatrix} > \text{CH}$. [233°]. Made from phenylacetamidine hydrochloride, benzyl-acetoacetic ether and dilute (10 p.c.) NaOH aq (Pinner, B. 22, 1623). Needles, v. sl. sol. water.

Oxy-phenyl-di-benzyl-pyrimidine

$\text{CH}_2\text{Ph.C} \begin{smallmatrix} \text{N.C(CH}_2\text{Ph)} \\ \text{N:C(OH)} \end{smallmatrix} > \text{CPh}$. [180°]. Formed by heating 'cyanbenzylidine' (derived from benzyl cyanide) with HCl aq (Wache, *z. pr.* [2] 30, 258).

Di-oxy-phenyl-benzyl-pyrimidine

$\text{CHPh(OH).C} \begin{smallmatrix} \text{N.CPh} \\ \text{N:C(OH)} \end{smallmatrix} > \text{CH}$. [218°]. Formed from α -oxy-phenyl-acetamidine and benzoyl-acetic ether (Pinner, B. 23, 2951). Felted needles, v. sl. sol. water, sol. alkalis and acids.

γ -OXY-PHENYL-BIURET

$(\text{NHPh.CO})_2\text{N(OH)}$. [178°]. Formed by the action of an aqueous solution of hydroxylamine on phenyl cyanate (von der Kall, A. 263, 263). Needles, sl. sol. hot water. Does not reduce Fehling's solution.

p -OXY-PHENYL-BROMO- p -TOLYL-THIO-UREA $\text{C}_6\text{H}_4(\text{OH}).\text{NH.CS.NH.C}_6\text{H}_4\text{Br}$.

Acetyl derivative. [156°]. Formed by the action of acetyl-oxy-phenyl-thiocarbimide on bromo- p -toluidine (Kalekhoff, B. 10, 1832). V. sol. acetic acid, sl. sol. alcohol and ether, insol. water.

OXY-PHENYL-BUTANE v. BUTYL-PHENOL

Di-oxy-phenyl-butane

$\text{CHPh(OH).C}_2\text{H}_4.\text{CH}_2\text{OH}$. (c. 200°). A thick syrup formed by reduction of $\text{C}_6\text{H}_5.\text{CO.C}_2\text{H}_5.\text{CHO}$ (Bureker, A. Ch. [5] 26, 469).

Di-oxy-di-phenyl-butane

$\text{CPhMe(OH).CPhMe(OH)}$. [120°]. Formed by adding sodium-amalgam to a solution of acetophenone in dilute alcohol (Emmerling a. Engler, B. 4, 147; 6, 1005; Buchka, B. 10, 1714). Long prisms, insol. water, v. sol. alcohol. Split up by long boiling in acetophenone and phenyl-methyl-carbinol (Zincke a. Thörner, B. 13, 641).

Di-oxy-tetra-phenyl-butane

$\text{CH}_2\text{Ph.CPh(OH).CPh(OH).CH}_2\text{Ph}$. [213°]. Formed, together with an isomeride [172°], by reducing benzoin with zinc (Limpricht a. Schwanert, A. 155, 60; Zagoumenny, B. 7, 1651; Wislicenus, A. 248, 5). The compound [218°] is formed, together with an isomeride (?) [61°], by reducing benzoin with Na and alcohol (Limpricht, A. 155, 98). The compounds [172°] and [213°] are both converted by heat into phenyl benzyl ketone and phenyl-benzyl-carbinol.

OXY-DI-PHENYL-BUTANE CARBOXYLIC ACID $\text{C}_6\text{H}_5.\text{CH}(\text{CO}_2\text{H}).\text{CH}_2.\text{CH}(\text{OH}).\text{CH}_2.\text{C}_6\text{H}_5$. *Tetrahydrocornicularic acid*. Formed by reducing hydro-cornicularic acid with sodium-amalgam (Spiegel, A. 219, 35). Thick oil, decomposed by boiling with water, yielding the lactone.

Lactone $\text{C}_6\text{H}_5\text{O}$. [71°].

Oxy-phenyl-butane dicarboxylic acid v. Oxy-benzyl-pyrotartaric acid.

Di-oxy-di-phenyl-butane dicarboxylic acid $\text{C}_6\text{H}_4(\text{OH}).\text{CH}_2.\text{CH}(\text{CO}_2\text{H}).\text{CH}(\text{CO}_2\text{H}).\text{CH}_2.\text{C}_6\text{H}_4(\text{OH})$. Formed by heating salicylic aldehyde with sodium succinate and Ac_2O , saponifying the resulting 'dicoumarin,' and reducing the product with sodium amalgam (Fittig a. Dyson, A.

255, 281). Colourless crystals, v. sol. alcohol. — $\text{CaC}_2\text{H}_3\text{O}_6\text{aq}$. — Ag_2A : bulky white pp.

Lactone

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{O.CO} \\ \text{CH}_2 \end{smallmatrix} > \text{CH.CH} \begin{smallmatrix} \text{CO.O} \\ \text{CH}_2 \end{smallmatrix} > \text{C}_6\text{H}_4$. *Dicoumarin tetrahydride*. [221°]. Formed by heating the acid above 100°. Needles (from chloroform-alcohol).

Di-oxy-di-phenyl-butane dicarboxylic acid.

Lactone $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CH.CH}_2 \\ \text{CO} \end{smallmatrix} \begin{smallmatrix} \text{O} \\ \text{O} \end{smallmatrix} \begin{smallmatrix} \text{O.CO} \\ \text{CH}_2 \end{smallmatrix} > \text{C}_6\text{H}_4$.

[210°]. Formed by treating $\text{C}_6\text{H}_4(\text{CO.C}_6\text{H}_5.\text{CO}_2\text{H})_2$ with sodium-amalgam (Gabriel a. Michael, B. 10, 2209). Needles (from alcohol), insol. water. The corresponding acid is unstable.

DI- p -OXY-DI-PHENYL-BUTINENE Di-methyl ether

$\text{C}_6\text{H}_4(\text{OMe}).\text{CH}:\text{CH}:\text{CH}:\text{CH}.\text{C}_6\text{H}_4(\text{OMe})$. [225°]. A body formed on heating anisic aldehyde with sodium succinate and Ac_2O at 120° (Fittig a. Politis, A. 255, 307). Crystals, insol. water, m. sol. HOAc.

DI- p -OXY-DI-PHENYL-BUTINENE DI-CARBOXYLIC LACTONE

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{O} \\ \text{CH} \end{smallmatrix} \begin{smallmatrix} \text{O} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{O} \end{smallmatrix} > \text{C}_6\text{H}_4$. *Dicoumarin* [above 330°]. Made by heating salicylic aldehyde with sodium succinate and Ac_2O at 140° (Fittig a. Dyson, A. 255, 275). Needles (from HOAc). Not attacked by cold alkalis.

α -OXY-PHENYL-BUTYLENE DICARBOXYLIC ACID.

Lactone $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{O} \\ \text{CH} \end{smallmatrix} \begin{smallmatrix} \text{O} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{O} \end{smallmatrix} > \text{C}_6\text{H}_4$. [171°]. Made by heating salicylic aldehyde with sodium pyrotartrate and Ac_2O for 30 hours at 120° (Fittig a. Brown, A. 255, 287). Plates (from water). Yields $\text{Ba}(\text{C}_{12}\text{H}_9\text{O}_6)_2$ 3aq, CaA' 5aq, and AgA' .

Di-oxy-di-phenyl-butylene dicarboxylic acid.

Lactonic acid $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{O} \\ \text{CH} \end{smallmatrix} \begin{smallmatrix} \text{O} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{O} \end{smallmatrix} > \text{C}_6\text{H}_4$. Formed by boiling dicoumarin with NaOH aq and adding sodium-amalgam (Fittig a. Dyson, A. 255, 277). Needles, sl. sol. hot water. — BaA' 2aq. — $\text{AgC}_6\text{H}_5\text{O}_6$: curdy pp.

Lactone $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{O} \\ \text{CH} \end{smallmatrix} \begin{smallmatrix} \text{O} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{O} \end{smallmatrix} > \text{C}_6\text{H}_4$. [256°]. Obtained by heating the lactonic acid at 130°. Crystals, insol. water, Na_2CO_3 aq, and NaOH aq. Yields an unstable dibromide.

α -OXY- β -PHENYL-ISOBUTYRIC ACID

$\text{CH}_2\text{Ph.CMe(OH).CO}_2\text{H}$. [99°]. Made by the action of KCl on the bisulphite compound of benzyl methyl ketone, the product being saponified (Gabriel a. Michael, B. 12, 814). Long prisms, sol. water and alcohol.

β -Oxy- β -phenyl-isobutyric acid

$\text{CHPh(OH).CHMe.CO}_2\text{H}$. [125°]. Formed by reducing α -benzoyl-propionic acid with sodium-amalgam (Perkin jun. a. Calman, C. J. 49, 161). Needles, v. e. sol. hot water. — AgA' : crystals.

γ -Oxy- γ -phenyl-butyric acid

$\text{CH}_2\text{Ph.CH(OH).CH}_2.\text{CO}_2\text{H}$. [98°]. Formed by boiling phenyl-isocrotonic acid with NaOH aq (Fittig, B. 24, 84). Flat needles.

γ -Oxy- γ -phenyl-butyric acid

$\text{CHPh(OH).CH}_2.\text{CH}_2.\text{CO}_2\text{H}$. *Benzhydripropionic acid*. [75°]. Formed by reducing benzoyl-propionic acid with sodium-amalgam (Bureker,

Bl. [2] 37, 5; A. Ch. [5] 26, 455; and also by boiling its lactone with baryta. Flat crystals (from CS_2), splitting up at 70° into water and lactone. Chromic acid mixture oxidises it to benzoyl-propionic acid. BaA'_2 — CuA'_2 — AgA'_2 : crystalline pp.

Lactone $\text{CHPh} \begin{smallmatrix} \text{O} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{CH}_2\text{CH}_2 \end{smallmatrix}$. [87°]. (306°).

Formed from γ -bromo- γ -phenyl-butyric acid by treatment with Na_2CO_3 or boiling with water (Jayne, A. 216, 103). Formed also by boiling phenyl-paraconic acid with diluted (1:1) H_2SO_4 (Erdmann, A. 228, 178). Six-sided trimetric tables (from CS_2); $a:b:c = 611:1:426$. It has a pleasant odour, and is volatile with steam.

Amide $\text{CHPh}(\text{OH})\text{CH}_2\text{CH}_2\text{CO.NH}_2$ [86°]. Formed by heating the lactone with alcoholic NH_3 at 100° (Fittig, A. 256, 155). Monodinic prisms, v. sol. hot water. Forms unstable $\text{C}_6\text{H}_5\text{NO.HCl}$, crystallising in needles.

o-Oxy-phenyl-butyric acid. *Methyl derivative*. $\text{C}_6\text{H}_4(\text{OMe})\text{C}_2\text{H}_4\text{CO}_2\text{H}$. [56°]. Obtained by reducing ether (a) or (b)-methoxy-phenyl-crotonic acid with sodium amalgam (Perkin, C. J. 39, 433). Transparent prisms (from light petroleum). May be distilled. BaA'_2 (dried at 100°).

a-Oxy-di-phenyl-isobutyric acid v. Di-benzyl-glycollic acid.

o-Oxy-di- γ -phenyl-butyric acid $\text{CPh}_2(\text{OH})\text{C}_2\text{H}_4\text{CO}_2\text{H}$. [145°]. Made from its lactone (Auger, A. Ch. [6] 22, 816). Thin leaflets (from alcohol). Changes to lactone on melting, but is stable at 100° . BaA'_2 : micaceous plates, sol. water.

Lactone $\text{Ph}_2 \begin{smallmatrix} \text{O} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{CH}_2\text{CH}_2 \end{smallmatrix}$. [90°]. Formed by the action of succinyl chloride on benzene in presence of AlCl_3 . Leaflets; insol. water, sl. sol. cold alcohol.

Oxy-tri-phenyl-butyric acid $\text{CHPh}(\text{OH})\text{CH}_2\text{CPh}_2\text{CO}_2\text{H}$. Formed by reducing di-phenyl-benzoyl-propionic acid in alkaline solution with sodium amalgam (Japp & Klingemann, C. J. 57, 680; B. 22, 2882). White solid, sol. $\text{Na}_2\text{CO}_3\text{Aq}$.

Lactone $\text{C}_{22}\text{H}_{18}\text{O}_2$ [153°]. Small needles, sol. hot alcohol.

β -Di-oxy- γ -phenyl-butyric acid $\text{CHPh}(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$. [118°]. Made from its lactone, which is got by oxidising phenyl-isocrotonic acid with KMnO_4 (Fittig, B. 21, 920). Crystals, forming the lactone on melting.

Lactone $\text{CHPh} \begin{smallmatrix} \text{O.CO} \\ \diagup \text{---} \text{CH}(\text{OH}) \end{smallmatrix} \text{CH}_2 \end{smallmatrix}$. [87°].

Melts when hydrated (with $\frac{1}{2}$ aq) at 77° .

Di-oxy-phenyl-butyric acid.

Methyl derivative

[41] $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. Got from its lactone [58-6°], which is made by the action of sodium amalgam on bromo-*p*-methoxy-phenyl-butyrolactone (Fittig & Politis, A. 255, 399). The free acid is solid, and yields the lactone when heated to 80° . BaA'_2 : amorphous mass.

Di-oxy-phenyl-isobutyric acid.

Methyl derivative

[48:1] $\text{C}_6\text{H}_4(\text{OH})(\text{OMe})\text{CH}_2\text{CHMe.CO}_2\text{H}$. *Hydrohomocaffeic acid*. [115°]. Obtained by reducing $\text{C}_6\text{H}_4(\text{OH})(\text{OMe})\text{CH}_2\text{CMe.CO}_2\text{H}$ (Tiemann &

Kraaz, B. 15, 2070). Sol. water, alcohol, and ether.

Di-methyl derivative

$\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CHMe.CO}_2\text{H}$. *Methyl-hydrohomocaffeic acid*. [59°]. Got in like manner. Crystals.

Methylene derivative

$\text{C}_6\text{H}_4(\text{O}_2\text{CH})\text{CH}_2\text{CHMe.CO}_2\text{H}$. *Hydrohomocaffeic acid*. [77°]. Formed by reduction of the methylene derivative of di-oxy-phenyl-methylacrylic acid (Lorenz, B. 13, 760). Thick prisms, sl. sol. water, v. sol. alcohol and ether.

Di-oxy-di-phenyl-butyric acid?

$\text{CH}_2\text{CPh}(\text{OH})\text{CPh}(\text{OH})\text{CO}_2\text{H}$. Formed from its nitrile, which is made from acetophenone, KOH , and aqueous K_2FeCy_4 (Buohka, B. 20, 889). BaA'_2 , 3 $\frac{1}{2}$ aq.

o-OXY-PHENYL-CARBAMIC ACID. *Ethyl*

ether $\text{C}_6\text{H}_4\text{NO}$, i.e. $\text{C}_6\text{H}_4(\text{OH})\text{NH.CO}_2\text{Et}$. [85°]. Formed from o-amido-phenol and ClCO_2Et (Groenvik, Bl. [2] 25, 177). Triclinic prisms (from ether-alcohol), almost insol. cold water. Yields, on distillation, alcohol and the anhydride.

Anhydride $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$ or

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{N} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O.H}$. *Ozycarbamil*. *Oxymethenylamidophenol*. *Anhydro-o-amido-phenyl-carbonic acid*. *Carbonyl-amido-phenol*. [138°]. (above 360°).

Formation.—1. As above.—2. By heating oxy-phenyl-urea (Kalekoff, B. 16, 1828).—3. By distilling o-amido-phenyl ethyl carbonate (Bender, B. 19, 2269, 2950).—4. By heating a mixture of urea and o-amido-phenol (Sandmeyer, B. 19, 2655).—5. By the action of phosgene on o-amido-phenol in benzene (Chetnicki, B. 20, 177; Jacoby, J. pr. [2] 37, 29).—6. By heating o-amido-phenyl di-phenyl-carbamate (Lellmann & Bonhöffer, B. 20, 2126).

Properties.—Needles (from water), sol. alcohol, ether, and alkalis. Decomposed by heating with HClAq above 150° into CO_2 and o-amido-phenol. Bleaching-powder and HCl yield crystalline $\text{C}_6\text{H}_4\text{Cl} \begin{smallmatrix} \text{NCl} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$, whence

further action of HClAq forms $\text{C}_6\text{H}_4\text{Cl} \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$ [196°]. Br forms $\text{C}_6\text{H}_4\text{BrO}(\text{NH})$ [196°]. HNO_3 produces $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{O}_2\text{NH}$ [256°]. Injected into rabbits, it becomes $\text{C}_6\text{H}_4(\text{OSO}_3\text{H}) \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$ (Nencki, M. 11, 253). $\text{AgC}_6\text{H}_4\text{NO}_2$: curdy pp.

Acetyl derivative $\text{C}_6\text{H}_4\text{O}_2\text{Nac}$. [99°].

Crystallises from water.

Phenyl-hydraside

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O} \cdot \text{C}_6\text{H}_5\text{Ph}$. [208°]. Yellow needles.

Ethyl derivative $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NEt} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$.

[29°]. (800°). Formed from the silver salt and EtI . Crystalline. Converted into ethyl-amido-phenol by heating with fuming HClAq at 180° .

Ethyl ether $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{N} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O} \cdot \text{COEt}$. (225°.

230°). Formed from amido-phenol hydrochloride and $\text{NH}_2\text{C}(\text{OEt})_2$ (Sandmeyer). Liquid, converted by HClAq into EtCl and $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$.

p-Oxy-phenyl-carbamic acid. *Ethyl ether* $C_8H_9NO_2$, i.e. $C_6H_5(OH).NHCO_2Et$. [120°]. Formed from *p*-amido-phenol and $ClCO_2Et$ (Groenwik, *Bt.* [2] 25, 179). Monoclinic tables, v. sol. alkalis. The ethyl derivative $C_8H_9(OEt).NHCO_2Et$, formed from $ClCO_2Et$ and $C_6H_5(NH_2)(OEt)$ (Köhler, *J. pr.* [2] 29, 257), crystallises in needles [94°], insol. water.

Reference. — CHLORO-OXY-PHENYL-CARBAMIC ACID.

p-OXY-DI-PHENYL-CARBINOL $C_{12}H_{10}O_2$, i.e. $C_6H_5.CH(OH).C_6H_5(OH)$. [161°]. Formed by reducing oxy-benzophenone with sodium-amalgam (Doebner, *A.* 210, 253). Silky needles (from water). Coloured red by $FeCl_3$.

op-Di-oxy-di-phenyl-carbinol $CH(OH)(C_6H_5.OH)_2$. [160°–165°]. Made by reducing di-oxy-benzophenone (salicyl-phenol) with sodium-amalgam (Michael, *B.* 14, 657). Amorphous powder, sol. hot alcohol.

Di-oxy-tri-phenyl-carbinol $C_6H_5.C(OH)(C_6H_5.OH)_2$. [c. 109°]. Made by warming $PhCCl_3$ with dry phenol, and treating the product with water (Doebner, *A.* 217, 227). Formed also by warming phenyl-glyoxylic acid with phenol and H_2SO_4 at 120° (Homolka, *B.* 18, 988). Brick-red powder, insol. cold water; melts under hot water. Its alcoholic solution dyes silk feebly yellow. In alkalis it dissolves with deep violet-red colour, and is reppd. by acids.

Di-acetyl derivative $C_6H_5.C(OH)(C_6H_5.OAc)_2$. [119°]. Colourless prisms (from dilute alcohol).

Tri-oxy-tri-phenyl-carbinol. *Anhydride* $C_{18}H_{11}O_5$, i.e. $(C_6H_5(OH))_3C < \begin{smallmatrix} C_6H_5 \\ O \end{smallmatrix} >$. Aurin.

Rosolic acid.

Formation. — 1. By heating phenol with oxalic acid and H_2SO_4 (Kolbe a. Schmitt, *A.* 119, 169; Dale a. Schorlemmer, *A.* 196, 79). — 2. By heating phenol with formic acid and $ZnCl_2$ at 120° (Nencki a. Schmid, *J. pr.* [2] 23, 549; 25, 278). — 3. By the action of $AlCl_3$ on a mixture of phenol and tri-chloro-nitro-methane (Elbs, *B.* 16, 1275). — 4. From para-rosaniline by the diazo-reaction (Fischer, *A.* 194, 268). — 5. From di-*p*-oxy-benzophenone by treatment with PCl_5 , and heating the product with phenol and H_2SO_4 (Caro a. Graebe, *B.* 11, 1350).

Preparation. — Phenol (10 pts.) is heated with dried oxalic acid (7 pts.) and H_2SO_4 (5 pts.) at 120°–130° about 24 hours, until gas no longer comes off rapidly. The product is poured into water, the pp. dissolved in $NaOH$ aq, saturated with SO_2 , and mixed with much water. The filtrate from ψ -rosolic acid (which amounts to 70 p.c. of crude product) is saturated at 70° with HCl , and on cooling it deposits aurin sulphite. This is recrystallised from dilute alcohol, which deposits methyl-aurin on cooling, while the mother-liquor, saturated with SO_2 , deposits aurin sulphite, which is freed from SO_2 by heat (Zulowsky, *A.* 194, 119; 202, 184).

Properties. — Dark-red trimetric crystals (from alcohol-HOAc) or red needles with green lustre (from alcohol). Not melted below 220°. Its alkaline solution is crimson.

Reactions. — 1. Reduced by zinc-dust and HOAc to tri-oxy-tri-phenyl-methane. — 2. Agonous NH_3 at 120° yields para-rosaniline. — 3.

Water at 250° yields phenol and di-*p*-oxy-benzophenone. — 4. On warming with KOH aq and KCy and adding HCl , a product is got which, when heated with Ac_2O , yields tri-acetyl-hydrocyanaurin [194°].

Salts. — $(NH_4)_2C_{18}H_{11}O_5$: dark-red needles with steel lustre. — $C_{18}H_{11}O_5.HCl.1\frac{1}{2}HOEt$: red crystals. — $C_{18}H_{11}O_5.HCl.HOAc$: red needles. — $(C_{18}H_{11}O_5)_2.H_2SO_4$ aq: brick-red cubes, sl. sol. cold alcohol. — $C_{18}H_{11}O_5.NH_4HSO_4$: $C_{18}H_{11}O_5.NaHSO_4$: $C_{18}H_{11}O_5.KHSO_4$: minute colourless tables. — $C_{18}H_{11}O_5.H_2SO_4$: $(C_{18}H_{11}O_5)_2.H_2SO_4$: bluish-violet needles.

Di-acetyl-derivative $(C_6H_5(OH))_3C(OAc)_2$. [168°]. Formed from aurin and Ac_2O at 100°. Colourless tables (from alcohol).

Tetra-oxy-tri-phenyl-carbinol

$C_{18}H_{13}O_5$, i.e. $C_6H_5.C(OH)(C_6H_5(OH))_3$. *Anhydride* $C_{24}H_{13}O_6$. *Resorcin-benzeth.* Formed by heating benzo-trichloride with resorcin at 180° (Doebner, *B.* 13, 610; *A.* 217, 234). Large crystals (from alcohol and HOAc). Yellow by transmitted, violet-red by reflected light; at 130° it loses $2H_2O$, and at 200° it is decomposed. Dilute alkaline solutions show yellowish-green fluorescence, but less intense than fluorescein; they dye wool yellow. Insol. water, v. sol. alcohol. Zinc-dust and HCl reduce it to tetra-oxy-tri-phenyl-methane. Bromine in alcohol and HOAc forms a fiery-red pp. $C_{18}H_{13}Br_2O_5$, which closely resembles eosin. Its salts dissolve readily in alcohol and dye wool and silk like eosin.

Penta-oxy-tri-phenyl-carbinol

$(C_6H_5(OH))_3C(OH).C_6H_5.OH$. *Anhydride* $C_{27}H_{15}O_7$. Formed by heating resorcin with formic acid and $ZnCl_2$ at 140° (Nencki a. Schmid, *J. pr.* [2] 23, 547). Hygroscopic brick-red powder, v. sol. alcohol.

p-OXY-DI-PHENYL-CARBINOL *o*-CABB-OXYLIC ACID.

Methyl derivative of the anhydride $C_6H_5 < \begin{smallmatrix} CH_3.C_6H_5.OMe \\ CO.O \end{smallmatrix} >$. [117°]. Formed by reducing methoxy-benzophenone carboxylic acid with zinc and alcoholic HCl (Nourrisson, *B.* 19, 2103). Flat white needles, v. sol. warm alcohol, insol. water.

Oxy-tri-phenyl-carbinol carboxylic acid.

Anhydride $C_{18}H_{11}(OH)CPh < \begin{smallmatrix} C_6H_5 \\ O \end{smallmatrix} > CO$.

Oxy-di-phenyl-phthalide. [155°]. Prepared by heating *o*-benzoyl-benzoic acid with phenol and $SnCl_4$ to 120°; yield 100 p.c. of the benzoyl-benzoic acid (Pechmann, *B.* 13, 1618). Colourless crystals. Sol. all ordinary solvents except water and ligroin. By fusion with KOH it gives benzoic acid and oxy-benzophenone. With alkalis it forms a deep-red solution. By strong H_2SO_4 it is converted into oxy-phenyl-anthranol $C_6H_5 < \begin{smallmatrix} C(OH) \\ C(C_6H_5.OH) \end{smallmatrix} > C_6H_5$. On reduction it gives oxy-triphenyl-methane carboxylic acid. *Acetyl derivative* $C_{18}H_{11}O_5(OAc)$. [186°]. Colourless crystals.

Di-bromo-derivative $C_{18}H_{11}Br_2O_5(OH)$. [196°]. Spikes.

Acetyl di-bromo-derivative $C_{18}H_{11}Br_2O_5(OAc)$. [172°]. Colourless prisms.

ap. di-oxy-di-phenyl-carbinol carboxylic anhydride. Methyl derivative

$\text{C}_6\text{H}_5\text{CH}(\text{CO}_2\text{H})(\text{CO}_2\text{Me})$, [117°]. Made by reducing 'p-anisophthaloylic' acid (Nourrisson, *Bl.* [2] 46, 206). Needles, insol. water, v. e. sol. alcohol.

Di-oxy-tri-phenyl-carbinol carboxylic acid.

Anhydride $\text{C}_6\text{H}_5(\text{OH})_2\text{CPh} < \text{C}_6\text{H}_5 > \text{CO}$.

Benzene-resorcin-phthalein. [176°]. Made by heating benzyl-benzoic acid with resorcin (Pechmann, *B.* 14, 1859). Prisms (containing CHCl_3) melting at 114° (from chloroform). Its alcoholic solution turns greenish-blue on addition of HCl. On heating with H_2SO_4 it yields anthraquinone. H_2SO_4 acting on its solution in HOAc forms $\text{C}_{20}\text{H}_{12}\text{O}_2$, [285°], which yields $\text{C}_6\text{H}_5\text{Ac}_2\text{O}$, [245°].

Di-acetyl derivative $\text{C}_{20}\text{H}_{12}\text{O}_2(\text{OAc})_2$, [137°].

Di-ferro-derivative $\text{C}_{20}\text{H}_{12}\text{Br}_2\text{O}_4$, [219°].

Tri-oxy-tri-phenyl-carbinol-carboxylic acid.

Anhydride $(\text{C}_6\text{H}_5(\text{OH})_2)\text{CPh} < \text{C}_6\text{H}_5 > \text{CO}$.

Benzene-pyrogallol-phthalein. Prepared by heating benzyl-benzoic acid with pyrogallol and crystallising the product from acetic acid (Pechmann, *B.* 14, 1861). Four-sided tables (containing AcOH), [190°]. Sol. most solvents except ligroin, sl. sol. hot water. It dissolves in alkalis with a green colour.

Tri-acetyl derivative $\text{C}_{20}\text{H}_{12}\text{O}_2(\text{OAc})_3$, [231°]. Fine needles. Sol. Ac_2O .

DI-OXY-DI-PHENYL-CARBOLACTONE v.

ISO-EUXANTHIC ACID.

OXY-DI-PHENYL-DI-CARBOXYLIC ACID.

Hexahydrate. $\text{C}_{12}\text{H}_{16}\text{O}_8$. An unstable acid formed by boiling hydro-oxybenzyluric acid with potash (Otto, *A.* 134, 830). Yields $\text{Et}_2\text{A}''$ (206°), a heavy oil.

Di-p-oxy-diphenyl carboxylic acid $\text{C}_{13}\text{H}_{10}\text{O}_4$, i.e. [4:1] $\text{C}_6\text{H}_4(\text{OH})\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})$ [1:4:2], [270°]. Made by fusing diphenylene-ketone disulphonic acid with potash (Schmidt a. Schultz, *B.* 12, 490). Sl. sol. water, v. sol. hot alcohol.

Di-p-oxy-diphenyl dicarboxylic acid

$\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{H}$, [151°]. S. 0052 at 15°. Formed by heating sodium di-oxy-di-phenyl with CO_2 at 200° under high pressure (Schmitt a. Krätzscher, *B.* 40, 2703).

Minute needles, sl. sol. water. FeCl_3 colours its solution bluish-violet.

Tetra-oxy-diphenyl dicarboxylic acid

$\text{C}_6\text{H}_3(\text{OH})_4(\text{CO}_2\text{H})_2\text{C}_6\text{H}_3(\text{OH})_4\text{CO}_2\text{H}$. *Di-resorcin dicarboxylic acid.* Formed by heating tetra-oxy-diphenyl (di-resorcin) with KHCO_3 and a little water at 130° (Wills a. Al'lecht, *B.* 17, 2105). Yellowish powder, decomposing without melting, above 300°. — $\text{K}_2\text{A}''$. — BaA'' 6aq. — $\text{Ag}_2\text{A}''$, white ppt.

Tetra-oxy-diphenyl dicarboxylic acid

$\text{C}_6\text{H}_3(\text{OH})_4(\text{CO}_2\text{H})_2\text{C}_6\text{H}_3(\text{OH})_4\text{CO}_2\text{H}$. *Dehydro-diprotocatechuic acid.* [above 300°]. Formed by fusing 'dehydrodivanillin' with potash (Tiemann, *B.* 18, 3495). Amorphous, v. sl. sol. water, sl. sol. alcohol.

Penta-oxy-diphenyl carboxylic acid

$\text{C}_6\text{H}_4\text{O}_5$. Formed by the action of POCl_3 on *o*-tri-oxy-benzoic acid (Schiff, *G.* 17, 552; *A.*

245, 87). Yellowish astringent powder. — BaA' , greyish-white powder.

Penta-acetyl derivative $\text{C}_{12}\text{H}_4\text{Ac}_5\text{O}_5$. White powder, rapidly darkening in air.

Ethyl ether EtA'. [102°].

Penta-oxy-di-phenyl carboxylic acid

$\text{C}_{14}\text{H}_{10}\text{O}_5$. Formed by heating phloroglucin carboxylic acid with POCl_3 (Schiff). Reddish-brown hygroscopic mass, resembling tannin and the preceding isom. tide.

TETRA-OXY-DIPHENYL DICARBOXYLIC ALDEHYDE. Di-methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})(\text{OH})(\text{CHO})\text{C}_6\text{H}_3(\text{OMe})(\text{OH})(\text{CHO})$.

Divanillin. [304°]. Formed by boiling vanillin $\text{C}_6\text{H}_3(\text{OMe})(\text{OH})(\text{CHO})$ [3:4:1] with FeCl_3 (Tiemann, *B.* 18, 3403). Slender white needles, sl. sol. alcohol, sol. alkalis.

Tetra-ethyl derivative. [138°].

p-OXY-PHENYL-CINNAMIC ACID. Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}:\text{CPh}.\text{CO}_2\text{H}$.

[189°]. Formed from sodium phenyl-acetate, anisic aldehyde, and Ac_2O (Ogialoro, *G.* 9, 533; 10, 481). Prisms (from alcohol), sl. sol. water.

a-OXY-γ-PHENYL-iso-CROTONIC ACID

$\text{C}_6\text{H}_4\text{CH}:\text{CH}.\text{CH}(\text{OH})\text{CO}_2\text{H}$, [115°]. Formed

by boiling cinnamic aldehyde with aqueous HCl and HCl (Matsumoto, *B.* 8, 1144; Peine, *B.* 17, 2114). Formed also by heating the ethyl ether of styryl-ψ-hydantoin with concentrated baryta-water (Pinner a. Spilker, *B.* 22, 690). Styryl-ψ-hydantoin $\text{CHPh}:\text{CH}.\text{CH} < \text{CO}_2\text{NH} > \text{O} < \text{CNH} >$ [198°] is

obtained by the action of warm alcoholic potash on styryl-hydantoin [172°], an isomeric body previously described by Pinner (*B.* 20, 2353) as oxystyryl-pyrazole. Styryl-hydantoin is got by the action of boiling dilute HClAq on (a)-ur-amido-phenyl-crotonic nitrile $\text{CHPh}:\text{CH}.\text{CH}(\text{NH}.\text{CO}.\text{NH}_2).\text{CN}$ [160°], which is made by heating oxy-phenyl-isocrotonic nitrile with urea.

Properties.—Needles, sl. sol. cold water, v. sol. alcohol and ether.

Salts.— PhA' , 2aq: needles. — AgA' : minute needles.

Methyl ether MeA'. (290°). Liquid.

Ethyl ether EtA'. (295°) (Peine).

Nitrile $\text{CHPh}:\text{CH}.\text{CH}(\text{OH})\text{CN}$, [81°].

Formed from cinnamic aldehyde, KOy, and HCl. Crystalline grains (from benzene-ligroin). Converted by hydroxylamine into the crystalline amidoxim $\text{CHPh}:\text{CH}.\text{CH}(\text{OH})\text{C}(\text{NH}_2):\text{NOH}$ (Bornemann, *B.* 19, 1513).

o-Oxy-phenyl-crotonic acid (a)-Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}:\text{CMe}.\text{CO}_2\text{H}$, [118°].

Made from its methyl ether by boiling with alcoholic potash (Perkin, *C. J.* 33, 213; 39, 431). Monoclinic crystals (from alcohol); $a:b:c = 863:1:1:252$; $\beta = 64^\circ 5'$ (Fletcher). Not converted into its (β) isomeride by light. With PCl_5 it gives MeCl , HCl , and the anhydride. Conc. H_2SO_4 also forms propionic coumarin. Sodium-amalgam reduces it to methoxy-phenyl-butyric acid. With Br and with HI it behaves like the (β) acid.

Methyl ether of the (a)-methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}:\text{CMe}.\text{CO}_2\text{H}$, (275°). S.G. $\frac{1}{4}$ 1.112; $\frac{1}{2}$ 1.1061. Formed from sodium propionic coumarin and MeI. Liquid.

(β)-Methyl derivative

$\text{C}_6\text{H}_4(\text{OMe})\text{CH}:\text{CMe}.\text{CO}_2\text{H}$, [107°]. Formed

from methyl-salicylic aldehyde, sodic propionate and propionic acid.

Properties.—Monoclinic crystals; $a:b:c = 1.281:1:1.762$. $\beta = 84^\circ 18'$ (Fletcher). With PCl_5 it gives the chloride of the acid. Conc. H_2SO_4 appears to polymerise it. Behaves like the α -isomeride with sodium amalgam. With dry bromine vapour it forms the compound $\text{C}_6\text{H}_4\text{Br}_2(\text{OMe})\text{CHBr}.\text{CMeBr}.\text{CO}_2\text{H}$ [α , σ , 200°]. With HI (S.G. 1.94) it unites, forming a product whence Na_2CO_3 liberates the methyl derivative of α -allyl-phenol.— AgA^+ : white pp.

Methyl ether of the (β)-methyl derivative MeA^+ . (c. 236°). S.G. $\frac{18}{15}$ 1.1279; n_D^{20} 1.1136.

(β)-Ethyl derivative. $\text{C}_6\text{H}_4(\text{OEt})\text{CH}:\text{CMe}.\text{CO}_2\text{H}$. [133°]. Formed from ethyl-salicylic aldehyde, sodic propionate, and propionic anhydride. Large tables (from alcohol). Its Ba salt forms satiny needles.

Anhydride $\text{C}_6\text{H}_4\text{CH}:\text{CMe}.\text{CO}$. **Propionic coumarin**. **Methyl-coumarin**. [90°]. (292-5°). Formed by heating sodium-salicylic aldehyde with propionic anhydride (Perkin, C. J. 28, 49). Trimetric crystals; $a:b:c = 2.1950:1:4.001$. Smells like coumarin, m. sol. alcohol, nearly insol. cold KOH aq. Fuming H_2SO_4 forms $\text{C}_6\text{H}_4(\text{SO}_3\text{H})$ whence BaA^+ , 10aq.

Oxy-phenyl-crotonic acid. **Anhydride** $\text{C}_6\text{H}_4\text{CH}:\text{CMe}.\text{CO}$. **β -Methyl coumarin**. [126°]. Formed by the action of H_2SO_4 on a mixture of acetoacetic ether and phenol (Pechmann a. Duisberg, B. 16, 2127).

p-Oxy-phenyl-crotonic acid. **Methyl derivative** $\text{C}_6\text{H}_3(\text{OMe})\text{CH}:\text{CMe}.\text{CO}_2\text{H}$. [154°]. Formed from anisic aldehyde, sodium propionate, and propionic anhydride. Rectangular tables (from alcohol).— AgA^+ .

i-Oxy-phenyl-isocrotonic acid. **Methyl derivative** $\text{C}_6\text{H}_3(\text{OMe})\text{CH}:\text{CH}.\text{CO}_2\text{H}$. [106-6°]. Formed by heating anisic aldehyde with sodium succinate and Ac_2O at 120° (Fittig a. Politis, A. 255, 294). Plates, m. sol. hot water.— BaA^+ , 3aq.— CaA^+ , 2aq.— AgA^+ : sol. hot water.

γ -Oxytri-phenyl-crotonic acid. **Lactone** $\text{C}_{22}\text{H}_{14}\text{O}_4$, i.e. $\text{CH}:\text{CPh}.\text{CO}$ (?). [118°]. Mol. w. 329 (by Raoult's method), 312 (calc.). Formed by heating $\alpha\beta$ -di-benzoyl-styrene at 310° (Japp a. Klingemann, C. J. 57, 679, 702; 59, 148). Lustrous needles or monoclinic prisms. Not attacked by phenyl-hydrazine or Ac_2O at 150°. Bromine forms $\text{C}_{22}\text{H}_{12}\text{BrO}_4$ [109°]. Chromic acid mixture oxidises it to benzophenone. May be reduced to oxy-tri-phenyl-butyric acid. Alcoholic potash at 100° yields $\text{CH}:\text{Bz}.\text{CPh}_2.\text{CO}_2\text{H}$, which at 810° changes to the original lactone. Alcoholic methylamine forms $\text{CH}:\text{Bz}.\text{CPh}_2.\text{CONHMe}$. [156°]. Ethylamine acts in like manner.

Oxy-tetra-phenyl-crotonic acid. **Lactone** $\text{C}_{26}\text{H}_{18}\text{O}_4$, i.e. $\text{CH}:\text{CPh}_2.\text{CO}$. **Tabular orylepiden**. [186°]. S. (alcohol) 7 at 78°. Formed by heating α -coucyl orylepiden $\text{C}_{26}\text{H}_{18}\text{O}_4$ at 840° (Zinin, J. 41, 5, 16; Bn. 8, 118; Japp a. Klingemann, C. J. 57, 685; Klingemann a. Laycock, C. J. 59, 140). Tables (from alcohol): insol. water. Converted by alcoholic potash into $\text{C}_{26}\text{H}_{16}\text{O}_4$. Methyl-

amines in alcohol at 100° forms $\text{CHPhBz}.\text{CPh}_2.\text{CONHMe}$ [267°] crystallising in triclinic plates.

Di-oxy-phenyl-crotonic acid. $\text{C}_6\text{H}_3(\text{OH})_2.\text{CMe}:\text{CH}.\text{CO}_2\text{H}$. (β)-**methyl-umbelliferic acid**.

Methyl derivative $\text{C}_6\text{H}_3(\text{OH})(\text{OMe})\text{CMe}:\text{CH}.\text{CO}_2\text{H}$. [140°]. Formed by boiling the methyl derivative of (β)-methyl-umbelliferon with conc. KOH aq. for 5 hours (Pechmann a. Duisberg, B. 16, 2125). Four-sided tables, insol. water, v. sol. alcohol. Reconverted into its lactone by boiling with acids or heating with NH_4Ag .

Di-methyl derivative $\text{C}_6\text{H}_3(\text{OMe})_2.\text{CMe}:\text{CH}.\text{CO}_2\text{H}$. [145°]. Formed by saponification of its methyl ether (310°-320°) which is obtained by further methylation of the methyl derivative (Pechmann a. Cohen, B. 27, 2132). Small needles, v. sol. alcohol.— AgA^+ : white powder.

Anhydride $\text{C}_6\text{H}_3(\text{OH})\text{CH}:\text{CMe}.\text{CO}$. (β)-**Methyl-umbelliferone**. [186°]. Formed by the action of H_2SO_4 on a mixture of acetoacetic ether and resorcin (Pechmann a. Duisberg, B. 16, 2119; A. 261, 169; cf. Schmid, J. pr. [2] 25, 82). Formed also by warming acetoacetic ether with resorcin and alcoholic potash, and heating the resulting methyl-umbelliferone carboxylic acid [191°] above its melting-point (Michael, J. pr. [2] 37, 469). (β)-methyl-umbelliferone is also obtained by heating citric acid with resorcin and H_2SO_4 (Wittenberg, J. pr. [2] 24, 125). Plates (by sublimation): sol. alcohol and hot water, sl. sol. ether. Its dilute alkaline solution has blue fluorescence. Potash-fusion forms di-oxy-acetophenone. Yields a nitro-compound, converted by reduction into amido-(β)-methyl-umbelliferone [247°], whence $\text{B}^+\text{H}_2\text{SO}_4$, 2aq and $\text{C}_6\text{H}_5(\text{NO})\text{NO}_2$. Sodium-amalgam reduces (β)-methyl-umbelliferone to $\text{C}_6\text{H}_3(\text{OH})_2$ [259°], whence $\text{C}_6\text{H}_3\text{AcO}$, [222°] (Michael, Am. 5, 436).

Acetyl derivative of the anhydride $\text{C}_{12}\text{H}_8\text{O}_4$. [150°]. Long white needles, v. sol. alcohol.

Benzoyl derivative of the anhydride $\text{C}_{10}\text{H}_8\text{BzO}_4$. [160°]. Needles (from alcohol).

Methyl derivative $\text{C}_6\text{H}_3(\text{OMe})\text{CH}:\text{CMe}.\text{CO}$. [159°]. Needles (from alcohol), insol. water. On reduction with sodium-amalgam it yields $\text{C}_6\text{H}_3(\text{OMe})\text{CH}:\text{CH}.\text{CO}$ [244°]. Bromine in chloroform reacts forming $\text{C}_6\text{H}_3(\text{OMe})\text{CH}:\text{CMeBr}.\text{CHBr}.$ [235°].

($\alpha\beta$)-**Di-oxy-phenyl-crotonic acid** $\text{C}_6\text{H}_3(\text{OH})_2.\text{CH}:\text{C}(\text{CH}_3)\text{CO}_2\text{H}$ (4:3:1). **Homocaffeic acid**.

p-Propionyl-m-methyl derivative $\text{C}_6\text{H}_3(\text{OCO}.\text{C}_2\text{H}_5)(\text{OMe})\text{CH}:\text{C}(\text{CH}_3)\text{CO}_2\text{H}$. **Propionohomocaffeic acid**. [129°]. Formed by heating vanillin with sodium propionate and propionic anhydride (Tieman a. Kraas, B. 15, 2060). White needles, sol. alcohol, ether, and benzene, insol. water and ligroin.

m-Methyl derivative $\text{C}_6\text{H}_3(\text{OH})(\text{OMe})\text{CH}:\text{C}(\text{OMe})\text{CO}_2\text{H}$. **Homocaffeic acid**.

acid. [168°]. Large trimetric tables. Sol. alcohol and ether, sl. sol. chloroform, benzene, and hot water, nearly insol. cold water and ligroin. On heating the acid it splits off CO_2 forming isoeugenol. — A^2Ba^1 : yellow needles.

Di-methyl derivative
 $\text{C}_6\text{H}_4(\text{OMe})_2\text{CH}:\text{C}(\text{CH}_3)_2\text{CO}_2\text{H}$. *Methyl-homoferulic acid*. [141°]. Needles. Sol. alcohol, ether, and hot water. — A^2Ag^1 : white crystalline pp.

Di-methyl-derivative-methyl ether
 $\text{C}_6\text{H}_4(\text{OMe})_2\text{CH}:\text{C}(\text{CH}_3)_2\text{CO}_2\text{Me}$. [68°]. Colourless plates.

Methylene derivative

$\text{CH}_2<\text{O}>\text{C}_6\text{H}_4\text{CH}:\text{CMe}:\text{CO}_2\text{H}$. [194°]. Formed by boiling piperonal with propionic anhydride and sodium propionate (Lorenz, *B.* 13, 759). Resins (from dilute alcohol). — AgA^1 : pp.

Tri-oxy-phenyl-crotonic acid. Anhydride

$\text{C}_6\text{H}_3(\text{OH})_3<\text{CO}>\text{CMe}:\text{CH}:\text{CO}_2\text{H}$. [235°]. Prepared by the action of H_2SO_4 on a mixture of acetoacetic ether and pyrogallol (Wittenberg, *J. pr.* [2] 26, 68; Pechmann a. Duisberg, *B.* 16, 2127). Needles, sol. alcohol and hot water. Coloured green by FeCl_3 . Yields a di-acetyl derivative [176°]. An isomeride [1981°] is formed by using phloroglucin instead of pyrogallol; it yields a di-acetyl derivative [140°] (Pechmann a. Cohen, *B.* 17, 2189).

Tetra-oxy-phenyl-crotonic acid. Methylene-di-methyl derivative

$\text{CH}_2<\text{O}>\text{C}_6\text{H}_2(\text{OMe})_2\text{CH}:\text{CMe}:\text{CO}_2\text{H}$. [209°]. Formed by heating apionic aldehyde with propionic aldehyde and sodium propionate (Cianician a. Silber, *B.* 22, 2483). Yellow needles, almost insol. water. — CaA^2 , BaA^2 : white gelatinous pp.

OXY-PHENYL-CUMINYLAMINE v. CUMINYLAMIDO-PHENOL.

OXY-PHENYL-CUMYLAMINE v. CUMINYLAMIDO-PHENOL.

o-OXY-PHENYL-CYANAMIDE. *Ethyl derivative* $\text{C}_6\text{H}_4(\text{OEt})\text{NH}:\text{C}(\text{CN})_2$. [94°]. Made by passing gaseous EtCN into an ethereal solution of *o*-amido-phenetole (Berlinerblau, *J. pr.* [2] 30, 100). Crystals. Insol. water, v. sol. alcohol and ether. Does not appear to polymerise. With fuming HCl at 120° it gives *o*-amido-phenol.

Salts. — $\text{C}_6\text{H}_4\text{N}_2\text{ONa}$. Microscopic needles, got by mixing alcoholic solutions of NaOEt and ethoxy-phenyl-cyanamide. Its aqueous solution does not absorb CO_2 . — $\text{C}_6\text{H}_4\text{N}_2\text{ONa}^2$. Curdy pp.

p-OXY-PHENYL-CYANAMIDE. *Ethyl derivative* $\text{C}_6\text{H}_4(\text{OEt})\text{NH}:\text{C}(\text{CN})_2$. [78°]. Made in the same way as the *o*-compound. Colourless crystals. Insol. water, v. sol. alcohol and ether. — $\text{C}_6\text{H}_4\text{N}_2\text{ONa}$.

OXY-PHENYL-CYANATE. Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{N}:\text{CO}$. [219°]. Made by distilling $\text{C}_6\text{H}_4(\text{OEt})\text{NH}:\text{CO}_2\text{Et}$ (Köhler, *J. pr.* [2] 29, 259). White needles (from HOAc), sol. alcohol and chloroform.

DI-OXY-PHENYL-DI-CYMYL-METHANE $\text{OHPH}(\text{C}_6\text{H}_4\text{MePr}:\text{OH})_2$. [146°]. Formed from benzoic aldehyde, thymol, and H_2SO_4 (Rusanoff, *B.* 22, 1949). Thin tables (containing, EtOH), v. sol. chloroform.

Di-acetyl derivative [126°]. Crystals.

OXY-DIPHENYLENE-ACETIC ACID

$\text{C}_6\text{H}_5<\text{O}>\text{C}(\text{OH})\text{CO}_2\text{H}$. [162°]. Formed by boiling phenanthraquinone with NaOHAq (Bayer, *B.* 10, 125; Friedländer, *B.* 10, 534). Plates (containing $\frac{1}{2}\text{aq}$), v. sl. sol. cold water, v. sol. alcohol. Conc. H_2SO_4 forms a blue solution on warming. Chromic acid mixture yields diphenylene ketone. NaOHAq at 160° splits it up into fluorescent alcohol and CO_2 . HIAq and P at 140° reduce it to diphenylene-acetic acid. Bromine forms $\text{C}_6\text{H}_4\text{Br}_2\text{O}_2$ [225°], whence $\text{C}_6\text{H}_4\text{Br}_2\text{EtO}_2$ [151°]. — CaA^2 , 2aq : crystals.

Ethyl ether EtA. [92°].

DI-OXY-PHENYLENE-DIAMINE

$\text{C}_6\text{H}_4(\text{OH})_2(\text{NH}_2)_2$. Got by reducing the dioxim of di-oxy-quinone with SnCl_2 and HCl (Nietzki a. Schmidt, *B.* 22, 1656). Yields on oxidation crystalline $\text{C}_6\text{H}_4(\text{OH})_2(\text{NH})_2$. — $\text{B}^1\text{H}^2\text{SO}_4$.

Tetra-acetyl derivative [225°]. Needles.

Isomeride v. DI-AMIDO-HYDROQUINONE.

DI-OXY-DIPHENYLENE-DIHYDRAZINE

$\text{C}_6\text{H}_4(\text{OH})(\text{N}_2\text{H}_4)\text{C}_6\text{H}_4(\text{OH})(\text{N}_2\text{H}_4)$. [140°]. Formed by reducing the diazo-compound from di-oxy-di-amido-diphenyl with SnCl_2 (Kunze, *B.* 21, 3333). Thin plates, forming with acetone a compound $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ [200°].

OXY-DIPHENYLENE KETONE $\text{C}_{12}\text{H}_8\text{O}_2$, i.e.

$\text{CO}<\text{C}_6\text{H}_4<\text{O}>\text{C}_6\text{H}_5\text{OH}$. [96°] (G); [91°] (R). Formed by warming dry sodium salicylate with excess of POCl_3 and distilling (R. Richter, *J. pr.* [2] 28, 294). It is also one of the products of the action of phenol on the sulphate of *o*-diazobenzoic acid (Griess, *B.* 21, 981). Needles, insol. water, v. sol. hot alcohol. Its vapour passed over red-hot lime yields diphenylene ketone and di-phenylene-ketone oxide [82°]. Distilled over red-hot zinc-dust it is reduced to diphenyl. Gives a nitro-derivative [221°], a di-nitro-derivative (c. 235°), and a bromo-derivative [193°].

OXY-DIPHENYLENE-KETONE OXIDE

$\text{C}_{12}\text{H}_8\text{O}_2$, i.e. $\text{C}_6\text{H}_5<\text{O}>\text{C}_6\text{H}_4(\text{OH})$. *Oxy-xanthone*. [147°]. Formed by heating resorcin with salicylic acid and ZnCl_2 (Michael, *Am.* 5, 91). Formed also by heating salicylic acid with (β)-resoreyic acid and Ac_2O (Graebe, *A.* 254, 290). Yellow needles (from alcohol). Split up by fusion with potash into resorcin and salicylic acid. Gives diphenylene-methane oxide [99°] when distilled with zinc-dust. Yields tri-oxy-benzophenone [133°] when fused with NaOH . — $\text{NaC}_6\text{H}_4\text{H}_2\text{O}_2$. — $\text{Na}_2\text{C}_6\text{H}_4\text{H}_2\text{O}_2$ (dried at 100°). Lemon-yellow needles.

Acetyl derivative $\text{C}_{12}\text{H}_8\text{AcO}_2$. [168°].

Di-oxy-diphenylene ketone oxide v. Euxanthone, vol. ii. p. 529. (β)-*Iso-euxanthone* $\text{C}_6\text{H}_5(\text{OH})<\text{O}>\text{C}_6\text{H}_4(\text{OH})$, got from di-nitro-diphenylene ketone oxide [260°], yields a crystalline di-acetyl derivative [175°] (Graebe, *A.* 254, 301). An isomeride $\text{C}_6\text{H}_5<\text{O}>\text{C}_6\text{H}_4(\text{OH})$, [247°] is obtained from phloroglucin and salicylic acid (von Kostanecki a. Nessler, *B.* 24, 1896). A second isomeride with the formula $\text{C}_6\text{H}_5<\text{O}>\text{C}_6\text{H}_4(\text{OH})_2$ [240°], got by heating tetra-oxy-benzophenone with water at 200°, yields a diacetyl derivative [161°] and dyes cotton

mordanted with alumina, yellow, and with iron, greyish-black (Grube, B. 24, 969). Another isomeride $[1^3]C_6H_4(OH)<\overset{O}{\parallel}CO>C_6H_4(OH)[1^5]$

[246° cor.] made by heating resorcylic acid with Ac_2O yields a diacetyl derivative [c. 127°] (G.).

Tetra-oxy-diphenylene ketone oxide v. Anhydride of Hexa-oxy-benzophenone.

DI-OXY-PHENYLENE-DI-METHYL DIKETONE $C_6H_4(OH)_2(CO.CH_3)_2$. [180°]. Obtained from di-oxy-acetophenone (10 g.), $ZnCl_2$ (20 g.), $HOAc$ (50 g.), and $POCl_3$ (10 g.), at 140° (Crepieux, B. 13, 6, 152). Crystals (from hot water); yields with phenyl-hydrazine the compound $C_6H_4(OH)_2(CMe.NHPh)_2$ [c. 231°].

Tri-oxy-phenylene di-methyl diketone $C_6H_3(OH)(CO.CH_3)_2$. [189°]. Formed in like manner from tri-oxy-acetophenone (G.). Yields a di-phenyl-di-hydrazide [246°] and also an acetyl derivative [209°] which yields a di-phenyl-di-hydrazide [265°].

DI-OXY-PHENYLENE DI-PHENYL DIKETONE $C_{10}H_8O_4$, i.e. $C_6H_4(OH)_2(CO.C_6H_5)_2$. **Di-benzoresorcin.** [149°]. Formed, together with dioxibenzophenone, by heating resorcin with $BzCl$ and $ZnCl_2$ (Doebner & Stachmann, B. 11, 2270; A. 210, 269). Leaflets, insol. water.

Di-acetyl derivative. [150°]. Needles.

Di-benzoyl derivative. [161°]. Needles.

Di-oxy-phenylene di-phenyl ketone $C_6H_4(OH)_2(CO.C_6H_5)_2$. **Dibenzohydroquinone** [207°]. Formed from hydroquinone, $BzCl$, and $AlCl_3$ (D.). Golden needles (from alcohol).

Di-benzoyl derivative. [146°]. Plates.

TETRA-OXY-DIPHENYLENE-DI-PHENYL-DI-THIO-DI-UREA. **Tetra-methyl derivative**

$NHPhCS.NH.O_2C_6H_4(OMe)_2C_6H_4(OMe)_2NHPhCS.NHPh$. [184°]. Formed by warming the compound $C_6H_4(OMe)_2(NH).C_6H_4(OMe)_2(NH)$ with phenylthiocarbimide (Bössler, B. 17, 2123). Flakes, sol. hot alcohol.

TETRA - OXY - DIPHENYLENEQUINONE.

Tetra-methyl ether v. Cereulogon.

DI-OXY-DIPHENYLENE-QUINOXALINE.

Di-ethyl ether

$[63.2]C_6H_4(OEt)_2<\overset{N}{\parallel}C_2C_6H_4[1:2]>N.C_2C_6H_4[1:2]$ [260°].

Formed by the action of phenanthraquinone on the hydrochloride of the diethyl ether of (a)-diamido-hydroquinone (Nietzki & Reehberg, B. 23, 1212). Yellowish needles, sl. sol. water.

OXY-DI-PHENYL-ETHANE

C_6H_5O i.e. $C_6H_5.CH_2.C_6H_4(OH)$ or $CH_3.CH(C_6H_5).C_6H_4(OH)$. [58°]. Formed by allowing a mixture of styrene, phenol, H_2SO_4 , and $HOAc$ to stand (Koenigs, B. 23, 3144). Crystals, sol. dilute $NaOH$ aq.

Benzoyl derivative [83°].

Methyl derivative $CH_3Ph.CH_2.C_6H_4OMe$. [61°]. Formed from a-phenyl-methoxy-cinnamic acid, alcohol, and Na (Freund & Remse, B. 23, 2865). Plates, sol. alcohol.

Sulphonic acid $C_6H_4(OH)(SO_3H)$. Formed by potash-fusion from s-di-phenyl-ethane disulphonic acid (Kade, B. 7, 239). Plates, sol. hot water.

Di-p-oxy-s-di-phenyl-ethane $C_6H_4(OH).CH_2.CH_2.C_6H_4(OH)$. [189°]. Formed from di-phenyl-ethane disulphonic acid by potash-fusion (Kade). Plates or needles, almost

insol. cold water. Does not give a dye-stuff on oxidation (Heumann & Wiernik, B. 20, 914).

Di-oxy-di-phenyl-ethane $CH_3.CH(C_6H_5)_2$. **Ethylidene diphenol.** [122°] (F.); [125°] (Claus, B. 13, 3004). Formed by the action of $SnCl_4$ or HCl on a mixture of phenol and paraldehyde (Fabin, B. 11, 283). Needles (containing $\frac{1}{2}C_6H_5$). Reduces ammoniacal $AgNO_3$, forming a mirror.

Di-benzoyl derivative. [185°]. Prisms.

Di-methyl derivative. [140°]. Formed from acetyl chloride, anisole, and $AlCl_3$ (Sattermann, B. 22, 1129). Micaceous scales.

Diethyl derivative [142°]. Scales.

Isomerides v. Di-oxy-ethyl-benzene.

Tri-oxy-tri-phenyl-ethane

$C_6H_4(OH).CH_2.CH(C_6H_5)_2$. **Ethenyl-triphenol.** Formed from $CH_3Cl.CHCl(OEt)$ and phenol (Wislicenus, A. 243, 153). Amorphous resin, v. sl. sol. ether. Yields iso-rosolic acid on oxidation with $FeCl_3$. Forms a tri-acetyl derivative.

Tetra-oxy-di-phenyl-ethane

$C_6H_4(OH).CH(OH).CH(OH).C_6H_4(OH)$.

Anhydride $C_{14}H_{10}O_2$. Two isomerides [68°] and [117°] are formed by the action of zinc-dust and $HOAc$ on o-oxy-benzoic aldehyde (Tiemann, B. 24, 3172; Harries, B. 22, 3175).

Tetra-oxy-tetra-phenyl-ethane $C_{18}H_{14}(OH)_4$. [218°]. Formed by fusing tetra-phenyl-ethane tetra-sulphonic acid with potash (Engler, B. 11, 930). Plates (from dilute alcohol).

Tetra-oxy-tetra-phenyl-ethane $(HO.C_6H_4).CH.CH(C_6H_5)_2$. Formed from di-oxy-benzophenone (Bagyer, A. 202, 133). Resin, yielding a crystalline tetra-acetyl derivative.

Hexa-oxy-tri-phenyl-ethane

$(HO).C_6H_4.CH_2.CH(C_6H_5)_2$. Three amorphous isomerides are formed from di-chloro-di-ethyl oxide by the action of pyrocatechin, resorcin, and hydroquinone respectively (Wislicenus, A. 243, 181). They are v. sol. alcohol.

OXY-DI-PHENYL-ETHANE CARBOXYLIC

ACID $C_6H_4(OH).CH_2.CHPh.CO_2H$. [120°].

Formed from phenyl-coumarin, dilute alcohol, and sodium-amalgam (Sardo, G. 13, 273). Small prisms. — AgA' : sl. sol. hot water.

Oxy-di-phenyl-ethane dicarboxylic acid

$C_6H_4(CO_2H).CH_2.CH(OH).C_6H_4.CO_2H$. **Hydroxy-diphthalic acid.** [c. 170°]. Formed from its anhydride, which is a product of the action of zinc-dust and $HOAc$ on phthalic anhydride (Wislicenus, B. 17, 2361). Prisms. — AgA'' : decomposes at 225° in vacuo (Hasselbach, 243, 240).

Ethyl ester Et.A''. Crystalline.

Anhydride $C_{16}H_{12}O_4$. **Hydrodiphthaliconic acid.** [193-5°]. Prisms. Converted by KCy at 215° into $C_6H_4(CO_2H).CH_2.CH(C_6H_5).CO_2H$. — AgA' spp.

Di-oxy-di-phenyl-ethane di-o-carboxylic acid $C_6H_4(CO_2H).CH(OH).CH(OH).C_6H_4.CO_2H$.

Formed by dissolving hydrodiphthalyl in KOH aq (Hasselbach, A. 43, 266). Hydrodiphthalyl is a product of the action of zinc-dust and $HOAc$ on diphthalyl. The free acid is unstable, at once yielding the anhydride $C_{16}H_{12}O_4$, which on heating to 190° yields its second anhydride hydrodiphthalyl $C_{16}H_{12}O_4$. [250°]. — AgA' Pp.

Di-oxy-di-phenyl-ethane di-p-carboxylic acid

$C_6H_4(CO_2H).CH(OH).CH(OH).C_6H_4.CO_2H$.

Formed by reducing benzoin dicarboxylic acid

with sodium-amalgam (Oppenheimer, B. 19, 1817). M. sol. water. Infusible.

***o*-OXY-PHENYL-ETHYL-AMIDO-ACETIC ACID. Ethyl derivative**

$C_6H_4(OEt).NH_2.CH_2.CO_2H$. Formed from chloroacetic acid (1 mol.), $C_6H_4(OEt).NH_2$ (2 mols.), and alcohol (Vater, J. pr. [2] 29, 296). Oil. — $C_6H_4(NO_2).HCl$. Very hygroscopic. — *Ethylchloride* $C_6H_4(NO_2).EtCl$. Formed from $C_6H_4(OEt).NH_2$ and chloroacetic acid. Oil. — $(C_6H_4(NO_2).EtCl)_2.PtCl_2$: yellow crystals.

***p*-OXY-PHENYL-ETHYLAMINE**

$C_6H_4(OH).CH_2.CH_2.NH_2$. Formed by heating tyrosine at 270° (Schmitt a. Nasse, A. 183, 214). Solids. Yields *p*-oxy-benzoic acid on fusion with potash (Barth, A. 152, 101). — B^*HCl . Needles.

Oxy-di-phenyl-ethylamine

$CHPh(OH).CHPh(NH_2)$. [161°]. Formed by reducing the oxim of hydrobenzoin or the monoxim of benzoin with sodium-amalgam and alcohol (Goldschmidt a. Polonowska, B. 20, 492; 21, 488). Needles (from alcohol). — B^*HCl . [210°]. — $B^*H_2PtCl_2$: 2aq. — B^*HOAc . [156°]. Prisms.

***Di*-acetyl derivative [159°].**

***p*-Oxy-di-phenyl-ethyl-amine. Ethyl ether** $EtN(C_6H_4)(C_6H_4.OEt)$. (319°). Formed from *p*-oxy-diphenylamine, EtI , and alcoholic potash. Oil, with an odour between that of geraniums and violets (Philip a. Calm, B. 17, 2434).

***β*-OXY-β-PHENYL-ETHYL-ISOAMYL MALONIC ACID** $CHPh(OH).CH_2.C(CO_2H)_2.C_6H_{11}$.

Formed by reducing phenacyl-isoamyl-malonic acid with sodium-amalgam (Paal a. T. Hoffmann, B. 23, 1503). Thick oil, almost insol. water, yielding the lactone of *γ*-oxy-*γ*-phenyl-heptonic acid on distillation.

OXY-PHENYL-ETHYL-CARBAMIC ANHYDRIDE $C_6H_4<\begin{smallmatrix} NH \\ O \end{smallmatrix}>CO$. [29°]. Formed from

$C_6H_4<\begin{smallmatrix} NH \\ O \end{smallmatrix}>CO$, alcoholic potash, and EtI (Bender, B. 19, 2952). Not affected by HCl .

***o*-OXY-PHENYL-ETHYL CARBAZIDE.**

Methyl derivative $C_6H_4.N_2H_2.CO_2$, i.e. $C_6H_4(OMe).N_2H_2.CO.NHEt$. [110°]. Formed from $C_6H_4(OMe).N_2H_2$ and phenyl cyanate (Reisenegger, A. 201, 322). Needles (from Aq).

***o*-OXY-DI-PHENYL-ETHYLENE** $C_6H_4.O$, i.e.

$C_6H_4.CH:CH.C_6H_4(OH)$. [186°]. Formed in small quantity by heating salicylic aldehyde with phenyl-acetic acid and $NaOAc$ at 200° (Michael, Am. 1, 315). Needles (from alcohol).

***p*-Oxy-di-phenyl-ethylene. Methyl derivative** $C_6H_4(OMe)$. [136°]. Formed by heating the methyl derivative of *p*-coumaric acid (Ogliaro, G. 9, 536). Plates, sol. alcohol.

***Di*-*o*-oxy-di-phenyl-ethylene**

$C_6H_4(OH).CH:CH.C_6H_4(OH)$. [95°]. Formed from salicylic aldehyde, zinc-dust, and H_2O_2 (Harries, B. 24, 3178; Tiemann, B. 24, 2775). Needles. Its alkaline solutions show blue fluorescence. Yields a *di*-benzoyl derivative [108°] which forms a dibromide [59°].

***Di*-*p*-oxy-di-phenyl-ethylene**

$C_6H_4(OH).CH:CH.C_6H_4(OH)$. *Di*-*oxy-stilbene*. [280°]. Formed by boiling an alcoholic solution of $CCl_3CH(C_6H_4.OH)_2$ with zinc-dust (E. J. Meer, B. 7, 1200; Elbs a. Hoermann, J. pr. [2] 89, 498). Small crystals (from $HOAc$). Yields a *di*-acetyl derivative [213°].

***Di*-oxy-di-phenyl-ethylene. Di-benzoyl derivative** $C_6H_4.C(Obz).C(Obz).C_6H_5$. *Isobenzil*. [159°]. Formed by the action of sodium on a mixture of benzoic aldehyde and $BzCl$, or on $BzCl$ alone, in ether (Klinger a. Schmitz, B. 34, 1276). Decomposed by HCl into benzil and benzoic acid. Alcoholic potash forms benzoin.

***Di*-*p*-oxy-di-phenyl-ethylene. Di-methyl derivative** $CH_3.C(C_6H_4.OMe)_2$. [140°]. Formed from anisole, $AcCl$, and $AlCl_3$ (Gattermann, B. 22, 332). Plates, v. sl. sol. cold alcohol. Yields $CO(C_6H_4.OMe)_2$ on oxidation by CrO_3 .

***Di*-ethyl derivative** $CH_3.C(C_6H_4.OEt)_2$. [142°]. Formed from $C_6H_4.OEt$, $AcCl$, and $AlCl_3$.

Tetra-oxy-tetra-phenyl-ethylene $C_6H_4O_4$. Formed by potash-fusion from tetra-phenyl-ethylene tetra sulphonic acid (Behr, B. 5, 278). Plates (from $HOAc$). Not melted at 800°. $FeCl_3$ in H_2O forms green metallic crystals of $C_6H_4O_4$, aq. sl. sol. alcohol.

DI-OXY-DI-PHENYL-ETHYLENE DIAMINE.

***Di*-ethyl derivative** $C_6H_4(NH.C_2H_5.OEt)_2$. [98°]. Formed by the action of ethylene bromide and Na_2CO_3 on the hydrochloride of $C_6H_4(OEt)NH_2$ (Bischoff, B. 23, 1979). Plates (from ether-alcohol).

OXY-DI-PHENYL-ETHYLENE CARBOXYLIC ACID $C_6H_4.CH_2.CH(OH).C_6H_4.CO_2H$. [96°].

Formed from deoxybenzoin *o*-carboxylic acid by sodium-amalgam (Gabriel a. Michael, B. 11, 1020; 18, 3480). Plates (from dilute alcohol). At 100° it forms an anhydride $C_{12}H_8O_2$ [60°].

The isomeric acid

$C_6H_4.CH(OH).CH_2.C_6H_4.CO_2H$. [127°], formed by reducing the isomeric deoxybenzoin *o*-carboxylic acid, also yields an anhydride $C_{12}H_8O_2$ [90°].

***p*-OXY-PHENYLETHYLENE-QUINOLINE**

$C_6NH_4.CH:CH.C_6H_4.OH$. [253°]. Formed from (*Py*. 1)-quinoline (lepidine) by heating with *p*-oxy-benzoic aldehyde and $KHSO_4$ at 160° (Heyman a. Koenigs, B. 21, 1424). Crystals, sl. sol. dilute $NaOH$ aq.

***p*-OXY-PHENYL ETHYL KETONE**

$C_6H_4(OH).CO.C_2H_5$. *Propionyl phenol*. [148°]. S. 0.34 at 15°; 3.3 at 100°. Formed by heating phenol with propionic acid and $ZnCl_2$ (Goldzweig, J. pr. [2] 43, 86), and also by the action of propionyl chloride on phenol (Perkin, C. J. 55, 546). Needles or prisms, v. e. sol. alcohol. Potash-fusion yields phenol and *p*-oxy-benzoic acid. Yields a *di*-bromo-derivative [100°] and a nitro-derivative [180°].

Methyl derivative $C_6H_4(OMe).CO.C_2H_5$. [27°]. [274°]. Formed from anisole (10 g.), propionyl chloride (10 g.), and $AlCl_3$ (12 g.) in CS_2 (Gattermann, B. 23, 1203). Yields an oxim [67°] crystallising from alcohol.

Ethyl derivative. [30°]. Prisms. Yields an oxim $C_6H_4(OEt).C(NOH).Et$ [97°].

***Di*-oxy-phenyl ethyl ketone**

[1:3:4] $C_6H_4(OH)_2.CO.C_2H_5$. [95°]. Formed from resorcin (1 pt.), propionic acid (1 pt.), and $ZnCl_2$ (Goldzweig). Needles. Gives a red colour with $FeCl_3$. Yields a phenyl-hydrazide [115°].

***Di*-ethyl derivative** $C_6H_4(OEt)_2.CO.C_2H_5$. [76°]. Formed from propionyl chloride, $C_6H_4(OEt)_2$, and $AlCl_3$ (Gattermann). Yields an oxim [183°] crystallising in needles.

***Di*-oxy-phenyl ethyl ketone**

[5:2:1] $C_6H_4(OH)_2.CO.C_2H_5$. [92°]. Formed from hydroquinone (1 pt.), propionic acid (1 pt.), and

ZnCl₂ (3 pts.) at 190° (Goldzweig). Needles, giving a yellowish-red colour with FeCl₃. Yields a phenyl-hydrazide [100°].

OXY-DI-PHENYL-ETHYL NITRITE

C₁₂H₁₁NO₂, i.e. CPh₂(OH).CH₂.ONO. [106°]. Formed from di-phenyl-ethane (1 pt.), HOAc (10 pts.), and HNO₃ (1 pt. of S.G. 1.5) in the cold (Anschütz a. Romig, A. 233, 327). Needles, oxidised by CrO₃ to benzophenone and di-phenyl-vinyl nitrite [87°].

DI-OXY-DI-PHENYL-DI-ETHYL-PYRAZINE DIHYDRIDE NPh- $\begin{array}{c} \text{CHEt.CO} \\ \text{CO.CEt} \end{array}$ -NPh.

[260°]. Formed, together with an isomeride [163°], by the action of Ac₂O on α -phenylamido-butyric acid (Nastvogel, B. 22, 1795; 23, 2014). Needles (from alcohol).

OXY-PHENYL-ETHYL-PYRIMIDINE

OE- $\begin{array}{c} \text{N-CPH} \\ \text{N:C(OH)} \end{array}$ -CH. [238°]. Formed from propionamidine hydrochloride, benzoyl-acetoacetic ether, and dilute (10 p.c.) NaOHaq (Pin-ner, B. 23, 1621). Needles, v. sl. sol. water.

OXY-TRI-PHENYL-ETHYL-PYRROLE

OPh- $\begin{array}{c} \text{CH:CPH} \\ \text{CO.NEt} \end{array}$. [123°] and [129°]. Formed from C₆H₅.CBz:CHBz and alcohol ethylamine (Japp a. Klingemann, C. J. 57, 705). Formed also by heating the ethylamide of di-phenyl-benzoyl-propionic acid at 340°. Triclinic prisms [23°]; $a:b:c = 912:1:952$; $\alpha = 78^\circ 48'$; $\beta = 89^\circ 10'$; $\gamma = 68^\circ 2'$. From dilute solutions it also crystallises in monoclinic prisms [129°]; $a:b:c = 1:690:1:1:958$; $\beta = 86^\circ 54'$ (Tutton, C. J. 57, 731). Yields a bromo-derivative C₁₂H₉BrNO [142°] crystallising in monoclinic prisms.

OXY-PHENYL-(Py. 1)-ETHYL-QUINOLINE

O₂H- $\begin{array}{c} \text{C(CH}_3\text{).CH}_2\text{C}_6\text{H}_4\text{(OH)} \\ \text{N:CH.CH} \end{array}$. Formed by condensing α -oxy-benzoic aldehyde with (Py. 1)-methyl-quinoline and reducing the product with HI in HOAc aq (Koenigs, B. 21, 1428, 2167). The α -compound melts at 181°, the m -compound at 209°, and the p -compound at 177°. They yield the oxybenzoic acids on fusion with potash.

β -OXY-PHENYL-ETHYL-SUCCINIC ACID

OO₂H.CHPh.CH(CO₂H).CH(OH)Me. Formed from phenyl-acetosuccinic ether, alcohol, and sodium-amalgam (Weltner, B. 18, 791). The free acid splits up at once, yielding the anhydride C₁₂H₁₂O₄ [167.5°] whence Ca(C₁₂H₁₁O₄)₂. AgC₁₂H₁₁O₄: flocculent pp.

DI-OXY-DI-PHENYL-ETHYL- ψ -THIO-UREA Di-methyl derivative

C₆H₅(OMe).N:C(SET).NH.C₆H₅OMe. [83°]. Got from di-anisyl-thio-urea and EtI (Foerster, B. 21, 1863). Prisms.—C₁₂H₁₂SO₂HI. [163°]. Rhombohedra.—B'H₂PO₄.

α -OXY-PHENYL-GLYOXYLIC ACID

O₂H₂(OH).CH.CH.CO₂H. Salicylglycidic acid. Formed by the action of conc. aqueous NaOH NBz

upon benzoyl-imido-coumarin O₂H- $\begin{array}{c} \text{CH.CO} \\ \text{CH.CO} \end{array}$ (Plochl a. Wolftrum, B. 18, 1185). Flat needles or prisms. V. sol. alcohol and ether, sl. sol. cold water. By boiling with dilute H₂SO₄ it is con-

verted into oxido-coumarin O₂H- $\begin{array}{c} \text{O} \\ \text{CH} \\ \text{O.CO} \end{array}$ [158°].

—CaA₂ 6aq: prisms.

α -OXY-PHENYL-GLYOXYLIC ACID

C₆H₅(OH).CO.CO₂H. [44°]. Formed by adding acid to a solution of NaNO₂ and isatin in dilute NaOH, and heating the solution of the diazo-compound thus obtained to 60° (Baeyer a. Fritsch, B. 17, 973). Yields α -di-oxy-phenyl-acetic acid on reduction with sodium-amalgam.

Di-oxy-phenyl-glyoxylic acid. Methyl derivative [4:3:1]C₆H₅(OH)(OMe).CO.CO₂H. [134°]. A product of the oxidation of acetyl-eugenol by KMnO₄ (Tiemann, B. 24, 2878). Prisms, v. sol. water and alcohol. Dimethyl derivative [4:3:1]C₆H₅(OMe)₂.CO.CO₂H. [189°]. Formed, together with veratric acid by oxidation of the methyl derivative of eugenol or iso-eugenol by KMnO₄ (Tiemann a. Matsumoto, B. 11, 141; Ciamician a. Silber, B. 23, 1165). Trimeric tables, melting at 100° when hydrated.

Methylene derivative

CH₂- $\begin{array}{c} \text{O} \\ \text{CH} \\ \text{O.CO} \end{array}$ -C₆H₅.CO.CO₂H. [149°]. Formed by oxidising iso-safrol with alkaline KMnO₄ (C. a. S.). Light-yellow needles, containing benzene of crystallisation (from benzene).—C₁₂H₁₂AgO₄.

α -OXY-PHENYL-HEXENOIC ACID

C₆H₅(OH).C₁₁H₁₉.CO₂H. Anhydride C₁₂H₁₉O₄. [54°]. [301°]. Formed by boiling sodium salicylic aldehyde with valeric anhydride (Perkin, A. 147, 235). Prisms (from alcohol), insol. cold Aq.

An isomeric lactone, prepared by heating phenyl-acetyl-butyric acid, is oily (Erdmann, A. 254, 182).

α -OXY-PHENYL-HEXOIC ACID

QHMe(OH).CH(CH₂Ph).CH₂.CO₂H. [76°]. Small prisms (containing aq).—CaA₂ 6aq: minute prisms. Anhydride C₁₂H₁₉O₄. Benzyl-valerolactone. [86°]. Formed by reducing benzyl-acetylpropionic acid with sodium-amalgam (Erdmann, A. 254, 182). Crystals (from CS₂).

α -OXY-PHENYL-HYDRAZINE Methyl

derivative C₆H₅(OMe).NH.NH₂. [43°]. [240°]. By reducing C₆H₅(OMe).N₂SO₂Na with Zn and glacial acetic acid there is formed the salt C₆H₅(OMe).N₂H₂SO₂Na aq; which is then warmed with HCl aq (Reisenegger, A. 22, 314). Needles (from liqroin). Yields B'HCl, B'H₂C₆O₄, and B'C₆H₅N₂O₄.

Acetyl derivative C₆H₅N₂O₄. [125°].

Di- α -oxy-di-phenyl-hydrazine Di-methyl

derivative {C₆H₅(OMe)₂.N₂H₂. [89°]. Formed by reducing the azo-compound N₂(C₆H₅OMe)₂ by alcoholic ammonium sulphide (Schmitt a. Mäh-lau, J. pr. [2] 18, 202). Colourless needles, insol. water, sol. alcohol and ether. The m -isomeride forms colourless needles [85°] (Buchstab J. pr. [2] 29, 300).

Tetra-oxy-di-phenyl-hydrazine Tetra-methyl derivative

C₆H₅(OMe)₄.N₂H₂.N₂H₂.CO₂H. Hydrasodimethylhydroquinone. Formed by reducing the di-methyl derivative of nitro-hydro-quinone in alkaline solution (Baessler, B. 17, 2126). Converted by acids into the tetra-methyl derivative of tetra-oxy-diamido-diphenyl.

p -OXY-PHENYL-IMIDO-DIACETIC ACID

Di-ethyl derivative of the oxy-anilide

$C_6H_5(OEt).N(OH_2.CO_2H).CH_2.CO.NH.C_6H_5.OEt$. [157°]. Got from $C_6H_5(OEt).NH.CH_2.CO_2H$ by heating at 260° (Bischoff a. Nastvogel, B. 22, 1790). Crystalline, insol. hot water.

DI-o-OXY-DI-PHENYL-IMIDO-ACETO-NITRILE. *Di-methyl derivative* $C_{12}H_{11}N_3O_2$, i.e. $NH(OHCy.C_6H_5.OMe)$. [123°]. Formed by heating $C_6H_5(OMe).CH(OH).CN$ with alcoholic NH_3 at 70° (Voswinkel, B. 15, 2025). Tables, insol. water, sol. alcohol.

o-OXY-PHENYL- α -IMIDO-PROPIONIC ANHYDRIDE. *Di-benzoyl derivative* $\{C_6H_5(OH).C_6H_5(NBz).CO\}_2O$. Obtained by heating hippuric acid with salicylic aldehyde dissolved in acetic anhydride with addition of sodium acetate (Plochl a. Wolfrum, B. 18, 1183). [160°]. Crystalline solid. By boiling its acetic acid solution with a few drops of aqueous HCl it is converted into the benzoyl derivative of imidocoumarin.

DI-o-OXY-DI-PHENYL-IMIDO-THIAZOLE. *Tetrahydride of the di-methyl derivative*

Formed by boiling di-anisyl-thio-urea with C_6H_5Br (Foerster, B. 21, 1364). Prisms. On heating with CS_2 at 200° it yields the compound $\begin{array}{c} N(C_6H_5.O) \\ | \\ CH_2-S \end{array} > CS$ [136°]. — $B_2H_2PtCl_6$: unstable when moist.

p-OXY-PHENYL-INDAZOLE

$C_6H_4 \begin{array}{c} N \\ | \\ CH \end{array} > N.C_6H_5.OH$. [195°]. Formed by boiling its ethyl derivative with $HIAg$ and a little P (Paal, B. 24, 965). Groups of short prisms, v. sol. $HClAg$, sl. sol. ether. — BHI . [200°]. Large yellow plates.

Ethyl derivative. [118°]. Formed by heating a conc. alcoholic solution of the ethyl derivative of o-nitro-benzyl-p-quinol-phenol with tin and HCl. Pearly plates (from alcohol), prisms (from benzene-ligroin), or needles (from dilute $HOAc$). The tin double salt crystallises in yellowish plates [138°].

OXY-PHENYL-INDOLE $C_{11}H_{11}NO$ i.e.

$C_6H_4 \begin{array}{c} C(OH) \\ | \\ NH \end{array} > C_6H_5(?)$. [c. 163°]. Formed by heating the phenyl-hydrazide of o-oxy-acetophenone with $ZnCl_2$ at 160° (Laubmann, A. 243, 246). Amorphous pp., v. sl. sol. ligroin.

DI-o-OXY-DI-PHENYL KETONE v. Di-oxy-BENZOPHENONE.

Di-oxy-di-phenyl-diketone. *Di-methyl derivatives* v. ANISIL. Anisil forms a monooxim [189°] and two di-oxims [197°] and [217°]. The (α)-dioxim [217°] forms a diacetyl derivative [189°], while the (β)-dioxim [195°] forms an isomeric di-acetyl derivative [130°] (Stierlin, B. 22, 877).

o-OXY-PHENYL MERCAPTAN

$C_6H_4(SH)(OH)$. *Thiopyrogallol*. [6°]. [217° cor.]. S.G. $\frac{1}{2}$ 1.237; $\frac{1}{4}$ 1.189. Formed by reducing di-oxy-di-phenyl disulphide with sodium-amalgam (Haitinger, M. 4, 170). Formed also by the action of potassium xanthate on diazophenol chloride, the oxyphenyl ethyl xanthate being subsequently saponified by sodium sulphide (Leuckart, J. pr. [2] 41, 192). Oil, volatile with steam, sl. sol. water. Attacks the skin.

p-Oxy-phenyl mercaptan $C_6H_4(SH)(OH)$. [20°]. [16°]. Formed in like manner from

p-diazophenol (L.). Crystalline mass, forming a bluish-green solution in sulphuric acid. — $Pb(SO_4.C_6H_5.OH)_2$: bulky yellow pp. Oxidised in alcoholic ammoniacal solution by air to di-p-oxy-di-phenyl disulphide [151°].

Acetyl derivative $C_6H_4(SH)(OAc)$. (280°).

Di-acetyl derivative [66°]. Plates.

Ethyl ethers $C_6H_4(SH)(OEt)$, [41°], (277°) and $C_6H_4(SET)(OEt)$, [41°], (287°). Crystalline.

OXY-PHENYL-METHACRYLIC ACID is described as OXY-PHENYL-CROTONIC ACID (q.v.).

OXY-DI-PHENYL-METHANE v. BENZYL-PHENOL.

o-Oxy-tri-phenyl-methane $CHPh.C_6H_5.OH$. [118°]. Formed by passing air through a solution of diazoamido-tri-phenol-methane sulphate, and boiling the product in a current of CO_2 (O. Fischer, A. 241, 362). Sol. alcohol and ether.

Di-p-oxy-di-phenyl-methane $CH_2(C_6H_5.OH)_2$. [158°]. Formed by fusing di-phenyl-methane disulphonic acid with potash (Beck, A. 194, 818). Plates or needles (from hot water), not volatile with steam. Its sodium salts $C_{12}H_9NaO_2$ and $C_{12}H_9Na_2O_2$ form green solutions. — BaA'' .

Di-acetyl derivative [70°]. Prisms.

Di-benzoyl derivative [156°]. Needles.

Di-methyl derivative $CH_2(C_6H_5.OMe)_2$. [52°] (M.); [49°] (B.). (335°). Formed from anisole, methylal, $HOAc$, and H_2SO_4 (Ter Meer, B. 7, 1200). Small plates (from alcohol).

Di-ethyl derivative $CH_2(C_6H_5.OEt)_2$. [39°]. Scales, v. sol. alcohol.

Isomeric v. OXY-DI-PHENYL-CARBINOL.

Di-p-oxy-tri-phenyl-methane

$CHPh(C_6H_5.OH)_2$. *Leucobenzaurin*. [161°]. Formed from di-oxy-tri-phenyl-carbinol, zinc-dust and HCl (Doebner, B. 12, 1483; A. 217, 230). Formed also from di-amido-tri-phenyl-methane by the diazo-reaction (O. Fischer, A. 206, 153), and from benzoic aldehyde, phenol, and H_2SO_4 (Rusanoff, B. 22, 1643). Yellowish needles (from dilute alcohol), sl. sol. hot water. Absorbs atmospheric oxygen when heated above 160°, changing to di-oxy-tri-phenyl-carbinol. Potash-fusion gives di-oxy-benzophenone. Yields a di-nitro-compound [154°].

Di-acetyl derivative [111°]. Plates.

Di-benzoyl derivative [130°].

Tri-oxy-tri-phenyl methane $CH(C_6H_5.OH)_3$. *Leucaurin*. Formed by reducing tri-oxy-tri-phenyl-carbinol (aurin) with zinc-dust and $NaOHAq$ (Dale a. Schorlemmer, A. 166, 286). Colourless prisms (from $HOAc$), sl. sol. water.

Tri-acetyl derivative [139°] (Zulkowsky, A. 202, 197). Small needles.

Tri-benzoyl derivative. Crystals.

Tetra-oxy-di-phenyl-methane? $C_{12}H_{12}O_4$. Formed by fusing orcin with $NaOH$ (Barth, M. 8, 646). Needles, turning brown at 260°.

Tetra-oxy-tri-phenyl-methane $C_{12}H_{12}O_4$, i.e. $CHPh(C_6H_5.OH)_3$. [171°]. Formed by reducing the anhydride of the corresponding carbinol ('resorcinbenzein') with zinc-dust and HCl (Doebner, A. 217, 236). Colourless needles (from dilute alcohol). Reoxidised by alkaline K_2FeO_4 to the anhydride of the carbinol.

Octo-oxy-tri-phenyl-methane. *Methyl derivative* $C_6H_4(OMe)(OH).OH(C_6H_5.OH)_2$. Formed from vanillin (1 pt.), pyrogallol (1.67 pts.), alcohol (20 pts.), and conc. $HClAg$ (50 pts.) (Ettl,

B. 20, 2748).

Oxy-di-phenyl-methyl-pyrazole $C_{18}H_{11}N_2O$ i.e.
 $NPh \begin{matrix} CO-OH \\ NN \end{matrix} CPh$ [150°]. Formed by methyla-

Di-oxy-di-phenyl-tetra-methyl-dipyrazyl
 $\text{NPh.CO} \searrow \text{C.C} \swarrow \text{CO.NPh}$
 $\text{NMe.CMe} \searrow \text{C.C} \swarrow \text{CMe.NMe}$ *Bis-antipyrine.*
 [245*]. Formed by methylation of the preceding
 body (Knorr, 4, 288, 210). Crystals (from MeOH).

nearly insol. water.— $B^+H_2Cl_2$ 2aq.— $B^+H_2PtCl_6$: orange-red prisms. Picrate [o. 161°].

Di-oxy-di-phenyl-di-methyl-dipyrzyl sulphide ($\begin{smallmatrix} NPh.CO \\ N=CMe \end{smallmatrix} > CH$) $_2S$. Formed by adding phenyl-hydrazine (2 mols.) dissolved in HOAc to thio-aceto-acetic ether (1 mol.) in the cold (Buchka a. Sprague, B. 23, 849). Formed also from oxy-phenyl-methyl-pyrazole and SCl_2 in chloroform. Small needles, decomposing at 188° without melting; sl. sol. alcohol, sol. alkalis.

OXY-PHENYL-METHYL-PYRIDAZINE

$NPh < \begin{smallmatrix} CO.CH \\ N:CMe \end{smallmatrix} > OH$. [82°]. Formed, together with its chloro-derivative [137°], from the anhydride of the phenyl-hydrazide of levulinic acid and PCl_5 at 160° (Acq. A. 253, 47). Translucent crystals, v. sol. alcohol. Na added to its alcoholic solutions forms a compound $C_{12}H_{11}N_2$? [200°], coloured violet by H_2SO_4 and CrO_3 .— B^+HCl .

Di-oxy-phenyl-methyl-pyridazine

$NPh < \begin{smallmatrix} CO.CO \\ N:CMe \end{smallmatrix} > CH_2$. [196°]. Formed from the chloro-derivative, mentioned above, by treatment with alcoholic potash, the resulting $NPh < \begin{smallmatrix} CO.CO(OEt) \\ N=CMe \end{smallmatrix} > CH$ [146°] being heated with HCl aq at 130°. White needles, sl. sol. hot water.

OXY-*p*-PHENYL-DI-METHYL-PYRIDINE

$C_{12}H_{11}NO$ i.e. $NPh < \begin{smallmatrix} CMe:CH \\ CMe:CH \end{smallmatrix} > CO$. *Phenyl-lutidine*. [197°]. (above 360°). Formed by the action of aniline on methyl dehydracetate (Perkin, B. 18, 682; C. J. 51, 498), and also by heating its carboxylic acids (Conrad a. Guthzeit, B. 20, 161; 22, 85). Needles or prisms (containing aq), v. sol. hot water and alcohol.— $B^+H_2PtCl_6$: yellow needles (from water).— $B^+C_2H_5(NO_3)_2.OH$. [95°]. Transparent plates.

Oxy-phenyl-di-methyl-pyridine

$NMe < \begin{smallmatrix} CO.CH \\ CMe:CH \end{smallmatrix} > CPh$. *Methyl-phenyl- ψ -picolostyryl*. [112°]. Formed by heating 'methyl-carbo-phenyl-lutidylum dehydride' with conc. HCl aq at 180° (Hantzsch, B. 17, 2915). Prisms. B^+HCl 2aq.— $B^+H_2PtCl_6$ 3aq: crystalline powder. *m-Oxy-(Py. 3)-phenyl-(Py. 1.5)-di-methyl-pyridine* $C_{12}H_{11}NO$ i.e. $C_6H_5(OH).C.NH(CH_3)_2$. *Oxy-phenyl-lutidine*. [191°]. From the corresponding amido-compound by the diazo-reaction. White crystalline solid (Lepetit, B. 20, 2399).— B^+HCl 2aq.— $B^+H_2PtCl_6$. [c. 200°].

OXY-*p*-PHENYL-DI-METHYL-PYRIDINE CARBOXYLIC ACID $C_{14}H_{13}NO_3$ i.e.

$NPh < \begin{smallmatrix} CMe:CH \\ CMe:C(CO_2H) \end{smallmatrix} > CO$. [257°]. Formed by heating the dicarboxylic acid at 227° (Conrad a. Guthzeit, B. 20, 161, 947; 22, 84). Formed also from β -phenyl-amido-acetonic ether and $NaOEt$ at 90° (Knorr, B. 20, 1399). Satiny needles. Melts at 267° when quickly heated.— BaA_2 4aq: needles, v. sol. water.

Methyl ether MeA' . [152°]. Formed from methyl dehydracetate and aniline (Perkin, jun., B. 18, 682; C. J. 51, 498). Needles.

Oxy-phenyl-di-methyl-pyridine dicarboxylic acid $NPh < \begin{smallmatrix} CMe:C(CO_2H) \\ CMe:C(CO_2H) \end{smallmatrix} > CO$. Got by electrolysis of its ether. Prisms, v. sol. hot alcohol.— $Ba(HA'')_2$ aq.

Ethyl ether EtA' . [171°]. Formed by

boiling an acetic acid solution of aniline and the product of the action of $COCl_2$ on cupris acetoneacetic ether (Conrad a. Guthzeit, B. 19, 25; 20, 161). Crystalline solid, v. sol. alcohol.— $B^+H_2PtCl_6$. [120°]. Orange-yellow pp.

m-Oxy-(Py. 3)-phenyl-(Py. 1.5)-di-methyl-pyridine-(Py. 2.4)-di-carboxylic acid $C_{14}H_{11}(OH).C.N(CH_3)_2(CO_2H)_2$. *m-Oxy-phenyl-lutidine-di-carboxylic acid*.

Di-ethyl-ether $A'Et$. [174°]. From the corresponding amido-compound by the diazo-reaction (Lepetit, B. 20, 2398). White needles.

OXY-PHENYL-METHYL-PYRIMIDINE

$CPh < \begin{smallmatrix} N:CMe \\ N.CO \end{smallmatrix} > CH_2$. [216°]. Formed by mixing a solution of benzamidine hydrochloride (1 mol.) with acetoacetic ether (1 mol.) and $NaOH$ (1 mol.). Formed also by the action of benzimidio-ether $CPh(NH).OEt$ on acetoacetic ether at 100° and of benzamidine on acetyl-malonio ether (Pinner, B. 18, 752, 2851; 22, 1624, 2617; 23, 3820). Needles, v. sol. alcohol, sl. sol. water.— $B^+H_2PtCl_6$ 2aq.— $B^+C_2H_5(NO_3)_2.OH$. [189°].— $B^+H_2Cr_2O_5$ 5aq. [177°]. Orange-red prisms.

Acetyl derivative $C_{13}H_{11}N_2O_2$. [41°].

Ethyl derivative $C_{13}H_{13}(OEt)N_2$. [81°].

(300°). Formed from chloro-phenyl-methyl-pyrimidine and $NaOEt$. Thick prisms.— B^+HCl 2aq. [86°].— B^+HCl . [149°].— $B^+H_2PtCl_6$. [197°].— B^+HCl aq. [144°]. Yellow prisms.

Oxy-phenyl-methyl-pyrimidine

$CMe < \begin{smallmatrix} N:CPh \\ N.CO \end{smallmatrix} > CH_2$. [238°]. Formed from acetamidine hydrochloride, benzoyl-acetic ether, and dilute (10 p.c.) $NaOH$ aq (Pinner, B. 22, 1618). Needles, m. sol. hot alcohol.

Oxy-phenyl-di-methyl-pyrimidine

$CPh < \begin{smallmatrix} N:CMe \\ N.CO \end{smallmatrix} > CHMe$. [203°]. Formed from benzamidine hydrochloride, methyl-acetoacetic ether, and $NaOH$ aq (Pinner, B. 22, 1624). Needles.

Oxy-di-phenyl-methyl-pyrimidine

$CPh < \begin{smallmatrix} N:CPh \\ N.CO \end{smallmatrix} > CHMe$. [250°]. S. 1.95 at 20°. Formed from benzamidine and α -benzoyl-propionic ether (E. v. Meyer, J. pr. [2] 30, 197; 40, 303; Schwarz, J. pr. [2] 42, 12). Minute needles. Oxidised by $KMnO_4$ to oxy-di-phenyl-pyrimidine carboxylic acid [236°]. Yields a methyl derivative [122°].

Di-oxy-phenyl-methyl-pyrimidine. *Ethyl derivatives* $C_6H_5(OEt).C < \begin{smallmatrix} N:CMe \\ N.CO \end{smallmatrix} > CH_2$. [146°].

Formed by mixing α -ethoxy-benzamidine hydrochloride with $NaOH$ and acetoacetic ether (Pinner, B. 23, 2953). Short columns, v. sol. alcohol.

• An isomeride [204°] is formed from p -ethoxy-benzamidine and acetoacetic ether or acetyl-malonio ether.

Di-oxy-phenyl-di-methyl-pyrimidine. *Ethyl derivative* $C_6H_5(OEt).C < \begin{smallmatrix} N:CMe \\ N.CO \end{smallmatrix} > CHMe$.

[216°]. Formed from p -ethoxy-benzamidine and methyl-acetoacetic ether (P.). Small prisms.

Reference. — BROMO-OXY-PHENYL-METHYL-PYRIMIDINE.

OXY-PHENYL-DI-METHYL-PYRIMIDINE CARBOXYLIC ACID

$CPh < \begin{smallmatrix} N:CMe \\ N.CO \end{smallmatrix} > CH.CH_2.CO_2H$. [259°]. Got by saponifying its ether. Needles, sl. sol. water.

Di-oxy-di-phenyl-methyl-ψ-thio-urea. *Di-methyl derivative* $C_6H_5(OMe).NH.C(SMe).CO_2H.OMe$. [87°]. Made by heating di-anisyl-thio-urea with MeI at 100° (Foerster, *B.* 21, 1860). Prisms, v. e. sol. hot alcohol. Yields on distillation $MeSH$ and a substance [56°] which on boiling with dilute HCl gives di-anisyl-urea [184°]. — $C_{16}H_{18}N_2SO_2.HCl$: white plates. — $B^+H_3PtCl_6$: prisms.

OXY-PHENYL-NAPHTHYL-ACETIC ACID $CPh(C_6H_5)(OH).CO_2H$. The salt $NaA'2aq$ [145°] is formed from sodium phenyl (α)-naphthyl ketone, water, and CO_2 (Beckmann, *B.* 22, 915).

α-DI-OXY-PHENYL-NAPHTHYL-KETONE $C_6H_5(OH).CO.C_6H_5(OH)$. [c. 106°]. Formed by heating (α)-phenonaphthoxanthone with alcoholic potash at 200° (Phomina, *ed.* 257, 93). Yields a *methyl derivative* [66°], an *acetyl derivative* [137°] and an *acetoxim* [196°].

The *α-isomeride* [169°] yields K_2A' and a *methyl derivative* [68°], an *ethyl derivative* [c. 141°], an *acetyl derivative* [103°], an *acetoxim* [188°], and a *phenyl-hydrazide* [198°].

DI-OXY-DI-PHENYL-OCTANE $OPhPr(OH).CPhPr(OH)$. [84°]. Formed by the action of sodium-amalgam on a solution of phenyl-*n*-propyl ketone in dilute alcohol (Schmidt a. Fieberg, *B.* 6, 499). Needles (from acetone).

Di-oxy-di-phenyl-octane $C_6H_5.CMe(C_6H_5.OH)_2$. [83-5°]. Formed from methyl hexyl ketone, phenol, and HCl (Dianin, *J. R.* 1888, 534). Needles. Yields a di-benzoyl derivative [114°].

OXY-PHENYL-OXANTHRANOL $C_{20}H_{11}O_2$. i.e. $C_6H_5 \begin{smallmatrix} CO \\ \diagup \quad \diagdown \\ C(OH)(C_6H_5.OH) \end{smallmatrix} C_6H_5$. [194°].

Formed by oxidising oxy-phenol-anthranol with $KMnO_4$ (Pechmann, *B.* 13, 1617). Yellowish crystals. Yields anthraquinone on oxidation.

Acetyl derivative $C_{22}H_{13}O_4$. Needles.

Di-oxy-phenyl-oxanthranol v. **PHENOL-PHTHALIDIN**.

OXY-PHENYL-ISO-OXAZOLE

$CPh \begin{smallmatrix} CH \\ \diagup \quad \diagdown \\ N.O \end{smallmatrix} CO$. [147°]. Formed from benzoyl-acetic ether and hydroxylamine in acid, neutral, or ammoniacal solution (Claisen a. Zedel, *B.* 24, 141; Hantzsch, *B.* 24, 502). Needles, sl. sol. cold alcohol. $HClAq$ at 120° yields the oxim of acetophenone. Ammonia forms $CPh \begin{smallmatrix} CH \\ \diagup \quad \diagdown \\ N.O \end{smallmatrix} CONH_2$ [168°]. Yields a

nitroso-derivative $CPh \begin{smallmatrix} C(NO) \\ \diagup \quad \diagdown \\ N.O \end{smallmatrix} CO$ [143°].

DI-OXY-DI-PHENYL OXIDE $C_6H_5.H_2O_2$ i.e. $O(C_6H_5.OH)_2$.? Formed from phenol and CrO_2Cl_2 (Etard, *B.* [2] 28, 276). Amorphous powder. Yields quinone on oxidation, v. **RESORCIN**.

DI-OXY-DI-PHENYL-OXINDOLE $C_{20}H_{11}NO_2$

i.e. $NH \begin{smallmatrix} C_6H_5 \\ \diagup \quad \diagdown \\ CO \end{smallmatrix} C(C_6H_5.OH)_2$. *Phenolisatin*.

[220°]. Formed by adding H_2SO_4 to a mixture of isatin and phenol (Baeyer a. Lazarus, *B.* 18, 2641). White needles, insol. water, sol. alkalis.

Acetyl derivative $C_{22}H_{13}O_4.NaO$. [185°]. Colourless needles (from $HOAc$).

Di-methyl derivative $C_{22}H_{15}Me_2NO_2$. [85°]. Made from anisole, isatin, and H_2SO_4 .

p-OXY-PHENYL PENTADECYL KETONE

Methyl derivative $C_{15}H_{31}.CO.C_6H_5.OMe$. [70-5°]. (280° at 15 mm.). Formed from anisole,

palmityl chloride, and $AlCl_3$ (Krafft, *B.* 21, 2265).

Ethyl derivative [69°]. (289 at 15 mm.). Formed in like manner from phenetole. Plates.

Di-oxy-phenyl pentadecyl ketone. *Di-methyl derivative*. [63-5°]. (290° at 15 mm.). Formed in like manner from the dimethyl derivative of resorcin (K.). Plates.

DI-OXY-PHENYL-PENTANE

$CHPh(OH).CH(OH)Pr$. [82°]. (287°). Formed by the action of alcoholic potash on a mixture of benzoic and isobutyric aldehydes (Soboda, *M.* 11, 390). White crystals, v. sol. ether.

Di-acetyl derivative $C_{15}H_{22}O_4$. [56°]. (307°).

Di-oxy-phenyl-pentane

$CHPh(OH).CH_2.CH_2.CH_2.C_6H_5.OH$. [54°]. Formed by reducing benzoyl-butyl alcohol with sodium-amalgam. The glycol is extracted with ether (Kipping a. Perkin, jun., *C. J.* 57, 312). Needles (from benzene) v. sol. ether.

Di-oxy-di-phenyl-pentane $CF_3(C_6H_5.OH)_2$. [200°]. Formed from di-ethyl ketone, phenol, and HCl (Dianin, *J. R.* 1888, 534). On fusion with $NaOH$ it yields $C_6H_5.C_6H_5.OH$ [76-5°] (253°).

OXY-PHENYL-PENTENOIC ACID v. **OXY-PHENYL-ANGELIC ACID**.

DI-OXY-DI-PHENYL-PENTENOIC ACID.

Di-methyl derivative

$C_6H_5(OMe).CH.CH.CO(C_6H_5.OH).CH.C_6H_5.OMe$. [160°]. Formed from *p*-methoxy-benzoic aldehyde, sodium succinate, and Ac_2O (Fittig a. Politis, *A.* 255, 299). Long yellow needles (from $HOAc$). — $BaA'2aq$: silky plates. — $CaA'2.3aq$. — AgA : light-yellow pp.

OXY-PHENYLPHENYLENE-ANHYDRIDE

QUINONE DIHYDRIDE $C_{22}H_{10}O_2$ i.e.

$CO \begin{smallmatrix} C_6H_5(OH) \\ \diagup \quad \diagdown \\ C_6H_5 \end{smallmatrix} CO \begin{smallmatrix} C_6H_5 \\ \diagup \quad \diagdown \\ C_6H_5 \end{smallmatrix} Ph$. [266°]. Formed by

fusing truxone with potash (Liebermann a. Bergami, *B.* 23, 321). Yellow needles, sl. sol. alcohol. Yields an acetyl derivative $C_{24}H_{18}AcO_2$ [180°], v. sol. $HOAc$.

OXY-DI-PHENYL-PHOSPHINE. *Phenyl derivative* $P(C_6H_5)_2.OPh$. (265°-270° at 62 mm.). S.G. $\frac{2}{3}$ 1.14. V.D. 10.02 (obs.). Got by heating PPH_2Cl with phenol (Michaelis a. La Coste, *B.* 18, 2109). Oil. Readily absorbs oxygen from the air, becoming $(C_6H_5)_2PO.OPh$.

Sulphur yields $(C_6H_5)_2PS.OPh$ [124°]. Selenium forms $Ph_2PSe(OPh)$ [113°]. Yields a crystalline *methyl iodide* [c. 136°] and a benzyl-*chloride* $Ph_2P(OPh)(OPh)C_6H_5.Cl$ [232°-236°].

TETRA-OXY-DI-PHENYL-PHTHALIDE

Anhydride v. **FLUORESCIN**.

OXY-PHENYL-PHTHALIMIDE v. **AMIDOPHENOL**.

DI-OXY-DI-PHENYL-PROPANE

$CM_2(C_6H_5.OH)_2$. [154° cor.]. Got from acetone, phenol, and $BzCl$ (Dianin, *J. R.* 1888, 534). Flat needles. Yields, on soda-fusion, *p*-isopropyl-phenol [61°].

OXY-PHENYL-PROPIOLIC ACID v. **COUMARIC ACID**.

α-OXY-β-PHENYL-PROPIONIC ACID

$C_6H_5.CH_2.CH(OH).CO_2H$. [98°]. Formed from phenyl-acetic aldehyde, HCy , and HCl (Erlenmeyer, *B.* 13, 303; *A.* 219, 179). Got also by reducing phenyl-glycidic acid with sodium-amalgam (Plöchl *B.* 16, 2823). Prisms (from

water). Yields formic acid and phenyl-acetic acid on heating.—BaA', aq: globular aggregates.

Nitrile [58°]. Needles (from benzene).

β-Oxy-β-phenyl-propionic acid

$C_9H_9(OH).CH_2.CO_2H$. [93°]. Formed by the action of sodium-amalgam on the acid $C_9H_9(OH).CHCl.CO_2H$ (Glaser, A. 147, 86) and by boiling *β*-bromo-*β*-phenyl-propionic acid with water (Fittig a. Binder, A. 195, 133). Got also by reducing benzoyl-acetic ether with sodium-amalgam (Porkin, C. J. 47, 254). Prisms, v. sol. cold water. Yields cinnamic acid on heating with baryta-water (Kast, A. 206, 26) or with fuming H_2SO_4 at 100° (Erlenmeyer).—KA'.—BaA', 1:1 aq.—ZnA', 3 aq.—AgA': needles.

Acetyl derivative [100.6°]. Crystals. Yields cinnamic acid when heated with Ac_2O at 120° (Slocum, A. 227, 59).

β-Oxy-α-phenyl-propionic acid

$CH_3(OH).CHPh.CO_2H$. *Tropic acid*. Mol. w. 166. [118°]. S. 2 at 445°.

Formation.—1. By decomposing atropine or hyoscyamine with fuming $HClAq$ or with baryta-water (Lossen, A. 138, 230; Kraut, A. 148, 238; Ladenburg, B. 13, 607).—2. From atropic acid by union with $HOCl$ followed by reduction with zinc dust, iron filings, and conc. KOH aq (Ladenburg a. Rügheimer, B. 13, 379).—3. From *α*-phenyl-propionic acid by heating it with fuming hydrogen chloride at 100° and digesting the resulting acid $CH_3Cl.CHPh.CO_2H$ with aqueous Na_2CO_3 at 120° (Ladenburg, A. 217, 114).—4. From acetophenone cyanhydrin by treatment with HCl ; the resulting chloro-phenyl-propionic acid being treated with sodium carbonate (Spiegel, B. 14, 137, 1352; Merling, A. 209, 5).

Properties.—Needles or tables, v. sol. water. Yields phenyl-acetic acid on fusion with potash. Chromic mixture oxidises it to benzoic acid.

Salts.—CaA', aq.—AgA': crystals.

Reference.—CHLORO-TROPIC ACID.

α-Oxy-α-phenyl-propionic acid

$C_9H_9.CMe(OH).CO_2H$. *Atrolactic acid*. [94°].

Formation.—1. From atropic acid by successive treatment with HBr and aqueous Na_2CO_3 (Fittig a. Wurster, A. 195, 145; 206, 24).—2. By oxidation of *α*-phenyl-propionic acid with alkaline $KMnO_4$ (Ladenburg a. Rügheimer, B. 13, 373; A. 217, 107).—3. By reduction of the dibromo-derivative obtained by the action of H_2SO_4 on a mixture of dibromo-pyruvic acid and benzene (Böttlinger, B. 14, 1438).—4. By dissolving the cyanhydrin of acetophenone in saturated $HClAq$ (Spiegel, B. 14, 1353; Tiemann, B. 14, 1580).

Properties.—Trimetric needles or tables (containing 2 aq); *a:b:c* = 72.4:57. Becomes anhydrous below 85°. Gives rise to atropic acid $CH_3.CPh.CO_2H$ on distillation with HCl .

Salts.—CaA', 8 aq.—BaA', 2 aq.—ZnA', 2 aq: small crystals, v. sl. sol. cold water.

Ethyl derivative $CMePh(OEt).CO_2H$. *Ethyl-tropic acid*. [c. 62°]. Formed from acetophenone by treatment with PCl_5 , acting upon the resulting $Ph.CCl_2Me$ with KCy and dilute alcohol, and saponifying the product with baryta. Small prisms, sol. hot water.

Nitrile. Formed from acetophenone, KCy and HCl (S.). Oil.

p-Oxy-α-phenyl-propionic acid

$CH_3(OH).CHMe.CO_2H$. *Phloretic acid*. [129°].

Formed from phloretin (7g.) and KOH (55 g. of S.G. 1.2) by boiling for 3 hours (Hlasiwetz, J. 1855, 700; Schiff, A. 172, 357). Formed also from amido-phenyl-propionic acid by diazo-reaction (Trinius, A. 227, 268). Yellowish needles. V. sol. hot water, sol. alcohol and ether, insol. CS_2 . Yields *p*-oxy-benzoic acid on fusion with potash. On heating with phloroglucin at 180° it yields the crystalline phloroglucide $C_{14}H_{10}O_4$. Heating with $VOCl_3$ forms crystalline triphloretide $C_{14}H_{10}O_6$. Phloretic acid gives a green colour with $FeCl_3$, possibly due to phloroglucin.

Salts.—BaA', 2 aq.—CuA', (at 120°).

Ethyl ether EtA' (above 265°).

Isoamyl ether $C_5H_{11}A'$ (above 290°).

Methyl derivative

$C_9H_9(OMe).CHMe.CO_2H$. [103°]. S. 11 at 25°. Got by methylation (Körner a. Corbetta, B. 7, 1732). Yields BaA', 2 aq and MeA' [38°] (278°).

Ethyl derivative [106.5°]. Scales.

Amide $C_9H_9.NO_2$. [110°–115°]. Prisms.

Isophloretic acid, made by boiling isophloretin with KOH aq (Rochleder, Z. 1868, 711) is probably identical with phloretic acid.

γ-Oxy-β-phenyl-propionic acid

$C_9H_9(OH).CH_2.CH_2.CO_2H$. *Melilotic acid*. *Hydrocoumaric acid*. [83°]. S. 5 at 18°; 109 at 40°. Occurs, partly combined with coumarin, in yellow melilot (*Melilotus officinalis*) (Zwenger a. Bodenbender, A. 126, 257; Suppl. 5, 100). Formed by reducing coumarin with sodium-amalgam (Zwenger, A. Suppl. 8, 32; Dyson, C. J. 51, 70; Hochstetter, A. 226, 355; Tiemann, B. 10, 286). Trimetric crystals. Its ammoniacal solution turns blue in air. Yields salicylic acid when fused with potash. Conc. HBr aq converts it into the anhydride.

Salts.—KA' aq.—BaA', 3 aq.—CaA', 3 aq.—MgA', 4 aq.—CuA', aq.—PbA', 2 aq.—ZnA', aq.—AgA': bulky pp.

Ethyl ether EtA'. [34°]. Prisms.

Methyl derivative

$C_9H_9(OMe).CH_2.CH_2.CO_2H$. [92°]. Crystals (from alcohol) (Perkin, C. J. 39, 416).

Ethyl derivative

$C_9H_9(OEt).CH_2.CH_2.CO_2H$. [80°]. Needles (from dilute alcohol). Yields the salts $Ba(C_9H_9O_2)_2$ and CaA_2 2 aq (Fittig a. Ebert, A. 216, 153).

Anhydride $C_9H_8O_2$. *Hydrocoumarin*. [25°]. (272°). Got by distilling the acid. Tables, sl.

sol. hot water. Its oxim $C_9H_8O_2 \xrightarrow{O} C(OH)$ is oily (Tiemann, B. 19, 1664).

Amide $C_9H_9.NO_2$. [70°]. Needles.

m-Oxy-β-phenyl-propionic acid

$C_9H_9(OH).CH_2.CH_2.CO_2H$. [111°]. Formed by reduction of *m*-coumaric acid (Tiemann a. Ludwig, B. 15, 2050). Long needles, insol. ligroin.

Methyl derivative [c. 61°]. Needles.

p-Oxy-β-phenyl-propionic acid

$[4:1]C_9H_9(OH).CH_2.CH_2.CO_2H$. *Hydroparacoumaric acid*. [129°]. Occurs in very slight quantity in human urine (Baumann, H. 4, 367). Formed by reducing paracoumaric acid with sodium-amalgam (Hlasiwetz a. Malin, A. 142, 358). Formed also from *p*-nitro-cinnamic ether by reduction followed by the diazo-reaction (Stöhr, A. 225, 57; cf. Buchanan a. Glaser, Z. 215, 193). Occurs in putrid meat (Salkowski, B. 13, 190). Formed also by putrefactive fermentation of tyrosine (Baumann, B. 12, 1450;

18, 279). • Monoclinic prisms (from ether), sl. sol., acid water. Gives a bluish-grey colour with FeCl_3 . Yields *p*-oxy-benzoic acid when fused with potash.— BaA , — ZnA , 2aq. S. 77 in the gold.— CaA , 2aq.— AgA : minute needles.

Ethyl ether EtA. Liquid smelling like rhubarb.

Methyl derivative

$\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. *Hydro- α -ethyl-naringenic acid*. [102°]. Feathery crystals or long white needles.— A'Ag : small needles, sl. sol. hot water.— A'Ba 2aq.

Di-methyl ether of the methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CH}_2\text{CO}_2\text{Me}$: [38°]; [265°–270°]. Formed by methylation of *p*-hydro-coumaric acid (Eigl, B. 20, 2531).

Amide $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{CH}_2\text{CONH}_2$. Needles. *α -Oxy- β -di-phenyl-propionic acid*

$\text{CHPh}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. [159°]. Formed by saponifying its ether with alcoholic potash. Thin needles, v. sol. alcohol. Forms a compound [c. 53°] when heated with dilute H_2SO_4 at 180°.

Ethyl ether EtA. [66°]. Got from di-phenyl-acetic aldehyde-cyanhydrin by conversion by alcoholic hydrochloric acid into $\text{CHPh}_2\text{CH}(\text{OH})\text{C}(\text{OEt})(\text{NH}_2\text{Cl})$ [106°] and decomposition of this body by water (Weise, A. 248, 43). Small plates, insol. water.

Acetyl derivative [53°]. Prisms.

[4:3:1] *Di-oxy-phenyl-propionic acid* $\text{C}_6\text{H}_3(\text{OH})_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. *Hydrocaffeic acid*. Formed by reducing caffeic acid with water and sodium-amalgam (Hlasiwetz, A. 142, 353). Trimetric crystals, v. sol. water. Its salts are gummy.

Methyl derivative

[4:3:1] $\text{C}_6\text{H}_3(\text{OH})_2(\text{OMe})\text{CO}_2\text{H}$. [90°]. Formed by reducing ferulic acid with sodium-amalgam (Tiemann a. Nagai, B. 11, 650; 14, 965). Minute tables, v. sol. alcohol.

Methyl derivative

[4:3:1] $\text{C}_6\text{H}_3(\text{OMe})_2(\text{OH})\text{CO}_2\text{H}$. [147°]. Formed by reduction of isoferulic acid (Tga. N.). Needles.

Di-methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. [97°]. Formed by reduction of $\text{C}_6\text{H}_3(\text{OMe})_2\text{CH}(\text{CH}_3)\text{CO}_2\text{H}$ (T. a. N.). Slender needles (containing aq.).

Methylene derivative

$\text{CH}_2 \begin{array}{c} \diagup \diagdown \\ \text{C}_6\text{H}_4 \end{array} \text{C}_6\text{H}_4\text{CH}_2\text{CO}_2\text{H}$. *Pipero-propionic acid*. [85°]. Formed by reduction of $\text{CHO}_2\text{C}_6\text{H}_4\text{CH}_2\text{CH}(\text{CO}_2\text{H})$ (Lorenz, B. 13, 753) and by oxidising (β)-hydropiperic acid with Na_2CO_3 and KMnO_4 (Regel, B. 20, 421). Needles (from ligroin), sl. sol. cold water.— CaA , aq.— AgA : feathery crystals.

(4,2,1)-Di-oxy-phenyl-propionic acid

$\text{C}_6\text{H}_3(\text{OH})_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. Formed by reducing umbelliferone with sodium-amalgam (Hlasiwetz a. Grabowski, A. 139, 102). Crystalline, decomposing at 110°. Yields resorcinol when fused with potash.

Di-methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. [105°]. Formed by reduction of the di-methyl derivatives of (α)- and (β)-umbelliferone with sodium-amalgam (Hlasiwetz a. Grabowski, A. 139, 102). Crystalline, decomposing at 110°. Yields resorcinol when fused with potash.

α -Di-oxy-phenyl-propionic acid

$\text{C}_6\text{H}_3(\text{OH})_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. *Salicyllactic acid*. Formed by reduction of α -oxy-phenyl-glycidic

acid with sodium-amalgam (Plöchl, B. 18, 1188). Syrup.— ZnA , — CaA , 6aq: prisms, v. sol. Aq.

α -Di-oxy-phenyl-propionic acid

$\text{C}_6\text{H}_3(\text{OH})_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. [144°]. Made from the corresponding di-amido-acid by the diazo-reaction (Erlenmeyer a. Lipp, A. 219, 226). Hemispherical groups of needles (containing aq) (from water at 0°), m. sol. alcohol. Melts at 140° after fusion.— CaA , 8aq.— CaA , 6aq: small crystals.

Di-oxy-phenyl-propionic acid

[4:1] $\text{C}_6\text{H}_3(\text{OH})_2\text{CH}(\text{OH})\text{CO}_2\text{H}$ (?). [164°]. Occurs in urine of dogs fed with much tyrosine (Blendermann, II. 6, 256). Needles (containing aq), m. sol. cold water.

α -Di-oxy-phenyl-propionic acid

$\text{CHPh}(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$. *β -Phenyl-glyceric acid*. [141°]. Formed by the action of alkalis on $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CHClCO}_2\text{H}$ (Glaser, A. 247, 98; Lipp, B. 16, 1287), and by oxidising coumaric acid with dilute KMnO_4 (Pittig, B. 21, 920). Monoclinic plates (from ether). At 100° it yields phenyl-acetic aldehyde. Gaseous HCl yields $\text{C}_6\text{H}_5\text{CHClCH}(\text{OH})\text{CO}_2\text{H}$ (Erlenmeyer, *Ann.*, B. 20, 2466).— AgA : amorphous p.

Di-benzoyl derivative [147°]

Di-benzoyl derivative of the methyl ether [114°]. Formed by the action of AgOEt on $\text{CHPhBrCHBrCO}_2\text{Me}$ (Anschtütz a. Kinnick, B. 12, 538). Small monoclinic crystals.

Di-benzoyl derivative of the ethyl ether $\text{CHPh}(\text{OBz})\text{CH}(\text{OBz})\text{CO}_2\text{Et}$. [109°].

Isomeride v. ARNOLESCURIC ACID.

Di-oxy-di-phenyl-propionic acid $\text{C}_6\text{H}_4\text{O}_2\text{aq}$ i.e. $\text{CH}_2\text{C}(\text{C}_6\text{H}_4\text{OH})_2\text{CO}_2\text{H}$. Made from phenol, pyruvic acid, and H_2SO_4 at 0° (Böttlinger, B. 16, 2071). Amorphous mass, carbonising above 268°, v. sol. acetone. Yields an amorphous diacetyl derivative.

Tri-oxy-phenyl-propionic acid. Tri-ethyl derivative $\text{C}_6\text{H}_3(\text{OEt})_3\text{C}_2\text{H}_5\text{CO}_2\text{H}$. [77°]. Formed by reduction of the tri-ethyl derivative of (α)- or (β)-ascetic acid with sodium-amalgam (Will, B. 16, 2111).

An isomeric acid [85°] is got by reducing the di-ethyl derivative of daphnetic acid (Will a. Jung, B. 17, 1087).

Hexa-oxy-di-phenyl-propionic acid $\text{C}_6\text{H}_4\text{O}_6$ i.e. $\text{CH}_2\text{C}(\text{C}_6\text{H}_4(\text{OH})_2)_2\text{CO}_2\text{H}$. [132°]. Formed, together with amorphous $\text{C}_6\text{H}_4\text{O}_6$, from pyrogallol, pyruvic acid, and H_2SO_4 at 0° (Böttlinger, B. 16, 2104). Resinous mass. Yields $\text{C}_6\text{H}_4\text{O}_6$ heated with Ac_2O , the compounds $\text{C}_6\text{H}_4\text{O}_6\text{Ac}_2\text{O}$ [110°] and $\text{C}_6\text{H}_4\text{O}_6\text{Ac}_2\text{O}$ [c. 200°].

References.—BROOK, CHLORO, CHLORO-NITRO-, and IODO-, OXY-PROPIONIC ACIDS.

p-OXY-DI-PHENYL-PROPYLENE-DIAMINE. Me-

thyl derivatives $\text{C}_{10}\text{H}_9\text{NO}$ i.e. $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CHPhCH}_2\text{NH}_2$. Formed from the anethyl derivative of α -phenyl-*p*-coumaric nitrile by reduction with alcohol and sodium (Freund a. Remse, B. 23, 2864). Yellow liquid, slightly volatile with steam.— $\text{B'H}_2\text{PtCl}_4$. [195°]. Aurolchloride [87°]. Golden plates.

p-OXY-DI-PHENYL-PROPYLENE-DIAMINE

$\text{C}_{10}\text{H}_9\text{N}_2\text{O}$ i.e. $\text{CH}(\text{OH})(\text{CH}_2\text{NHPh})_2$. [84°]. Made by the action of aniline on epichlorhydrin (Fauconnier, C. R. 107, 250). Needles (from alcohol). — $\text{B'H}_2\text{C}_2\text{O}_4$ 13aq. [50°]. $\text{B'H}_2\text{PtO}_4$ 4aq: yellow plates.

Acetyl derivative $C_{11}H_{11}AcON_2O_4$. [100°]. Prisms.

Nitrosamine $C_6H_5(NO)N_2O$. [109°].

DI-*p*-OXY-DI-PHENYL-PROPYLENE. *Di-methyl derivative* $CH_3CH_2C(C_6H_5OMe)_2$. [101°]. Formed from anisole, $AlCl_3$, and propionyl chloride (Gattermann, *B.* 22, 1150). Plates. Yields $CO(C_6H_5OMe)_2$ on oxidation. The homologous $CH_3CH_2C(C_6H_5OEt)_2$ crystallises in needles [77°].

OXY-PHENYL ISOPROPYL KETONE.

Ethyl derivative $C_6H_5(OEt).CO.CHMe_2$. [41°]. Made from isobutyl chloride, C_6H_5OEt , and $AlCl_3$ (Gattermann, *B.* 23, 1200). Tables (from ether). Yields an oxim [111°] crystallising in needles.

Oxy-phenyl propyl ketone $C_6H_5.CO.C_3H_7OH$. [91°]. (c. 280°). Formed from phenol and butyl chloride (Perkin, *C. J.* 55, 546). Pearly plates.

DI-OXY-PHENYL-ISOPROPYL-PYRIMIDINE $CH_2C(Ph-N)C(OMe)(OH)$. [198°].

Formed from oxy-isobutylamide hydrochloride, benzoyl-acetic ether, and $NaOH$ (Pinner, *B.* 22, 2625). Prisms (from alcohol or benzene).

OXY-TRI-PHENYL-PROPYL-PYRROLE

C_6H_5NO is. $NPhCO.C_3H_7$. [105°]. Formed from $C_6H_5CBz:CHN$ and alcoholic propylamine at 100° (Japp a. Klingemann, *C. J.* 57, 706). Monoclinic prisms [95°-98°] or trimetric prisms [105°]; $a:b:c = 694:1:765$.

DI-OXY-DI-PHENYL-PROPYL-ψ-THIO-UREA. *Di-methyl derivative* $O(SPh)(NH.C_6H_5OMe).N.C_6H_5OMe$. [58°]. Made from di-anisyl-thio-urea and propyl chloride (Foerster, *B.* 21, 1864). Plates, insol. water.

OXY-DI-PHENYL-PYRAZINE. *Tetra-*

hydride $NPhCH_2CH_2NPh$. [148°]. Formed from di-phenyl-ethylene-diamine, chloro-acetic acid, and $NaOAc$ at 170° (Bischoff a. Nastvogel, *B.* 22, 1783; 23, 2026). Crystalline. Insol. Aq.

Di-oxy-di-phenyl-pyrazine. *Dihydride* $NPhCH_2CH_2NPh$. *Di-phenyl-αβ-diacipiperazine*. [258°]. Got by oxidising the above with CrO_3 and $HOAc$, and also by heating di-phenyl-ethylene-diamine with oxalic acid at 200° (B. a. N.). Plates, v. sl. sol. alcohol and ether. Nitrous acid forms $C_6H_5N_2O_4$ [290°].

Di-oxy-di-phenyl-pyrazine. *Dihydride* $NPhCH_2CH_2NPh$. *Diphenyl-αγ-diacipiperazine.* *Di-oxy-di-phenyl-pyrazine dihydride*. [263°]. Made from aniline and chloro-acetic acid (Hausdörfer, *B.* 22, 1797; cf. Meyer, *B.* 10, 1967; Abenius, *J. pr.* [2], 40, 431). Needles.

Alcoholic potash forms phenyl-amido-acetic acid [127°] on boiling, and in the cold produces $NHPh.CH_2.CO.NPh.CH_2.CO_2H$ [130°].

Di-oxy-phenyl-pyrazine. *Dihydride* $NPhCH_2CH_2NPh$. [158°]. Made from aniline and chloro-acetic amide (B.). Prisms.

Di-oxy-di-phenyl-pyrazine. *Dihydride* $NPhCH_2CH_2NPh$. *Diphenyl-αβ-diacipiperazine.* [152°]. Formed by heating the mono-anilide of phenyl-imido-diacetic acid with Ac_2O

at 160° (Bischoff, *B.* 23, 1900). Needles. Nitrous acid yields $C_6H_5N_2O_4$ [c. 95°] crystallising in golden plates.

Di-p-oxy-di-phenyl-pyrazine. *Di-methyl derivative of the hexahydride*

$C_6H_5(OMe)NCH_2CH_2N.C_6H_5OMe$. [288°].

Formed from *p*-anisidine, ethylene-bromide, and $NaOAc$ (Bischoff, *B.* 22, 1782). Tables.

Di-ethyl derivative of the hexahydride. [223°]. Gives a nitroso-derivative [c. 80°].

Tri-oxy-di-phenyl-pyrazine. *Di-ethyl derivative of the tetrahydride*

$C_6H_5(OEt)NCH_2CH_2N.C_6H_5OEt$. [162°].

Formed from $C_6H_5(NH.C_6H_5OEt)_2$ by heating with chloro-acetic acid and fused $NaOAc$ at 150° (Bischoff, *B.* 23, 2030). Crystals, sl. sol. ether.

Tetra-oxy-di-phenyl-pyrazine. *Di-ethyl derivative of the dihydride*

$C_6H_5(OEt)NCH_2CO.N.C_6H_5OEt$. [265°].

Formed by heating *p*-ethoxy-phenyl-amido-acetic acid at 260° (B. a. N.). Needles.

OXY-PHENYL-PYRAZOLE $C_6H_5(OH)N_2$.

[153°]. Got from bromo-oxy-phenyl-pyrazole by reduction with sodium-amalgam (Fischer a. Knoevenagel, *A.* 239, 201). Needles. Sol. conc. HCl and alkalis. The Na salt forms needles.

Oxy-phenyl-pyrazole tetrahydride $C_6H_5N_2O$

is. $NPhCH_2CH_2NPh$. [104°]. Formed by the action of phenyl-hydrazine on epichlorhydrin in ethereal solution at 15° (Gerhard, *B.* 24, 352). Pearly prisms (from ether), v. sol. warm water. Yields aniline and phenyl-pyrazole on boiling with phenyl-hydrazine hydrochloride in benzene solution. Forms an acetyl derivative.—Salt: $B_2H_4PtCl_4$ 2aq. [166°]. Yellowish-red prisms.

Oxy-di-phenyl-pyrazole $NPhCH_2CH_2NPh$. *Di-phenylpyrazolone*. [251°]. Formed by heating cinnamoyl-phenyl-hydrazine (Knorr, *B.* 20, 1108). Needles (from alcohol), exhibiting green fluorescence.

Oxy-di-phenyl-pyrazole $NPhCH_2CH_2NPh$.

[137°]. Formed from benzoyl-acetic ether and phenyl-hydrazine (Knorr a. Klotz, *B.* 20, 2546). Yields, with nitrous acid, the red compound $NPhCH_2CH_2NPh$. [200°]. Diazobenzene chloride forms $C_6H_5N_2O(NPh)$ [171°]. Phenyl-hydrazine converts it into di-oxy-tetra-phenyl-dipyrazyl melting above 300°. — $BHCl$. — BH_4SO_4 . Powder. Decomposes at 237°.

Oxy-di-phenyl-pyrazole $NPhCH_2CH_2NPh$.

[196°]. Formed from α -phenyl-glyoxylic acid and phenyl-hydrazine (Wislicenus, *B.* 20, 2982). Plates (from $EtOH$), sol. alkalis, sl. sol. ether.

Di-oxy-phenyl-metapyrazole $C_6H_5N_2O$, probably $C_6H_5CH=N$

$C(OH):N$. [182°]. Obtained by boiling phenyl-uramido-aceto-nitrile $C_6H_5CH(ON).NH.CO.NH_2$ (from benzaldehyde-cyanhydrin and urea) with dilute HCl . Colourless dimetric plates. Dissolves readily in alkalis (Pinner a. Lifschütz, *B.* 20, 2355).

OXY-PHENYL-PYRAZOLE CARBOXYLIC

ACID $C_8H_7N_2O_4$, i.e. $NPh \cdot \begin{smallmatrix} N \\ \diagup \quad \diagdown \\ C(OH) \end{smallmatrix} \cdot \begin{smallmatrix} CO_2H \\ \diagup \quad \diagdown \\ CO_2H \end{smallmatrix}$. [263°].

Formed by the action of HCl or NaOH on the phenyl-hydrazide of oxalacetic ether (Buehner, B. 22, 2931). Colourless needles, v. sl. sol. cold water. FeCl₃ colours its solution dark blue.

Ethyl ether [182°]. Formed by heating the above phenyl-hydrazide by itself (Wislicenus, A. 246, 806).

OXY-PHENYL-PYRIDINE C_8H_7NO . Formed by heating aniline chelidonate (Tereh, M. 5, 407). Crystallises from water in needles (containing aq.).

Oxy-di-phenyl-pyridine $C_{17}H_{13}NO$ i.e. $NH \cdot \begin{smallmatrix} CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CO \\ \diagup \quad \diagdown \\ CO \end{smallmatrix}$. [267°]. Formed by heating dehydro-benzoyl-acetic acid with alcoholic NH₃ at 160° (Feist, B. 23, 3736). Plates.

DI-OXY-PHENYL-PYRIDINE CARBOXYLIC ACID $C_{18}H_{11}(OH)_2NPh \cdot CO_2H$. Made by boiling a solution of cinnamic acid with aniline (Mennel, J. pr. [2] 32, 177). Tetrahedra (containing aq.) m. sol. water. Coloured violet by FeCl₃.

OXY-PHENYL-PYRIMIDINE $C_{10}H_7N_2O$ i.e. $CPh \cdot \begin{smallmatrix} N-CH \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \cdot \begin{smallmatrix} CO_2H \\ \diagup \quad \diagdown \\ CO_2H \end{smallmatrix}$. [199°]. Made by heating its carboxylic acid (Pinner, B. 22, 2616). Small prisms, sl. sol. hot aq., v. sol. alkalis and acids.

Oxy-di-phenyl-pyrimidine $C_{16}H_{11}N_2O$ i.e. $CPh \cdot \begin{smallmatrix} N-CH \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \cdot \begin{smallmatrix} CO_2H \\ \diagup \quad \diagdown \\ CO_2H \end{smallmatrix}$. [284°]. Formed from benzamidinehydrochloride, benzoyl-acetic ether, alcohol, and dilute (10 p.c.) NaOH (Pinner, B. 22, 1626). Formed also by heating amido-di-phenyl-pyrimidine with HClAq at 180° (Schwarze, J. pr. [2] 42, 15). Needles, v. sl. sol. hot alcohol.

Oxy-tri-phenyl-pyrimidine $C_{22}H_{15}N_2O$. [340°]. Formed by heating the corresponding amido-compound with HClAq at 170° (Wache, J. pr. [2] 39, 255). Needles.

Di-oxy-di-phenyl-pyrimidine. *Ethyl derivative* $C_8H_7(OEt)_2C \cdot \begin{smallmatrix} N \cdot CPh \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \cdot \begin{smallmatrix} CO_2H \\ \diagup \quad \diagdown \\ CO_2H \end{smallmatrix}$. [274°]. Formed from p-ethoxy-benzamidine and benzoyl-acetic ether (Pinner, B. 23, 2955).

OXY-PHENYL-PYRIMIDINE CARBOXYLIC ACID $C_8H_7 \cdot \begin{smallmatrix} N \cdot C(CO_2H) \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \cdot \begin{smallmatrix} CO_2H \\ \diagup \quad \diagdown \\ CO_2H \end{smallmatrix}$. [247°]. Formed from benzamidine hydrochloride, oxalacetic ether, and dilute (10 p.c.) NaOH (Pinner, B. 22, 1626, 2616). Granules, sl. sol. water. —BaA'. —CaA'. Prisms. —Amide: prisms, sl. sol. water. —Benzamidide $C_{18}H_{11}N_4O$, [263°].

Oxy-di-phenyl-pyrimidine carboxylic acid $C_8H_7 \cdot \begin{smallmatrix} N \cdot CPh \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \cdot \begin{smallmatrix} CO_2H \\ \diagup \quad \diagdown \\ CO_2H \end{smallmatrix}$. [236°]. Made by oxidising oxy-di-phenyl-methyl-pyrimidine with KMnO₄ (E. von Meyer, J. pr. [2] 40, 303). Yellowish prisms (from alcohol). Yields oxy-di-phenyl-pyrimidine [284°] on heating.

Di-oxy-phenyl-pyrimidine carboxylic acid. *Ethyl derivative* $C_8H_7(OEt)_2C \cdot \begin{smallmatrix} N \cdot C(CO_2H) \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \cdot \begin{smallmatrix} CO_2H \\ \diagup \quad \diagdown \\ CO_2H \end{smallmatrix}$. [246°]. Made from p-ethoxy-benzamidine and oxalacetic ether (Pinner, B. 23, 2956). Needles, sl. sol. hot alcohol. —Salt $C_8H_7(OEt)_2CN \cdot H_2A'$. [280°].

Vol. III.

OXY-TRI-PHENYL-PYRROLE $C_{22}H_{15}NO$ i.e.

$NH \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix}$. Mol. w. 311. [221°]. Formed by boiling $C_8H_7 \cdot CBz \cdot CHBz$ for a long time with alcoholic ammonia (Japp a. Klingemann, B. 22, 2884; C. J. 57, 682). Triclinic crystals; $\alpha:\beta:\gamma = 779:1:513$; $\alpha = 78^\circ 56'$; $\beta = 73^\circ 23'$; $\gamma = 87^\circ 32'$ (Tutton, C. J. 57, 720). Sl. sol. hot alcohol.

Dihydride $NH \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix}$. [201°]. Formed by reduction with sodium and amyl alcohol. Ac₂O at 180° yields an acetyl derivative $NAc \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix}$. [105°].

Oxy-tri-phenyl-pyrrole

$C_8H_7(OH) \cdot N \cdot \begin{smallmatrix} CPh \cdot CH \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CPh \cdot CH \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix}$. [176°]. Made by heating its carboxylic acid with lime (Paal a. Braikoff, B. 22, 3094). Yellowish needles, v. sol. alkalis.

Oxy-tetra-phenyl-pyrrole

$C_{22}H_{15}NO$ i.e. $NH \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix}$. [207°]. Formed by heating $CPhBz \cdot CPhBz$ with alcoholic NH₃ at 200° (Klingemann a. Laycock, C. J. 59, 144; B. 24, 513). Pale-yellow plates.

Dihydride $NH \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CO \cdot CPh \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix}$. [237°].

Oxy-tetra-phenyl-pyrrole $C_{22}H_{15}NO$. [162°]. Formed from $CPhBz \cdot CHBz$ and alcoholic NH₃ at 200°. Yellow prisms. Changed into the isomeride [207°] by heating to 310°.

OXY-TRI-PHENYL-PYRROLE CARBOXYLIC

ACID $C_{23}H_{17}(OH) \cdot N \cdot \begin{smallmatrix} CPh \cdot CO_2H \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix} \cdot \begin{smallmatrix} CPh \cdot CO_2H \\ \diagup \quad \diagdown \\ CPh \end{smallmatrix}$. [245°].

Made from its ethyl ether [159°] which is got by the action of o-amido-phenol on phenacyl-benzoyl-acetic ether (Paal a. Braikoff, B. 22, 3093). Nodular groups of needles, v. sol. ether.

OXY-PHENYL-QUINAZOLINE

Dihydride $C_8H_7 \cdot \begin{smallmatrix} CH \cdot NPh \\ \diagup \quad \diagdown \\ NH \cdot CO \end{smallmatrix}$. [143°]. Formed from phenyl-o-oxy-tolyl-urea and HCl (Söderbaum a. Widman, B. 22, 1670). Needles.

Oxy-phenyl-quinazoline

$C_8H_7 \cdot \begin{smallmatrix} C(OH) \cdot N \\ \diagup \quad \diagdown \\ N = CPh \end{smallmatrix}$. [234°]. S. (alcohol) 2. Formed by heating benzoyl-o-amido-benzamide (Körner, J. pr. [2] 36, 157). Needles, insol. water. —B₂H₂PtCl₆: brick-red needles.

Oxy-phenyl-quinazoline $C_8H_7 \cdot \begin{smallmatrix} CO \cdot NPh \\ \diagup \quad \diagdown \\ N = CH \end{smallmatrix}$. [189°]. Formed by oxidation of phenyl-quinazoline dihydride with KMnO₄ (Paal a. Busch, B. 22, 2691). Plates, v. sol. benzene. With hydrazine N₂H₄ it forms $C_8H_7 \cdot \begin{smallmatrix} C(NH_2) \cdot NPh \\ \diagup \quad \diagdown \\ N = CH \end{smallmatrix}$. [204°]. —B'HCl. [214°]. —Platinocchloride [above 300°]. Yellow needles.

Di-oxy-phenyl-quinazoline. *Dihydride* $C_8H_7 \cdot \begin{smallmatrix} CH \cdot C \cdot N = CPh \\ \diagup \quad \diagdown \\ CO \cdot CH_2 \cdot CO(OH) \cdot N \end{smallmatrix}$. [272°]. Formed from di-oxy-terephthalic ether, dihydride, and benzamidine (Pinner, B. 22, 2623). Slender needles, sol. alkalis, v. sol. alcohol.

OXY-PHENYL-QUINAZOLINE CARBOXYLIC

ACID $C_8H_7 \cdot \begin{smallmatrix} N = CH \\ \diagup \quad \diagdown \\ CO \cdot N \cdot C \cdot CO_2H \end{smallmatrix}$. [320°]. Made by oxidising oxy-p-tolyl-quinazoline (Paal a. Busch, B. 22, 2688). White crystals.

(a) -OXY-(Py. 1)-phenyl-quinoline

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{C}_6\text{H}_5\text{OH})\text{CH} \\ \text{OH} \end{smallmatrix}$. Phenol-quinoline. [243°]. Formed by diazotising (a)-amido-(Py. 1)-phenyl-quinoline [150°], and boiling the dilute H_2SO_4 solution (Koenigs a. Nef, B. 20, 629). Colourless flat needles or plates. Volatilises undecomposed. V. sol. alcohol and chloroform, sl. sol. benzene, nearly insol. ether. By CrO_3 and H_2SO_4 , it is oxidised to cinchoninic acid. The sulphate yellow tables; both are v. sol. hot water, sl. sol. cold. The platinum-chloride forms hair-fine yellow needles, v. sol. conc. HCl . The K and Na salts are colourless glistening plates, which dissolve in water with a yellow colour.

(B. 4)-Oxy-(Py. 1)-phenyl-quinoline

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{C}_6\text{H}_5\text{OH})\text{CH} \\ \text{OH} \end{smallmatrix}$. Phenol-quinoline. [235°]. Formed by diazotising the corresponding amido-compound [198°] and boiling the dilute H_2SO_4 solution (Koenigs a. Nef, B. 20, 630). Colourless granular crystal. Sl. sol. alcohol, nearly insol. ether. Volatilises undecomposed. Dissolves with a yellow colour in alkalis and acids. By CrO_3 and H_2SO_4 , it is oxidised to cinchoninic acid. KOH fusion yields di-oxy-phenyl-quinoline [305°]. The sulphate crystallises in glistening yellow needles, the hydrochloride in yellow tables; both are m. sol. cold water.

o-Oxy-(Py. 3)-phenyl-quinoline

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{CH}:\text{CH} \\ \text{N}=\text{C}_6\text{H}_4\text{OH} \end{smallmatrix}$. [115°]. Got by heating its (Py. 1)-carboxylic acid [238°] (Doebner, A. 249, 101f. Light-yellow needles (from alcohol), sol. alkalis and acids.— $B^+H_2PtCl_6$ — $B^+C_6H_5N_2O_2$, [184°]. Yellow needles.

m-Oxy-(Py. 3)-phenyl-quinoline

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{CH}:\text{CH} \\ \text{N}=\text{C}_6\text{H}_4\text{OH} \end{smallmatrix}$. [156°]. Formed by the action of nitrous acid upon m-amido-phenyl-quinoline (Miller a. Kinkelin, B. 18, 1908). Long needles, v. sol. alcohol and ether.

p-Oxy-(Py. 3)-phenyl-quinoline

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{CH}:\text{CH} \\ \text{N}=\text{C}_6\text{H}_4\text{OH} \end{smallmatrix}$. [238°]. Formed from the amido-compounds (Weidel, M. 8, 127). Monoclinic needles, insol. water, v. sol. hot benzene. Yields quinoline carboxylic acid [157°] on oxidation. Yields a crystalline tetrahydride on reduction.— B^+HCl_2 2aq.— $B^+H_2PtCl_6$.

Methyl derivative [123°]. Plates.

(Py. 1, 4)-Oxy-phenyl-quinoline

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{OH})\text{CH} \\ \text{N}=\text{C}_6\text{H}_4\text{OH} \end{smallmatrix}$. [254°]. Formed, by heating to 250° from the phenyl-3-amido-cinnamic ether $NPhH.CPh.CH.CO_2Et$, got by the action of aniline on benzoyl-acetic ether (Cofrad a. Limpach, B. 21, 521; Knorr, A. 245, 377). Got also by heating its carboxylic acid (ust, B. 19, 1462). Plates, v. sl. sol. water, insol. ether.— B^+HCl . [230°]. Needles (from alcohol).— B^+HCl 2aq (J.).

(B. 2)-Oxy-(Py. 3)-phenyl-quinoline. Methyl derivative

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{OMe})\text{CH}:\text{CH} \\ \text{C}(\text{OMe})\text{CH}:\text{CH} \end{smallmatrix}$. [133°]. Got by heating its carboxylic acid [237°] (Doebner, A. 249, 106). Plates (from dilute alcohol).— B^+HCl : needles, sol. hot water.— $B^+H_2PtCl_6$. Plates [205°].

(B. 4)-Oxy-(Py. 3)-phenyl-quinoline. Methyl derivative

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{CH}:\text{CH} \\ \text{C}(\text{OMe})\text{CH}:\text{CH} \end{smallmatrix}$. [133°]. Formed by heating its carboxylic acid [216°] (D.). Oil.— $B^+H_2PtCl_6$ 2aq: orange needles.

Di-oxy-phenyl-quinoline $C_{11}H_{11}NO_2$ i.e.

$C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{C}_6\text{H}_5\text{OH})\text{CH} \\ \text{C}(\text{OH}) \end{smallmatrix}$. [305°]. Formed by potash-fusion from (B. 2)-oxy-(Py. 1)-phenyl-quinoline [235°]; the yield being 75 p.c. (Koenigs a. Nef, B. 20, 432). Needles, v. sol. alcohol. Has no basic properties. An isomeride, solid at 315°, appears to be formed from (a)-oxy-(Py. 1)-phenyl-quinoline by potash-fusion.

Di-oxy-phenyl-quinoline. [114°]. Formed in small quantity when p-amido-(Py. 3)-phenyl-quinoline is acted upon by nitrous acid (Weidel, M. 8, 127). Prisms, insol. water. Reduced by zinc-dust to (Py. 3)-phenyl-quinoline.

Di-oxy-phenyl-quinoline

$C_{11}H_{11}NO_2$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{OH})\text{CH}:\text{CH} \\ \text{C}(\text{OH})\text{CH}:\text{CH} \end{smallmatrix}$. [247°]. Formed from (B. 2)-oxy-p-amido-(Py. 3)-phenyl-quinoline by the diazo-reaction (Weidel a. Georgievitch, M. 9, 138). Pale-yellow mass of hair-fine needles, sl. sol. hot water. Yields (Py. 3)-phenyl-quinoline when distilled with zinc-dust.

Di-oxy-(Py. 1)-phenyl-quinoline. Methyl derivative

$C_{11}H_{11}NO_2$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{OH})\text{CH}:\text{CH} \\ \text{C}(\text{OMe})\text{CH}:\text{CH} \end{smallmatrix}$. [188°]. Got by boiling the diazo-compound of m-amido-(Py. 1)-phenyl-(B. 2)-methoxy-quinoline with dilute H_2SO_4 (Miller a. Kinkelin, B. 20, 1922). Plates. Its solution in dilute H_2SO_4 gives with chlorine-water, a little NaOH, and ammonia, a dark-green colour.

Tetrahydride [111°]. Tablets. Gives a deep-green with $FeCl_3$ and HCl .— B^+HCl : plates.

(Py. 4)-OXY-(Py. 2)-PHENYL-ISOQUINOLINE

$C_{11}H_{11}NO$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{CH}:\text{CPh} \\ \text{CO}:\text{NH} \end{smallmatrix}$ or

$C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{CH}:\text{CPh} \\ \text{C}(\text{OH})\text{N} \end{smallmatrix}$. Isobenzylidene-

phthalimidine. [197°]. Formed by the action of ammonia on deoxybenzoin o-carboxylic acid $CH_2Bz.C_6H_4.CO_2H$. Prepared by heating crude isobenzylidene-phthalide (15 g.) with alcohol NH_3 (30 c.c.) at 100° for 8-10 hours (Gabriel, B. 18, 2449, 3470; 19, 830). Triclinic crystals, $a:b:c = .8608:1:?$, $\alpha = 88^\circ 28'$, $\beta = 111^\circ 24'$, $\gamma = 74^\circ 47'$. Sl. sol. cold alcohol. By heating with $POCl_3$ or PCl_5 it is converted into (Py. 4)-chloro-(Py. 2)-phenyl-isoquinoline; PCl_5 yields (Py. 1,4)-di-chloro-(Py. 2)-phenyl-quinoline. Nitrous acid converts it into (Py. 1)-nitro-(Py. 4)-oxy-(Py. 2)-phenyl-isoquinoline.

Ethyl ether $C_{11}H_{11}NO$ (OEt). [46°]. Formed by heating chloro-phenyl-isoquinoline with alcoholic sodium ethylate (Gabriel, B. 19, 835). Flat colourless needles; v. sol. ordinary solvents; weak base.— $B^+H_2ClPtCl_6$: reddish pp.

Di-oxy-phenyl-iso-quinoline

$C_{11}H_{11}NO_2$ i.e. $C_6H_5 \cdot \text{N} \begin{smallmatrix} \text{C}(\text{OH})\text{CH}:\text{CPh} \\ \text{CO}:\text{NH} \end{smallmatrix}$. [257°]. Formed from nitro-benzylidene-phthalide, P, and HI (Gabriel, B. 18, 3471; 20, 2866). Crystals, sl. sol. boiling Aq. Methyl ethers. Two isomeric methyl ethers [287°] and [121°] may be prepared. Both are crystalline.

Reference. — CHLORO-OXY-PHENYL-ISOQUINOLINE.

(Py. 1, 3, 2)-OXY-PHENYL-QUINOLINE CARBOXYLIC ACID $C_6H_4 \begin{smallmatrix} C(OH)C_6H_4 \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \begin{smallmatrix} C(OH)C_6H_4 \\ \diagdown \quad \diagup \\ N \end{smallmatrix} CPh$ [232°]. Made from its ethyl ether [262°] which is formed by heating $NPh:CPh.CH(CO_2Et)_2$ to 150°, alcohol being split off (Just, B. 18, 2632; 19, 1462). Crystals (containing aq), $\frac{1}{2}$ sl. sol. hot water. — AgA' : sl. sol. water.

o-Oxy-(Py. 3, 1)-phenyl-quinoline carboxylic acid $C_6H_4 \begin{smallmatrix} C(CO_2H)CH \\ \diagup \quad \diagdown \\ N \end{smallmatrix} \begin{smallmatrix} C(CO_2H)CH \\ \diagdown \quad \diagup \\ N \end{smallmatrix} C_6H_4.OH$. [238°]. Made from salicylic aldehyde, aniline, and pyruvic acid (Doebner, A. 249, 98). Needles, v. sol. alcohol. — AgA' : H_2A', H_2PtCl_6 : golden-yellow needles. (B. 2; Py. 3, 1)-Oxy-phenyl-quinoline carboxylic acid. *Methyl derivative* $C(OMe):CH.C(CO_2H)CH:CH$ Phenyl-quinic acid. [237°]. Formed by heating together equimolecular quantities of *p*-amido-anisole, benzoic aldehyde, and pyruvic acid in an alcoholic solution (Doebner, A. 249, 105). Needles, insol. water. — AgA' : H_2A', H_2PtCl_6 : orange-red crystals.

(B. 4; Py. 3, 1)-Oxy-phenyl-quinoline carboxylic acid. *Methyl derivative* $CH:CH \begin{smallmatrix} C(CO_2H)CH \\ \diagup \quad \diagdown \\ N \end{smallmatrix} C(OMe).C \begin{smallmatrix} C(CO_2H)CH \\ \diagdown \quad \diagup \\ N \end{smallmatrix} CPh$. [216°]. Formed in like manner from [2:1] $C_6H_4(NH_2).OMe$, benzoic aldehyde, and pyruvic acid (D.). Yellow needles. — PbA', aq : — AgA' : H_2A', H_2PtCl_6 .

DI-OXY-DI-PHENYL-QUINOXALINE. *Di-ethyl derivative* $CH:C(OEt).C.N.CPh$ $CH:C(OEt).C.N.CPh$. [163°]. Formed by the action of benzil and $NaOAc$ on an alcoholic solution of the di-ethyl ether of (a)-di-amido-hydroquinone (Nietzki & Rochberg, B. 23, 1212). Yellow needles.

Di-oxy-di-phenyl-quinoxaline. Dihydride. *Di-methyl derivative*

$C_6H_4 \begin{smallmatrix} N.CH.C_6H_4.OMe \\ \diagup \quad \diagdown \\ N \end{smallmatrix} CH(CO_2H)CH(CO_2H)OMe$ Phenyl-anisaldehyde. [129°]. Formed from anisic aldehyde and phenylene-*o*-diamine (Rügheimer & Ladenburg, B. 11, 1660). Needles (from alcohol).

o-OXY-PHENYL-SUCCINIC ACID $C_6H_4.C(OH).CO_2H.CM_2.CO_2H$ Phenyl-maleic acid. [188°]. S. 1:59 at 15°. Formed by heating α -bromo-phenyl-succinic acid with hot water (Alexander, A. 258, 76). Needles (from chloroform). Yields on heating, phenyl-maleic anhydride [110°], phenyl-fumaric acid [161°], and a sublimate [106°] probably atropic acid.

o-Oxy-phenyl-succinic acid $C_6H_4.CH(CO_2H).CH(OH).CO_2H$. [150°–160°]. S. 37:35 at 15°. Got from $C_6H_4.CH(CHO).CO_2Et$, potassium cyanide, and HCl (A.). Crystalline powder, v. sol. water. Yields phenyl-maleic anhydride when heated to 160°.

Di-oxy-di-phenyl succinic acid $CO_2H.CPh(OH).CPh(OH).CO_2H$. The nitrile of this acid $CPh(OH)Cy.CPh(OH)Cy$ [132°] is formed by union of benzil with HCy (Zinin, A. 34, 189; Jacoby, B. 19, 1519). It is converted in the acid by $HOAc$ saturated with HBr into the amide $C_6H_4.N_2O$ [150°–230°] (Burton, B. 16, 2282).

DI-OXY-DI-PHENYL SULPHIDE $S(C_6H_4.OH)_2$. [151:5°]. Formed from 'thio-

aniline' by the diazo-reaction (Krafft, B. 7, 1165; 22, 821), and also by the action of $SOCl_2$ on phenol in presence of CS_2 (Tassinari, G. 17, 83). Silvery plates, sl. sol. cold water.

Di-acetyl derivative [83°]. An isomeride [129°] may be obtained from $S(C_6H_4.Br.OH)_2$ [176°] by reduction with zinc-dust (T.).

Reference. — **DI-BROMO-DI-OXY-DI-PHENYL SULPHIDE**.

Di-p-oxy-di-phenyl disulphide $S_2(C_6H_4.OH)_2$. [151°]. Formed by oxidising *p*-oxy-phenyl mercaptan (thio-hydroquinone) with dilute $FeCl_3$ (Leuckart, J. pr. [2] 41, 196). Yellow needles, v. e. sol. alcohol.

Di-acetyl derivative [89°]. Plates.

Di-o-oxy-di-phenyl disulphide $S_2(C_6H_4.OH)_2$. Formed by heating sodium phenate (2 mols.) with sulphur (1 at.) at 190° (Haitinger, M. 4, 165). Thick oil. Yields *o*-oxy-phenyl mercaptan, on reduction. — $NaHA'$ 6aq. — KHA' 5aq. — PbA' : yellow pp.

Tri-methyl derivative MeA' . [119° cor.]. Yields anisole-*o*-sulphonic acid on oxidation.

DI-OXY-DI-PHENYL SULPHONE

$SO_2(C_6H_4.OH)_2$. [239°]. S.G. 1:306. Formed by heating phenol (3 pls.) with fuming H_2SO_4 (1 pt.) at 190° (Glutz, A. 147, 52; Annheim, J. pr. [2] 1, 14; 2, 385; B. 8, 1059; 11, 1068; A. 172, 28). Trimetric crystals; $a:b:c = 1:283:1:0:534$. V. sol. hot water and alcohol. — KA' . Sol. alcohol (Guareschi, G. 8, 246). — NH_4HA' . — $NaHA'$ aq. — $AgHA'$. — AgA' .

Di-acetyl derivative. Needles (Glutz).

Di-methyl ether MeA' . [130°].

Di-ethyl ether. [159°]. Laminæ.

Di-isoamyl ether. [98°]. Plates.

Di-oxy-di-phenyl sulphone $SO_2(C_6H_4.OH)_2$. [187°]. Got from its acetyl derivative which is made by oxidation of $C_6H_4(OAc)(SH)$ [1:2 or 3] (Tassinari, C. C. 1888, 1354). Crystalline, sl. sol. water.

References. — **DI-BROMO-DI-BROMO-DI-NITRO-DI-CHLORO-, TETRA-IODO-, DI-ODO-DI-NITRO-, AND DI-NITRO-DI-OXY-DI-PHENYL-SULPHONE.**

OXY-PHENYL SULPHONIC ACID v. PHENOL SULPHONIC ACID.

Oxy-diphenyl sulphonic acid $C_6H_4(OH).SO_3H$. Made, together with the disulphonic acid, by heating oxydiphenyl (1 pt.) with H_2SO_4 (3 pts.) (Lasschinnoff, J. R. 5, 54). — KA' aq: plates; sl. sol. water. — BaA' aq. — CaA' 3aq. — K_2CuA' 6aq: green laminæ.

Oxy-diphenyl disulphonic acid $C_6H_4(OH)(SO_3H)_2$. Made as above. — KA' 1:1 aq.

Di-oxy-diphenyl disulphonic acid

$[4:2:1] C_6H_4(OH)(SO_3H).C_6H_4(OH)(SO_3H)(OH)$ [1:2:4]. Made from benzidine disulphonic acid by the diazo-reaction (Linpricht, A. 261, 834). Crystalline mass. The K salt forms laminæ, v. e. sol. water. — BaA' 2aq. — PbA' 4aq: rhombohedra.

Di-p-oxy-diphenyl disulphonic acid

$C_6H_4(OH)(SO_3H)_2$. Got by warming di-oxy-diphenyl with fuming H_2SO_4 (Doebner, B. 9, 180). Probably identical with the preceding acid. — K_2A' prisms, sl. sol. cold water.

Di-p-oxy-diphenyl trisulphonic acid

$C_6H_4(OH)(SO_3H)_3$. Formed, together with the tetra-sulphonic acid, from benzidine by diazotising and warming with conc. H_2SO_4 (Grise, J. 1866, 462). — $Pb_2C_6H_4S_3O_{12}$ 2aq. — $Pb_2O_2H_2S_3O_{12}$ 2PbO.

Di-*p*-oxy-diphenyl tetrasulphonic acid $\text{O}_2\text{H}(\text{OH})(\text{SO}_3\text{H})_2$. Made as above.— $\text{Ba}_2\text{A}^1\text{Ba}^2$: prisms. $\text{Pb}_2\text{C}_{12}\text{H}_8\text{S}_4\text{O}_{12}$: amorphous pp.

***o*-OXY-PHENYL-SULPHONO-ISOBUTYRIC ACID** $\text{C}_6\text{H}_4(\text{SO}_2\text{CH}_2\text{CMe}(\text{OH})\text{CO}_2\text{H})$. [121°]. Made by oxidising $\text{CH}_3(\text{SPh})\text{CMe}(\text{OH})\text{CO}_2\text{H}$ with KMnO_4 in the cold (Delisle, A. 280, 259). Prisms (from ether).— KA^1Ba^2 : needles.— BaA^1 .— CaA^1 , aq; groups of needles.

OXY-PHENYL SULPHURIC ACID

$\text{C}_6\text{H}_4(\text{OH})\text{O}_2\text{SO}_3\text{H}$. The K salts of the *o*-, *m*-, and *p*-compounds are formed by the action of $\text{K}_2\text{S}_2\text{O}_8$ on potassium-pyrocatechin, resorcin, and hydroquinone respectively (Baumann, B. 11, 1918). They are crystalline, sol. water, and unstable. Potassium-pyrogallol yields, in like manner, $\text{C}_6\text{H}_3(\text{OH})_2\text{SO}_3\text{H}$ crystallising in needles.

OXY-PHENYL-THIAZOLE

$\text{S} \begin{smallmatrix} \text{C}(\text{OH}) \\ \text{CH:CP}^h \end{smallmatrix} > \text{N}$. [205°]. Formed from bromo-acetophenone by the action of xanthamide (Hubacher, A. 259, 243) or by successive treatment with barium sulphocyanide and dilute HCl (Arapides, A. 249, 14; cf. Dyckerhoff, C. J. 32, 347). Needles, insol. water, sol. cold NaOH aq. Converted by PCl_5 into chloro-oxy-phenylthiazole [206°] and another body [98°] (Schaltzmann, A. 261, 18).

Sodium and EtI yield $\text{CH}_2\text{CP}^h > \text{NEt}$ [71°], which on heating with HCl at 220° gives NEtH .

Di-*o*-*o*-oxy-phenyl-thiazole dihydride.

Methyl derivative $\text{CH}_2\text{CH}_2 > \text{N} \begin{smallmatrix} \text{C}(\text{H})\text{OMe} \\ \text{CH}_2\text{CH}_2 \end{smallmatrix}$. [116°]. Formed by the action of boiling alcoholic chloro-acetic acid on the product of the action of CS_2 on the substance formed from ethylene bromide and di-anisyl-thio-urea (Fogster, B. 21, 1867). Plates, v. s. sol. alcohol.

***p*-OXY-PHENYL-THIOCARBIMIDE**. **Acetyl derivative** $\text{C}_6\text{H}_4(\text{OAc})\text{NCS}$. [36°]. Made by heating di-*p*-oxy-di-phenyl-urea with Ac_2O (Kalkhoff, B. 16, 1831). Plates, sol. alcohol.

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{NCS}$. [265°]. Formed from anisidine and CS_2 (Hofmann, B. 20, 1796; cf. Salkowski, B. 7, 1012).

Isomeride: **Oxy-methenyl-amido-phenyl-mercaptan**.

Di-oxy-phenyl-thiocarbimide. **Di-methyl derivative** $\text{C}_6\text{H}_4(\text{OMe})_2\text{NCS}$. Formed by heating $\text{CS}(\text{NH}_2\text{C}_6\text{H}_4(\text{OMe}))_2$ with conc. HCl aq (Bechhold, B. 22, 2381). Occurs in three crystalline forms [57°], [120°], and [155°]. Sol. acetic and H_2SO_4 .

Di-*o*-oxy-di-phenyl-thiohydantoin. **Di-methyl derivative** $\text{C}_6\text{H}_4(\text{OMe})_2\text{N}_2\text{SO}_2$, i.e. $\text{C}_6\text{H}_4(\text{OMe})_2\text{N}(\text{C}(\text{N}(\text{C}_6\text{H}_4(\text{OMe}))\text{CO})_2$. [190°]. Made from di-anisyl-thio-urea and fused chloro-acetic acid (Foerster, B. 21, 1867). Needles.

***p*-OXY-PHENYL-THIO-UREA** $\text{C}_6\text{H}_4\text{N}_2\text{SO}$, i.e. $\text{C}_6\text{H}_4\text{NH}(\text{CS}(\text{NH}(\text{OH})))$. [108°]. Formed from phenyl-thiocarbimide and aqueous hydroxylamine (Schiff; E. Fischer, B. 22, 1935; Tie-mann, B. 22, 1939; Von der Kall, A. 263, 260; Voltmer, B. 24, 378). White plates, insol. water, al. sol. ether, v. sol. alcohol. Fehling's solution ppt. Cu_2S . Dilute acids and alkalis decompose it, yielding phenyl cyanamide.

Methyl derivative $\text{NHPh}(\text{CS}(\text{NH}(\text{OMe})))$. [116°]. Formed from phenyl-thiocarbimide and methyl-hydroxylamine.

Ethyl derivative. [133°]. Prisms. Decomposed, by boiling its alcoholic solution, into phenyl cyanamide, alcohol, and S.

Benzyl derivative. [116°]. Prisms.

o-Oxy-phenyl-thio-urea

$\text{C}_6\text{H}_4(\text{OMe})\text{NH}(\text{CS}(\text{NH}_2)))$. [161°]. Made from *o*-amido-phenol hydrochloride and potassium sulphocyanide (Bendix, B. 11, 2263). Needles, sol. hot water.— $\text{B}^1\text{H}^2\text{PtCl}_4$.

Methyl derivative

$\text{C}_6\text{H}_4(\text{OMe})\text{NH}(\text{CS}(\text{NH}_2)))$. [142°]. Needles (from alcohol) (Müllhäuser, B. 13, 923).

Ethyl derivative

Alkalis (Berlinerblau, J. pr. [2] 80, 105).

p-Oxy-phenyl-thio-urea

$[\text{4:1}] \text{C}_6\text{H}_4(\text{OH})\text{NH}(\text{CS}(\text{NH}_2)))$. [214°]. Got by evaporating to dryness, on the water-bath, a solution of potassium sulphocyanide and *p*-amido-phenol hydrochloride (Kalkhoff, B. 16, 375). Tables, sl. sol. cold water.

Ethyl derivative

o-Oxy-diphenyl-thio-urea

$\text{NHPh}(\text{CS}(\text{NH}(\text{C}_6\text{H}_4\text{OH})))$. [146°]. Formed by the action of phenyl-thiocarbimide on *o*-amido-phenol (Kalkhoff, B. 16, 1829). White pearly plates. Heated by itself or with HgO it loses H_2S , yielding anilido-carbamido-phenol.

Methyl derivative

$\text{NHPh}(\text{CS}(\text{NH}(\text{C}_6\text{H}_4\text{OMe})))$. [127°]. Formed from anisyl-thiocarbimide and aniline, and also from phenyl-thiocarbimide and anisidine (Foerster, B. 21, 1868). Prisms. With ethylene bromide it forms crystals [143°] whence platonic chloride yields $(\text{C}_6\text{H}_4\text{N}_2\text{OS})_2\text{I}_2\text{PtCl}_6$.

p-Oxy-di-phenyl-thio-urea

$\text{NHPh}(\text{CS}(\text{NH}(\text{C}_6\text{H}_4\text{OH})))$. ***p*-Oxy-thiocarbimide**. [162°]. Formed by the action of phenyl-thiocarbimide on *p*-amido-phenol (K.). V. sol. alcohol and alkalis, nearly insol. water.

Acetyl derivative

Di-*o*-oxy-di-phenyl-thio-urea. **Di-methyl derivative** $\text{CS}(\text{NH}(\text{C}_6\text{H}_4\text{OMe}))_2$. [185°]. Formed from *o*-anisidine, CS_2 , and alcoholic potash (Müllhäuser). Formed also from anisidine and thio-urea in alcoholic solution (F.). Needles, sl. sol. water. With methyl iodide it forms $\text{C}_6\text{H}_4(\text{OMe})_2\text{N}(\text{C}(\text{SMe})\text{NH}(\text{C}_6\text{H}_4\text{OMe}))$. [87°]. EtI forms $\text{C}_6\text{H}_4\text{N}_2\text{SO}_2$ [82-5°], while propyl iodide gives $\text{C}_6\text{H}_4\text{N}_2\text{SO}$ [58°]. Ethylene bromide gives $\text{CH}_2\text{CH}_2\text{N}_2\text{C}_6\text{H}_4\text{OMe}$ crystallising in trimetric prisms [186°] and yielding $\text{C}_6\text{H}_4\text{N}_2\text{SO}_2\text{MeI}$ [c. 141°] and, on boiling with alcohol and chloro-acetic acid, $\text{S} < \text{CO} > \text{NC}_6\text{H}_4\text{OMe}$ [116°].

Di-*p*-oxy-di-phenyl-thio-urea. [222°]. Got from *p*-amido-phenol and CS_2 (K.). Pearly plates; v. sol. alkalis.

Di-methyl derivative

(Salkowski, B. 7, 1012). Sl. sol. alcohol.

Di-oxy-di-phenyl-thio-urea

Di-methyl derivative $\text{NHPh}(\text{CS}(\text{NH}(\text{C}_6\text{H}_4\text{OMe})))$. [187°]. Formed by the combination of phenyl-thiocarbimide with amido-di-methyl-hydroquinone (Baessler, B. 17, 2123). Minute needles; v. sol. hot benzene and hot alcohol.

Tetra-oxy-di-phenyl-thio-urea

Tetra-methyl derivative $\text{CS}(\text{NH}(\text{C}_6\text{H}_4\text{OMe}))_2$. [160°]. Formed from the di-methyl derivative of amido-resorcin and CS_2 (Bechhold, B. 22, 2380). White mass (from alcohol-ether), insol. alkalis.

An isomeride [109°] is formed from the dimethyl derivative of amido-hydroquinone (Baessler).

Reference.—DI-CHLORO-DI-OXY-DI-PHENYL-THIO-UREA.

OXY-PHENYL-TOLYLAMINE *v.* **TOLYL-AMIDO-PHENOL**.

TRI-OXY-DI-PHENYL-TOLYL-CARBINOL.

Anhydride $C_{20}H_{14}O_3$, *i.e.*

Corallin. Formed by the action of nitrous acid on rosaniline (Caro a. Wanklyn, *J. pr.* 100, 49; *A.* 179, 192). Got also by heating a mixture of phenol and cresol with H_2SO_4 and arsenic acid (Zulkowsky, *B.* 10, 1201). Red plates with green lustre, nearly insol. water, sol. chloroform, alcohol, and acids. Alkalis form a red solution. Reduced by sodium-amalgam to tri-oxy-di-phenyl-tolyl-methane. Water at 240° yields phenol and $C_6H_4(OH).CO.C_6H_4Me(OH)$. KCy followed by HCl forms crystalline $C_{20}H_{14}NO_3$, whence Ac_2O yields $C_{20}H_{14}Ac_2NO_3$ [142°].

p-OXY-PHENYL-p-TOLYL-HYDRAZINE.

Ethyl derivative

$C_6H_4(OEt).NH.NH.C_6H_4Me$ Formed by reducing $C_6H_4(OEt).N_2.C_6H_4Me$ with alcoholic ammonium sulphide (Noelting a. Werner, *B.* 23, 3258; *Bl.* [3] 4, 794). Needles, v. sol. hot alcohol. The isomerides $C_6H_4.NH.NH.CO.C_6H_4Me$ [1:3:4] [76°] and $C_6H_4.NH.NH.CO.C_6H_4Me(OEt)$ [1:5:2] [105°] are formed in like manner.

DI-OXY-PHENYL-TOLYL-KETONE

$C_6H_4(OH).CO.C_6H_4Me(OH)$. [200°]. Formed by heating rosolic acid with water at 220°–250° (Graebe a. Caro, *A.* 179, 196). Crystals, sol. hot water.

Di-acetyl derivative [150°]. Needles.

Di-oxy-phenyl-tolyl-ketone. *Anhydride*

$C_6H_4 \begin{array}{c} O \\ \diagup \diagdown \end{array} CO \begin{array}{c} O \\ \diagup \diagdown \end{array} C_6H_4Me$. [105°]. Made by boiling *p*-tolyl salicylate for a long time (Graebe a. Feer, *B.* 19, 2612). V. c. sol. hot alcohol.

Tri-oxy-phenyl-tolyl-ketone

$C_6H_4(OH).CO.C_6H_4Me(OH)_2$. *Anhydride* $C_{21}H_{14}O_4$. [140°]. Made by fusing salicylic acid with orcin and $ZnCl_2$ (Michael, *Am.* 5, 95). Yellow needles (from alcohol).— NaA' 1½ aq.

Acetyl derivative $C_{21}H_{14}AcO_4$. [152°].

DI-OXY-PHENYL-DI-TOLYL-METHANE

$CHPh(C_6H_4Me.OH)_2$. [171°]. Formed from *o*-cresol-benzoin and boiling SO_2Aq (Schroeter, *A.* 257, 70). Yellow needles. Yields a di-bromo-derivative [180°] and a di-nitro-derivative [127°].

Di-acetyl derivative $C_{22}H_{16}Ac_2O_2$. [94°].

Di-benzoyl derivative [91.5°]. Plates.

Tri-oxy-di-phenyl-tolyl-methane

$C_6H_4Me(OH).OH(C_6H_4OH)_2$. *Phenolphthalol*. [190°]. Obtained by boiling phenol-phthalin $CO_2H.C_6H_4.OH(C_6H_4OH)_2$ with $HOAc$ and sodium-amalgam (Baeyer, *A.* 202, 87). Prisms (from dilute $HOAc$), v. sol. alcohol.

Tri-acetyl derivative $C_{28}H_{18}O_6$. [40°].

Tri-oxy-di-phenyl-tolyl-methane $C_{28}H_{18}O_6$, *i.e.* $C_6H_4Me(OH).OH(C_6H_4OH)_2$. *Leucorosolic acid*. Got by reducing rosolic acid with potash and zinc dust (Graebe a. Caro, *A.* 179, 198). Needles (from alcohol), v. sl. sol. water.

Tri-acetyl derivative. [149°]. Needles.

DI-OXY-PHENYL-o-TOLYL-PYRAZINE.

[166°]. Formed by heating aniline with chloroacetyl-*o*-tolyl-amido-acetic acid at 160° (Abenius, *J. pr.* [2] 40, 443). Formed also by the action of *o*-toluidine on chloroacetyl-phenyl-amido-acetic acid in presence of $NaOAc$ (Bischoff, *B.* 23, 1996). White needles, v. c. sol. hot alcohol. The isomeric compound from *p*-toluidine also crystallises in needles [22°].

OXY-PHENYL-p-TOLYL-PYRIMIDINE

$C_6H_4Me.C \begin{array}{c} N.CPh \\ N:COH \end{array} CH$. [above 290°]. Made from tolenyl-amidine and benzoyl-acetic ether (Pinier, *B.* 23, 3826). Slender needles, sl. sol. hot alcohol.

o-OXY-PHENYL-o-TOLYL-THIO-UREA

$CH_2(OH).C_6H_4.NH.CO.S.NHPh$. [c. 136°]. Made from phenyl thiocarbimide and *o*-amido-benzyl alcohol (Söderbaum a. Widman, *B.* 22, 1671). Prisms. Alcohol and HgO convert it into $C_6H_4 \begin{array}{c} CH.NPh \\ NH.CO \end{array}$ [142°].

o-OXY-PHENYL-TOLYL-UREA

$CH_2(OH).C_6H_4.NH.CO.NHPh$ [191°]. Made from *o*-amido-benzyl alcohol and $PhNCO$ (Söderbaum a. Widman, *B.* 22, 1670). Needles.

v-OXY-PHENYL-UREA $C_6H_4.NH.CO.NH.OH$.

[140°]. Made from phenyl cyanate and aqueous hydroxylamine (E. Fischer, *B.* 22, 1935; von der Kall, *A.* 263, 264). Crystals, v. sl. sol. water, sol. alkalis. Reduces hot Fehling's solution. On boiling with alkalis it yields aniline, CO_2 , and hydroxylamine.

Benzyl derivative

$NHPh.CO.NH.COCH_2Ph$. [106°]. Needles (Tiemann, *B.* 22, 1940; Voltmer, *B.* 24, 384).

o-Oxy-phenyl-urea $C_6H_4(OH).NH.CO.NH_2$.

[154°]. Made from *o*-amido-phenol hydrochloride and potassium cyanate (Kalkhoff, *B.* 18, 374). Prisms, v. sol. water.

Methyl derivative

$C_6H_4(OMe).NH.CO.NH_2$. [147°]. Crystals (Mühlhäuser, *B.* 13, 922; *A.* 207, 244).

p-Oxy-phenyl-urea $C_6H_4N_2O_4$. [168°] (K.). Needles or tables; sol. acids and alkalis.

Ethyl derivative. [200°].

Made from $C_6H_4(NH_2).OEt$ and $KCyO$ (Berlinerblau, *J. pr.* [2] 30, 103). Nitrous acid passed into its alcoholic solution forms brick-red crystals of $C_6H_4N_2O_4$.

Di-oxy-di-phenyl-urea.

Di-methyl derivative $CO(NH.C_6H_4.OMe)_2$. [182°]. Made from $COCl_2$ and *o*-anisidine (M.; Conrad, *B.* 21, 1649). Crystals, v. sol. alcohol.

Di-p-oxy-di-phenyl-urea.

Di-methyl derivative $C_{12}H_{10}N_2O_4$. [234°]. Prisms or needles (Lossen, *A.* 175, 295; Fieschel, *A.* 175, 312). V. sl. sol. hot alcohol.

3-OXY-PHENYL-VALERIC ACID $C_9H_{10}O_3$, *i.e.* $CHPh(OH).CH_2.CO_2H$. *Phenyl-oxypivalic acid*. [134°].

Formed from benzaldehyde, sodium isobutyrate, and isobutyric anhydride by Perkins's reaction (Fittig a. Jayne, *A.* 216, 119; Ott, *A.* 227, 61). Needles, sl. cold water. Split up at 160° into CO_2 and phenyl-butylene.— BaA' , 4 aq.— CaA' , 4 aq.; plates, m. sol. water.

Acetyl derivative. [137°]. Monoclinic crystals (from CS_2). Yields $Ba(C_9H_9O_3)_2$, 2 aq and CaA' , 2 aq.

Anhydride $C_{10}H_{10}O_4$. [155°]. Prisms. *Iso-butyryl derivative*. [65°]. Needles, v. sl. sol. water. Yields $Ba(C_{10}H_{10}O_4)_2$, 2aq, CaA' , 2aq, and AgA' .

β-Oxy-phenyl-γ-valeric acid $C_9H_8CH_2CH_2CH(OH)CH_2CO_2H$. [131°]. "Got by boiling β-styryl-propionic acid with $NaOHAq$ (Fittig, B. 24, 84). Prisms.

β-Oxy-phenyl-valeric acid $CH_3CH(OH)CH(CH_2Ph)CO_2H$. [153°]. Got by reducing benzyl-aceto-acetic ether (Ehrlich, B. 8, 1036; A. 187, 26). Needles (from benzene). — BaA' , 2aq. — $Zn(OH)A'$. — $Cu(OH)A'$.

γ-Oxy-α-phenyl-valeric acid $CH_3CH(OH)CH_2CHPhCO_2H$. Formed from α-phenyl-β-acetyl-propionic acid by reduction with sodium-amalgam (Weltner, B. 17, 73). The free acid at once forms the oily anhydride $C_{11}H_{12}O_4$ — $Ca(C_{11}H_{12}O_4)_2$, aq; crystalline.

γ-Oxy-γ-phenyl-isovaleric acid. The oily lactone $C_9H_8CH<\begin{smallmatrix} CHMe \\ O.CO \end{smallmatrix}>CH_2$ is made by ~~reducing~~ *γ-bromo-γ-phenyl-isovaleric acid* with aqueous Na_2CO_3 (Fittig a. Liebmann, A. 255, 271). It yields $Ba(C_{11}H_{12}O_4)_2$.

α-Oxy-phenyl-valeric acid. Methyl derivative $C_9H_8(OMe)CH_2CH_2CH_2CO_2H$. Got by reducing $C_9H_8(OMe)C_2H_4CO_2H$ with sodium-amalgam (Perkin, C. J. 39, 438). — Oil. — BaA' .

Di-oxy-phenyl-valeric acid. Methylene derivative $C_{12}H_{14}O_4$, i.e. $CH_3O_2C_2H_4CH_2CH_2CH_2CO_2H$. Piperhy-dronic acid. [96°]. Made by reducing (c)-hydro-piperic acid with sodium-amalgam (Fittig a. Buri, A. 216, 178). Thin tables (from alcohol). — CaA' , aq; v. sl. sol. cold water.

Di-oxy-phenyl-valeric acid $C_9H_8(OH)CH_2CH(CO_2H)CH(OH)CH_3$. The oily anhydride of this acid is got by reducing phenacyl-acetoacetic ether (Wellner, B. 17, 63).

Tri-oxy-phenyl-valeric acid. Methylene derivative

$CH_3O_2C_2H_4CH_2CH(OH)CH_2CH_2CO_2H$. [95°]. Made by reducing with sodium-amalgam the acid $CH_3O_2C_2H_4CH_2CO_2CH_2CH_2CO_2H$ (Weinstein, A. 227, 38). Crystals, m. sol. hot water. Yields an oily lactone. — BaA' . — AgA' : flocculent pp.

Tri-ppr-qxy-di-phenyl-valeric acid. Di-methyl derivative

$C_9H_8(OMe)CH(OH)CH_2CH(CO_2H)CH_2C_6H_5OMe$. The lactone [83°] is got by the action of sodium-amalgam on its bromo-derivative [136°], which is formed by dissolving in $HOAc$ di-*p*-methoxy-di-phenyl-valeric acid in $NaOAc$ (Fittig a. Solitis, A. 255, 305). It yields a gummy Ba salt.

Tetra-bxy-phenyl-valeric acid. Methylene derivative

$CH_3O_2C_2H_4CH_2CH(OH)CH(OH)CH_2CO_2H$. [128°]. Made by oxidising (a)-hydro-piperic acid with $KMnO_4$ at 0° (Regel, B. 20, 415). Slender crystals. — BaA' . — AgA' : needles.

Anhydride $C_{11}H_{12}O_4$. [104.5°]. Crystals.

• *An isomeric acid* $CH_3O_2C_2H_4CH_2CH(OH)CH(OH)CO_2H$ [165°], formed by oxidising (β)-hydro-piperic acid, yields the salts CaA' , aq and AgA' .

Reference. — *Tetra-bromo-xy-phenyl-valeric acid*.

• *α-Oxy-phthalic acid* $C_8H_6(OH)(CO_2H)_2$ [1:3:3]. [c. 200°]. S. 20 at 17°. Obtained by potash-fusion from its methyl derivative (Jacob-

sen, B. 16, 1965), and from *c*-sulpho-phthalic acid (Stokes, Am. 6, 282). Got also from *c*-amido-phthalic acid (Bernthgen, B. 20, 937). Prisms (from water), v. sol. alcohol and ether. Coloured red by $FeCl_3$. Forms a fluorescein when heated with resorcin. — KHA' : needles. — AgA' : gpa sl. sol. hot water.

Anhydride $C_8H_6(OH)<\begin{smallmatrix} CO \\ CO \end{smallmatrix}>O$. [c. 148°].

Formed by heating the acid.

Methyl derivative $C_8H_6(OMe)(CO_2H)_2$. [160°]. Formed by oxidation of *c*-methoxy-toluic acid with $KMnO_4$. Minute prisms.

Anhydride of the methyl derivative $C_8H_6(OMe)CO_2$. [87°]. Needles (by sublimation).

i-Oxy-phthalic acid $C_8H_6(OH)(CO_2H)_2$ [1:3:4]. [185°] (Rée); [205°] (Claus). S. 3 at 10°.

Formation. — 1. From *i*-amido-phthalic acid by the diazo-reaction (Baeyer, B. 10, 124, 1079). 2. By oxidising *i*-methoxy-*o*-toluic acid with potassium permanganate, and heating the resulting $C_8H_6(OMe)(CO_2H)_2$ with hydrochloric acid (Schall, B. 12, 816) — 3. By potash-fusion from $C_8H_6(SO_2NH_2)(CO_2H)_2$, which is got by oxidising [3:4:1] and [5:2:1] $C_8H_6Me(SO_2NH_2)(CO_2H)$ (Jacobsen, B. 14, 42). — 4. By fusing *i*-sulpho-phthalic acid with $NaOH$ (Graebe a. Rée, C. J. 49, 524; B. 18, 1130, 1630). — 5. By fusing di-chloro-(a)-naphthoquinone sulphonie acid with potash (Claus, J. pr. [2] 37, 194). — 6. By fusing di-nitro-naphthol sulphonic acid with potash (Rée, A. 233, 230).

Properties. — Needles, sl. sol. cold water, sol. alcohol and ether. Gives a yellowish-red colour with $FeCl_3$. Dilute HCl at 180° forms *m*-oxy-benzoic acid. Gives the fluorescein reaction with resorcin at 200°. — AgA' : tufts of needles.

Methyl ether MeA' . [102°]. Plates.

Anhydride $C_8H_6O_4$. [165°]. Masses by heating the acid.

Methyl derivative $C_8H_6(OMe)(CO_2H)_2$. [138°-144°]. Needles. Forms on heating an anhydride [93°]. — $Ag_2C_8H_6O_4$: cryd pp.

s-Oxy-isophthalic acid $C_8H_6(OH)(CO_2H)_2$ [1:3:5]. [288° cqr]. S. 0.305 at 5°; 19 at 99°. Made by fusing *s*-sulpho-isophthalic acid with potash (Heine, B. 13, 491; Lönnies, B. 13, 705). Got also from rufgallig acid by potash-fusion (Schreder, M. 1, 437), and by the action of nitrous acid on *s*-amido-isophthalic acid (Boyer, J. pr. [2] 25, 515). Needles (containing 2aq), v. sol. hot water, alcohol, and ether. — BaA' 8aq. — $Cu_2(C_8H_6O_4)_2$, 4aq. — Ag_2A' . — $AgHA'$: needles.

Di-methyl ether Me_2A' . [140°]. Needles.

Di-ethyl ether Et_2A' . [103°]. Prisms.

c-Oxy-isophthalic acid $C_8H_6(OH)(CO_2H)_2$ [1:2:6]. [239°]. S. 8 at 100°; 14 at 24°.

Formation. — 1. Obtained by potash-fusion from (2*f*, 6)-aldehydo-*oxy*-benzoic acid (Tiemann a. Reimer, B. 10, 1563), and also from the acid [1:2:6] $C_8H_6(SO_2NH_2)(CO_2H)_2$ (Jacobsen, B. 11, 902). — 2. From (1,2,6)-methoxy-toluic acid by oxidising with $KMnO_4$, and heating the resulting $C_8H_6(OMe)(CO_2H)_2$ with HCl at 160° (Schall, B. 12, 826). — 3. In small quantity, in the preparation of the following isomeric, by the action of CCl_4 and KOH on salicylic acid (Hasse, B. 10, 2186). — 4. By oxidising α-naphthol with CrO_3 and $HOAc$ (Miller, A. 208, 247). — 5. From *c*-amido-isophthalic ether (M.).

Properties. — Needles (containing aq), v. sol.

alcohol and ether. Melts at 244° after drying at 100° (T. a. R.). Coloured cherry-red by FeCl_3 . Forms salicylic acid when strongly heated. Its solutions exhibit bluish-violet fluorescence.— $\text{Ag}_2\text{A}'$: minute plates.— $\text{Et}_2\text{A}'$: oil.

Mono-methyl ether

$\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})(\text{CO}_2\text{Me})$. [185°]. Made from $[\text{1:2}]\text{C}_6\text{H}_3(\text{ONa})\text{CO}_2\text{CH}_3$ by heating with CO_2 at 150° under pressure (Hähle, *J. pr.* [2] 44, 6). Grouped needles, which melt under water. Coloured red by FeCl_3 . Gives NaA' as colourless needles.

Methyl derivatives $\text{C}_6\text{H}_4(\text{OMe})(\text{CO}_2\text{H})_2$. [218°]. Prisms, sol. hot water.

i-Oxy-isophthalic acid $\text{C}_6\text{H}_3(\text{OH})(\text{CO}_2\text{H})_2$. [1:2:4]. [306°]. S. 0.2 at 10°; 625 at 100°.

Formation.—1. By potash-fusion from (2,1,4)- and (4,1,2)-aldehydo-oxy-benzoic acid (Tiemann a. Reimer, *B.* 10, 1562), from *m*-xylenol (Jacobsen, *B.* 11, 377), from *m*-xylene sulphonic acid (Remsen, *B.* 11, 580), from $\text{C}_6\text{H}_3(\text{SO}_2\text{NH}_2)(\text{CO}_2\text{H})_2$ (Remsen, *Am. I.* 131), and from benzoic acid (Barth, *M.* 3, 803).—2. By the action of KOH , dilute alcohol, and CCl_4 on salicylic acid (Hasso).—3. By heating $\text{C}_6\text{H}_3(\text{ONa})\text{CO}_2\text{Na}$ [1:2] or [1:4] in a current of CO_2 (Ost, *J. pr.* [2] 14, 15, 301; Kupferberg, *J. pr.* [2] 16, 428).

Preparation.—A mixture of $\text{C}_6\text{H}_3\text{ONa}$ (3 mols.) and $\text{C}_6\text{H}_5\text{OK}$ (1 mol.) is heated in a current of CO_2 at 800°. The yield is 30 p.c. of the phenol used (Ost).

Properties.—Needles, sl. sol. water, insol. chloroform. Not volatile with steam. Its aqueous solution is coloured cherry-red by FeCl_3 . Yields salicylic acid and phenol when distilled. Br yield tri-bromo-phenol on heating.— NaA' aq.— $\text{Ca}_2(\text{C}_6\text{H}_3\text{O}_4)_2$ 5aq.— CdA' 5.5aq.— $\text{Ag}_2\text{A}'$: needles.

Methyl ether $\text{Me}_2\text{A}'$. [96°].

Mono-ethyl ether

$\text{C}_6\text{H}_3(\text{OH})(\text{CO}_2\text{H})(\text{CO}_2\text{Et})$ [4:3:1]. [195°]. Made from $[\text{4:1}]\text{C}_6\text{H}_3(\text{ONa})\text{CO}_2\text{Et}$ and CO_2 at 170° under pressure (Hähle, *J. pr.* [2] 44, 12). Monoclinic leaflets.

Di-ethyl ether $\text{Et}_2\text{A}'$. [52°].

Phenyl ether

$\text{C}_6\text{H}_3(\text{OH})(\text{CO}_2\text{Ph})(\text{CO}_2\text{Et})$ [4:3:1]. [65°]. Got from HEtA' , phenol, and POCl_3 (H.).

Amide $\text{C}_6\text{H}_3(\text{OH})(\text{CONH}_2)_2$. [250°].

Methyl derivative $\text{C}_6\text{H}_3\text{O}_4$. [261°].

Oxy-isophthalic acid. **Hexahydrate**

$\text{CH}_3\text{CH}_2\text{C}(\text{OH})(\text{CO}_2\text{H})_2$. Formed by saponification of its semi-nitrile $[\text{180}^\circ\text{--}140^\circ]$ which is the product of the union of prussic acid with $\text{CH}_3\text{CH}_2\text{CO}$ $\text{CH}_3\text{CH}(\text{CO}_2\text{H}) > \text{CH}_2$ (Baeyer a. Tutein, *B.* 22, 2186). Nodules (from alcohol).— Ag_2A_2 .

Di-oxy-phthalic acid. **Methyl derivative** $\text{C}_6\text{H}_3(\text{OMe})(\text{OH})(\text{CO}_2\text{H})_2$. **Normethylhemipic acid**. [225°] (Wegscheider, *M.* 3, 378). Made by warming hemipic acid with conc. HIAq (Liechth, *A. Suppl.* 7, 151; Beckett a. Wright, *O. J.* 29, 281). Nodules (containing 2aq). Melts at 150°–155° when hydrated. V. sol. water and alcohol. Coloured blue by FeCl_3 . Yields protocatechuic acid when fused with potash. The anhydride $\text{C}_6\text{H}_3\text{O}_4$ 2aq forms crystals [148°].— KHA' aq.

Di-methyl derivative v. **HEMIPIC ACID**.

Methylene derivative

$\text{CH}_2\text{O}_2\text{C}_6\text{H}_3(\text{CO}_2\text{H})_2$. [175°]. **Hydrastic acid**.

Got by the action of boiling potash on the methimide [233°] which is obtained by oxidising hydrastimic acid (Freund a. Lachmann, *B.* 22, 2325). Needles (from Ag).— $\text{NMe}_2\text{H}_2\text{A}'$. [224°].

Di-oxy-phthalic acid. **Hexahydrate** $\text{C}_6\text{H}_3\text{O}_4$. [180°]. Got by the action of baryta on 'bionol-malophthalic' acid (Baeyer, *A.* 166, 355). Prisms (containing 2aq), v. sol. water.— PbA' aq: needles.

Reference.—**OXYTEREPHTHALIC** **ACID**.

(a) **OXY-ISOPHTHALIC ALDEHYDE**

$\text{C}_6\text{H}_3(\text{OH})(\text{CHO})_2$ [4:3:1]. [108°]. Formed by boiling *oxy*-benzoic aldehyde with chloroform and NaOHAq , and also, together with the (β)-isomeride, from salicylic aldehyde in like manner (Voswinkel, *B.* 15, 2021). Needles, sol. ether, sl. sol. water, almost insol. ligroin.

(β) **Oxy-isophthalic aldehyde**

$\text{C}_6\text{H}_3(\text{OH})(\text{CHO})_2$ [2:3:1]. [88°]. Made as above. Needles (from water), v. sol. ligroin. Yields *c*-oxy-isophthalic acid on fusion with potash.

Di-oxy-isophthalic aldehyde

$\text{C}_6\text{H}_3(\text{OH})_2(\text{CHO})_2$. **Resorcylic aldehyde**. [127°]. Made by the action of chloroform and NaOHAq on resorcin (Tiemann a. Lewy, *B.* 10, 2212; 13, 2368). Needles (from hot water). With alcoholic aniline it yields yellow crystals [199°]. Phenyl-hydrazine acetate forms $\text{C}_6\text{H}_3(\text{OH})_2(\text{CHO})_2$ [c. 230°] (Rudolph, *A.* 248, 105). Yields a dioxim [209°] (Marcus, *B.* 21, 3062).

Methyl derivatives

$\text{C}_6\text{H}_3(\text{OMe})(\text{OH})(\text{CHO})_2$. Two isomerides, [179°] and [89°], are formed from $[\text{1:3}]\text{C}_6\text{H}_3(\text{OMe})(\text{OH})$, chloroform, and NaOHAq .

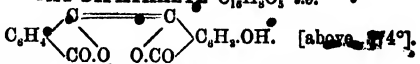

OXY-PHTHALIDE $\text{C}_6\text{H}_4\text{O}_2$ i.e.

$\text{C}_6\text{H}_3(\text{OH}) < \text{CH}_2 > \text{O}$. [222°]. Got by reducing *oxy*phthalimide with tin and HCl , treating with nitrous acid, and heating the resulting nitroso-*oxy*-phthaliding with NaOHAq (Graebe a. Rée, *C. J.* 49, 526). Prisms or needles, sl. sol. ether.

OXY-PHTHALIMIDE $\text{C}_6\text{H}_3(\text{OH}) < \text{CO} > \text{NH}$

or $\text{C}_6\text{H}_3(\text{OH}) < \text{C}(\text{NH}) > \text{O}$. [290°]. Formed by saturating *i*-oxy-phthalic acid with NH_3 (Rée, *A.* 233, 232; *C. J.* 49, 525). Yellow crystals, sl. sol. ether. When reduced by tin and HCl it yields a product from which a nitroso-compound [170°] may be prepared.

OXY-DIPHTHALYL $\text{C}_{16}\text{H}_{10}\text{O}_4$ i.e.

Made by heating phthalide with *i*-oxy-phthalic anhydride and NaOAc at 206° (Graebe a. Guye, *A.* 233, 244). Needles (from HOAc).

A di-oxy-diphthalyl [250°] appears to be formed by dissolving di-chloro-diphthalyl in alcoholic potash (Ador, *A.* 164, 245).

• **DI-OXY-PROPANE** v. **PROPYLENE GLYCOL**.

• **DI-OXY-PROPANE TRI-CARBOXYLIC ACID**

$\text{C}_3\text{H}_3(\text{OH})(\text{CO}_2\text{H})_3$. Formed by oxidation of isosaccharin with HNO_3 (Kiliani, *B.* 18, 638). Colourless syrup. By HI it is reduced to glutaric acid $\text{C}_5\text{H}_8(\text{CO}_2\text{H})_3$.— $\text{A}'\text{H}_2\text{Ca}$: small prisms.

An isomeric acid, formed by boiling chlorocitric acid with lime, forms the salts $\text{Ca}_2\text{A}'$ 9aq, $\text{Ba}_2\text{A}'$ 5aq, and $\text{Cd}_2\text{C}_3\text{H}_3\text{O}_7$ 8aq (Pavlossek, *A.* 178, 157). The same acid, yielding $\text{Ba}_2\text{A}'$ 10aq,

occurs in beet-root juice (Lippmann, *B.* 16, 1078).

Tri-oxy-propane tri-carboxylic acid $C_3H_2O_8$, i.e. $CO_2H.OH(OH).CH(OH).C(OH)(CO_2H)_2$. Got by oxidising mannite with alkaline $KMnO_4$ (Eabst, *J.* 1880, 611). Yields a soluble NH_4 salt.

OXY-PROPANE PHOSPHONIC ACID

$C_3H_5PO_4$, i.e. $CH_2(OH).PO(OH)_2$. [162°]. Formed from propionic aldehyde and PCl_5 , followed by water (Fossek, *M.* 7, 29). Plates, v. sol. water.— CaA .

OXY-PROPANE SULPHONIC ACID

$C_3H_5(OH)(SO_3H)$. Formed from *n*-propyl alcohol and SO_3 , and also by boiling allyl alcohol with aqueous $KHSO_4$ (Max Müller, *B.* 6, 1441). The same, or an isomeric acid, is got from propylene oxide and $NaHSO_4$ (Erlenmeyer, *A.* 158, 260). The K salt crystallises in small needles.

Oxy-propane disulphonic acid

$CH(OH)(CH_2SO_3H)_2$. Formed by boiling glycerin dichlorhydrin with aqueous K_2SO_5 (Schäuffelen, *A.* 148, 111) and, in like manner, from epichlorhydrin (Lazschke, *J. pr.* [2], 1, 86; *Z.* [2] 5, 613). Syrup.— K_2A 2aq: trimetric octahedra: $\alpha:\gamma:c = 41:48:1$.— BaA 2aq: m. sol. watf.— PbA 2aq.— AgA : crystals, v. sol. alcohol.

Referenc.e.—CHLORO-OXY-PROPANE SULPHONIC ACID.

TRI-OXY-PROPENYL-BENZENE.

Tri-

methyl derivative $[1:2:4:5]C_6H_4(OMe)_2.CH:CHMe$. This is the constitution of asarone (*q.v.*) (Eykmann, *B.* 22, 3172).

OXY-PROPENYL-BENZOIC ACID

$C_6H_4(O_2H)(OH)CO_2H$ [4:2:1]. *Propenyl-salicylic acid*. [146°]. Formed from oxyisopropyl-salicylic acid $C_6H_4(CMe_2OH)(OH)CO_2H$, by elimination of H_2O by warming with dilute HCl . White slender needles. V. sol. alcohol, ether, and CS_2 , sl. sol. water. Sublimable. Volatile with steam. Gives a deep reddish-violet colouration with $FeCl_3$. By sodium amalgam it is reduced to oxy-cuminic acid $C_6H_4Pr(OH)CO_2H$ [4:2:1].

Salts.— $A'Ag$: sparingly soluble white crystalline pp.— $A'Cu$ 2aq: small green crystals, nearly insol. water.

Polymeride $(C_{10}H_8O)_x$. [230°]. Formed by boiling oxy-propenyl-benzoic acid with strong HCl . Small white crystals. M. sol. hot acetic acid, alcohol, and ether, insol. water and CS_2 . Gives a deep bluish-violet colouration with $FeCl_3$. Not volatile with steam.— $(CuA' 1)aq$.— $(AgA')_x$: white pp. (Haymann a. Königs, *B.* 19, 3313; 20, 2860).

OXY-PROPIONAMIDINE

$CH_2.CH(OH).C(NH).NH_2$. The hydrochloride $BHCl$ is formed from $(CH_2.CH(OH).C(NH).OC_2H_5)_2$, HCl , and alcoholic NH_3 (Pinner, *B.* 23, 2947). Needles; converted by $AgNO_3$ into $B'HNO_3$ [84°], v. sol. water.

OXY-PROPIONIC ACID = LACTIC ACID and HYDROXYLIC ACID. *J.* also Bromo-, Chloro-, and Iodo-, OXY-PROPIONIC ACIDS.

Di-oxy-propionic acid v. GLYCOERIC, GLYCOXYLIC, PRUVIC, and GLYCIDIC ACIDS.

α -OXY-PROPIONIC ORTHALDEHYDE.

Tri-methyl derivative $C_6H_4(O_2H)_3$, i.e. $CH_2(OH)(OMe).CH(OMe)_2$ (148°). S.G. 2.949. Formed by heating acrolein (2 vols.) with methyl alcohol (6 vols.) and $HOAc$ (1 vol.) at 100° (Alsberg, *J.* 1864, 495). Liquid, with pleasant smell, sl. sol. water.

Tri-ethyl derivative (186°). S.G. 1.4.90.

OXY-PROPIONIC IMIDO-ISOAMYL ETHER

$CH_2(OH)(OH).C(NH).OC_4H_9$. The hydrochloride $B'HCl$ [69°], formed by the action of HCl gas on a solution of aldehyde-cyanhydrin in isomyl alcohol, crystallises in thin needles. The homologous $CH_2(OH).C(NH).Cl.OC_4H_9$, also melts at 69° and gradually decomposes forming lactamide and ammonium chloride (Pinner, *B.* 23, 2947).

OXY-PROPYL-AMIDO-BENZOIC ACID

$C_6H_4(CMe_2OH)(NH_2)CO_2H$ [4:2:1]. [168°]. Made by reduction of nitro-oxypropyl-benzoic acid with $FeSO_4$ and ammonia (Widman, *B.* 19, 271). Prisms. Exhibits blue fluorescence in ethereal solution.

Acetyl derivative

$C_6H_4(C_2H_5O)(NHAc)CO_2H$. [174°]. Trimetric tables, v. sol. hot alcohol.

Oxypropyl-amido-benzoic acid

$C_6H_4(CMe_2OH)(NH_2)(CO_2H)$ [4:3:1]. Made by reducing the corresponding nitro-acid (Widman, *B.* 16, 2570; 17, 1305). Prisms, v. sol. alcohol, v. sl. sol. ether. With $ClCO_2Et$ it forms $C_6H_4(CMe_2OH)(NH.CO_2Et).CO_2H$ [167°] and $C_6H_4(CMe_2O)_2$ [above 300°] which is converted by H_2SO_4 into $CO(NH.C_6H_4(CMe_2OH)(CO_2H))_2$.

Acetyl derivative. Crystalline.

α -OXY-PROPYLAMINE

$CH_2(OH)(OH).CH_2NH_2$. *Amido-iso-propyl-alcohol*. [30°]. (176°). Formed from allylamine and H_2SO_4 , followed by water (Liebermann a. Paal, *B.* 16, 531). Needles.

Benzoyl derivative

$CH_2(OH)(OBz).CH_2NH_2$. Got by boiling bromo-propyl benzamide with $HBrAq$. Oil, v. sol. water. Converted into $CH_2(OH)(OBz).CH_2OH$ by nitrous acid. Boiling $NaOHAq$ converts it into the isomeric $CH_2(OH)(OH).CH_2NH_2$ [93°] (Hirsch, *B.* 23, 970).— $C_{10}H_{15}NO_2.HBr$. [133°]. Needles.— $B'C_6H_5N_2O_2$. [189°]. Needles.— $B'H_2PtCl_4$: yellow needles (from water).

β -Oxy-propylamine $CH_2(OH).CH_2CH_2NH_2$

Formed by heating bromo-propyl-phthalimide with dilute (1:2) H_2SO_4 for 5 hours at 200° (Gabriel, *B.* 21, 2672).— $B'H_2PtCl_4$: yellow plates.— $B'HfAuCl_4$: plates.

Sulphuric acid derivative

$CH_2(O.SO_3H).CH_2CH_2NH_2$. [221°]. Formed from β -bromo-propylamine hydrobromide and aqueous Ag_2SO_4 at 100° (Gabriel a. Lauer, *B.* 23, 91). Prisms (from warm water). Indifferent body.

Benzoyl derivative $NH_2.C_6H_5.OBz$

Liquid, v. sol. water. Formed from phenyl-pentoxazoline and HBr (Gabriel a. Elfeldt, *B.* 24, 3216). Yields $B'HBr$ [135°], $B'H_2PtCl_4$ [205°] and $B'C_6H_5N_2O_2$ [178°].

Phényl derivative $PhO.C_6H_5.NH_2$

(242°). Got from phenoxy-propyl-phthalamic acid and HCl (Lohmann, *B.* 24, 2634). Yields $B'HCl$ [168°] crystallising in shining plates, and $PhO.C_6H_5.NHBz$ [118°]. Cyanic acid forms $PhO.C_6H_5.NH.CO.NH_2$ [114°].

Oxy-di-propyl-amine $(C_2H_5OH)(C_2H_5)NH$

(175°). [30°]. S.G. 1.4.9018. Prepared by heating propyl-allyl-amine with H_2SO_4 , and pouring the product into water (Liebermann a. Paal, *B.* 16, 531). Needles. $B'H_2PtCl_4$ 2aq: efflorescent.

Oxy-tri-propyl-amine $(C_2H_5OH)(C_2H_5)_2$. Got by heating di-propyl-allyl-amine with

DI-OXY-ISOPROPYL-TRIMETHYLENE.

H₂SO₄ and pouring the product into water (L. a. P.).—B⁺H₂PtCl₆.

OXY-PROPYL-AMYL-AMINE C₈H₁₇NO *is.* (C₂H₅OH)(C₂H₅)NH (c. 200°). [c. 2°]. Formed by heating allyl-amyl-amine with H₂SO₄ and pouring the product into water (Liebermann & Paal, B. 16, 531). Solidifies to long fine needles.

Oxy-propyl-di-isoamyl-amine (C₂H₅)₂N(C₂H₅OH). (243°). Formed from propylene chlorhydrin and di-isoamyl-amino (Louise, A. Ch. [6] 13, 433). Oil, sl. sol. water. Inactive to light.—B⁺H₂PtCl₆: orange crystals. The acetyl and benzoyl derivatives form crystalline oxalates, the latter being C₂H₅NO₂H₂C₂O₄.

OXY-PROPYL-BENZENE v. **PROPYL-PHENOL** and **PHENYL-PROPYL-ALCOHOL**.

Di-oxy-propyl-benzene CH₃CH(OH).CH(OH).C₆H₅. [53°]. Made from phenyl-propylene bromide by successive treatment with KOAc and alcoholic potash (Zincke, B. 17, 709). Tables (from ether ligroin), v. e. sol. water. A more sparingly soluble isomeride [93°], made from phenyl propylene bromide by boiling with aqueous K₂CO₃, crystallises from ether in monoclinic tables.

Tri-oxy-propyl-benzene v. **PROPYL-XYR-GALLOL**.

Tetra-oxy-propyl-benzene. Methylene derivative CH₂(OH).CH(OH).CH₂.C₆H₄.O.CH₂. [83°]. Formed from safrol and dilute KMnO₄ at 75° (Tiemann, B. 24, 2881). White needles, v. sol. boiling water and ether. Yields piperonal, piperonylic acid, and CH₂O₂.C₆H₄.CH₂.CO₂H on further oxidation. Phenyl cyanate forms CH₂O₂.C₆H₄.CH₂.C₆H₅(O.CO.NHPh)₂ [127°].

Acetyl derivative CH₂O₂.C₆H₄.CH₂.C₆H₅(OAc)₂. (240° at 18 mm.).

OXY-PROPYL-BENZENE SULPHONIC ACID Me₂C(OH).C₆H₄.SO₃H. Got from cumene p-sulphonic acid, KOH and KMnO₄ (R. Meyer, A. 219, 302).

Salts.—KA'.—BAa'. Splits off H₂O at 140°.—PbA'. Splits off 2H₂O at 110°, probably forming lead propenyl-benzene sulphonate.

Reaction.—PCl₅ followed by ammonia forms the amide of propenyl-benzene sulphonate acid [152°].

OXY-*o*-ISOPROPYL-BENZOIC ACID CMe₂(OH).C₆H₄.CO₂H. The salt KA' [197°] is formed by the action of conc. KOH aq on di-methyl-phthalide (Wislicenus, A. 248, 59). The free acid is unstable, at once forming di-methyl-phthalide [68°].

Oxy-p-isopropyl-benzoic acid CMe₂(OH).C₆H₄.CO₂H. [156°]. Formed by oxidising cuminic acid, or cymene, with alkaline KMnO₄ (R. Meyer, B. 11, 1283, 1790; A. 219, 248; Remsen & Emerson, A. O. J. 1, 267; Widman, B. 19, 583). Thin triclinic prisms (from water), v. sol. alcohol and ether. Gives no colour with FeCl₃. Yields terephthalic and acetyl-benzoic acids on oxidation by CrO₃. Boiling HCl aq forms two isomeric propenyl-benzoic acids.—BAa', aq.—CaA', 2 aq.—CuA', 8 aq.—AgA' 1 aq: crystalline pp.

An isomeric or identical acid is got by boiling bromo-propyl-benzoic acid with alcoholic potash (Oumpeilik, B. 3, 478).

Isomerides v. OXY-CUMINIC ACIDS.

Di-oxy-isopropyl-benzoic acid C₂H₅(CMe₂OH)(OH).CO₂H [1:2:4]. [175°].

Formed by the action of nitrous acid on *o*-amido-isopropyl-benzoic acid (Widman, B. 722). Crystals (from water), v. sol. alcohol & ether. Coloured dark brown by FeCl₃.

Di-oxy-isopropyl-benzoic acid C₂H₅(CMe₂OH)(OH).CO₂H [1:3:4]. [180°-185°] Formed by oxidising carvacryl-sulphuric acid with alkaline KMnO₄ (Heymann & Königs, B. 19, 3310). Flat needles (from water), v. e. s. alcohol.—CuA' aq.—AgA': needles.

DI-OXY-DI-ISOPROPYL-DI-CARBOXY-DIPHENYL-ALLOPRANIC ETHER C₂H₅N₂O₂: N(CO₂Et)₂C₆H₄(CMe₂OH).CO₂H [above 800°] CO₂NH.C₆H₄(CMe₂OH).CO₂H.

Formed, with CO(NH.C₂H₅)(CMe₂OH).CO₂H, & CO₂Et.NH.C₆H₄(CMe₂OH).CO₂H [167°], by the action of AlCl₃ on oxy-amido-isopropyl benzoic acid (Widman, B. 17, 1306). Table (from HOAc), almost insol. water.

OXY-PROPYLENE-DIAMINE C₂H₅N₂O₂: CH(OH)(CH₂NH₂)₂. Formed from glycerin & chlorhydria and alcoholic NH₃ (Clare, A. 16, 36).—B⁺H₂PtCl₆.

OXY-PROPYLENE-TETRA-METHYL-DIAMINE C₂H₅(OH)(NMe₂)₂. (170°-185°). Formed by heating s-dichlorhydrin with NMe₂H (Berend, B. 17, 610). Liquid, v. sol. water.

Benzoyl derivative. Crystalline.

OXY-PROPYL-ETHYL-AMINE v. **ETHYL OXY-PROPYL-AMINE.**

OXY-PROPYL-MALONIC ACID CO₂H.CH(CH₂).CHMe(OH).CO₂H. The free acid at once splits off water, leaving the lactonic acid. The salts BaC₂H₃O₆, CaA', and Ag₂A' may however, be prepared.

Lactonic acid C₂H₃O₄. Got by combining allyl-malonic acid with HBr, and boiling the product with water (Hjelt, B. 15, 621; A. 216, 59). Syrup, v. sol. water, sl. sol. ether. Yield Ba(C₂H₃O₄)₂ crystallising in soluble plates.

Di-oxy-propyl-malonic acid (CO₂H)₂.CH.CH₂.CH(OH).CH₂OH. The free acid in aqueous solution remains unchanged at 15° but at 100° it splits off water, forming a lactonic acid whose barium salt is (C₂H₃O₄)₂Ba.

Salts.—BAa'. Got by boiling di-bromo propyl-malonic acid with baryta (Hjelt, A. 216, 58).—Ag₂A': flocculent pp.

Di-oxy-di-propyl-malonic acid (CH₂.CH(OH).CH₂).C(CO₂H)₂.

Lactone C₂H₃O₄. [106°]. Obtained from di-allyl-malonic acid by evaporating with conc. HBr aq (Hjelt). Thin plates (from alcohol), long needles (from water), or trimetric crystals (from conc. HBr aq) *anhydrous* = 61:1:92. Warm baryta-water forms (C₂H₃O₄)₂Ca(CO₂)₂Ba, which on heating splits up into BaCO₃ and the neutral lactone C₂H₃O₄.CH₂.CHMe<CO<O>.

Reference.—DI-BROMO-DI-OXY-DI-PROPYL-MALONIC ACID.

DI-OXY-ISOPROPYL-TRIMETHYLENE so-called CHPr<CH.OH? (126°). S¹⁰. Formed from isobutyric aldehyde and ethylene glycol by heating in a sealed tube (Locher, B. [3] 43, 716). Liquid, lighter than water, v. sol. alcohol and ether. Decomposed by water at 100° into its constituents. Bromine yields a heavy oil C₂H₅Br.CH(OH).CH₂ (c. 187°).

α -OXY-*p*-PROPYL-PHENYL-ACETIC ACID $C_{11}H_{12}O_4$, i.e. $C_6H_4(C_2H_5)CH(OH)CO_2H$. [159°]. S. 19 at 21°. Formed from cuminic aldehyde, HCl, and HCl (Raab, B. 8, 1148; Plöchl, B. 14, 1316). Small needles (from water).— BaA' , 4aq.— PbA' — AgA' : stellate needles.

OXY-ISOPROPYL-DIPHENYLENE-KETONE CARBOXYLIC ACID $C_{15}H_{12}O_4$, i.e.

Formed by oxidising retene-quinone with alkaline $KMnO_4$ (Bamberger & Hooker, B. 18, 1030, 1750; A. 229, 150). Yellow plates, sl. sol. cold water and ether, n. sol. alcohol.— BaA' , aq.— CuA' — AgA' : yellow flocculent pp.

Opt. Not melted at 270°.

TRI-OXY-TRI-PROPYL-PHOSPHINE.

Hydrate $PH(OH)(CH_2OH)_3$. Formed by the action of conc. $KOHAq$ upon $(C_3H_7O)_3PH$, which is got, together with the crystalline oxypropylo-iodide $(C_3H_7O)_3PI$ by dissolving PHI in propionic aldehyde at 0° (De Girard, A. Ch. [6] 2, 27). Syrup, sl. sol. water.

OXY-PROPYL-PHTHALIMIDE $C_{11}H_{11}NO_3$, i.e. $C_6H_4C_2O_2NCH_2CH_2CH_2OH$. Formed from bromo-propyl-phthalimide and hot conc. $KOHAq$ (Gabriel & Lauer, B. 23, 87). Needles (from Aq).

Phenyl derivative $C_{15}H_{11}C_2O_2NCH_2CH_2OPh$. [88°]. Formed from the bromo-propyl-derivative of phenol and potassium phthalimide at 220° (Lohmann, B. 24, 2633). Needles, converted by KOH into $PhOC_3H_7NHCO.C_3H_7CO_2Et$ [134°] a white crystalline powder.

OXY-PROPYL-PIPERIDINE

$C_8H_{13}N.C_3H_7.OH$. So-called '*piperpropylalkaline*.' (1942). S.G. 2.947; d_4^{20} 0.936. V.D. 4.79 (obs.). Made from piperidine and propylene chlorhydrin (Ladenburg, B. 14, 1880, 2407; 15, 1144; Lauw, B. 17, 680). Liquid, sol. water.— $B'HauCl_4$.— $B'H_2PtCl_6$.—Mandelate: dilute HCl forms $C_8H_{13}NO_3$, which gives $B'HauCl_4$.

Acetyl derivative $C_{11}H_{15}NO$.— $B'HauCl_4$.

Benzoyl derivative $C_{15}H_{17}N.C_6H_5.O_2$.— $B'HauCl_4$.— $B'C_6H_5NO_2$: yellow powder.

Oxy-propyl-piperidine

$C_8H_{13}(CH_2CH(OH)CH_3)NH$. So-called '*(a)-pipercolyl methylalkine*.' [47°]. (225°). Got by reducing the corresponding oxypropyl-pyridine with sodium and alcohol (Ladenburg, B. 22, 2588). Crystalline, v. sol. water, alcohol, and ether. Yields an oily nitrosamine.— $B'H_2PtCl_6$. [140°]. Small crystals (from alcohol).

Oxy-propyl-piperidine $C_8H_9(CH(OH)Et)NH$. [107°]. Got by reducing (*a*)-pyridyl ethyl ketone in amyl alcohol with sodium (Engler & Bauer, B. 24, 2538). Needles. Probably identical with the ψ -conhydrin in *Conium maculatum*.

Dioxypropyl-piperidine $C_8H_{11}NO_2$. Made by heating piperidine with glycerin chlorhydrin (Roth, B. 15, 1150). Silky plates.— $B'HBr$.— $B'HauCl_4$: yellow needles.

OXY-PROPYL-PYRIDINE C_8H_9NO , i.e. $C_6H_4(CH_2CH_2CH_2OH)N$. So-called '*(a)-lut-idylalkine*.' (c. 130° at 17 mm.). Formed from (*a*)-ethyl-pyridine and formic aldehyde (Ladenburg & Adam, B. 24, 1678). V. sol. water.— $B'HauCl_4$. [71°].— $B'H_2PtCl_6$. [142°].

Hexahydrate $C_8H_{11}NO_6$.— $B'HBr$.

Oxypropyl-pyridine

$C_8H_9(CH_2CH(OH)CH_3)N$. '*(a)-picolylmethylalkine*.' (176°–181° at 18 mm.). Made from

(*a*)-methyl-pyridine and acetic aldehyde (L.). Liquid, sl. sol. water.— $B'H_2PtCl_6$. [189°]. Small tables, sl. sol. water.

Oxy-propyl-pyridine $C_8H_9(CH(OH)Et)N$. (215°). Got, together with conine and another body [89°], by reducing (*a*)-pyridyl ethyl ketone with sodium-amalgam at 80°–40° (Engler & Bauer, B. 24, 2532).— $B'H_2PtCl_6$.

Oxy-propyl-pyridine. Tetrahydride $CH_3 \begin{array}{c} \diagup CH(C_6H_5)CO \\ \diagdown CH_2 \end{array} NH$. [57°]. (274°).

Made by heating δ -amido- α -propyl-valeric acid to 230° (Asghan, B. 23, 3701). Flat, snowy needles.

OXY-PROPYL-PYRIDINE DIHYDRIDE CARBOXYLIC ACID v. MORRHUIC ACID.

(*Py*, 3)-OXY-(*B*, 3)-ISOPROPYL-QUINOLINE $CH:CH.C_6H_4:CH$ $CH:CH.C_6H_4:CO$ *Cumostyryl*. [169°]. Made by boiling the hydrochloride of phenyl-*o*-amido-cumyl-acrylic acid with water and a few drops of HCl for 5 hours (Widman, B. 19, 264). Needles, v. sol. hot alcohol, sl. sol. hot water.

Oxy-*n*-propyl-quinoline. Dihydride $CH:CH.C_6H_4:CH_2$ $CH:CH.C_6H_4:CO$ [134°]. Formed, by intramolecular change, by reducing the preceding body, and also from nitro-*n*-cumyl-propionyl acid (Widman, B. 19, 2778). Prisms (from benzene-ligroin), insol. water.

OXY-PROPYL-SUCCINIC ACID. Lactonic acid $CH_3CH \begin{array}{c} \diagup CH_2CHCH_2CO_2H \\ \diagdown O-CH \end{array}$ [69°].

(c. 260°). Formed from allyl-succinic acid and conc. $HBrAq$ (Ejelt, B. 16, 334). Crystals (from alcohol).

OXY-ISOPROPYL-SULPHOBENZOIC ACID $CMe_2(OH).C_6H_4(SO_3H)CO_2H$. [1:3:4]. Made by oxidising cumene sulphonic acid, an intramolecular change taking place. Got also from isocumene sulphonic acid and $KMnO_4$ (R. Meyer & Boner, A. 220, 8, 30; B. 13, 1495; 14, 2391; Remsen, Am. 8, 262).— K_2A' 5aq. Triclinic crystals; $a:b:c = 675:1:642$; $\alpha = 131^\circ 14'$; $\beta = 104^\circ 26'$; $\gamma = 66^\circ 27'$.— K_2A' 2aq.— BaA' aq. An isomeric acid, got from *m*-isocumene sulphonic acid, yields BaA' and PbA' .

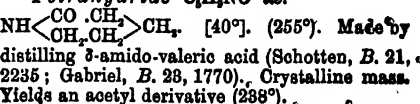

OXYPROPYL-*p*-TOLUIDINE $C_{11}H_{13}NO$, i.e. $C_6H_4Me.NH.C_3H_7.OH$. [74°]. (293° cor.). Formed from propylene oxide and *p*-toluidine (Morley, C. J. 41, 387; B. 15, 179). Needles (from light petroleum), insol. water, v. sol. benzene and ether.— $B'H_2C_2O_4$. [151°]. Pearly plates.

(*a*)-OXY-PYRIDINE C_8H_9NO , i.e.

Formed by distilling its carboxylic acids (Königs, B. 16, 2160; 17, 590, 2391; 19, 2433; Pechmann, B. 17, 2384; Weidemann, Strache, M. 7, 297). Dimetric needles, v. e. sol. water and alcohol. Coloured red by $FeCl_3$. Yields a di-bromo-oxy-pyridine [207°].

Tetrahydride C_8H_9NO , i.e.

(β)-Oxy-pyridine C_8H_9NO , i.e.

potash-fusion from pyridine sulphonie acid (Fischer a. Renouf, *B.* 17, 763, 1896). Needles, v. sol. water and alcohol. Coloured red by FeCl_3 .—Oxalate. [175°]. White needles.

Acetyl derivative. (210° uncor.). Oil. **Ethyl derivative.** Made by ethylation, and also from bromo-pyridine and alcoholic potash (Weidel a. Blau, *M.* 6, 664). Oil.— $\text{B}'\text{H}_2\text{PtCl}_6$. [192°]. Prisms.

Methylo-iodide $\text{B}'\text{MeI}$. Needles. **Methylo-chloride** $\text{B}'\text{MeCl}$. Needles.— $\text{B}'\text{Me}_2\text{PtCl}_6$: Orange prisms, sl. sol. alcohol.

(γ)-Oxy-pyridine $\text{NH} \begin{smallmatrix} \text{CH:CH} \\ \text{CH:CH} \end{smallmatrix} \text{CO}$. **Pyridone.** [148°]. (above 350°). S. 100 at 15°. Formed by heating chelidonic acid under reduced pressure at 230° or with water at 196° (Lerch, *M.* 5, 403; Hattinger a. Jöben, *M.* 6, 800). Formed also by distilling its carboxylic acid (Ost, *J. pr.* [2] 29, 65). Small efflorescent grains (from alcohol), prisms (containing aq), or trimetric tables; $a:b:c = 55:1:1.5$. V. sol. water and alcohol. Melts below 100° when hydrated. Converted by treatment with MeI and KOH into $\text{NMe} \begin{smallmatrix} \text{CH:CH} \\ \text{CH:CH} \end{smallmatrix} \text{CO}$, a deliquescent mass [89°] which gives $(\text{C}_4\text{H}_5\text{NO})_2\text{H}_2\text{PtCl}_6$ aq [176°], $\text{B}'\text{MeI}$, and $\text{B}'\text{Me}_2\text{PtCl}_6$. Does not yield an acetyl derivative.

Salts. — $\text{B}'\text{H}_2\text{PtCl}_6$ aq. — $\text{B}'\text{H}_2\text{PtCl}_6$ 2aq. Efflorescent monoclinic needles [200°], converted by boiling water into $\text{B}'\text{H}_2\text{PtCl}_6$ aq.— $\text{B}'\text{HNO}_3\text{AgNO}_3$: tables.— $\text{B}'\text{HgCl}_2$.— $\text{B}'\text{IHg}_2\text{Cl}_2$.

Methyl derivative $\text{N} \begin{smallmatrix} \text{CH:CH} \\ \text{CH:CH} \end{smallmatrix} \text{COMe}$. (101° cor.) at 788 mm. Formed from (γ)-chloro-pyridine and NaOMe (H. a. L.). Liquid, sol. water. Alkaline in reaction. Changes at 220° into the crystalline isomeride (*v. supra*). Gives a deep-blue liquid with aqueous CuSO_4 . Conc. HIAq converts it into (γ)-oxy-pyridine.— $\text{B}'\text{H}_2\text{PtCl}_6$: crystals, sl. sol. water.

Di-oxy-pyridine $\text{C}_4\text{H}_2(\text{OH})_2\text{N}$. [α . 255°] (K. a. G.); [239°] (W. a. B.). Formed by potash-fusion from its ethyl derivatives and also from pyridine disulphonic acid (Königs a. Geigy, *B.* 17, 1835; Weidel a. Blau, *M.* 6, 651). Needles (containing aq), v. sol. water, sl. sol. alcohol. Coloured red by FeCl_3 .— $\text{B}'\text{HCl}$: needles.

Mono-ethyl derivative $\text{C}_4\text{H}_5\text{NO}$. [128°]. Formed, together with the di-ethyl derivative, by heating dibromopyridine [111°] with alcoholic potash. Tables, sl. sol. cold water.— $\text{B}'\text{HNO}_3$.— $\text{B}'\text{H}_2\text{PtCl}_6$: red triclinic needles.

Di-ethyl derivative $\text{C}_4\text{H}_4(\text{OEt})_2\text{N}$. (α . 244°). Made as above. Liquid, nearly insol. water.— $\text{B}'\text{H}_2\text{PtCl}_6$: yellow needles.— $\text{B}'\text{IHg}_2\text{Cl}_2$. [106°]. Crystals (from HClAq).

Di-oxy-pyridine. Di-oxim of the dihydride $\text{NH} \begin{smallmatrix} \text{C}(\text{NOH})\text{CH}_2 \\ \text{C}(\text{NOH})\text{CH}_2 \end{smallmatrix}$. [193°]. A product of the action of hydroxylamine on trimethylene cyanide (Biedermann, *B.* 22, 2967). Yields a di-acetyl derivative [127°] and a dibenzoyl derivative [180°].

Picrate. [176°]. Needles.

Tri-oxy-pyridine $\text{C}_4\text{H}_2\text{NO}_3$, i.e. $\text{N} \begin{smallmatrix} \text{C}(\text{OH})\text{CH} \\ \text{C}(\text{OH})\text{CH} \end{smallmatrix} \text{COH}$ [220°-230°]. Formed by boiling di-oxy-amido-pyridine (glutazine)

with conc. HClAq (Stokes a. Von Pechmann, *Am.* 8, 384; *B.* 19, 2701). Yellowish sandy powder, v. sol. hot water. On evaporation of its solution it is partly converted into its anhydride. FeCl_3 gives a red colour. Forms with bromine $\text{CBr}_3\text{CO.CBr}_3\text{CONH}_2$. NH_4OAc at 140° converts it into glutazine.— BaA'_2 .— AgA'_2 .— $\text{B}'\text{HCl}$.

• **Oxim** $\text{NH} \begin{smallmatrix} \text{CO.CH} \\ \text{CO.CH} \end{smallmatrix} \text{C:NOH}$. [196°].

Made by boiling tri-oxy-pyridine or glutazine with hydroxylamine hydrochloride. Minute hexagonal plates (containing aq), m. sol. hot water.— $\text{B}'\text{HCl}$: plates.

Phenyl-hydrazide

$\text{NH} \begin{smallmatrix} \text{CO.CH} \\ \text{CO.CH} \end{smallmatrix} \text{C:N.HPh}$. [230°]. Tables.

Anhydride $\text{C}_4\text{H}_2\text{N}_2\text{O}_2$. Made by boiling glutazine with dilute H_2SO_4 . Minute flesh-coloured prisms, sl. sol. water.— BaA'_2 4aq: yellow prisms.— AgHA'_2 .— $\text{B}'\text{H}_2\text{SO}_4$.— $\text{B}'\text{HCl}$.

References.—Di-bromo-, Di-chloro-, and Di-iodo-, OXY-PYRIDINE.

OXY-PYRIDINE CARBOXYLIC ACID

$\text{C}_4\text{H}_3\text{N}(\text{OH})\text{CO}_2\text{H}$. (α)-**Oxy-picolinic acid**. [267°]. Made by heating di-chloro-oxy-pyridine carboxylic acid [282°] with HI in HOAc at 210° (Ost, *J. pr.* [2] 27, 289). Long needles (containing aq) or short anhydrous needles; v. sol. hot water and alcohol, insol. ether. Coloured reddish-brown by FeCl_3 . AgNO_3 is not reduced, but gives a white pp.— BaA'_2 aq.— CaA'_2 .— $\text{C}_4\text{H}_3\text{N}(\text{OH})\text{CO}_2\text{K}$ aq: groups of needles.

Oxy-pyridine carboxylic acid

$\text{C}_4\text{H}_3\text{N}(\text{OH})\text{CO}_2\text{H}$. (β)-**Picolinic acid**. [250°]. Made by the action of HI in HOAc on chloro-oxy-pyridine carboxylic acid [257°] at 200° (Qst). Formed also without by-products by boiling comanic acid $\text{C}_4\text{H}_3\text{O}_2(\text{CO}_2\text{H})$ with NH_4Aq (Ost, *J. pr.* [2] 29, 61). Glittering plates. Yields oxy-pyridine [148°] on heating strongly.—Salt: BaA'_2 2aq: small needles, m. sol. water.

Oxy-pyridine carboxylic acid

$\text{C}_4\text{H}_3\text{N}(\text{OH})\text{CO}_2\text{H}$. (γ)-**Oxy-picolinic acid**. [258°]. Formed by the action of tin and HClAq on chloro-oxy-pyridine carboxylic acid [224°] (Bellmann, *J. pr.* [2] 29, 7). Small trimetric pyramids (containing aq), sl. sol. water, sol. conc. HClAq . Coloured brown by FeCl_3 .— BaA'_2 : prisms.— CaA'_2 4aq: needles.

Oxy-pyridine carboxylic acid

$\text{C}_4\text{H}_3\text{N}(\text{OH})\text{CO}_2\text{H}$ i.e. $\text{C}(\text{OH}) \begin{smallmatrix} \text{N.CH} \\ \text{CH:CH} \end{smallmatrix} \text{C.CO}_2\text{H}$. **Oxy-nicotinic acid**.

[302°]. Formed by heating oxy-pyridine di-carboxylic (oxyquinaldic) acid with water at 195° (Königs a. Geigy, *B.* 17, 589). Formed also by the action of NH_4Aq on the methyl ether of coumalic acid (*v. vol.* ii. p. 264), the product being saponified (Weichmann a. Welsh, *B.* 17, 2364; *C. J.* 47, 145). Needles, sl. sol. hot water. May be sublimed. PbCl_2 yields chloro-pyridine carboxylic acid, whence tin and HCl form nicotinic acid. FeCl_3 gives a light-yellow colour.— PhA'_2 2aq: needles, sol. hot water.

Methyl derivative $\text{C}_4\text{H}_3\text{N}(\text{OMe})\text{CO}_2\text{H}$. [238°]. Formed by methylating the acid, and also from methyl coumalate and methylamine, the product being saponified. Needles (containing aq), nearly insol. cold water.

Phenyl derivative $\text{C}_4\text{H}_3\text{N}(\text{CPh})\text{CO}_2\text{H}$.

[280°]. Formed by the action of boiling NaOH aq on methyl coumal-anilide (*loc. cit.*). Needles.

Oxy-pyridine carboxylic acid

$\text{CH} \begin{smallmatrix} \text{N} \cdot \text{C}(\text{OH}) \\ \text{CH} \cdot \text{CH} \end{smallmatrix} > \text{C} \cdot \text{CO}_2\text{H}$. (a)-Oxy-nicotinic acid.

[256°]. Formed by heating (a)-oxy-isocinchomeronic acid with HOAc and a little As_2O_3 at 210° (Weidel a. Strache, *M.* 7, 295). Slender needles (from water). Yields (a)-oxy-pyridine when heated.—AgA' a silky needles.

Oxy-pyridine dicarboxylic acid $\text{C}_6\text{H}_4\text{NO}_4$, i.e.

$\text{N} \begin{smallmatrix} \text{C}(\text{CO}_2\text{H}) \cdot \text{CH} \\ \text{C}(\text{OH}) \cdot \text{C}(\text{CO}_2\text{H}) \end{smallmatrix} > \text{CH}$. (a)-Oxyisocinchomeronic acid.

Formed by oxidising (a)-diquinolyl with KMnO_4 (Weidel a. Strache, *M.* 7, 293). Vitreous crystals. Gives no colour with FeCl_3 .—BaA'—AgA'—needles, nearly insol. water.

Oxy-pyridine dicarboxylic acid

$\text{C}_6\text{H}_4\text{N}(\text{OH})(\text{CO}_2\text{H})$, i.e.

$\text{N} \begin{smallmatrix} \text{C}(\text{CO}_2\text{H}) \cdot \text{C}(\text{CO}_2\text{H}) \\ \text{C}(\text{OH}) \end{smallmatrix} > \text{CH}$. Oxyquinolinic acid.

Formed from quinolinic acid by potash-fusion (Königs a. Könaer, *B.* 16, 2158). Small crystals (from dilute H_2SO_4), blackening at 254°. FeCl_3 colours its aqueous solution red. Its Ag-salt yields (a)-oxy-pyridine on heating.—BaA', 4aq; needles (from hot water).

Methyl derivative $\text{C}_6\text{H}_4\text{N}(\text{OMe})(\text{CO}_2\text{H})$, [140°]. Got by adding KMnO_4 to an aqueous solution of the methyl derivative of (γ)-amido-carboxystyryl (Feer a. Königs, *B.* 18, 2338). Needles, v.e. sol. water.—AgH₂A'. Needles (from water).

Isomeric v. CHELIDAMIC ACID, vol. i. p. 729.

Di-oxy-pyridine carboxylic acid $\text{C}_6\text{H}_4\text{NO}_4$, i.e.

$\text{N} \begin{smallmatrix} \text{C}(\text{OH}) \cdot \text{CH} \\ \text{C}(\text{OH}) \cdot \text{CH} \end{smallmatrix} > \text{C} \cdot \text{CO}_2\text{H}$. Citrazic acid. Formed

by heating the mono-, di-, or tri- amide of citric acid with HCl or H_2SO_4 (Behrmann a. Hofmann, *B.* 17, 2687). Crystalline powder, nearly insol. water, sl. sol. hot HCl aq. Carbonises at 300°. PbCl_2 converts it into di-chloro-pyridine carboxylic acid [210°]. Gives a deep-blue colour with NaNO_2 . Tin and HCl reduce it to tricarballylic acid.—BaA', 2aq.

Di-acetyl derivative. Crystalline.

Methyl ether MeA'. Plates, decomposing above 220°.

Ethyl ether EtA'. Plates.

Amide $\text{C}_6\text{H}_4\text{N}(\text{OH}) \cdot \text{CONH}_2$. Formed by the action of conc. NH_3 aq on ethyl acetyl-citrate and on acetic ether (Ruhemann, *C.* J. 51, 405; *B.* 20, 3366). Small grey crystals (from water).

Di-oxy-pyridine carboxylic acid

$\text{C}_6\text{H}_4\text{N}(\text{OH}) \cdot \text{CO}_2\text{H}$. Comenic acid. **Di-oxy-picolinic acid**. Formed by heating hydrogen ammonium comenat at 190°, or by boiling comenic acid with NH_3 aq. The yield is about 45 p.c. of the comenic acid used (How, *T. E.* 20 [2] 265; *A.* 80, 65; 83, 350; Ost, *J. pr.* [2] 27, 269). Tables (containing 2aq), m. sol. hot water and alcohol. Not decomposed by boiling NaOH aq. Gives a purple colour with FeCl_3 .

Reactions.—1. Yields pyridine on distillation with zinc-dust (Lieben a. Haitinger, *B.* 16, 1253). 2. Conc. HCl aq at 200° does not attack it, but when heated with it for two days at 270° pyrocomenic acid (probably a di-oxy-pyridine) $\text{C}_6\text{H}_4\text{NO}_4$ is formed. This body crystallises in needles (containing aq), gives a violet colour with FeCl_3 , and forms H^+HBr .—3. PbCl_2 (3 mols.) acting on the acid (1 mol.) at 100° forms a product

which on treatment with tin and HCl aq yields a di-oxy-methyl-pyridine $\text{C}_6\text{H}_4\text{NO}_4$, crystallising in trimetric prisms (containing aq), and forming the salts B^+HCl and $\text{B}^+\text{H}_2\text{PO}_4$. PbCl_2 and POCl_3 at 200° convert this di-oxy-methyl-pyridine at 200° into hexa-chloro-methyl-pyridine and $\text{C}_6\text{H}_2\text{Cl}_6\text{N}(\text{Cl})_2$, which is converted by boiling water into chloro-(γ)-oxy-pyridine (a)-carboxylic acid (Bellmann, *J. pr.* [2] 29, 19). Excess of PbCl_2 (6 mols.) at 220° acting on comenic acid in presence of POCl_3 forms penta- and hexa-chloro-methyl-pyridine, and other bodies, whence water produces chloro-(γ)-oxy-pyridine (a)-carboxylic acid and chloro-cyanic acid $\text{C}_6\text{H}_4\text{ClNO}$, which crystallises in needles [186°], and gives a blue colour with FeCl_3 . Chlorocyanic acid yields the salts AgA' and BaA' , aq.—4. Ammonium comenamate forms, among other products, on distillation, a very poisonous base called 'Oxycomezine' $\text{C}_{10}\text{H}_8\text{N}_2\text{O}$ (Krippendorff, *J. pr.* [2] 82, 153). The base crystallises from alcohol in four-sided prisms, *S.* 0.0035 at 20°. Its solutions in dilute acids show green fluorescence, and in strong acids a blue fluorescence. Tin and HCl reduce it to oxy-amido-pyridine. Oxycomezine forms the following salts: $\text{B}^+\text{H}_2\text{Cl}$, [c. 265°], $\text{B}^+\text{H}_2\text{PbCl}_2$, $\text{B}^+\text{H}_2\text{SO}_4$, 3aq, [c. 295°], and $\text{C}_6\text{H}_4\text{AgN}_2\text{C}$.—5. KMnO_4 oxidises comenic acid to tri-oxy-pyridine carboxylic acid.

Salts.— $\text{NH}_4\text{A}'$: very small grains.— $\text{BaC}_6\text{H}_4\text{NO}_4$, aq: pp.— BaA' , 2aq: crystalline.

Ethyl ether EtA'. [205°]. Needles (containing aq), sol. hot water (Reibstein, *J. pr.* [2] 24, 284). Yields $\text{Ba}(\text{C}_6\text{H}_4\text{NO}_4)_2$, 2aq and $\text{EtA}'\text{HCl}$ aq, both crystalline. When heated with AcCl it yields an anhydride $\text{C}_6\text{H}_4\text{NO}_4$ [261°] and two derivatives, $\text{C}_6\text{H}_4\text{N}(\text{OH})(\text{OAc}) \cdot \text{CO}_2\text{Et}$ [152°] and $\text{C}_6\text{H}_4\text{N}(\text{OAc}) \cdot \text{CO}_2\text{Et}$ [38°]. BzCl forms $\text{C}_6\text{H}_4\text{N}(\text{OBz}) \cdot \text{CO}_2\text{Et}$ [102°].

Di-oxy-pyridine carboxylic acid $\text{C}_6\text{H}_4\text{NO}_4$. **Oximido-comenic acid**. Made from comenic acid and hydroxylamine (Ost, *J. pr.* [2] 29, 378). Small needles, decomposing at 200°. Reduced by tin and HCl to (β)-oxy-picolinic acid.

Di-oxy-pyridine dicarboxylic acid. **Ethyl derivative** $\text{N} \begin{smallmatrix} \text{C}(\text{OEt}) \cdot \text{C}(\text{CO}_2\text{H}) \\ \text{C}(\text{OH}) \cdot \text{C}(\text{CO}_2\text{H}) \end{smallmatrix} > \text{CH}$. [182°].

Formed by the action of NaOH aq on the mono-ethyl ether EtHA' [160°], which is made by treating ethoxy-(a)-pyrone dicarboxylic ether with NH_3 aq (Guthzeit a. Dressel, *B.* 22, 1427; *A.* 262, 104). Needles (containing aq). Conc. HCl aq at 140° forms glutaric acid [134°]. PbCl_2 in POCl_3 at 250° gives di-chloro-pyridine dicarboxylic acid [230°] whence EtA' [76°] and, by treatment with HI , pyridine dicarboxylic acid [322°] may be prepared.—AgA'.

Mono-ethyl ether

$\text{OH} \begin{smallmatrix} \text{C}(\text{OEt}) \cdot \text{C}(\text{CO}_2\text{Et}) \\ \text{C}(\text{OH}) \cdot \text{C}(\text{CO}_2\text{H}) \end{smallmatrix} > \text{N}$. [160°]. Needles. Yields AgA' and an acetyl derivative $\text{C}_6\text{H}_4\text{NO}_4$, [100°].

Di-ethyl ether EtA'. [81°].

Tri-oxy-pyridine carboxylic acid $\text{C}_6\text{H}_4\text{NO}_4$. **Tri-oxy-picolinic acid**. **Oxy-comenic acid**. Formed, in small quantity, by oxidising comenic acid with potassium permanganate and H_2SO_4 in the cold. Prepared by heating oxy-comenic acid $\text{C}_6\text{H}_4\text{NO}_4 \cdot \text{CO}_2\text{H}$ with conc. NH_3 aq at 160° (Reibstein, *J. pr.* [2] 24, 290; Ost, *J. pr.* [2] 27, 265). Small needles (contain-

sulpho-pyrotartaric acid with potash, yields $\text{Ag}_2\text{A}''$ aq (Wieland, A. 157, 41). A fluid isomeride, got by potash fusion from bromo-cyano-butyric acid, yields $\text{Ag}_2\text{A}''$.

Di-oxy-pyrotartaric acid $\text{C}_4\text{H}_4\text{O}_6$. *Citrataric acid*. Formed by the action of boiling baryta-water on chloro-citramalic acid prepared from barium citraconate and HOCl (Carius, A. 129, 159) and by heating oxycitraconates with water at 120° (Morawski, J. pr. [2] 11, 432). Amorphous, deliquescent mass. — $\text{Pb}_2\text{A}''$ aq.

Isomeride v. ITARTARTARIC ACID.

DI-OXY-DI-PYRRYL-BUTANE $\text{C}_{12}\text{H}_{18}\text{N}_2\text{O}_4$

i.e. $\text{C}_6\text{H}_7\text{N.CMe(OH).CMe(OH).C}_6\text{H}_7\text{N}$. [120°]. Formed from pyrryl-methyl-ketone, water, and sodium amalgam (Dennstedt & Zimmermann, B. 19, 2204). Monoclinic prisms (containing 2 aq). Melts at 98° when hydrated. V. s. sol. alcohol.

OXY-PYRUVIC ACID $\text{C}_3\text{H}_4\text{O}_5$ i.e.

$\text{CH(OH).CO.CO}_2\text{H}$. Formed by dissolving 'nitro-cellulose' (collodion) in dilute NaOHAq and allowing the solution to stand at 20° (Will, B. 21, 405). Amorphous, v. sol. water, but pptd. by alcohol. *Reduces Fehling's solution and ammoniacal AgNO_3 . Its solutions, and those of its salts, are slightly laevogyrate. Phenyl hydrazine forms the compound $\text{C}_7\text{H}_{11}\text{N}_3\text{O}_2$ or $(\text{N}_2\text{EPH})\text{CH.C(N}_2\text{EPH).CO}_2\text{H}$, [205°], whence NaA' [231°], KA' [233°], $\text{NH}_4\text{A}'$ [200°], CaA' , and EtA' [149°].

Salts.— CaA' , 8 aq.— SrA' , 4 aq.— CdA' , 4 aq.

OXY-QUINALDINE v. OXY-METHYL-QUINOLINE.

OXY-QUINAZOLINE. Dihydride

$\text{C}_8\text{H}_8\text{N}_2\text{O}$ CH_2NH NH.CO 'Phenylidihydroacimiazine.' [160°]. *Formed from oxy-tolyl-urea and HCl (Söderbaum & Widman, B. 22, 1669). Soluble, insol. cold conc. KOH aq .— $\text{B}'\text{HCl}$.— $\text{B}'\text{H}_2\text{PtCl}_4$ 2 aq. [205°].— $\text{B}'\text{H a u Cl}$. [179°].

Oxy-quinazoline $\text{C}_8\text{H}_6\text{N}_2\text{O}$ C(=H):N N=CH [212°].

Made by heating formyl-o-amido-benzamide [123°] for two hours at 180° (Knape, J. pr. [2] 43, 214). Thin needles.— $\text{B}'\text{H}_2\text{PtCl}_4$ aq. [above 250°].

Methyl derivative [71°].

Di-oxy-quinazoline

$\text{C}_8\text{H}_8\text{N}_2\text{O}_2$ C(OH).NH N=C.OH 'Uramido-benzoyl.' [above 350°]. Formed by passing cyanogen into an alcoholic solution of o-amido-benzoic acid and boiling the product with HCl aq . *Formed also by fusing o-amido-benzoic acid or o-amido-benzamide with urea, and by heating the product of the action of ClCO_2Et on o-amido-benzamide (Griess, B. 2, 415; 11, 1985; Abt, J. pr. [2] 39, 140). Needles, sl. sol. hot water. With PbCl_2 it yields di-chloro-quinazoline [115°].— $\text{C}_8\text{H}_6\text{N}_2\text{O}_2\text{Et.OH}$ needles.

Di-methyl derivative $\text{C}_8\text{H}_{10}(\text{OMe})_2\text{N}_2$ [66°]. Made from di-chloro-quinazoline* and NaOMe . Needles, v. s. sol. alcohol.

OXY-p-QUINAZOLYL-BENZOIC ACID

$\text{C}_8\text{H}_6\text{N}_2\text{O}_3$ N:CH $\text{CO.N.C}_6\text{H}_4\text{CO}_2\text{H}$ Made by oxidising p-tolyl-quinazoline dihydride with KMnO_4 (Paal & Busch, B. 22, 2699). Small needles.— AgA' .

OXY-QUINHYDRONE $\text{C}_{12}\text{H}_{10}\text{O}_4$. Formed from oxyhydroquinone and HNO_3 (Barth & Schroeder, M. 5, 595). Dark greyish-blue crystals.

(Py. 1)-OXY-QUINOLINE $\text{C}_9\text{H}_7\text{N}$ CH.CO.OH NH.OH

[235°]. Made by heating phenyl-β-amido-acrylic acid at 200° or oxanilic acid at 170° (Reissert, B. 20, 2103; B. 21, 1376). Long needles (from alcohol). Yields quinoline* when distilled with zinc-dust.

Acetyl derivative. [228°]. Needles.

Phenyl hydrazide $\text{C}_{11}\text{H}_{11}\text{N}_3$. [168°].

(Py. 2)-Oxy-quinoline. This is probably the constitution of cynurine v. *infra*.

(Py. 3)-Oxy-quinoline $\text{C}_9\text{H}_7\text{N}$ CH:CH N=C.OH

Carbostyryl. [199°].

Formation.—1. By reducing o-nitro-cinnamic acid (Chiozza, A. 83, 118; Tiemann, B. 13, 2070; Friedländer, B. 14, 1916).—2. By heating o-amido-cinnamic acid with HCl aq (T.) or dilute H_2SO_4 (Feer & Königs, B. 18, 2395).—3. By reducing tri-chloro-oxy-quinoline with HI .—4. By heating (Py. 3)-chloro-quinoline with water at 120° (Friedländer & Ostermayer, B. 15, 335).—5. By the action of aqueous HOCl upon quinoline (Erlenmeyer & Rosenhek, R. 18, 3295).—6. By heating quinoline on the water-bath with a conc. solution of bleaching-powder (E. a. R., B. 19, 489; Roos, B. 21, 619).

Properties.—Long thin feathery crystals (containing aq) (from water) or thick anhydrous prisms (from alcohol); v. sl. sol. cold water, insol. NH_4Aq .

Salts.— $\text{Ba(C}_9\text{H}_6\text{NO)}_2$: plates.— AgA'' : pp.

Methyl ether MeA' . [247°]. Oil.

Ethyl ether EtA' . (256°). Formed from (Py. 3)-chloro-quinoline and KOEt . Formed also by heating o-amido-cinnamic ether with alcohol and ZnCl_2 at 90° (Friedländer & Weinberg, B. 15, 1424, 2103) and by ethylation of carbostyryl. Pungent oil, solidifying below 0° . Yields a dihydride [199°] when reduced by sodium-amalgam.

Phenyl ether. [69°]. Plates.

Dihydride v. AMIDO-PHENYL-PROPIONIC ACID.

(B. 1)-Oxy-quinoline CH:C(OH).C.CH:CH OH:CH C:N:CH

[224°]. Formed by potash-fusion from quinoline (Py. 1)-sulphonic acid (Riemerschmied, B. 16, 721; Lellmann, B. 20, 2174). Formed also from (Py. 1)-amido-quinoline by the diazo-reaction (Skraup, M. 5, 533). Silky needles or plates, sl. alcohol and aqueous Na_2CO_3 , v. sl. sol. water.—Salts: B'HCl : yellow needles.— $\text{B}'\text{H}_2\text{PtCl}_4$ 4 aq: orange tables.

Tetrahydride $\text{C}_9\text{H}_{10}(\text{OH})_2$ CH_2CH_2 NH.CH_2

[117°]. Made by reducing with tin and HCl . Needles, sol. water, alcohol, and ether. Yields a nitrosamine crystallising in tables, sol. alcohol.

(B. 2)-Oxy-quinoline C(OH).CH:C(OH):CH CH:CH C:N:CH

[193°]. (above 860°). Formed by heating a mixture of p-amido-phenol, p-nitro-phenol, glycerin, and H_2SO_4 (Skraup, B. 16, 593; M. 3, 545). Formed also by heating its carboxylic acids (Weidel, M. 2, 575; Skraup, M. 4, 696) and by potash-fusion from its sulphonic acid (Fischer, B. 17, 440). Small prisms (from alcohol). Not coloured by ferric chloride solution $\text{B}'\text{H}_2\text{PtCl}_4$ 2 aq [238°].— $\text{B}'\text{O}_2(\text{OAc})$.— $\text{B}'(\text{H}_2\text{SO}_4)_2$ 11 aq.— B'HCl aq : prisms, v. s. sol.

water.—B'MeI aq. Crystalline (Claus a. Howitz, *J. pr.* [2] 42, 232; 48, 520).—B'MeCl. [c. 272°].
—B'Me.PtCl.₂.—B'Me₂SO, 56aq.—B'MeOH. [c. 200°].—B'EtBr. [c. 242°].—B'C₂H₅Cl 1½aq. [337°].—(B'C₂H₅Cl).PtCl₂.

Methyl ether MeA'. p-Quinaniso. (305°). S.G. 2 1.665. Got by methylation, and also from p-anisidine, nitro-anisole, glycerin, and H₂SO₄ (Skraup, *M.* 6, 762). Oil. Solutions of its salts show blue fluorescence. Gives a green colour with chlorine-water and ammonia.—B'HCl 2aq.—B'₂H₂PtCl₂ 4aq.—B'H₂SO₄.—B'₂H₂SO₄.—B'₂H₂CrO₄.—B'MeI. [235°]. Prisms.—Picroate [204°].

Acetyl derivative C₈H₇(OAc)N. [38°]. (298°). Crystals.—B'₂H₂PtCl₂. Prisms.

Benzoyl derivative. [231°]. Needles.

Tetrahydride of the methyl ether C₈H₁₀(OMe)N. *Thallin.* [43°]. (283°) at 735 mm. Got by reducing the methyl ether with tin and conc. HCl aq. Prisms. FeCl₃ gives a golden colour, changing to emerald green.—Chlorine-water gives a green colour turned yellow by ammonia.—B'HCl.—B'₂H₂SO₄ 2aq.—B'HI. [155°].—B'C₂H₅O₂: four-sided prisms. S. 10 at 15°.—Picroate. [162°].

Acetyl derivative C₈H₇Ac(OMe)N. [47°].
CH : CH' : C(OH):CH : C—N:CH'
(B. 3)-Oxy-quinoline C(OH):CH : C—N:CH'

[c. 238°]. Formed by heating o-nitro-phenol with m-amido-phenol, glycerin, and H₂SO₄ (Skraup, *B.* 15, 893; *M.* 3, 559). Formed also by potash-fusion from quinoline (B. 3)-sulphonic acid (Fischer, *B.* 15, 1979). Silky needles, sol. alcohol, not volatile with steam. Its solutions show green fluorescence. FeCl₃ gives a brownish-red colour.—B'₂H₂PtCl₂ 2aq.—B'HCl 1½aq: prisms.—B'Cu(OAc)₂.—Picroate. [244°].

Benzoyl derivative. [86°]. Prisms.

Methyl ether C₈H₇NO. (275° at 720 mm.). Oil, volatile with steam.

(B. 4)-Oxy-quinoline CH:CH — C(OH):CH
CH:C(OH).C—N:CH'
[75°]. (267° cor.).

Formation.—1. By distilling its carboxylic acid (Weidel a. Cobenzl, *M.* 1, 862).—2. By soda fusion from its sulphonic acid (Bedall a. Fischer, *B.* 14, 443, 1366).—3. By heating o-amido-phenol with o-nitro-phenol, glycerin, and H₂SO₄ (Skraup, *B.* 15, 893; *M.* 3, 536).

Properties.—Prisms, al. sol. water. May be distilled with steam. FeCl₃ gives a green colour. Gives quinolinic acid on oxidation with KMnO₄ (Fischer a. Renouf, *B.* 17, 756). Chlorine in HOAc forms mono-, di-, and tri-, chloro-derivatives (Zincke a. Hebebrand, *A.* 264, 198). Ethylene chlorhydrin forms crystalline B'(C₂H₅OH)Cl, whence (C₁₀H₁₂NO₂Cl).PtCl₂ (Wartz, *C. R.* 96, 1269). ClCO.Et forms C₁₀H₁₁NO₂ [105°] whence (C₁₀H₁₁NO₂).H₂PtCl₂ (Lippmann, *M.* 8, 439). According to Lippmann (*M.* 10, 667), MeI in MeOH at 100° forms (C₈H₇(OMe)N)(C₂H₅(OH)NMe)HI 2aq, whence C₈H₇ClN.O₂HCl 56aq and C₈H₇ClN₂O₂PtCl₂ 2aq. These bodies may perhaps be more simply formulated, as below. Chloroform and Na yield CH(C₂H₅(OH)N), (Lippmann, *B.* 19, 2471).

Salts.—B'HCl aq.—B'₂H₂PtCl₂ 2aq: golden needles.—B'H₂SO₄ 2aq.—B'C₂H₅N₂O₂. [204°]. Cu(C₈H₇NO)₂: canary-yellow pp.—B'MeI aq. [c. 170°].—B'MeCl 2aq. [c. 260°].—B'₂Me₂PtCl₂ 2aq.

Acetyl derivative C₈H₇(OAc)N. (280°). Oil.—B'₂H₂PtCl₂ 2aq: yellow plates.

Benzoyl derivative. [120°]. Crystals.

Methyl ether C₈H₇(OMe)N. (268°). Got by methylation, and also from o-amido-anisole by Skraup's reaction. Oil.—B'₂H₂PtCl₂ 2aq.—B'HCl.—C₈H₇N₂O₂: yellow needles or plates.—B'MeI aq. [160°]. Leaflets (Claus a. Howitz, *J. pr.* [2] 42, 229).

Ethyl ether C₈H₇(OEt)N. (286°) at 718 mm. Needles (Fischer a. Renouf, *B.* 17, 759).—Picroate. [181°]. Yellow needles.

Tetrahydride C₈H₁₀(OH):C₂H₅N. [122°]. Made by reducing (B. 4)-oxy-quinoline with SnCl₂ (Fischer, *B.* 14, 1368; 14, 2571; 16, 713; 17, 759). Needles or prisms, sol. hot water. Yields a nitrosamine [68°]. The methyl ether C₈H₁₀(OMe)₂ is oily and yields a crystalline hydrochloride and a nitrosamine [80°]. The ethyl ether is also liquid (275°) at 715 mm., and forms a crystalline nitrosamine [113°] and an oily acetyl derivative [307°].

Oxy-quinoline C₈H₇N₂. *Cynurine* [above 300°]. S. 477 at 15°. Probably (Py. 1)-or (Py. 2)-oxy-quinoline. Formed by heating its carboxylic acid (cynuronic acid) (Schmiedeborg a. Schulzen, *A.* 108, 158; Kretschy, *M.* 2, 68). Formed also by oxidising cinchonine or cinchoninic acid (Skraup, *M.* 9, 821; 10, 729). Monoclinic prisms (containing 3aq), m. sol. hot water. Melts at 52° when hydrated. Tastes bitter. KMnO₄ oxidises it to cynuric acid. ICl gives a brownish pp. [275°] (Dittmar, *B.* 18, 1618). Distillation with zinc dust forms quinoline. Ac₂O on heating forms an indigo-blue dye. Yields a tetrahydride.—B'₂HI 2aq: monoclinic prisms.—B'HCl aq.—B'₂H₂PtCl₂ 2aq: orange needles.

(Py. 2, 3)-Di-oxy-quinoline

CH:CH(OH) β-Oxy-carbostyrl. [above 300°]. Prepared by heating (Py. 2, 3)-chloro-oxy-quinoline (β-chloro-carbostyrl) with fused KOH at 200° (Friedländer a. Weinberg, *B.* 15, 2681). Fine colourless needles. May be sublimed. Is a very weak base but a strong acid; it dissolves in concentrated HCl, but is reprecipitated on dilution. By PCl₅ it is converted into the di-chloro-quinoline [104°].—Ag: crystalline.

Di-oxy-quinoline C₈H₇<N=C(OH):C(OH) [above 320°].

Formation.—1. By the action of conc. H₂SO₄ on o-amido-phenyl-propionic acid (Baeyer a. Bloem, *B.* 15, 2151).—2. By potash-fusion from (Py. 1, 8)-bromo-oxy-quinoline (Friedländer a. Weinberg, *B.* 15, 2683).—3. By reducing o-nitro-benzoyl-malonic ether with tin and HCl (Bischoff, *B.* 22, 387; *A.* 251, 377).—4. By boiling its carboxylic acid with conc. HCl aq (B.).

Properties.—Needles, sol. NH₄CO₃ and in a mixture of alcohol and HCl aq, insol. ordinary menstrua. Its ammoniacal solution turns blue in air. PCl₅ yields di-chloro-quinoline [67°].

Salt.—C₈H₇AgNO₂: needles.

Ethyl ether C₈H₇<N=C(OH):C(OEt) [228°]. Formed by reducing o-nitro-benzoyl-malonic ether with tin and HCl (B.). Slender needles.

Dihydride C₈H₇<CH(OH):CH₂ [149°]. Formed by reducing o-nitro-β-oxy-phenyl-propyl-

(containing aq), sl. sol. hot water, m. sol. hot alcohol. Gives a green colour with FeCl_3 . Yields (B. 4)-oxy-quinoline on distillation, and pyridine (a)-tri-carboxylic acid on oxidation.— BaA' ,— $\text{BaC}_6\text{H}_4\text{NO}_2$, aq.— AgHA' , aq.— AgA' .— $\text{HA}'\text{HCl}$: monoclinic needles.— $\text{B}'\text{H}_2\text{PtCl}_4$, 2aq: needles.

(B. 2)-Oxy-quinoline carboxylic acid $\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})\text{N}$. (B)-Oxy-cinchonic acid. [c. 320°]. Made by potash-fusion from (B)-sulpho-cinchonic acid (Weidel, *M.* 2, 571). Tables (containing aq), sl. sol. water. Yields (B. 2)-oxy-quinoline on distillation, and a pyridine tri-carboxylic acid on oxidation.— BaA' ,— $\text{HA}'\text{HCl}$ aq: needles.— $(\text{HA}')\text{H}_2\text{PtCl}_4$, 2aq: monoclinic tables, decomposed by water.

(B. 3)-Oxy-quinoline (Py. 1³)-carboxylic acid $\text{C}_6\text{H}_4\text{NO}_2$. *Xanthoquinic acid*. [above 300°]. Possibly identical with the preceding acid. Got by heating quinic acid with conc. HCl aq at 225° (Skraup, *M.* 2, 601; 4, 695). Yellow grains. Yields (B. 2)-oxy-quinoline on distillation.—Salts: BaA' , 6aq.— CaA' , 10aq.— CuA' , aq.— AgA' , 2aq.— $\text{HA}'\text{HCl}$ 2aq.— $\text{H}_2\text{A}'\text{H}_2\text{PtCl}_4$, 6aq.— $\text{H}_2\text{A}'\text{H}_2\text{SO}_4$, 2aq: golden prisms.

Methyl derivative $\text{C}_6\text{H}_3(\text{OMe})(\text{CO}_2\text{H})\text{N}$. *Quininic acid*. [280°]. Made by oxidising quinine or cinchonine with chromic acid (Skraup, *M.* 2, 589). Thin yellowish prisms, sl. sol. hot water and hot alcohol, nearly insol. ether. Its alcoholic solution shows blue fluorescence, destroyed by H_2SO_4 . KMnO_4 oxidises it to pyridine tri-carboxylic acid.—Salts: BaA' , 4aq.— CaA' , 2aq.— CuA' , 1aq.— AgA' : pulverulent pp. $\text{HA}'\text{HCl}$ 2aq: trichlinic tables.— $\text{H}_2\text{A}'\text{H}_2\text{PtCl}_4$, 4aq: yellow crystals.

(B. 4)-Oxy-quinoline carboxylic acid $\text{C}_6\text{H}_4\text{NO}_2$. [280°]. Made by boiling o-oxy-quinoline with CO_2 , water, KOH , and alcohol (Lippmann a. Fleissner, *B.* 19, 2467; *M.* 8, 318). Minute prisms, v. sl. sol. hot water. Yields (B. 4)-oxy-quinoline on distillation, and pyridine dicarboxylic (quinolinic) acid [235°] on oxidation. FeCl_3 gives a green colour. Yields a di-bromo-derivative [193°].— $\text{BaC}_6\text{H}_4\text{NO}_2$, aq: needles.— AgHA' , (dried at 105°). Minute needles.

Tetrahydride $\text{C}_{10}\text{H}_{11}\text{NO}_2$. [265°]. Got by reduction with tin and HCl . Prisms, sl. sol. water, almost insol. ether. Reduces AgNO_3 in the cold. Gives a red colour with FeCl_3 . EtI yields $\text{C}_{10}\text{H}_{11}\text{EtNO}_2\text{HI}$, whence $\text{C}_{10}\text{H}_{11}\text{EtNO}_2$ [220°] may be got. Nitrous acid forms a nitrosamine [195°].— $(\text{C}_{10}\text{H}_{11}\text{NO}_2)\text{HCl}$ aq: needles.— $\text{B}'\text{H}_2\text{SO}_4$, 8aq.— $\text{B}'\text{HOAc}$: pp.

(B. 4)-Oxy-quinoline carboxylic acid $\text{C}_6\text{H}_4\text{NO}_2$, aq. [260°]. Got from o-oxy-quinoline dithiocarboxylic acid $\text{C}_6\text{H}_4(\text{OH})(\text{CS}_2\text{H})\text{N}$ by warming with lead acetate and KOH aq (Lippmann a. Fleissner, *M.* 9, 300). Silky needles, sol. water. Coloured red by FeCl_3 . Yields o-oxy-quinoline on distillation.— KA' ,— BaA' (dried at 180°).— AgA' .— $\text{Hg}_2\text{A}'\text{Cl}_2$.— $\text{H}_2\text{A}'\text{H}_2\text{PtCl}_4$, 4aq.— $\text{HA}'\text{HCl}$ 2aq: trimetric crystals.

Tetrahydride $\text{C}_{10}\text{H}_{11}\text{NO}_2$. [222°]. Crystalline powder.— $\text{B}'\text{HCl}$: needles, v. sol. water.

(B. 4)-Oxy-quinoline carboxylic acid $\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})\text{N}$. Formed by heating sodium o-oxy-quinoline with liquid CO_2 in a closed vessel at 160° (Schmitt a. Engelmann, *B.* 20, 1217, 3090). Small yellow prisms (containing aq), m. sol. hot water and hot alcohol. Coloured red.

VOL. III.

by FeCl_3 . At 150° it splits up into CO_2 and o-oxy-quinoline. Yields $\text{C}_{10}\text{H}_7\text{BrNO}_2$ [235°].

Salts.— $\text{B}'\text{HCl}$: needles.— $\text{B}'\text{HNO}_3$.— $\text{NH}_4\text{A}'$ aq.— BaA' , 2aq: needles, sl. sol. water.— $\text{BaC}_6\text{H}_4\text{NO}_2$: amorphous, v. gl. sol. water.— AgA' : amorphous powder.

Phenyl ether PhA' : [226°]. Made by heating the acid with phenol and POCl_3 at 170°. Prisms.

Tetrahydride $\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})\text{N}$. Colourless prisms.— $\text{B}'\text{HCl}$: prisms. MeI and MeOH at 100° form $\text{C}_6\text{H}_4\text{Me}(\text{OH})(\text{CO}_2\text{H})\text{N}$ [211°], which crystallises with 2aq.

(B. 2)-Oxy-quinoline carboxylic acid $\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})\text{N}$. [204°]. Formed by boiling p-oxy-quinoline with NaOH , CCl_4 , water, and alcohol (Lippmann a. Fleissner, *M.* 8, 824). Made also by heating potassium (not sodium) p-oxy-quinoline with liquid CO_2 at 170° (Schmitt a. Altschul, *B.* 20, 2695). Minute prisms, v. sl. sol. hot water and alcohol. Splits up at 200° into CO_2 and p-oxy-quinoline. Yields quinolinic acid on oxidation.— $\text{HA}'\text{HCl}$.— $\text{HA}'\text{HNO}_3$: needles.— $\text{H}_2\text{A}'\text{H}_2\text{PtCl}_4$, 2aq.— $\text{NH}_4\text{A}'$ aq: needles, v. sl. hot water.— BaA' , 2aq.— CaA' , 6aq.— $\text{PbC}_6\text{H}_4\text{NO}_2$, aq.— CaA' , 6aq: small needles.— AgA' .

Oxy-quinoline carboxylic acid $\text{C}_6\text{H}_4\text{NO}_2$. *Cymurenic acid*. [258°]. S. 9 at 100°. Occurs in the urine of dogs after a fat diet (Liebig, *A.* 36, 125; 108, 354; Voit a. Richter, *J.* 1865, 676; Schmiedeborg a. Schultzen, *A.* 164, 155; Hofmeister, *H.* 5, 70), or a diet of flesh only (Kretschy, *M.* 2, 57; 5, 16). Prisms (containing aq), insol. cold water. Decomposed by heat into CO_2 and oxy-quinoline. Yields quinoline on distillation with zinc-dust. Evaporates with KClO_3 and HCl leaves a residue which is turned emerald-green by ammonia (Jaffé, *H.* 7, 399).— $\text{HA}'\text{HCl}$. Decomposed by water (Brieger, *H.* 4, 92).— $\text{NH}_4\text{A}'$.— KA' , 2aq.— BaA' , 4aq.— BaA' , 3aq.— CaA' , 2aq.— CuA' , 2aq.— AgA' aq: thick white pp.

(Py. 3)-Oxy-quinoline (B. 3)-carboxylic acid. *Dihydride* $\text{C}_6\text{H}_4\text{CH}=\text{CH}\cdot\text{CO}_2\text{H}$. [above 280°]. Prepared by the reduction of [3:1:4] $\text{C}_6\text{H}_3(\text{NO}_2)(\text{CO}_2\text{H})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ with ammonia and FeSO_4 (Widman, *B.* 22, 2274). Yellow plates (from water), v. sl. sol. alcohol. Yields a methyl ether MeA' [192°] crystallising in tables.

Di-oxy-quinoline carboxylic acid. *Ethyl derivative of the ethyl ether* $\text{C}_6\text{H}_3\text{N}(\text{OH})(\text{CO}_2\text{H})(\text{CO}_2\text{Et})$. [107°]. Got by the action of zinc, alcohol, and gaseous HCl on o-nitro-benzoyl-malonic ether (Bischoff, *B.* 22, 386). Small needles. Coloured violet by FeCl_3 .

Tetraoxy-quinoline carboxylic acid. Lactone of the di-methyl derivative of the dihydride. $\text{C}_{12}\text{H}_{11}\text{NO}_4$, i.e. $\text{C}_6\text{H}_4(\text{OMe})_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. [a. 256°]. Prepared by the reduction of o-nitro-mecolin-acetic acid

$\text{C}_6\text{H}(\text{NO}_2)(\text{OMe})_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ with tin and HCl (Liebemann a. Kleemann, *B.* 19, 2396). Colourless needles (from water), v. sol. alcohol. Boiling baryta-water yields $\text{Ba}(\text{C}_{10}\text{H}_7\text{NO}_2)_2$, 6aq.

HI and HOAc at 120° form $C_{10}H_7NO_4$ [220°], a crystalline solid. $POCl_3$ yields $C_{10}H_7ClNO_4$ [218°].

DI-OXY-ISOQUINOLINE CARBOXYLIC
ACID $C_{15}H_{11}NO_4$. [221°]. Formed by heating
its di-methyl derivative with $HIAg$. Yellow
powder. $FeCl_3$ gives a violet colour. When
heated it yields a compound [230°] which gives
isoquinoline on distillation with zinc-dust.

Di-methyl derivative
 $C_8H_{11}(OMe)_2(CO.H)N$. [205°]. Got by oxidation of capaverine (Goldschmidt, *M.* 6, 96t; 8, 519; 9, 322). Yel'low needles (containing 2aq).—
 $HA \cdot HCl$ 2aq: needles.

LAURELYNE
α-XYLYLAQUINOLINE SULPHONIC ACID
 $C_{12}H_9(OH)(SO_3H)N$. Formed by fusing quinaline
(a)-disulphonic acid with potash (La Costé &
Valeur, B. 19, 997; 20, 100). Pale-yellow plates
(containing aq), sl. sol. water.— K_2A aq: prisms,
v. e. sol. water.— BA_2 , 3aq.— CaA_2 , 6aq.—
 CuA_2 , 4aq: green needles.— $CaC_2H_5NSO_3$, 1½aq.—
 $CaC_2H_5NSO_3$, 3aq: yellow needles, sl. sol. water.

β-Quinoline sulphonic acid
 $C_8H_6(OH)(SO_3H)N$. [270° - 275°]. Formed by
 potash-fusion from quinoline (β)-disulphonic
 acid (La Coste a. Valeur, B. 19, 998; 20, 8200).
 Yellow plates (containing eq), v. sol. hot water,
 insol. ether.

(B. 3)-Oxy-quinoline sulphonic acid
 $C_8H_7(OH)(SO_3H)N$. [c. 270°]. Made from *m*-oxy-quinoline and fuming H_2SO_4 (Riemerschmidt, B. 16, 724). Yellow plates (containing aq.) sl. sol. cold water.

(Py. 3) - Oxy - quinoline sulphonic acid.
Methyl derivative $C_8H_7(OMe)NSO_3H$.
Formed from the methyl derivative of carbostyryl
and fuming H_2SO_4 (Feer a. Königs, B. 18, 2395).
Needles, sol. hot water.—AgA': needles.

(B. 4)-Oxyquinoline (B. 1)-sulphonic acid $C_8H_6(OH)(SO_3H)N$. [270°]. Formed by sulphonating o-oxyquinoline by H_2SO_4 in the cold (Claus a. Posselt, *J. pr.* [2]. 41, 36). Needles (containing aq). $FeCl_3$ gives a green colour.

Salts. — $\text{NaA}'\text{aq.}$ — $\text{Na}_2\text{C}_6\text{H}_5\text{NSO}_4, 2\text{aq.}$ — $\text{KA}'\text{aq.}$ — $\text{K}_2\text{C}_6\text{H}_5\text{NSO}_4, 3\text{aq.}$ — $\text{BaA}'_2\text{aq.}$ — $\text{CaA}'_2\text{aq.}$; small needles, sl. sol. water.

(B. 4.) **Oxy-quinoline sulphonic acid**
 $C_8H_5(OH)(SO_3H)N$. Formed by heating o-oxy-quinoline with H_2SO_4 at 180° (Lippmann & Fleissner, *M.* 10, 800). Crystals (containing $1\frac{1}{2}$ aq). Coloured green by $FeCl_3$.— KA' .— BaA' .— AgA' .

B. 2-Oxy-quinoline sulphonic acid
 $C_8H_6(OH)(SO_3H)N$. Made by sulphonating *p*-oxyquinoline with fuming H_2SO_4 in the cold or at 100° (Claus & Posselt, *J. pr.* [2] 41, 159). Yellow needles (containing $\frac{1}{2}$ aq.), v. sl. sol. cold water. Decomposes at 270°: $-NaA$, aq.— KA , p.

Oxy-quinoline sulphonio acid $C_{10}H_7NSO_4$.
Formed by heating o-amido-phenyl¹propionic
acid with H_2SO_4 at 210° (Baeyer & Bloem, *B.* 15,
2152). M. sol. cold water.

(B. 4). **Oxy-quinoline disulphonic acid** $\text{C}_8\text{H}_5(\text{OH})(\text{SO}_3\text{H})_2\text{N}$. Made by heating *o*-oxy-quinoline with H_2SO_4 and P_2O_5 at 200° (U. S. F.). Hygroscopic mass, decomposing at 500° . FeCl_3 gives a green colour. — KHA . — $\text{H}_2\text{C}_4\text{H}_5\text{N}_2\text{SO}_3$. — PAA^{11} 360 — $\text{C}_8\text{H}_5(\text{OH})(\text{SO}_3\text{Na})_2\text{N}$ 1062. green ppt.

OXY, QUINOLINE-2-DITHIOCARBOXYLIC
ACID $C_8H_6(OH)(NH_2)C(SH)_2$. [180°]. Made by heat-
ing *o*-oxy-quinoline with potassium xanthate and
alcohol at 100° (Lippmann & Fleissner, *M. 9*,

296). Small red crystals, nearly insol. water. FeCl₃ colours its aqueous solution brown. KMnO₄ yields quinolinic acid [281°].—NH₄A'. Tables, sl. sol. water.

(4)-OXY-(α)-DIQUINOLYL C₁₆H₁₂N₂O. [208°]. Made by fusing di-(Py. 8)-quinolyl sulphonic acid with potash (Weidel, *M.* 7, 312). Monoclinic needles (from xylene), insol. water, sl. sol. hot alcohol.—K⁺ ac.—PbA⁺ (dried at 100°).

Oxy-(Py. 3, B. 1)-diquinolyl. [187°]. Needles by fusing (Py. 3, B. 1)-diquinolyl sulphonic acid with potash (Weidel, M. 8, 144). Crystalline powder (from alcohol), v. e. sol. alcohol.

(B. 2)-Oxy-(Py. 1, B. 1 or 3)-diquinolyl.
'Methylether $C_{14}H_{11}N_2O$ i.e.

$$\text{C}_6\text{H}_4(\text{OMe}) \begin{array}{c} \diagup \quad \diagdown \\ \text{N} \quad \text{CH} \end{array} \text{CH} \text{C}_6\text{H}_4 \begin{array}{c} \diagdown \quad \diagup \\ \text{N} \quad \text{CH} \end{array} \text{CH} \quad \text{Two}$$
 isomerides of this formula are formed together by heating *m*-amido-(*Py.* 1)-phenyl-(*B.* 2)-methoxyquinoline with *o*-nitrophenol, glycerin, and H_2SO_4 (Miller a. Kinkelin, *B.* 20, 1924).

(a)-Isomeride. [151²]. Thin monoclinic tables, sol. alcohol and ether. Solutions of its salts exhibit blue fluorescence. — $B''H_2Cl_2$ 2aq. — $B''HCl$. — $B''H_2PtCl_2$ 2aq. — $B''H_2PtCl_4$: long needles. — $B''MeI$: yellow crystalline powder.

(B)-Isomeride. [120°]. Plates or flat monoclinic prisms. Its alcoholic and ethereal solutions show blue fluorescence. — $B''H_2PtCl_4$: amorphous pp. changing to a crystalline powder.

(a)-Di-oxy-di-(Py. 8)-quinolyl $C_{16}H_{12}N_2O_2$ [239°]. Made by potash-fusion from diquinolyl (a)-disulphonic acid (Weidel & Gläser, *M.* 7, 320). Minute needles, inso^l. water and alcohol, sol. xylene. — $B''HCl$: yellow needles. — $B''H.PtCl_2$: red plates.

Di-acetyl derivative $C_{15}H_{16}Ac_2N_2O_2$.
[170°]. Rhombohedral crystals.

(β)-Di-oxy-di-(Py. 3)-quinolyl. [above 305°].
Made by potash-fusion from diquinolyl (β)-disulphonic acid (W. a. G.). Crystalline powder (from alcohol), v. sol. alkalis.

Di-acetyl derivative [218°]. Plates. Tetra-oxy-diquinolyl. *Di-ethyl derivative of the anhydride* $C_{22}H_{18}N_2O_8$, i.e. $O(C_2H_5)(OEt)N$. A base which apparently has

this constitution is prepared by heating $C_{12}H_{19}(NH_{1/2})(OEt)_4$ (cf. p. 667) with *o*-nitrophenol, glycerin, and H_2SO_4 . It crystallises from ether, gives a green colour with $FeCl_3$, and forms $B''H_3PtCl_2 \cdot 2aq$ (Colson, *C. R.* 107, 1008).

(Py. 8)-OXY-(Py. 2)-QUINQLYL METHYL KETONE $C_{11}H_9NO$, i.e. $C_6H_5 \begin{matrix} \text{CH: C.CO.CH,} \\ \text{N= C.OH} \end{matrix}$

[232°]. Made by heating a mixture of *o*-amido-benzoic aldehyde and acetoacetic ether at 180° (Friedländer, *B.* 16, 1898). Needles, al. sol. Aq. CC(=O)OCC(=O)O **ACETACETIC ACID**

OXY-QUINOLYL PHENYL KETONE
 $\text{C}_6\text{H}_5\text{--}\begin{matrix} \text{CH}:\text{C}.\text{CO}.\text{C}_6\text{H}_4 \\ \text{N}=\text{C}.\text{OH} \end{matrix}$. [above 270°]. Made by heating *o*-amido-benzoic aldehyde with benzoyl-acetic ether (Friedländer & Göhring, *B*, 16, 1888). Sl. sol. most solvents.

α-OXY-(Py. 8)-QUINOLYL-PROPIONIC ACID
 $C_{12}H_{11}NO_3$, i.e. $(C_6H_4N)CH_2CH(OH).CO_2H$.
 [125°]. Formed from $(C_6H_4N)CH_2CH(OH).COCl$
 by heating with alcoholic NaOH. (Einhorn, *B.*
 18, 8465; 19, 906). Orange crystals, sol. water
 and ppd. by alcohol. Yields $(C_6H_4N)CHO$ on

oxidation by KMnO_4 .— NaA : 8aq.— AgA : yellow pp. H_2A : H_2PtCl_6 5aq.

β-Oxy-(1', 3)-quinolyl-propionic acid
 $\text{C}_6\text{H}_4 \begin{array}{c} \text{CH}_2\text{CH} \\ \diagup \quad \diagdown \\ \text{N}=\text{C} \cdot \text{CH}(\text{OH}) \cdot \text{CH}_2 \cdot \text{CO}_2\text{H} \end{array}$ [176°]. Got from its amide, or by the action of Na_2CO_3 aq on bromo-quinolyl-propionic acid in the cold (Einhorn, *A.* 246, 176). Colourless prisms, v. sol. alcohol and HOAc , insol. chloroform.— NaA :— AgA :— HA : HCl . [188°]. White prisms.— H_2A : H_2PtCl_6 . [218°]. Yellowish-red prisms.
Methyl ether, MeA : [62°]. Prisms.

Amide. [152°]. Made by dissolving the hydrobromide of bromo-quinolyl-propionic acid in ammonia in the cold. White crystals (from alcohol).

Lactone ($\text{C}_6\text{H}_4\text{N} \begin{array}{c} \text{CH} \\ \diagup \quad \diagdown \\ \text{O} \end{array} \text{CO}_2$). [82°].

Made by adding an equivalent quantity of Na_2CO_3 to the hydrobromide of bromo-quinolyl propionic acid suspended in water (Einhorn, *A.* 246, 169). Needles.— $\text{C}_6\text{H}_4\text{N} \cdot \text{HCl}$. [138°].— B°C : $\text{H}_2\text{N} \cdot \text{O}$. Golden plates (from alcohol).

OXY-QUINONE. *Methyl ether*
 $\text{C}_6\text{H}_4\text{O}_2(\text{OMe})_2$. [140°]. Prepared by oxidation of *o*-anisidine with $\text{K}_2\text{Cr}_2\text{O}_7$ and dilute H_2SO_4 (Mühlhäuser, *B.* 13, 323; *A.* 207, 251; Will, *B.* 21, 605). Got in like manner from the methyl ether of amido-resorcin (Bechhold, *B.* 22, 2381). Yellow needles, with pleasant smell, sol. alcohol, m. sol. ether and water. Conc. H_2SO_4 forms a deep-blue solution. The vapour colours filter-paper red. Reduced by SO_2 to $\text{C}_6\text{H}_4(\text{OH})_2(\text{OMe})_2$. With aniline it forms $\text{C}_6\text{H}_4(\text{NHPh})_2(\text{OMe})_2$, crystallising in corky needles, and forming a dark-blue solution in H_2SO_4 (Schweitzer, *C. C.* 1888, 1434). *o*-Toluidine, *o*-xylydine, and diphenylamine form corresponding bodies melting at 239°, 228°, and 120° respectively.

Ethyl ether $\text{C}_6\text{H}_4\text{O}_2(\text{OEt})_2$. [117°]. Made by oxidation of $\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})_2$ with $\text{K}_2\text{Cr}_2\text{O}_7$ and dilute H_2SO_4 at 15° (Will a. Pukall, *B.* 20, 1123). Yellow needles (by sublimation), m. sol. warm water, decomposed by hot water.

Dioxy-quinone $\text{C}_6\text{H}_4(\text{OH})_2\text{O}_2$. [52:4:1].

Formation.—1. By boiling the basic sodium salt of dioxyquinone dicarboxylic acid with HCl or H_2SO_4 (Loewy, *B.* 19, 2387).—2. From di-amido-resorcin by oxidation to di-imido-resorcin and treatment of this body with dilute (10 p.c.) KOH at 70° (Nietzki, *B.* 21, 2374; Böniger, *B.* 22, 1288).—3. By heating $\text{C}_6\text{H}_4(\text{NHPh})(\text{OH})\text{O}_2$ or tetra-methyl-di-amido-quinone with KOH aq (Kehrmann, *B.* 23, 904).

Properties.—Dark-yellow needles, almost insol. cold water, v. sol. alcohol. Its alkaline solutions are red. Not melted at 180°. May be sublimed. Forms a dioxim. Conc. HNO_3 forms nitragillic acid.— $\text{Na}_2\text{C}_6\text{H}_4\text{O}_2$.— $\text{BaC}_6\text{H}_4\text{O}_2$ aq: bluish-black needles.

Di-methyl ether MeA : [c. 220°]. Obtained by methylation. Prepared also from $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OMe})_2$ by reduction followed by oxidation with FeCl_3 (Nietzki a. Reehberg, *B.* 23, 1216). Got also by oxidation of acetyl-di-methyl pyrogallol $\text{C}_6\text{H}_2(\text{OMe})_2(\text{OAc})$ (Hofmann, *B.* 11, 382). Yellow needles. Yields, on reduction, colourless $\text{C}_6\text{H}_4\text{O}_2$. [166°].

Di-ethyl ether $\text{C}_6\text{H}_4(\text{OEt})_2\text{O}_2$. [183°]. Got by oxidising the di-ethyl ether of diamido-hydroquinone with FeCl_3 (N. a. R.). Sulphur-

yellow plates (from water). Yields a crystalline dioxim $\text{C}_6\text{H}_4(\text{OEt})_2(\text{NOH})_2$, which may be reduced by SnCl_2 to $\text{C}_6\text{H}_4(\text{OEt})_2(\text{NH})_2$.

Di-oxy-quinone. *Di-methyl ether* $\text{C}_6\text{H}_4(\text{OMe})_2\text{O}_2$. [249°]. *AA* product of the oxidation of $\text{C}_6\text{H}_4(\text{OMe})_2$ [1:2:3] by nitric acid (Will, *B.* 21, 603). Prisms, v. sol. hot HOAc . May be sublimed. Reduced by SnCl_2 to $\text{C}_6\text{H}_4(\text{OH})_2(\text{OMe})_2$ [158°]. Gives $\text{C}_6\text{Br}_2(\text{OMe})_2\text{O}_2$ [175°].

Tri-oxy-quinone $\text{C}_6\text{H}_3(\text{OH})\text{O}_3$. Made from tri-amido-resorcin by the action of FeCl_3 , the resulting amido-di-imido-resorcin being heated with HCl aq at 150° (Merz a. Zetter, *B.* 12, 2035). Nearly black powder, insol. water, sl. sol. alcohol. Yields a crystalline tri-acetyl derivative.— BaA :—; nearly black pp.— PbA :—;— AgA :—; black pp.

Tetra-oxy-quinone $\text{C}_6(\text{OH})_4\text{O}_4$. *‘Dihydro-carboxylic acid’*. Formed by the action of alcohol, air, and HCl on the black mass containing $\text{C}_6(\text{OK})_4$ got by combination of potassium with CO (Lerch, *A.* 124, 20). Formed also by atmosp. spheric oxidation of a solution of hexa-oxy-benzene (Nietzki a. Benckiser, *B.* 18, 507, 1886, 355). It is also a product of the action of HNO_3 on inosite (Magneux, *A. Ch.* [6] 12, 112). Steel-blue monoclinic needles and plates, v. sol. alcohol and hot water, sl. sol. ether. Oxidised in alkaline solution by the air to croconic acid. Nitric acid forms C_6O_4 . Aniline forms the compound $\text{C}_6(\text{OH})_4\text{O}_4(\text{NPh})\text{NH}_2\text{Ph}$, crystallising in red needles with green lustre. Phenylene-*o*-diamine yields $\text{C}_6\text{H}_2\text{N}_2\text{O}_4$, sol. HCl aq (Kehrmann, *B.* 23, 2448). *o*-Tolylene-diamine forms black crystals of $\text{C}_6\text{O}_4(\text{OH})_2 \cdot \text{N} \begin{array}{c} \diagup \quad \diagdown \\ \text{NH} \end{array} \text{C}_6\text{H}_4$ (Nietzki a. Kehrmann, *B.* 20, 3150).— $\text{K}_2\text{C}_6\text{H}_4\text{O}_4$: stable in the air.— $\text{K}_2\text{C}_6\text{O}_4$: Readily oxidised by air to $\text{C}_6(\text{OK})_4\text{O}_4$.— $\text{Na}_2\text{C}_6\text{H}_4\text{O}_4$: dark needles with metallic lustre. Sl. sol. water, forming a dark-yellow solution.— $\text{BaC}_6\text{H}_4\text{O}_4$ (dried at 100°): dark-red pp.

Di-acetyl derivative

$\text{C}_6(\text{OH})_2(\text{OAc})_2$ [2:5:3:6:4:1]. [205°]. Yellow plates, sl. sol. water.

Tetra-benzoyl derivative

$\text{C}_6(\text{OBz})_4\text{O}_4$. Yellow needles, sol. hot BaCl (Magneux, *Bl.* [2] 48, 64; *C. R.* 104, 1719).

Anilide $\text{C}_6(\text{OH})_2(\text{ONPh})_2$. Made from $\text{C}_6(\text{OH})_4$, aniline, and alcohol. Red plates with golden lustre, v. sl. sol. ordinary solvents.

References.—Di-bromo- and Di-chloro-*di-oxy-quinone*.

OXY-QUINONE OXIM v. NITROSO-RESORCIN.

DI-OXY-QUINONE DICARBOXYLIC ETHER

$\text{C}_6\text{O}_4(\text{OH})_2(\text{CO}_2\text{Et})_2$. [157°]. Formed by passing dry nitrous acid gas into an ethereal solution of di-oxy-terephthalic ether (Hantzsch a. Loewy, *B.* 19, 26, 2693; 20, 1306, 1311). Got also by dissolving $\text{C}_6\text{Cl}_4\text{O}_4(\text{CO}_2\text{Et})_2$ in NaOH aq, and by atmosp. spheric oxidation of tetra-oxy-terephthalic ether in presence of NaOH aq (Böniger, *B.* 22, 1284). Greenish-yellow monoclinic prisms (from alcohol) or yellow triclinic plates (from xylene), sl. sol. cold water. Acid to litmus. Its solutions are yellow. Has no action on phenyl cyanate (Goldschmidt, *B.* 23, 265). SO_2 yields $\text{C}_6(\text{OH})_2(\text{CO}_2\text{Et})_2$. Hydroxylamine produces $\text{C}_6\text{O}_4(\text{ONH}_2)_2(\text{CO}_2\text{Et})_2$ [170°]. Phenyl-hydrazine forms $\text{C}_6\text{O}_4(\text{ONH}_2)_2(\text{Ph})_2(\text{CO}_2\text{Et})_2$ [184°]. Hot NaOH aq yields an amorphous acidium salt.

$\text{Na}_2\text{C}_2\text{H}_2\text{O}_4$, 2aq, decomposed by hot HCl aq. yielding $\text{C}_2\text{H}_2(\text{OH})_2\text{O}$. $\text{Na}_2\text{C}_2\text{H}_2\text{O}_4$, 2aq: heavy yellow powder. $\text{Na}_2\text{C}_2\text{H}_2\text{O}_4 \cdot \text{EtOH}$. $\text{MgC}_2\text{H}_2\text{O}_4$, 2aq: orange pp. $\text{MnC}_2\text{H}_2\text{O}_4$, 2aq. $\text{Ag}_2\text{C}_2\text{H}_2\text{O}_4$, 2aq.

Acetyl derivatives $\text{C}_2\text{O}_4(\text{OAc})_2$, $(\text{GOEt})_2$, [174°]. Needles (from HOAc) (Böppiger, B. 22, 1284).

OXY-QUINOXALINE. Dihydrate

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \cdot \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{N} \cdot \text{COH} \end{smallmatrix}$. [C. 130°]. Made by reduction of *o*-nitro-phenyl-amido-acetic acid with tin and HCl (Fischer, B. 19, 8). Prisms (containing aq), sol. alcohol, ether, acids, and alkalis. Melts at 94° when hydrated.

Di-oxy-quinoxaline $\text{C}_6\text{H}_2\text{N}_2\text{O}_2$, i.e. o

$\text{C}_6\text{H}_2 \begin{smallmatrix} \text{N} \cdot \text{COH} \\ \diagup \quad \diagdown \\ \text{N} \cdot \text{COH} \end{smallmatrix}$ Formed by heating with HCl at 150° the compound of phenylene-*o*-diamine and cyanogen, (Bladin, B. 18, 674; Bl. [2] 42, 104). Needles (containing aq), sl. sol. water. Not melted at 200°.

DI-OXY-DIQUINOYL $\text{C}_{12}\text{H}_8\text{O}_4$, i.e. $\text{C}_6(\text{OH})_2\text{O}_2$. *Rhodonic acid*. *Carboxylic acid*. Formed by treatment of $\text{C}_6(\text{OK})_2$ with dilute alcohol and air (Heller, A. 24, 1; 34, 232; Lerch, A. 124, 32; Will, A. 118, 189). Formed also by atmospheric oxidation of $\text{C}_6\text{O}_2(\text{OK})_2$ and by reduction of U_3O_8 with SO_2 (Nietzki a. Benckiser, B. 18, 513, 1838; 20, 323; 28, 3136). The hydroxyls are probably in the *o*-position. Colourless crystals, forming a colourless aqueous solution.

Reactions.—1. Oxidised by H_2O_2 to triquinoyl C_{12}O_6 .—2. Air and Na_2CO_3 aq. yield oronic acid.—3. Phenylene-*o*-diamine forms reddish-brown needles of theazine $\text{C}_6\text{H}_4\text{N}_2\text{C}_6(\text{OH})_2\text{O}_2$ (Nietzki a. Schmidt, B. 21, 1227).—4. *Tolylene-*o*-diamine* forms $\text{C}_6(\text{OH})_2\text{O}_2\text{N}_2\text{C}_6\text{H}_4$, which crystallises from HOAc in yellowish-brown needles.

Salts.— $\text{Na}_2\text{C}_{12}\text{O}_8$: violet needles, forming an orange aqueous solution. $\text{K}_2\text{C}_{12}\text{O}_8$: red powder, or small blue-black needles.

DI-OXY-RICINOLEIC ACID $\text{C}_{18}\text{H}_{32}\text{O}_4$. *Tri-oxyoleic acid*. [64°]. Made from ricinoleic acid and H_2SO_4 (Liechti a. Suida, B. 10, 2455). Insol. water, v. e. sol. alcohol.

OXY-SALICYLIC ACID v. Di-oxy-benzozoic acid.

OXY-SALTS. This name is sometimes used to distinguish salts which contain O from those which do not; i.e. it is applied to salts which are not haloid salts (including cyanides), thio- (or sulphydro-) salts, nor salts of acids composed of E, halogen, and metal or non-metal (v. Salts in vol. IV). M. M. P. M.

OXY-SEBACIC ACID $\text{C}_{18}\text{H}_{34}\text{O}_4$. [143°]. Made by boiling dibromo-sebacic acid with water (Olaus a. Steinkauler, B. 20, 2880). Granules, m. sol. cold water. Na_2A : crystalline powder, v. e. sol. water.

Di-oxy-sebacic acid $\text{C}_{18}\text{H}_{32}\text{O}_4$. [180°]. Made from di-bromo-sebacic acid, water, and Ag_2O (O. a. S.). Nodules, v. e. sol. water. Na_2A : v. e. sol. water.

DI-OXY-SHIKIMIC ACID. *Dihydrate*

$\text{CH}(\text{OH}) \begin{smallmatrix} \text{CH}(\text{OH}) \cdot \text{CH}(\text{OH}) \\ \diagup \quad \diagdown \\ \text{CH} \quad \text{CH} \end{smallmatrix} \text{CO}_2\text{H}$

[166°]. $[\alpha]_D = -28^\circ$. Formed from bromo-shikimic acid and baryta (Eykman, B. 24, 1294). Long needles, m. sol. cold water.

OXY-SORBITU ACID $\text{C}_6\text{H}_{12}\text{O}_7$. [85°]. Made from pyridine (*s*)-carboxylic acid by treatment

with sodium-amalgam (Weidel, B. 12, 2001). Very deliquescent needles. *Reductive Fehling's solution*. BaA , CaA .

***o*-OXY-SEBACIC ACID** $\text{C}_{18}\text{H}_{34}\text{O}_4$, i.e. $\text{C}_{18}\text{H}_{32}\text{O}_4 \cdot \text{CH}(\text{OH})\text{CO}_2\text{H}$. [81°] (G.); [85°] (B.). S. (alcohol) 9-68 at 20°; 2-8 at 20° (B.).

Formation.—1. A mixture of H_2SO_4 (1 mol.) with oleic acid (1 mol.) at 0° yields $\text{C}_{18}\text{H}_{32}\text{O}_4 \cdot \text{CH}(\text{SO}_3\text{H})\text{CO}_2\text{H}$, a liquid acid soluble in ether, water, and alcohol, and forming the salts K_2A , Na_2A , $(\text{NH})_2\text{A}$, $\text{Ba}(\text{HA})_2$, and $\text{Cu}(\text{HA})_2$. This acid is decomposed by boiling dilute acids into H_2SO_4 and *o*-oxy-sebacic acid (Geitel, J. pr. [2] 37, 74; cf. Fremy, A. 38, 15; Ssabanjeff, B. 19, 239 Ref.; Saytzeff, J. pr. [2] 35, 369).—2. By the action of moist Ag_2O on iodo-sebacic acid prepared from oleic acid, P, and I (Saytzeff, J. pr. [2] 33, 310; 35, 378; Bl. [2] 47, 169).

Preparation.— H_2SO_4 (32g.) is gradually added to olive oil (88 pts.) in the cold, and the mixture boiled with alcoholic potash. The product is acidified by hydrogen chloride, and the separated acids crystallised from ether (Geitel). In this preparation there is also formed the acid $\text{C}_{18}\text{H}_{32}\text{O}_4 \cdot \text{CH}(\text{CO}_2\text{H})_2\text{SO}_4$ [24°], which yields *o*-oxy-sebacic acid on boiling with dilute acids.

Properties.—White six-sided plates, m. sol. alcohol, v. sol. ether. At 200° it forms a syrupy anhydride, which is also formed by heating with fuming HCl aq. at 100° for 12 hours. Does not unite with Br. Reduced by HI to stearic acid.

Salts.— NaA , CaA , small crystals (G.). CaA , aq. (C. a. S.). BaA , ZnA , CuA : green powder. PbA , AgA .

***o*-Oxy-stearic acid** $\text{C}_{18}\text{H}_{34}\text{O}_4$. The lactone $\text{C}_{18}\text{H}_{32}\text{O}_4$ [48°] is one of the products of the action of H_2SO_4 on oleic acid. After boiling with potash it yields $\text{Ca}(\text{C}_{18}\text{H}_{32}\text{O}_4)_2$ and $\text{Pb}(\text{C}_{18}\text{H}_{32}\text{O}_4)_2$, whence acids at once set free the lactone.

Di-oxy-stearic acid $\text{C}_{18}\text{H}_{32}\text{O}_4$. [186°] S. (alcohol) 6 at 19°. S. (ether) 19 at 18° (Spiridonoff, J. pr. [2] 40, 249). Formed from dibromo-sebacic acid (oleic acid dibromide) by treatment with moist Ag_2O (Overbeck, A. 140, 72). Got also by boiling oxyoleic acid with potash (O.). Prepared by oxidising oleic acid with alkaline KMnO_4 (Saytzeff, J. pr. [2] 31, 541; 33, 804; Bl. [2] 45, 255). Probably identical with a di-oxy-sebacic acid [181°] got by oxidising tallow with KMnO_4 (Gröger, B. 22, 620). Tables, insol. water, v. sol. hot alcohol, v. sl. sol. ether. Converted by HI into iodo-sebacic acid. Reduced by alcohol and zinc to stearic acid. Distilled under 100 mm. it gives an acid (c. 70°), which may be its anhydride $\text{C}_{18}\text{H}_{32}\text{O}_4$. This acid forms the salts $\text{C}_{18}\text{H}_{32}\text{O}_4\text{AgO}_2$ and $\text{C}_{18}\text{H}_{32}\text{O}_4\text{NaO}_2$. Yields octoic, sebacic, and azelaic acids on oxidation by KMnO_4 .

Salts.— NaA , KA , CaA , aq. BaA , ZnA , AgA .

Di-acetyl derivatives. Syrup, spl. ether. *Methyl ether*. [106°]. S. (alcohol) 8-45 at 18-5°. S. (ether) 1-04 at 19°. Plates.

Ethyl ether. [100°]. S. (alcohol) 4-8 at 16°; 4-95 at 18°. S. (ether) 1-78 at 18°. Plates.

Di-oxy-stearic acid $\text{C}_{18}\text{H}_{32}\text{O}_4$. [100°]. Formed by oxidising elaidic acid with alkaline KMnO_4 (Saytzeff, J. pr. [2] 33, 315). More sol. alcohol

and ether than the preceding isomeride.—NaA'.—AgA'.

Di-oxy-stearic acid $C_{18}H_{34}O_4$. [78°]. Got by the action of Ag_2O on the dibromide of iso-oleic acid [45°], which is formed from iodo-stearic acid and alcoholic potash (Saytzeff, *J. pr.* [25-37, 276]. Crystalline powder, v. sol. alcohol and ether. HI yields an iodo-stearic acid reduced by tin and HCl to stearic acid.

Tri-oxy-stearic acid $C_{18}H_{32}O_5$. '*Ricinolic acid*'. [141°]. Occurs among the products of the oxidation of castor oil with alkaline $KMnO_4$ (Hazura a. Grüssner, *M.* 9, 476).—KA'.—NaA'.—AgA'.

Tri-oxy-stearic acid $C_{18}H_{32}O_5$. '*Ricinisolic acid*'. [111°]. Occurs together with the preceding isomeride, among the products of oxidation of castor oil by $KMnO_4$ (H. a. G.).

Tri-oxy-stearic acid $C_{18}H_{32}O_5$. [115°]. Formed by oxidising ricinelaidic acid with alkaline $KMnO_4$ (Hazura a. Grüssner, *M.* 10, 199). Tri-metric prisms, insol. cold water; v. sol. HOAc and ether.

Tetra-oxy-stearic acid $C_{18}H_{30}O_6$ i.e. $C_{18}H_{32}(OH)_4O_2$. '*Sativic acid*'. [173°]. A product of the oxidation of linoleic acid by alkaline $KMnO_4$ (Hazura, *M.* 9, 190). Long prisms. Converted by HI into $C_{18}H_{42}I_2O_2$ and finally into stearic acid.

Hexa-oxy-stearic acid $C_{18}H_{26}O_8$. '*Linusic acid*'. [203°]. Got by oxidising linoleic acid with alkaline $KMnO_4$, being derived from linolenic acid, which is present in linoleic acid (Hazura, *M.* 7, 637; 8, 155, 267). Minute needles (from water). More sol. water and less sol. alcohol than sativic acid. Yields a hexa-acetyl derivative.

Hexa-oxy-stearic acid $C_{18}H_{26}O_8$. '*Isolinusic acid*'. [175°]. Occurs in small quantity, together with sativic and linusic acids, in the product of the oxidation of linoleic acid by alkaline $KMnO_4$. Needles, insol. ether, v. sol. hot water. Forms a hexa-acetyl derivative, sl. sol. ether.

OXY-STILBENE v. OXY-DIPHENYL-ETHYLENE.

DI-o-OXY-DI-STYRYL DIKETONE $C_{18}H_{14}O_4$, i.e. $CO(CH:CH:CH:CH)_2$. [160°]. Got by heating the glucoside with dilute H_2SO_4 . Brownish powder, sol. alcohol.

Glucoside $CO(CH:CH:CH:CH:OC_6H_5)_2$. [257°]. Formed, together with the compound $CH_2:CO:CH:CH:CH:OC_6H_5$, by condensation of helicin with acetone in presence of a little alkali (Tiemann a. Kees, *B.* 18, 1987). Colourless crystals (containing aq), sl. sol. alcohol, nearly insol. water, insol. ether.

Tetra-oxy-di-styryl ketone. Di-methylene derivative $CO(CH_2:CH:O:CH_2:O:CH_2)_2$. [185°]. Made from piperonal, acetone, and NaOHAq (Haber, *B.* 24, 617). Yellow needles, insol. water, m. sol. alcohol. Colours H_2SO_4 a deep blue.

o-OXY-STYRYL METHYL KETONE $C_{11}H_{10}O_3$ i.e. $C_6H_5(OH):CH:CH:CO:CH_3$. [189°]. Got by hydrolysis of its glucoside by emulsin (Tiemann a. Klees, *B.* 18, 1964). Formed also from salicylic aldehyde, acetone, and dilute NaOH (Haber, *B.* 24, 6180). Long needles (from alcohol), sl. sol. water. $FeCl_3$ colours its aqueous solution blue. Sodium-amalgam reduces it to $C_6H_5(OH):CH:CH:CH(OH):CH_3$. [48°].

Yields a benzoyl derivative $C_6H_5(OBz):CO:CH_3$ [88°], an oxim $C_6H_5(OH):C(NO:CH_3):CH_3$ [85°], and a phenyl-hydrazide [160°].

Glucoside $CH_2:CO:CH:CH:OC_6H_5(O:CH_2:O)_2$. [192°]. Made by adding a few drops of caustic soda solution to a mixture of acetone and helicin $C_6H_5(OC_6H_5)_2:CHO$. Slender needles (containing aq), v. sol. hot water. Levorotatory. Yields an oxim [173°].

p-Oxy-styryl methyl ketone. Methyl derivative $C_6H_5(OMe):CH:CH:CO:CH_3$. [76°]. Made by allowing anisic aldehyde, acetone, and aqueous NaOH to stand in the cold (Einhorn a. Grabfield, *A.* 243, 863). Plates, v. sol. alcohol.

Di-oxy-styryl methyl ketone. Methyl derivative $CH_3:CO:CH:CH:CH:CH_2(OH)(OMe)$ [148]. Got from its glucoside by the action of emulsin. Yellow needles, v. sol. alcohol.

Glucoside $CH_3:CO:CH:CH:CH:CH_2(OMe)(O:CH_2:O)_2$. [267°]. Got by heating the glucoside of vanillin with acetone and NaOHAq (Tiemann, *B.* 18, 3491). Pale-yellow needles (containing 2aq), m. sol. water. Levorotatory.

Methylene derivative $CH_3:CO:CH:CH:CH:CH_2:O:CH_3$. [107°]. Made from piperonal, acetone, and NaOHAq (Haber, *B.* 24, 618). Prisms, sl. sol. warm water. Changed by steam into an isomeride (?) [111°]. Yields a yellow oxim [186°] and phenyl-hydrazide [160°]. The isomeride [111°] yields a colourless oxim [183°] and phenyl-hydrazide [163°].

DI-OXY-STYRYL-m-PYRAZOLE $C_{11}H_8N_2O_3$, i.e. $CO<NH.CO$

$Di-oxy-styryl-glyoxaline$. $Styryl hydantoin$. [172°]. Made by the action of boiling dilute hydrogen chloride upon $CH:Ph:CH:CH:CH:Ph.NH.CO.NH_2$, which is got from cinnamic aldehyde cyanhydrin, and urea (Pinner a. Lifschütz, *B.* 20, 2858; 22, 686). White plates, changing on fusion to an isomeride [195°].

Reactions.—1. On heating with alcoholic potash it yields the isomeric $C(NH)<NH.CO$

which decomposes at 300° and, with KOH and EtBr, yields $C(NH)<NH.CO$

2. Alcoholic potash and EtBr at 100° from $CO<NH.CO$

$CO<NH.CO$ [162°].—3. Bromine in $CHCl_3$ forms $C_6H_5N_2O_3Br$. [200°]. Bromine

water produces $CO<NH.CO$

[220°], whence NaOHAq forms tri-oxy-styryl

metapyrazole $CO<NH.CO$

talline powder [185°].

Acetyl derivative $CO<NAC.CO$

[185°]. Small white prisms.

o-OXY-STYRYL-PYRIDINE $C_{11}H_8NO$ i.e.

$C_6H_5(OH):CH:CH:CO:CH_3$. [132°].

Formed by heating (a) methyl-pyridine (10 g.) with salicylic aldehyde (13 g.) and water (7 g.) at 140° (Butler, *B.* 23, 2697). Small crystals (from dilute alcohol). Yields a dibromide. Reduced by Na and alcohol to $C_6H_5(OH):CH:CH:CH_2.N$ [94°]. Salts.— $B_2H_4PtCl_6$. [188°].— BiH_3Cl_4 .

[a. 170°]. Salts of the ethyl derivative

$(C_8H_7(OEt)N)_2.HgCl_2$. [92°]. Light-yellow needles. — $(C_8H_7(OEt)N)_2.H_2PtCl_6$. [183°].

Ethyl iodide of the ethyl derivative $C_8H_7(OEt)NEtI$. [218°]. Golden crystals.

Oxy-styryl-pyridine. Methyl derivative $C_8H_7(OMe)OH:CH.C_5H_4N$. [97°]. Formed from anisic aldehyde and methyl-pyridine (Schuffen, B. 23, 2719). Plates. — $B_2H_2PtCl_6$. [184°]. Yellow plates.

p-Oxy-(Py. 8)-styryl-quinoline

$C_{11}H_9NO$ *is.* $C_6H_5 \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} \begin{smallmatrix} CH:CH \\ N=C:CH \end{smallmatrix} C_6H_4.OH$ [243°]. Formed from *p*-amido-styryl-quinoline by the diazo-reaction (Bulach, B. 22, 286). Formed also from *p*-oxybenzoic aldehyde, quinaldine, and $ZnCl_2$ (Wallach, B. 16, 2009). Yellow plates.

o-Oxy-(Py. 1)-styryl-quinoline [215°]. Made from salicylic aldehyde, lepidine, and $KHSO_4$ (Heymann & Königs, B. 21, 1429, 2172). Yellow crystals.

m-Oxy-(Py. 1)-styryl-quinoline. [255°]. Got from *m*-amido-styryl-quinoline. Brownish-yellow crystals (from alcohol).

p-Oxy-(Py. 1)-styryl-quinoline [249°]. Got from *p*-oxy-benzoic aldehyde, lepidine, and $KHSO_4$ (H. a. K.). Yellow crystals (from alcohol).

OXYSUBERANIC ACID $C_8H_7O_2$ *is.* $C_6H_5(OH).CO_2H$. [90°]. Made from suberone cyanhydride and conc. $HClAq$ (Spiegel, A. 211, 118). Tables (containing 3 aq). Melts at 50° when hydrated. V. e. sol. alcohol and hot water.

OXYSUBERIC ACID $C_8H_7O_2$. [112°]. Made by boiling bromo-suberic acid with $NaOHaq$ (Hall & Rempel, B. 15, 149; 18, 817). Nodules (from ether). HNO_3 oxidises it to adipic and oxalic acids. — MgA'' aq. — CuA'' — ZnA'' 2 aq. — Ag_2A'' : crystalline pp.

Ethyl derivative $C_8H_7(OEt)(CO_2H)_2$. Made from bromo-suberic acid and alcoholic potash. Syrup, v. sol. water and alcohol. — BaA'' — ZnA'' — PbA'' — Ag_2A'' : amorphous pp.

Oxy-isosuberic acid $C_8H_7O_2$. A sticky mass got by saponification of its ether, which is a product of the action of silver on bromo-butyric ether (Heli. a. Mülhaußer, B. 13, 477). $HIAq$ at 160° reduces it to β -isobutyric acid. — Ag_2A'' .

Di-oxy-suberic acid $C_8H_7O_2$. Made from di-bromo-suberic acid and KOH (Gay & Gay-Lussac, A. 155, 251). Amorphous.

Di-ethyl derivative $C_8H_7(OEt)_2(CO_2H)_2$. Made from di-bromo-suberic acid and alcoholic potash (H. a. R.). Syrup, v. sol. water, alcohol, and ether. — Ag_2A'' : amorphous pp.

OXY-SUCCINIC ACID *is.* **MALIC ACID.**

Di-oxy-succinic acid is. **TARTARIC ACID.**

Tetra-oxy-succinic acid $C_4H_4O_8$ *is.* $CO_2H.C(OEt).C(OH).CO_2H$ or $CO_2H.CO.CO.CO_2H$ 2 aq. *Di-oxy-tartaric acid.*

Carboxytartaric acid. [98°]. Formed by passing nitrous acid into an ethereal solution of protocatechuic acid (Grüber, B. 12, 514), of pyrocatechin (Bath, M. 1, 869), of guaiacol (Herzig, M. 8, 825), or of 'nitro-tartaric acid' (Kekulé, A. 221, 240). The free acid is got by decomposing the dry sodium salt in dry ether with HCl gas (W. L. Miller, B. 22, 2015). White crystals, v. sol. water. The salt $Na_2C_4H_4O_8$ 2 aq. is nearly insol. water. It splits up on heating into CO_2 and sodium tartronate. With $NaHSO_4$

at 90° it yields glyoxal (Hinsberg, B. 24, 3235). The salt $Ba_2(C_4H_4O_8)_2$ aq. is a crystalline pp. $HClAq$ and zinc reduce it to a mixture of racemic and inactive tartaric acids. Yields hydantoin when the Na salt is rubbed up with urea and dilute $HClAq$ at 55° (Anschütz, A. 254, 258).

Ethyl ether. Thick liquid (Anschütz, A. 261, 130). Converted by urea into the ureide $C_4H_4N_2O_8$, which crystallises in needles, sl. sol. cold water, decomposing at 245°.

(8)-*Oxim* $CO_2H.C(OH).C(OH).CO_2H$ [145°-150°]. Got from the Na salt, hydroxylamine and HCl . Colourless prisms, v. e. sol. water and alcohol, insol. benzene (Müller, B. 16, 2985; Söderbaum, B. 24, 1223). After crystallisation from water it melts at 70°-75°. It yields the salts CaA'' 4 aq and Ag_2A'' and a crystalline diacetyl derivative, v. sol. water. Conc. $HClAq$ converts the oxim into an isomeride [145°-150°] crystallising in nodules, which are v. e. sol. water and yield the salts CaA'' 3 aq and Ag_2A'' aq. Ac_2O decomposes this (a)-oxim into cyanogen and CO_2 .

Phenyl hydrazide $C_8H_7N_2O_2$ *is.* $CO_2H.CO.C(N_2HPh).CO_2H$. *Monophenylisine diorytartaric acid*. [218°]. Made by mixing a solution of the acid (1 mol.) with phenyl-hydrazine (1 mol.) dissolved in $HClAq$ (Ziegler & Locher, B. 20, 835). Feathery needles, insol. cold water, v. sol. hot alcohol. Coloured red by $FeCl_3$. — $BaCl_2.H_2N_2O_3$ 3 aq. — NaA'' . — Ag_2A'' : orange-yellow pp.

Di-phenyl-di-hydrazide $CO_2H.C(N_2HPh).C(N_2HPh).CO_2H$. *Diphenylisine diorytartaric acid*. [above 200°]. Made from tetra-oxy-succinic acid (1 mol.) and phenyl-hydrazine (2 mols.). Orange-yellow powder, sl. sol. water, v. sol. warm alcohol. On heating with

Ac_2O it yields $O < CO.C.N_2HPh$ [c. 234°], which crystallises in rod needles, v. sol. Ac_2O . — $(NH_4)_2A''$: colourless plates. — $(NH_4)HA''$: brick-red needles. With silver nitrate it gives

$AgN < CO.C.N_2HPh$ of a vermilion colour.

NaA'' : lemon-yellow plates. — $NaHA''$: brick-red needles. — The ethyl ether $C_8H_7N_2O_2$ [121°] is got from phenyl-hydrazine and tetra-oxy-succinic ether (A. a. G.); it forms canary-yellow crystals.

Di-p-sulpho-di-phenyl-di-hydrazide $CO_2H.(N_2HPh.SO_3H).C(N_2HPh.SO_3H).CO_2H$. Formed from sodium tetra-oxy-succinate, sodium phenyl-hydrazine *p*-sulphonate, and $HClAq$. The Na salt is an orange-yellow powder, v. sol. water, insol. alcohol, and is used as a yellow dye (tartrazine).

Di-phenyl-hydrazide. [168°]. Made from the acid and N_2H_2Ph . Yellow pp., turning blue in the air.

Tetra-phenyl-di-hydrazide $CO_2H.C(N_2Ph).C(N_2Ph).CO_2H$. [177°]. Made from the acid (1 mol.) and diphenylhydrazine (2 mols.) (Ziegler & Locher, B. 20, 841). Yellowish plates (from hot alcohol), insol. water. Conc. H_2SO_4 forms a red solution, becoming green. On fusion with resorcin it gives a crimson mass, coloured blue by $NaOH$; hydroquinone and pyrogallol give green and blue masses respectively. Bromine gives a crystalline bromo-

acriavave. As_2O_3 forms $\text{O} \begin{smallmatrix} \text{CO.C.N.Ph.} \\ \text{CO.C.N.Ph.} \end{smallmatrix}$ [222°] crystallising in ruby-red prisms with green lustre. Converted into the imide $\text{NH} \begin{smallmatrix} \text{CO.C.N.Ph.} \\ \text{CO.C.N.Ph.} \end{smallmatrix}$ [192°] by NH_3 — $\text{Na}_2\text{A}''$: rosettes of needles (from water) or plates (from alcohol).— CuA'' .— PbA'' : white pp.

m-Nitro-phenyl-hydrazide. [175°]. Made by using *m*-nitro-phenyl-hydrazine (Bischler & Brodsky, B. 22, 2814). Sl. sol. hot water and alcohol.

Di-m-nitro-phenyl-di-hydrazide. [e. 200°]. Made from *m*-nitro-phenyl-hydrazine (2 mols.) and tetra-oxy-succinic acid (1 mol.). Sl. sol. hot water.

OXY-SULPHIDES. Compounds of an element, or positive compound radicle, with O and S. The term is generally restricted to compounds of metals with O and S. Oxysulphides of metals are not numerous, and they have not been much studied. They are produced in various reactions, of which the following are the chief: by acting on the sulphide with water, e.g. oxysulphide of Ba; by heating the oxide with S, e.g. Bi oxysulphide; by boiling the oxide and sulphide with water, e.g. Ca oxysulphide; by partially reducing the sulphate by H, e.g. oxysulphides of Co and Mn; by heating the oxide in H_2S , or by passing H_2S into an aqueous solution of the oxide, e.g. oxysulphides of Fe and Os; by adding a little alkali sulphide to the solution of a salt, e.g. Cu oxysulphide. M. M. P. M.

OXY-SULPHO-BENZOIC ACID $\text{C}_6\text{H}_4(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. *Sulphosalicylic acid*. [120°]. Made by sulphonation of salicylic acid (Mendius, A. 103, 46; Remsen, A. 179, 107). Long thin needles, v. e. sol. water and alcohol. Gives a reddish-violet colour with FeCl_3 . Yields phenol and salicylic acid on fusion with potash.— NaHA'' 2aq.— $\text{Na}_2\text{A}''$ 3aq.— KHA'' 2aq.— $\text{K}_2\text{A}''$ 2aq.— $\text{K}_2\text{HA}''$ aq.— KNaA'' 4aq.— CaA'' aq.— $\text{Ba}(\text{HA})''$ 4aq.— MgA'' 3aq.— ZnA'' 3aq.— PbA'' .— CuA'' .— $\text{Cu}_2\text{A}''(\text{OH})$ 2aq.— $\text{Ag}_2\text{A}''$ aq: crystalline powder, v. sol. hot water.

Ethyl ether. $\text{Et}_2\text{A}''$. [58°]. Crystals.

Oxy-sulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$ [4:3:1]. Made from *p*-oxy-benzoic acid by treatment with SO_2 (Kölle, A. 164, 150) or by digesting with H_2SO_4 at 100° (Klepl. J. pr. [2] 28, 196). Deliquescent needles, v. e. sol. water and alcohol, insol. ether. FeCl_3 gives a red colour. Potash-fusion yields protocatechuic acid.— KHA'' aq: crystals, sl. sol. water (Klepl.).— $\text{K}_2\text{A}''$ aq (Kölle).— $\text{K}_2\text{O}, \text{H}_2\text{SO}_4$ 2aq (Kölle).— BaA'' 4aq.— $\text{Ba}_2(\text{C}_2\text{H}_3\text{SO}_4)$: amorphous (Kölle).— CdA'' 3aq.— $\text{Ag}_2\text{A}''$: small prisms.

Methyl derivatives
 $\text{C}_6\text{H}_4(\text{OMe})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. Made from fuming H_2SO_4 and anisic acid at 160° (Zervas, A. 103, 888; Limpricht, Gm. 18, 128). Needles, insol. ether.— BaA'' aq.— PbA'' aq: needles, sl. sol. Aq.

Oxy-sulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$ [4:3:1]. Formed by the diazo-reaction from (4,3,1)-amido-sulpho-benzoic acid (Hedrick, Am. 9, 416). Crystalline, sol. water, alcohol, and ether.— $\text{Ba}(\text{HA})''$: insol. dilute HOAc .— BaA'' .— CaA'' 5aq: triclinic prisms, sol. hot water.— CdA'' 7aq.— CdA'' 8aq.— BaA'' 3aq (Pisanello).

Imide of the ethyl derivative

$\text{C}_6\text{H}_4(\text{OEt})(\text{CO})\text{NH}$. [258°]. Made by oxidising $\text{C}_6\text{H}_4\text{Me}(\text{OEt})\text{SO}_2\text{NH}_2$ with KMnO_4 and ppg. with HCl (Remsen & Palmer, Am. 8, 227). Concentric groups of needles.— $\text{K}_2\text{C}_2\text{H}_3\text{NSO}_4$.— $\text{AgC}_2\text{H}_3\text{NSO}_4$: lustrous needles, sl. sol. water.

Oxy-sulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$ [3:4:7:1]. Formed from *m*-oxy-benzoic acid and SO_2 (Barth, A. 148, 38; Senhofer, A. 152, 102). Yellowish-green needles (containing 1 aq), v. sol. alcohol. Coloured red by FeCl_3 . Yields protocatechuic acid and an acid [189°] when fused with potash.— BaA'' 4aq.— $\text{Cd}(\text{HA})''$ 2aq.— $\text{Pb}_2(\text{C}_2\text{H}_3\text{SO}_4)_2$: reddish amorphous mass.

Oxy-sulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. Got by dissolving *m*-diazo-benzoic acid in warm H_2SO_4 (Griess, Z. 1864, 538). White laminae (from water). Perhaps identical with the preceding acid.— BaA'' .

Oxy-disulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. [146°]. Made from salicylic acid and ClSO_3H at 180° (Pisanello, G. 18, 346). Deliquescent needles (containing 4aq). Gives a red colour with FeCl_3 .— $\text{Na}_2\text{A}''$ 3aq.— $\text{K}_2\text{A}''$ 3aq.— $\text{Ca}_2\text{A}''$ 12aq.— $\text{Ba}_2\text{A}''$ 6 aq prisms, sl. sol. water.— $\text{Pb}_2\text{A}''$ 10aq.— $\text{Cd}_2\text{A}''$ 18aq.— $\text{Cu}_2\text{A}''$ 12aq.— $\text{Zn}_2\text{A}''$ 15aq: plates.

Oxy-disulpho-benzoic acid $\text{C}_6\text{H}_4\text{S}_2\text{O}_6$. Got by boiling trisulpho-*m*-oxy-benzoic acid with BaCO_3 (Kretschy, B. 11, 862).— $\text{Ba}_2\text{A}''$ 3aq.

Oxy-trisulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. Made by heating *m*-oxy-benzoic acid with H_2SO_4 , SO_3 , and P_2O_5 at 250° (Kretschy, B. 11, 855). Hygroscopic syrup, containing 4aq at 100°. FeCl_3 gives a red colour.— $\text{K}_2\text{C}_2\text{H}_3\text{S}_3\text{O}_6$ 2aq: monoclinic prisms.— $\text{K}_2\text{A}''$ 2aq.— $\text{Pb}_2(\text{C}_2\text{H}_3\text{S}_3\text{O}_6)_2$ 6aq.— $\text{Pb}_2\text{A}''$ 8aq.— $\text{Cd}_2\text{A}''$ 8aq.— $\text{Ba}_2\text{A}''$ 4aq: colourless plates.

Di-oxy-sulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})_2(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. Formed from (4, 3, 1)-di-oxy-benzoic acid and H_2SO_4 (Zehenter, M. 2, 468). Hygroscopic needles (containing 2aq). FeCl_3 colours its aqueous solution red.—Salts.— $\text{K}_2\text{A}''$ 5aq.— BaA'' 2aq.— PbA'' 2aq.— $\text{Cu}_2(\text{C}_2\text{H}_3\text{SO}_4)_2$ 5aq.— $\text{Ag}_2\text{A}''$ 2aq: needles.

Di-oxy-sulpho-benzoic acid
 $\text{C}_6\text{H}_4(\text{OH})_2(\text{SO}_2\text{H})(\text{CO}_2\text{H})$ [5:2:2:1]. Made by heating (5, 2, 1)-di-oxy-benzoic acid with H_2SO_4 and P_2O_5 at 130° (Senhofer & Sarlay, M. 2, 464). Needles.— $\text{K}_2\text{A}''$ aq.— $\text{Pb}_2(\text{HA})''$ 8 aq.— BaA'' 2aq.— PbA'' 2aq: crystalline powder.

OXY-SULPHO-ISOCUMINIC ACID
 $\text{CMe}_2(\text{OH}).\text{C}_6\text{H}_3(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. Made by oxidising the sulphonic acids of gymene and *m*-isocymene by KMnO_4 (R. Meyer, A. 220, 7, 29).— $\text{K}_2\text{A}''$ 5aq.— BaA'' aq: minute plates.— PbA'' .

OXY-SULPHOCYANO-ACETOACETIC ETHER. *Anhydride* $\text{O}(\text{Cac}(\text{SCy}).\text{CO}_2\text{Et})$. [c. 168°]. Made by heating equivalent weights of Bariumsulphocyanide and dichloro-acetoacetic ether (207°) (Fischer, A. 250, 293). Yellow crystalline powder (from alcohol) insol. ether.

OXY-SULPHO-NAPHTHOIC ACID
 $\text{C}_{10}\text{H}_7(\text{OH})(\text{SO}_2\text{H})(\text{CO}_2\text{H})$. Made from (α)-oxy-naphthoic acid and H_2SO_4 at 60° (König, B. 22, 787; 26, 306). Needles (containing 5aq), v. sol. water and alcohol. Its alkaline solutions fluoresce blue. HNO_3 yields di-nitro-naphthol [138°]. Diazobenzene chloride forms the azo-compound

$C_{10}H_7(OH)(NPh)SO_3H$.—NaHA': needles, v. sol. water.—NaA' aq.—Ba(HA')₂.

Oxy-di-sulpho-naphthoic acid

$C_{10}H_6(OH)(SO_3H)_2CO_2H$. Formed from (a)-oxy-naphthoic acid and fuming H_2SO_4 (K.). Stellate groups of needles (containing 4aq.)—K₂A'.—Ba₂(C₁₀H₆S₂O₆)₂: needles, m. sol. water.

OXY-SULPHYDRO-ALLYL-QUINAZOLINE

$C_8H_7 < \begin{smallmatrix} CO.N.C_6H_5 \\ NHCS \end{smallmatrix}$. Allylthiobenzoylurea. [199°].

Formed from o-amido-benzamide and allyl thiocarbimide (Stewart, *J. pr.* [2] 44, 416). Needles. Its benzene solution fluoresces blue.

OXY-SULPHYDRO-DI-METHYL-GLYOXALINE. Di-methyl derivative

$NMe < \begin{smallmatrix} C(OMe).CMe \\ C(SMe).N \end{smallmatrix}$. Formed from di-methyl-thio-hydantoin [167°], alcoholic potash, and MeI (Marckwald, *B.* 24, 3293). Syrup.—E'HCl: syrup.—B'H₂SO₄: crystalline.—B'H₂PtCl₆.

The isomeride $NMe < \begin{smallmatrix} CO—CMe_2 \\ C(SMe).N \end{smallmatrix}$ formed from tri-methyl-thiohydantoin, alcoholic potash, and MeI yields the crystalline salts B'H₂SO₄ [188°] and B'H₂PtCl₆ [150°].

OXY-SULPHYDRO-PHENYL-METHYL-GLYOXALINE. Di-methyl derivative

$NPh < \begin{smallmatrix} C(OMe).CMe \\ C(SMe).N \end{smallmatrix}$ [90°]. Formed from phenyl-methyl-thiohydantoin, alcoholic KOH, and MeI (Marckwald, *B.* 24, 3290). Crystals.—B'HCl [140°].—B'H₂PtCl₆ [213°].—B'C₆H₅N₃O₆ [192°].

The isomeric compound $NPh < \begin{smallmatrix} CO—CMe_2 \\ C(SMe).N \end{smallmatrix}$ (223°) from phenyl-di-methyl-thiohydantoin [67°] forms the salts B'HCl, B'H₂PtCl₆ [132°] and B'C₆H₅N₃O₆ [174°].

OXY-SULPHYDRO-PHENYL-QUINAZOLINE

$C_8H_7 < \begin{smallmatrix} CO.NPh \\ NHCS \end{smallmatrix}$ [199°]. Formed from o-amido-benzamide and phenyl thiocarbimide (Stewart, *J. pr.* [2] 44, 416). Satiny tables.

OXY-SULPHYDRO-QUINAZOLINE

$C_8H_7 < \begin{smallmatrix} CO.NH \\ NHCS \end{smallmatrix}$ [281°]. Formed from o-amido-benzamide and thioc-urea (Stewart, *J. pr.* [2] 44, 416). Nodules (from alcohol).

OXY-SULPHYDRO-THIAZOLE $C_4H_5NS_2O$ i.e.

$NH < \begin{smallmatrix} OS.S \\ CO.CH_3 \end{smallmatrix}$ [167°]. Formed by heating

$NH < \begin{smallmatrix} CO—CH_3 \\ C(NH).S \end{smallmatrix}$ with CS₂ in alcohol at 160° (Mitscherlich, *Z.* 262, 84). Formed also from chloroacetic ether, ammonium dithiocarbamate, and alcoholic HCl; and from sulphocyanacetic ether by successive treatment with H₂S and HCl.

OXY-SULPHYDRO-o-TOLYL-METHYL-GLYOXALINE. Di-methyl derivative

$C_8H_7MeN < \begin{smallmatrix} C(OMe).CMe \\ C(SMe).N \end{smallmatrix}$ [120°]. Got from o-tolyl-methyl-thiohydantoin, alcoholic potash, and MeI (Marckwald, *B.* 24, 3292). Plates, v. sol. alcohol. Yields the following salts: B'HCl [120°], B'H₂PtCl₆, B'H₂SO₄ [205°], B'HNO₃, and the picate B'C₆H₅N₃O₆ [200°].

OXY-SULPHYDRO-o-TOLYL-METHYL-GLYOXALINE. Di-methyl derivative

$C_8H_7MeN < \begin{smallmatrix} C(OMe).CMe \\ C(SMe).N \end{smallmatrix}$ [120°]. Got from o-tolyl-methyl-thiohydantoin, alcoholic potash, and MeI (Marckwald, *B.* 24, 3292). Plates, v. sol. alcohol. Yields the following salts: B'HCl [120°], B'H₂PtCl₆, B'H₂SO₄ [205°], B'HNO₃, and the picate B'C₆H₅N₃O₆ [200°].

The isomeric $C_8H_7MeN < \begin{smallmatrix} C(OMe).N \\ CO—CMe_2 \end{smallmatrix}$ from o-tolyl-di-methyl-thiohydantoin yields the salts B'HCl [113°], B'H₂PtCl₆, B'H₂SO₄ [208°], and B'C₆H₅N₃O₆ [212°].

Oxy-sulphhydro-p-tolyl-methyl-glyoxalina. Di-methyl derivative. [109°]. Plates. Yields B'HCl [123°], B'H₂PtCl₆, and B'C₆H₅N₃O₆ [180°].

* The isomeric $[4:1]C_8H_7MeN < \begin{smallmatrix} C(SMe).N \\ CO—CMe_2 \end{smallmatrix}$ yields B'H₂SO₄ [210°], B'H₂PtCl₆ [152°], and B'C₆H₅N₃O₆, decomposing at 190°.

DI-OXY-TARTARIC ACID v. TETRA-OXY-SUCCINIC ACID.

OXY-TEREBIC ACID $C_{10}H_8O_4$. [100°-120°]. Made by boiling chloro-terebic acid with water and CaCO₃ (W. Roser, *A.* 220, 264). Syrup, crystallising with difficulty, v. sol. water.—CaA'.—AgA': needles, v. sol. water.

OXY-TEREPHTHALIC ACID $C_8H_6O_4$ i.e.

$C_8H_6(OH)(CO_2H)_2$. Formed by the diazo-reaction from amido-terephthalic acid (De la Rue a. Müller; Burkhardt, *B.* 10, 144, 1273). Prepared also by potash-fusion from bromo-terephthalic acid (Fischli, *B.* 12, 621), from oxy-aldehydo-benzoic acid (Tiemann a. Landshoff, *B.* 12, 1335), from p-xyleneol, from carthol, and thymol (Jacobsen, *B.* 11, 570), from oxy-p-toluic acid (Hart a. Remsen, *B.* 12, 1433), and from rufgallic acid (Schreder, *M.* 1, 439).

Properties.—Crystalline powder, sl. sol. water, v. sol. alcohol. Not melted at 300°. FeCl₃ colours its solution reddish-violet. Yields CO₂ and phenol when strongly heated. On fusion with NaOH it gives salicylic acid and some p-oxy-benzoic acid (Barth a. Schreder, *B.* 12, 1260). Yields m-oxy-benzoic acid on heating with HClAq at 120°. Forms a di-nitro-derivative [179°].

Salts.—BaA' 3aq: laminae (from water).—AgA': white pp., insol. water.

Methyl ether Me₂A'. [94°]. Leaflets. Yields an acetyl derivative $C_8H_6(OAc)(CO_2Me)$, [76°].

Methyl derivative $C_8H_6(OMe)(CO_2H)$. [279°]. Got by oxidation of methoxy-toluic acid and of methyl-thymol. Small prisms.

Methyl ether of the methyl derivative $C_8H_6(OMe)(CO_2Me)$. [65°]. Concentric needles.

Ethyl derivative $C_8H_6(OEt)(CO_2H)$. [254°]. Got by oxidation of the ethyl ether of thymol (Paterno a. Canzoneri, *G.* 9, 460). Stellate groups of minute crystals, insol. water.

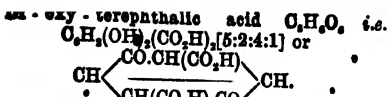

Benzyl derivative

$C_8H_6(OCH_2Ph)(CO_2H)$. [230°-240°]. Made from $C_8H_6(ONa)(CO_2Me)$ and benzyl chloride, the product being saponified (Baeyer a. Tutein, *B.* 22, 2188). Slender needles.

Tetrahydride $C_8H_8(OH)(CO_2H)$. Got by reducing the acid with sodium-amalgam (Baeyer a. Tutein, *B.* 22, 2180). Yellowish-white needles, sl. sol. cold water. Coloured bluish-violet by FeCl₃. Its methyl ether forms feathery needles [77°].

Hydroxylamine converts the tetrahydride into $C_8H_8O_2(NOH)$ [170°], while phenyl-hydrazine forms $C_8H_8O_2(NPh)$ [125°] converted by HClAq into $NH < \begin{smallmatrix} C_8H_7.CO_2H \end{smallmatrix}$, a crystalline

body [230°] giving off a faecal odour when heated. The tetrahydride, heated at 120°, loses CO₂ and forms $C_8H_6O(CO_2H)$, whence NaA' and $C_8H_6(OH)C_2O_2H$ [180°-140°] may be prepared; the latter body yielding the crystalline acid $C_8H_6(OH)(CO_2H)$, on saponification.

Quinone hydro-dicarboxylic acid. Hydroquinone dicarboxylic acid. [above 300°].

Formation.—1. By passing a current of air through a solution of the dihydride ether (succinyl-succinic ether) containing excess of alkali (Herrmann, *B.* 10, 107; *A.* 211, 335).—2. By the oxidising action of $KMnO_4$ on $C_6H_4Me(CO_2H)(OPO_2K)_2$, a derivative of thymoquinone, and on $C_6H_4Me_2(OPO_2K)_2$, a derivative of hydro-*p*-xyloquinone (Heymann & Königs, *B.* 20, 2392).—3. By the action of PCl_5 on succinyl-succinic ether (Levy & Curchod, *B.* 22, 2108).—4. By saponifying its ether.

Properties.—Interlaced needles (containing 2aq) (from water) or yellow plates (from alcohol), sl. sol. alcohol and ether, v. sl. sol. water. Its alcoholic solution shows blue fluorescence. $FeCl_3$ gives a deep-blue colour. When distilled it yields Hydroquinone. Bromine-water yields tetrabromoquinone. Chlorine passed into its alcoholic solution forms tetra-chloro-quinone (Loewy, *B.* 19, 2394).

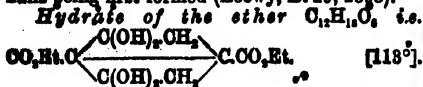

Salts.— K_2A'' : yellow needles, forming a solution with green fluorescence. — KHA'' . — Na_2A'' 2aq. — $NaHA''$ 2aq. — $NaA''(OH)$, 10aq; crystals ppd. by conc. $NaOHAq$. — $(NH_4)_2A''$ 2aq (Duisberg, *A.* 213, 162). — BaA'' . — CaA'' 5aq. — $Ca(HA'')$, 5aq. — PbA'' . — AgA'' : green-yellow pp.

Mono-ethyl ether $EtHA''$. [184°]. Made by the action of dilute KOH on the di-ethyl ether in the cold. Pale-yellow needles (from water), sl. sol. water, alcohol, and ether. — $Ba(EtA'')$, 5aq. — $Ca(EtA'')$, 5aq; greenish-yellow needles.

Di-ethyl ether Et_2A'' . [133°]. S. (ether) 1:6 at 20°. Prepared by adding bromine to a solution of its dihydride in CS_2 or to the dihydride suspended in water (Herrmann, *A.* 211, 327; *B.* 19, 2229). Formed also by the action of sodium on di-bromo-acetoacetic ether dissolved in ether (Wedel, *A.* 219, 74).

Properties.—Greenish-yellow trimetric tables (from benzene) or needles (from ether). May be sublimed. Its alcoholic solution shows blue fluorescence. $FeCl_3$ gives a bluish-green colour. Does not react with phenyl cyanate (Goldschmidt & Meissler, *B.* 23, 259). Does not react with phenyl-hydrazine or hydroxylamine. Sol. alkalis, forming a yellow liquid, from which it is ppd. by CO_2 , and, as a scarlet pp., $Na_2C_2H_2O_4$, by conc. $NaOHAq$. Ac_2O has no action at 510°.

Reactions.—1. Reduced to its dihydride by SiO_2 and $HClAq$ (Baeyer, *B.* 19, 428).—2. Bromine-vapour forms $C_6H_4Br_2(CO_2Et)_2$ [157°] and afterwards $C_6H_4Br_2(CO_2Et)_2$ (Herrmann, *B.* 19, 2284; Böniger, *B.* 21, 1758).—3. Dry nitrous acid gas passed into its solution in absolute ether oxidises it to di-oxy-quinone dicarboxylic ether (Hantzsch & Loewy, *B.* 19, 26); an intermediate crystalline powder $C_8H_4NO_6$ or $C_8H_4NO_8$ [148°] giving a violet colour with alkalis being first formed (Loewy, *B.* 19, 2393).

Formed, together with the ether, by the action of bromine on the dihydride (succinyl-succinic ether) (Hantzsch & Zeckendorf, *B.* 20, 2800). Yellow needles. On boiling with alcohol it changes to the ether $C_8H_4O_5$ [133°]. Hydroxylamine reduces it to $C_8H_4O_5$ [128°].

Di-acetyl derivative of the ether $C_8H_4(OAc)_2(CO_2Et)_2$. [154°]. Got by the action of $AcCl$ on the ether or on $C_6H_4(ONa)_2(CO_2Et)_2$ (Wedel, *A.* 219, 81; Nef, *A.* 258, 206). Monoclinic crystals. Not attacked by Br. Its alcoholic solution is not fluorescent.

Di-benzoyl derivative of the ether $C_8H_4(OBz)_2(CO_2Et)_2$. [171°]. Made from the ether, $NaOHAq$, and $BzCl$. Colourless needles (from alcohol). Not attacked by Br in $CHCl_3$. Conc. H_2SO_4 sets free $C_6H_4(OH)_2(CO_2Et)_2$. Zinc-dust and conc. $HClAq$ form three isomeric dihydrides $C_8H_4(OBz)_2(CO_2Et)_2$, melting at 165°, 85°–95°, and 100°–110°.

Di-methyl derivative $C_8H_4(OMe)_2(CO_2H)_2$. [267°]. Formed by saponification of $C_8H_4(OMe)_2(CO_2Et)_2$ (*v. infra*) with alcoholic potash (Nef, *A.* 258, 298). Colourless needles. Its aqueous solution shows bluish-violet fluorescence. — $(NH_4)_2A''$: sol. water. Not fluorescent.

Di-methyl derivative of the ethyl ether $C_8H_4(OMe)_2(CO_2Et)_2$. [108°–5°]. Made from $C_6H_4(ONa)_2(CO_2Et)_2$ and MeI at 100° (Nef, *A.* 258, 297). Colourless tables. Its solutions show bluish-violet fluorescence. Not reduced by zinc-dust and $HOAc$.

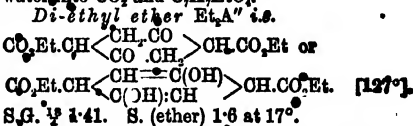

Di-benzyl derivative of the ethyl ether $C_8H_4(OCH_2Ph)_2(CO_2Et)_2$. [96°–5°]. Monoclinic needles (from alcohol), sol. $KOHAq$.

Oxy-amide $C_8H_4(OH)_2(CO_2NH_2)_2$. Formed by the action of hydroxylamine on the ether (Jeaurenaud, *B.* 22, 1278). Prisms (containing 2aq), sol. water and alcohol.

Dioxyterephthalic acid dihydride $C_8H_6O_5$. *Succinyl-succinic acid.* S. 0.15 at 19°–5°. Got from its ether and the calculated quantity of cold $NaOHAq$. Minute needles, decomposed by heat, yielding $C_8H_4O_5$ [78°] and CO_2 . $FeCl_3$ colours its solution violet (Baeyer & Noyes, *B.* 22, 2168). — BaA'' 24aq. — $(NH_4)_2A''$ 2aq.

Methyl ether Me_2A'' . [132°]. Made by the action of sodium on methyl succinate (Ebert, *A.* 229, 50). Got also from bromo-acetoacetic ether and ammonia (Geuther, *A.* 244, 204). Sol. alcohol and ether.

Mono-ethyl ether $EtHA''$. [98°]. Got from the di-ethyl ether and cold $NaOHAq$ (Herrmann). Yellowish prisms (from ether). Its alcoholic solution shows blue fluorescence. $FeCl_3$ gives a violet colour. Decomposed by boiling water into CO_2 and $C_8H_4O_5$.

Formation.—1. By the action of K or Na on ethyl succinate (Fehling, *A.* 49, 186; Herrmann, *A.* 211, 306; Duisberg, *B.* 16, 138).—2. By the action of $NaOEt$ (free from alcohol) on succinic ether (Volhard, *B.* 16, 184).—3. From bromo-acetoacetic ether by the action of alcoholic NH_3 (Duisberg, *A.* 213, 139) or of $NaOEt$

Wedel, A. 219, 92).—1. By reducing di-oxyterephthalic ether with zinc and HClAq (Baeyer, 3, 19, 428).

Properties.—Green triclinic crystals with blue fluorescence (from ether), v. sl. sol. hot water. Insol. NH₄Aq, but forms a yellow solution in NaOHaq. Its alcoholic solution shows blue fluorescence. FeCl₃ gives a red colour decomposed by excess of KOHAq, yielding black products containing a very 'succinyl-propionic' acid C₆H₄O₄ and a crystalline acid C₆H₄O₄, 139°, which forms BaA'' 2aq. The alkaline solution is turned brown by oxygen. Does not react with phenyl cyanate (Goldschmidt & Meissler, B. 23, 258).

Reactions.—1. Converted by bromine into di-oxy-terephthalic ether. Bromine and potash yield brominated quinones.—2. Nitrous acid forms a di-nitrosd-derivative C₆H₄(N₂O)₂, [114°], a white powder, insol. water and alcohol, decomposed by boiling alcohol with formation of di-oxy-terephthalic ether, and by boiling water with formation of the oxim of pyruvic ether.—3. Hydroxylamine in presence of NaOHaq form C₆H₄(NOH)₂(CO₂Et)₂, crystallising from alcohol in plates which begin to decompose at 160° (Jeaurenaut, B. 22, 1282). An alcoholic solution of phenyl-hydrazine forms the white hydrazone-compound C₆H₄(NH.NHPh)₂(CO₂Et)₂, [165°] whence bromine produces the disazo compound C₆H₄(N₂Ph)₂(CO₂Et)₂, [126°], which on saponification yields the acid C₆H₄(N₂Ph)₂(CO₂H)₂, [over 250°]. The white hydrazone-compound is accompanied by C₆H₄(NH.NHPh)₂(CO₂Et)₂, [208°], a yellow isomeride identical with Knorr's body [206°] (Baeyer, B. 24, 2690).—4. Phenyl hydrazine (2 mols.) forms in presence of toluene and some glacial acetic acid, the four following compounds C₆H₄(O.N.HPh)₂(CO₂Et)₂, [160°], C₆H₄(N.HPh)₂(CO₂Et)₂, [206°], C₆H₄(N₂O)₂, [212°], and C₆H₄(N₂O)₂, decomposing above 300° (Knorr a. Bülow, B. 17, 2054). The last body yields a di-methyl derivative C₆H₄(Me.N₂O)₂ and is converted by nitrous acid into a blue substance C₆H₄(N₂O)₂.—5. PCl₅ forms the chlorides of di-chloro-dihydroterephthalic and dioxyterephthalic acids (Levy & Curchod, B. 22, 2106).

Salts.—Na.Et.C₆H₄O₄2EtOH. Got from the ether by ppg. with alcoholic soda (Remsen, B. 8, 1409). Fed; on drying it changes to colourless Na.Et.C₆H₄O₄ (Hantzsch a. Herrmann, B. 21, 1756).—K₂C₆H₄O₄2Et. Colourless.—K.Et.C₆H₄O₄2EtO₂: orange.—MgEt.C₆H₄O₄2aq: dark-red amorphous mass.—BaC₆H₄O₄2aq: red pp.—CaC₆H₄O₄2aq.

Di-acetyl derivative of the ether C₆H₄(OAc)₂(CO₂Et)₂, [177°]. Made from the ether and AcCl. Needles (by sublimation). Its solutions are not fluorescent.

Di-benzoyl derivative of the ether C₆H₄(OBz)₂(CO₂Et)₂, [165°]. Formed from C₆H₄(ONa)₂(CO₂Et)₂ and BzCl (Net, ed. 258, 810). Formed also, together with two isomerides [188°] and [102-5°], by reducing the di-benzoyl derivative of di-oxy-terephthalic ether with zinc and HClAq. The three isomerides may be separated by crystallisation from ether-ligroin. The three o-tolyls are converted into C₆H₄(OH)₂(CO₂Et)₂, B'HCl [1] and into C₆H₄(OBz)₂(CO₂Et)₂ by Br in C₆H₅N₃O₄.

(a) **Di-benzoyl derivative of the ether** C₆H₄(OCH₂Ph)₂(CO₂Et)₂, [169°]. Made in small quantity (5 p.c.) from C₆H₄(OCH₂Ph)₂(CO₂Et)₂, by reducing with Zn and HCl (Net, A. 258, 801). Colourless needles. May be sublimed.

(b) **Di-benzoyl derivative of the ether** C₆H₄(OCH₂Ph)₂(CO₂Et)₂, [148-5°]. Made, together with a (γ)-isomeride [140-5°], by the action of benzyl chloride on C₆H₄(ONa)₂(CO₂Et)₂, at 100°. Less soluble in alcohol than the (γ)-isomeride. H₂SO₄ converts it into a crystalline polymeride [272°]. Hydroxylamine and phenyl-hydrazine have no action.

Di-ethyl derivative C₆H₄(OEt)₂(CO₂H)₂, [126-5°]. Got, with EtBr, by heating bromo-ethyl-acetoacetic ether at 100° (Wedel, A. 219, 104). Trimeric octahedra; a:b:c = 245:1:641. Sol. water and alcohol, forming acid solutions, coloured red by FeCl₃.—(NH₄)₂A''—Na₂A'' 2aq.—K₂A''aq.—BaA'' 2aq.—CaA''aq.—MgA'' 2aq.—ZnA'' 2aq.—MnA'' 4aq.—PbA''—EtA''.

Di-oxy-terephthalic acid tetrahydride C₆H₄O₄ i.e. C₆H₄(OH)₂(CO₂H)₂, [191°]. Made by the action of hydroxylamine on dioxyterephthalic ether (Jeaurenaut, B. 22, 1279). Prisms, sl. sol. cold water, v. e. sol. alcohol and ether. FeCl₃ gives a brown colour.—(NH₄)₂A': needles.—BaA': white powder.—AgA'' 2aq: needles.

Ethyl ether EtA'', [128°]. Made by the action of hydroxylamine on the hydrate of di-oxyterephthalic ether [113°] (Hantzsch a. Zeckendorf, B. 20, 2801). Yellow crystalline body.

Di-oxy-terephthalic acid hexahydride C₆H₄(OH)₂(CO₂H)₂. **Di-oxy-hexamethylene dicarboxylic acid.** The salt BaA'' 8aq is got by saponifying the nitrile with baryta-water (Baeyer a. Noyes, B. 22, 2177). Thick prisms or needles, v. sl. sol. water.

Nitrile C₆H₄O₄(CN)₂, [180°]. Made from quinone tetrahydride (diketohexamethylene) and HCN. Colourless, v. sol. hot water and alcohol.

c-Di-oxy-terephthalic acid C₆H₄(OH)₂(CO₂H)₂, [1:2:3:4]. [290°]. Formed from sodium pyrocatechin and CO₂ (Schmitt a. Hähle, J. pr. [2] 44, 1). Thin needles (containing aq) forming solutions with deep-blue fluorescence. FeCl₃ gives a blue colour.—Na₂A'' 2aq: fluorescent prisms.—Pb₂C₆H₄O₄—Ag₂A''.

Methyl ether MeA'', [145°]. Needles.

Ethyl ether EtA'', [90°]. Tables.

Tetra-oxy-terephthalic acid C₆H₄O₄ i.e. C₆(OH)₄(CO₂H)₂. **Ethyl ether EtA''**, [178°]. Formed by passing SO₂ into a feebly-alkaline solution of di-oxy-quinone dicarboxylic ether (Loewy, B. 15, 2388). Golden plates (from chloroform), v. sl. sol. water, alcohol, and ether. In presence of NaOHaq it is oxidised by air to di-oxy-quinone dicarboxylic ether (Böniger, B. 22, 1284). Phenyl cyanate (4 mols.) and some chloroform at 170° yield C₆(O.CO.NHPh)₂(CO₂Et)₂, [260°], an orange powder, insol. most solvents (Goldschmidt a. Meissler, B. 23, 266). Ac₂O yields the tetra-acetyl derivative C₆(OAc)₄(CO₂Et)₂, [202°], a colourless crystalline powder (Hantzsch a. Zeckendorf, B. 20, 2798). Hydroxylamine forms C₆O₄(O.NH₂OH)₂(CO₂Et)₂, [170°]. Alcoholic phenyl-hydrazine forms, on boiling, the corresponding salt C₆O₄(O.N.HPh)₂(CO₂Et)₂, [184°] (Böniger).

References.—Di-oxy-terephthalic acid.

DI-OKY-TETRADECANE *v.* BUTYRO-PINACONE and DI-ISOBUTYL-PINACONE.

DI-OKY-TETRADECOIC ACID $C_{24}H_{48}(OH)_2 \cdot O_2$ [80°]. A product of oxidation of oil of millet by $KMnO_4$ (Kassner, *Ar. Ph.* [3] 25, 1081). Insol. water, v. sol. alcohol and ether.

OKYTETRIC ACID, formed by heating methyl-acetoacetic ether with bromine and a little water, is identical with MESAGYRIC ACID (Closs, *Bl.* [3] 3, 598; *C. R.* 110, 583; Walden, *B.* 24, 2033; Gomhoff, *J. R.* 1887, 605).

α-OKY-THIENYL-ACETIC ACID

$C_8H_7S.CH(OH).CO_2H$ [115°]. Formed by reducing thienyl-glyoxylic acid with sodium-amalgam (Ernst, *B.* 10, 3280). Needles (from benzene), v. sol. water, alcohol, and ether. Yields thiophenic aldehyde on boiling with MnO_2 . Reduced by HI and P to thienyl-acetic acid.— BaA' , aq.— CaA' , aq.: v. sol. water.— Ag_2A' : white pp.

α-OKY-THIOBENZOIC ACID $C_8H_7SO_2$ i.e. $C_8H_7(OH).CO.SH$. Made from α-oxo-benzoyl chloride and KSH (Carius, *A.* 129, 11). Brownish-yellow amorphous mass, insol. water.— BaA' .

Methyl derivative of the ethyl ether $C_8H_7(OMe).CO.SEt$ (198° at 80 mm.). Made from $C_8H_7(OMe).CO.OPh$ and $NaSEt$ in ether (Seifert, *J. pr.* [2] 31, 475). Oil, smelling like mercaptan.

α-OKY-thiobenzoic acid $C_8H_7(OH).CS.OH$. *Amide* $C_8H_7(OH).CS.NH_2$ [118°]. Made by fusing salicylamide with P_2S_5 (Spilker, *B.* 22, 2767). Colourless needles, v. sol. alcohol. $FeCl_3$ colours its aqueous solution violet. Slowly converted into $C_8H_7(OH).CO.NH_2$ by boiling water.

Di-oxo-dithio-benzoic acid $C_8H_7(OH)_2.CS_2H$ [42.1]. Made by heating resorcin with potassium xanthate at 100° (Lippmann, *M.* 10, 618). Yellow needles (containing aq.). Melts at 131° when hydrated, but decomposes at 124° when anhydrous. Potash-fusion yields (4,2,1)-di-oxo-benzoic acid.

Tri-oxo-di-thio-benzoic acid $C_8H_7(OH)_2.CS_2H$ [43:2:1]. [54°]. Made by heating pyrogallol with potassium xanthate and alcohol (L.). Yellow crystals (containing aq.), v. sol. alcohol and ether. Yields c-tri-oxo-benzoic acid when fused with potash.

OKY-THIONARHTHENE C_8H_7SO i.e.

$OH \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} CH.C(OH).CH \begin{smallmatrix} \diagdown \\ \diagup \end{smallmatrix} S \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} CH:CH$ [72°]. Made by heating thiophenic aldehyde with sodium succinate and Ac_2O at 135° (Biedermann, *B.* 19, 1618). Needles (by sublimation), sl. sol. water, v. sol. $NaOH$ aq. Gives the indophenine reaction. Chloroform and KOH aq. give a bluish-green colour on warming.

OKY-THYMOQUINONE $C_{10}H_{16}O_2$ i.e.

$C_6H_5Me(C_2H_5)(OH)OPh$ [1:4:6:2:5]. [165°]. *Formation*.—1. By the oxidising action of $FeCl_3$ on di-amido-thymol (Carstanjen, *J. pr.* [3] 15, 399; Ladenburg a. Engelbrecht, *B.* 10, 1216). 2. By dissolving bromo-thymoquinone in KOH aq. (Carstanjen, *J. pr.* [2] 3, 57).—3. By the action of H_2SO_4 or HCl aq. on methylamidothymoquinone (Zincke, *B.* 14, 97) or dimethylamidothymoquinone (Schulz, *B.* 16, 898).

Properties.—Yellow needles, sol. alcohol, ether, and hot water. Forms a violet-red solution in alkalis. May be sublimed.

Reactions.—1. Eff. at 100° forms $C_{10}H_{14}EtO_2$

which sublimes in golden plates.—2. *Aniline* in alcohol forms $C_6H_5Me(C_2H_5)(OH)O(NHPh)$ [185°], crystallising in violet-black needles, and forming a bluish-violet solution in NH_4 aq.—8. *p-Toluidine* yields the corresponding *p*-toluide [165°].

(β)-Oxy-thymoquinone

$C_6H_5Me(C_2H_5)(OH)O_2$ [1:4:3:2:5]. [183°]. Made from di-nitro-carvacrol by reduction and subsequent oxidation with $FeCl_3$ (Mazzara, *B.* 23, 1390). Orange prismatic tables, volatile with steam. Na_2CO_3 aq. forms a violet solution.

Di-oxo-thymoquinone $C_6H_5Me(C_2H_5)(OH)_2O_2$ [213°]. Formed by boiling chloro-oxo-thymoquinone with KOH aq. (E. a. L.) and by boiling dimethylamido-thymoquinone with alcohol and H_2SO_4 or KOH (Zincke, *B.* 14, 95). Red needles or prisms, forming a violet solution in alkalis. Phenylene-phenyl-o-diamine, in presence of alcohol and $HOAc$, forms oxythymophenindulone

$C_6H_5 \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} NPh \begin{smallmatrix} \diagdown \\ \diagup \end{smallmatrix} C_6H_5Me(C_2H_5)(OH)O$ as ruby-red crystals [175°] (Kehrmann a. Messinger, *B.* 24, 590).

— BaA' aq.— PbA' —green pp.

Di-acetyl derivative. [31°]. Needles.

Di-benzoyl derivative. [163°].

Reference.—CHLORO-OKY-THYMOQUINONE.

DI-OKY-DITHYMYL-ETHANE $C_{12}H_{20}O_2$ i.e.

$CH_3.CH(C_2H_5).OH$ [185°]. Formed by reducing $CCl_3.CH(C_2H_5).OH$ with zinc-dust and alcohol (Jäger, *C. J.* 31, 262) and also by adding a mixture of chloroform and $SnCl_4$ to a cooled mixture of paraldehyde and thymol (Steiner, *B.* 11, 287). Efflorescent plates (from alcohol).

Di-acetyl derivative. [100°]. Needles.

Di-benzoyl derivative. [191°]. Needles.

Di-ethyl ether $C_2H_5.Ot.O_2$. [72°].

DI-OKY-DITHYMYL-ETHYLENE

$CH_3.C(C_2H_5).OH$ [171°]. Formed, together with the preceding body, by boiling the compound $CCl_3.CH(C_2H_5).OH$ with zinc-dust and alcohol (Jäger, *C. J.* 31, 263). Needles (from $HOAc$). K_2FeCy_4 oxidises it, in alcoholic solution, to $C_{12}H_{20}O_2$ [215°], crystallising in green needles. Alkaline K_2FeCy_4 forms $C_{12}H_{20}O_2$ [215°], which forms dark-red crystals.

DI-OKY-DITHYMYL SULPHIDE

$(C_{10}H_{16}OH)_2S$. [152°]. Formed from thymol and SCl_2 (Tassinari, *G.* 17, 92).

OKY-TOLUAMIDOXIM

[3:6:1] $C_6H_5Me(OH).C(NO_2).NH_2$ [124°]. Formed from the thioamide in alcohol by treatment with hydroxylamine hydrochloride and $NaOH$ aq. (Goldbeck, *B.* 24, 3662). Yellowish plates (from benzene), v. sol. water. Coloured cherry-red by $FeCl_3$ — $BHCl$ [215°].

Acetyl derivative. Plates (from benzene) gives $C_6H_5(OH) \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} C \begin{smallmatrix} \diagdown \\ \diagup \end{smallmatrix} N.O \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} CMe$ [45°] on heating with water in a sealed tube.

Benzoyl derivative

$C_6H_5(OH).C(NO_2)NH_2$ [182°]. Plates, sl. sol. alcohol. Coloured green by $FeCl_3$ in acetone.

Di-benzoyl derivative. [143°].

β-OKY-toluamidoxim

[3:2:1] $C_6H_5Me(OH).C(NO_2).NH_2$ [126-5°]. Formed from the nitrile and hydroxylamine (Paschen, *B.* 24, 3670). Tables, v. sol. alcohol and hot water. Yields a dibenzoyl derivative $C_6H_5Me(OBz).C(NO_2)NH_2$ [164°], whence KOH forms $C_6H_5Me(OH) \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} N.O \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} OPh$ [150°]

OXY-TOLUENE v. CRESOL and BENZYL

ALCOHOL.

Di-oxy-toluene $C_7H_8O_2$, i.e.

$C_7H_7Me(OH)$, [1:2:4]. *Cresorcin*. *Lutorcin*. Mol. w. 124. [104°]. [α , 269°]. Formed from amido-*p*-cresol and from amido-*o*-cresol [161°] by the diazo-reaction (Knecht, A. 215, 92; B. 15, 298; Wallach, B. 15, 2835). Formed also by potash-fusion from the corresponding toluenedisulphonic acid (Nöltting, B. 19, 186) and from bromo-*p*-cresol (Vogt a. Henninger, J. R. 94, 650). Spherical crystalline groups, v. sol. water, alcohol, and ether, sl. sol. benzene and ligroin. $FeCl_3$ colours its solutions blue. NH_3 with damp air turns it brown, green, and finally blue. Bleaching-powder gives a yellow colour. Its solution in $NaOHAq$ is turned brown by air. On heating with chloroform and $NaOHAq$ it gives a rose-red colour. On heating with phthalic anhydride it forms the phthalein $C_{22}H_{16}O_3$, which is a brick-red powder, exhibits green fluorescence in alkaline solution, and yields $C_{22}H_{14}Ac_2O_3$ [260°]. Unlike resorcin, cresorcin gives no colour when the product got by heating with H_2SO_4 and nitro-benzene is diluted and made alkaline.

Di-acetyl derivative $C_7H_8(OAc)_2$, [α , 160°].

Di-oxy-toluene $C_7H_7Me(OH)$, [1:2:6]. [83°-66°]. Made by the diazo-reaction from amido-cresol [124°-128°] (Ullmann, B. 17, 1960). Needles, v. sol. water and alcohol. Coloured red by bleaching powder. With phthalic anhydride it gives a compound analogous to fluorescein. Reduces cold ammoniacal $AgNO_3$.

Is-o-cresin $C_7H_7(OH)_2$, [87°]. (260°). Made by potash-fusion from toluene (γ)-disulphonic acid (Fenhof, A. 164, 131). Needles (containing aq). Sol. water, alcohol, and ether. Tastes sweet. $FeCl_3$ gives a brownish-green colour. Reduces cold ammoniacal $AgNO_3$.

Other di-oxy-toluenes are described as HYDROTOLUQUINONE, ISOHYDROTOLUQUINONE, ORCIN, and METHYL-PYROCATECHIN.

o-OXY-TOLUENE PHOSPHINIC ACID

$C_7H_7CH(OH).P(OH)_2$, [90°]. Formed, together with $(C_7H_7CH(OH))_2P_2O_5$ [165°] by heating benzoic aldehyde with hypophosphorous acid (Ville, C. R. 107, 659; 110, 848). Plates, decomposing at 140° with formation of benzoic aldehyde. Reduces $AgNO_3$.— $Ba(HA)''$, 1 aq: small plates.

Acetyl derivative $CHPh(OAc).P(OH)_2$.

o-OXY-TOLUENE PHOSPHONIC ACID

$C_7H_7CH(OH).PO(OH)_2$, [173°]. Made from benzoic acid by successive treatment with PCl_3 and water (Fossek, M. 7, 34). Hard crusts (from benzene and $HOAc$).— BaA'' .— $Ba(HA)''$.

OXY-TOLUENE, SULFONIC ACID v.

CRESOL SULFONIC ACID.

OXY-o-TOLUIC ACID $C_7H_8O_2$, i.e.

$C_7H_7Me(OH).CO_2H$ [2:3:1]. *Oxy-methylbenzoic acid*. Mol. w. 152. [183°]. Formed by the diazo-reaction from amido-*o*-toluic acid [191°], and by potash-fusion from sulpho-*o*-toluic acid (Jacobsen, B. 16, 1963; 17, 163). Needles, sol. cold water, alcohol, and ether, sl. sol. chloroform. Volatile with steam. $FeCl_3$ gives a brown pp.

Methyl derivative $C_7H_7Me(OMe).CO_2H$, [8°]. Needles, sl. sol. cold water.— OAA' , 2 aq.

o-Tolyl-Formation.—1. By potash-fusion from

$B'HCl$ (leading aldehyde (Tiemann a. Schotten, B. 11, 777)), and from the corresponding

$C_7H_7Me(SO_2NH_2).CO_2H$ (Jacobsen, B. 14, 40).—2. By heating *m*-cresol with CCl_4 and alcohols $NaOH$ (Schall, B. 12, 819).—3. From amido-*o*-toluic acid [α , 165°] by the diazo-reaction (Jacobsen, B. 17, 164).

Properties.—Needles (containing 1 aq), v. sol. hot water, alcohol, and ether, insol. cold chloroform. Not coloured by $FeCl_3$. Yields *m*-cresol on distillation.— OAA' , 2 aq: crystals, v. sol. water.

Methyl derivative $C_7H_7Me(OMe).CO_2H$, [176°]. Needles (from water).

Oxy-o-tolyl acid $C_7H_7Me(OH).CO_2H$ [2:5:1]. [172°]. Formed by potash-fusion from the corresponding $C_7H_7Me(SO_2NH_2).CO_2H$, and also from amido-*o*-toluic acid [196°] by the diazo-reaction (Jacobsen, B. 14, 41; 17, 163). Prisms, sol. alcohol, ether, and hot water, v. sl. sol. chloroform. Volatile with steam. $FeCl_3$ gives a brown pp. The Cu salt forms bluish-green plates.

Oxy-o-tolyl acid $C_7H_7Me(OH).CO_2H$ [2:6:1]. [168°]. S. 143 at 25°. Formed by potash-fusion from bromo-*o*-toluic acid (Jacobsen, B. 16, 1962). Long needles, v. sol. hot water, alcohol, and ether. Volatile with steam. At 200° it yields *m*-cresol. $FeCl_3$ gives a bluish-violet colour.

Oxy-m-tolyl acid $C_7H_7Me(OH).CO_2H$ [3:2:1].

Homosalicylic acid. (*o*)-*Cresotic acid*. [164°].

Formation.—1. By the action of CO_2 on sodium-*o*-cresol (Engelhardt a. Latschinoff, Z. 1869, 623; Kekulé, B. 7, 1006; Ihle, J. pr. [2] 14, 456).—2. By heating *o*-cresol with CCl_4 and $NaOH$ at 100° (Schall, B. 12, 816).—3. By means of potash-fusion from the corresponding $C_7H_7Me(SO_2NH_2).CO_2H$ (Jacobsen, B. 11, 902).—4. From *c*-amido-toluic acid (Jacobsen, B. 14, 2854).

Properties.—Long needles, sl. sol. cold water, v. sol. chloroform. Volatile with steam. $FeCl_3$ gives a violet colour. Poisonous (Dunstan a. Black, Ph. [8] 21, 429).

Methyl derivative $C_7H_7(OMe).CO_2H$, [81°]. Feathery needles.

Methyl ether MeA' . (235°). S.G. 1.1444 (Pinner, B. 23, 2938).

Ethyl ether EtA' . (248°). S.G. 1.1020. With benzamidine it forms $C_7H_7N_4O$ crystallising in yellowish needles, insol. acids and alkalis (Pinner, B. 23, 2939).

Nitrile $C_7H_7(OH).CN$, [88-5°]. Got from its acetyl derivative, which is formed by the action of Ac_2O on the oxim of *o*-toluic aldehyde (Paschen, B. 24, 3669). Tables, v. sol. alcohol.

Oxy-m-tolyl acid $C_7H_7Me(OH).CO_2H$ [3:4:1]. [173°]. *Formation*.—1. By potash-fusion from the corresponding $C_7H_7Me(SO_2NH_2).CO_2H$ (Jacobsen, B. 11, 897; Remsen a. Iles, Am. 1, 87; B. 11, 462; Mahon, Am. 4, 186). From bromo-*m*-toluic acid and from chloro-*m*-toluic acid [210°] (Jacobsen, B. 14, 2851; 18, 1761).—2. By heating *o*-cresol with CCl_4 and $NaOH$; the yield being 46 p.c. (Schall, B. 12, 816).—3. By the diazo-reaction from amido-*m*-toluic acid (Remsen a. Kuhara, Am. 8, 429).—4. By oxidation of the corresponding aldehyde (Tiemann a. Schotten, B. 11, 777).

Properties.—Long needles (containing 1 aq), sol. hot water, alcohol, and ether, insol. cold chloroform. Gives no colour with $FeCl_3$. Yields *o*-cresol when heated with $HClAq$ at 180°. Gives a nitro-compound [85°].

Salts.—CaA', 3aq: minute needles.—BaA', 3aq.—CuA', 1aq: blue flocculent pp.

Methyl derivative $C_6H_5Me(OMe).CO_2H$ [193°]. Minute needles. Got by saponifying $C_6H_5Me(OMe).CO_2Me$ [87°] (Schall). The amide $C_6H_5Me(OMe).CONH_2$ [144°] is prepared from $C_6H_5Me(OMe)$ [1:2], $ClCONH_2$, and $AlCl_3$ (Gattermann, A. 244, 64).

Ethyl derivative $C_6H_5Me(OEt).CO_2H$ [199°]. Obtained by saponification of the amide $C_6H_5Me(OEt).CONH_2$ [167°] which is got from $C_6H_5Me(OEt)$ and $ClCONH_2$ (G.).—CaA', 2aq (Brown, Am. 4, 375).

o-Oxy-m-toluic acid
 $C_6H_4Me(OH).CO_2H$ [3:5:1]. [208°]. Formed from m-toluic acid by sulphonation followed by potash-fusion, the resulting acid being freed from its isomeride by steam distillation (Jacobsen, B. 14, 2857). Formed also by the action of baryta-water on $C_6H_4O_3$ [90°], which is obtained from acetyl-pyruvic ether and NaOHaq (Claisen, B. 22, 6271). Needles or prisms, v. sol. hot water, not volatile with steam.—CaA', 2aq: prisms.—SrA', 2aq.

Methyl ether MeA'. [93°]. Needles.
Oxy-m-toluic acid
 $C_6H_4Me(OH).CO_2H$ [3:5:1]. **p-Homosalicylic acid.**
(a) **O-cresotic acid.** [161°].

Formation.—1. By passing CO_2 over p-cresol in which sodium has been dissolved (Engelhardt a. Lataphinoff, Z. 1869, 622, 712; Kolbe a. Laetemann, A. 115, 203; Ihle, J. pr. [2] 14, 455). 2. By heating p-cresol with CCl_4 and NaOH (Schall, B. 12, 816).—3. By potash-fusion from chloro-m-xylene sulphonic acid (Voigt, Z. [2] 5, 577; B. 2, 284), from m-xylene sulphonic acid (E. a. L.), from (1,3,4)-xylenol or its (β)-sulphonic acid, from bromo-m-toluic acid, and from sulpho-m-toluic acid (Jacobsen, B. 11, 374; 14, 2352; Staedel a. Holz, B. 18, 2919).—4. By oxidation of the corresponding aldehyde (Tiemann a. Schotten, B. 11, 778).—5. From amido-toluic acid [172°] by the diazo-reaction (Panasotovic, J. pr. [2] 33, 64).

Properties.—Colourless trimetric prisms (from water), al. sol. water, v. sol. alcohol, ether, and chloroform. Volatile with steam. Its aqueous solution is turned violet by $FeCl_3$. Conc. HClaq at 180° yields p-cresol $POCl_3$, forming various dehydration-products (Schiff, A. 245, 43). Distillation with Ac_2O yields C_6H_5O , [148°] (Kostanecki, B. 18, 1988).

Salt.—BaA', 2aq: leaflets.
Methyl ether MeA'. (242°). S.G. 1.1438. Liquid (Pinner, B. 23, 2938).

Ethyl ether EtA'. (261°). S.G. 1.1037. Reacts with benzamidine, forming $C_6H_5N_2O$ crystallising in yellowish needles (P.).

Amide $C_6H_4Me(OH).CONH_2$ [178°]. Got from the acid by treatment with $POCl_3$ at 60° followed by alcoholic NH_3 at 160° (Schiff, G. 17, 559; A. 245, 43), and from the ether and NH_3 (Goldbeck, B. 24, 3659). Needles (from alcohol). P_2O_5 forms $C_6H_4(OH).OS.NH_2$ [127°].

Anilide $C_6H_4(OH).CONHPh$ [58°]. Plates.
Nitrile $C_6H_4(OH).CN$. V. sol. alcohol. Its acetyl derivative [57°] is got by the action of Ac_2O on the oxim of toluic aldehyde.

Methyl derivative $C_6H_4Me(OMe).CO_2H$ [70°] (L.); [67°] (Schall, B. 22, 749). Long needles.—AgA'.

Amide of the methyl derivative $C_6H_4Me(OMe).CONH_2$ [163°]. Made from $C_6H_4Me(OMe)$ and $ClCONH_2$ in presence of $AlCl_3$ (Gattermann, A. 244, 66). Needles (from hot aq.).

Nitrile of the methyl derivative $C_6H_4Me(OMe).CN$. [270° uncor.]. Made by warming diazotised amido-p-cresol with $CuOy$ (Limpach, B. 22, 851). Oil.

Amide of the ethyl derivative $C_6H_4Me(OEt).CONH_2$ [152°]. Made from $C_6H_4Me(OEt)$, $ClCONH_2$, and $AlCl_3$ (G.). Silky needles (from dilute alcohol).

Oxy-p-toluic acid $C_6H_4Me(OH).CO_2H$ [4:2:1]. (γ) **Cresotic acid. m-Homosalicylic acid.** [177° cor.]. **Formation.**—1. By passing CO_2 into m-cresol in which sodium has been dissolved (E. a. L.; Biedermann a. Pike, B. 6, 823).—2. By oxidation of the corresponding aldehyde (Tiemann a. Schotten, B. 11, 777).—3. By heating m-cresol with CCl_4 and NaOHaq (Schall, B. 12, 816).—3. By potash-fusion from p-xylenol (Jacobsen, B. 11, 570).

Properties.—Needles (from water) or monoclinic prisms (from alcohol), m. sol. hot water, v. sol. alcohol and chloroform. Volatile with steam. $FeCl_3$ gives a red colour. HClaq at 170° yields m-cresol.

Salts.—CaA', 3aq.—BaA', 3aq: prisms.
Methyl ether MeA'. (243°). S.G. 1.1395 (Pinner, B. 23, 2938).

Ethyl ether EtA'. (254°). S.G. 1.10978. Converted by benzamidine into $C_6H_5N_2O$ crystallising in needles [235°].

Methyl derivative $C_6H_4Me(OMe).CO_2H$ [104°]. Leaflets, sq. hot water (Schall).

Ethyl derivative $C_6H_4Me(OEt).CO_2H$ [109°]. Got by oxidising the ethyl derivative of thymol (Paterno, J. 1879, 519).

Oxy-p-toluic acid $C_6H_4Me(OH).CO_2H$ [4:3:1]. [207° cor.].

Formation.—1. By potash-fusion from sulpho-p-toluic acid or its mono-amide (Flesh, B. 6, 481; Remsen a. Hall, Am. 2, 54; Weinreich, B. 20, 981), and from chloro- or bromo-p-toluic acid (Gerichten, B. 11, 868).—2. From nitro-toluic acid [190°] by reduction, followed by the diazo-reaction (Fittica, B. 7, 927).

Properties.—Needles; sol. hot water, alcohol, and ether, insol. chloroform. Volatile with steam. Not coloured by $FeCl_3$. Gives o-cresol on distillation with lime.

Salts.—CaA', 4aq.—PbA', 2aq: needles.
Ethyl ether EtA'. [75°]. Prisms.

Methyl derivative $C_6H_4Me(OMe).CO_2H$ [156°]. Needles (by sublimation).—BaA', 4aq.

o-Oxy-p-toluic acid $CH_3(CH_2)_3CO_2H$ [118°]. Made by dissolving phthalide in boiling NaOHaq (Hessert, B. 10, 1446; 11, 237). Powder, v. sol. cold water, v. sol. alcohol and ether. Changes on fusion, and on boiling with water, into its anhydride.—BaA',—AgA': octahedra.

• **Anhydride** v. **Phthalide**.

o-Oxy-p-toluic acid $CH_3(OH).C_6H_4.CO_2H$.

Oxymethyl-toluic acid. [181°]. Formed, together with terephthalic acid and $C_6H_4(CH_2OH)_2$, by boiling terephthalic aldehyde with NaOHaq (Low, A. 281, 378). Formed also by boiling $CH_3Br.C_6H_4.CO_2H$ with baryta-water (Kekulé a. Dittmar, A. 162, 842). Plates or needles, v. sol. water and ether. Not reddened or resinified by H_2SO_4 —AgA'.

Di-oxy-o-toluic acid $C_7H_5Me(OH)_2CO_2H$ [2:5:3:1]. *Cresorsellinic acid*. Mol. w. 168. [145°]. S. 86 at 0°. Formed by fusing di-sulpho-o-toluic acid with potash (Jacobsen, B. 16, 1960). Long needles, v. sol. alcohol and boiling water. $FeCl_3$ gives a brownish-black colour. Reduces alkaline Ag and Cu solutions. Conc. H_2SO_4 gives a bright-red colour on heating.— NH_4A' 2aq: prisms.

Di-oxy-toluic acid. Methyl derivative $C_7H_5Me(OMe)(OH).CO_2H$ [1:3:4:5]. *Créosol-carboxylic acid*. [182°]. Obtained by the action of CO_2 upon sodium cresol (Wefide, B. 19, 2324). Concentric needles. Sublimable. V. sol. alcohol, ether, and chloroform, al. sol. water, nearly insol. benzene. Gives a blue colouration with $FeCl_3$.

Salts.— NH_4A' : needles.— KA' : small readily soluble needles.— BaA' : small needles.— PbA' : white pp.— CuA' : yellow powder.

Methyl ether MeA': [92°]; small colourless trimetric crystals, $a:b:c = 0.5285:1.0:0.7334$. Gives bluish-green colour with $FeCl_3$.

Ethyl ether EtA': [77°]; small needles.

Di-oxy-*o*-toluic acid $C_7H_5Me(OH)_2CO_2H$ [1:2:4:3or5]. *Cresorcin carboxylic acid*. [206°]. Made by boiling cresorcin (di-oxy-toluene) (1 pt.) with $NaHCO_3$ (4 pts.) and water (8 pts.) (Kostanecki, B. 12, 3203). Prisms (containing aq.) v. e. sol. water.— KA' 2aq: prisms, v. sol. water.

Di-oxy-*p*-toluic acid $C_7H_5Me(OH)_2CO_2H$ [4:5:3:1a]. [176°]. Formed by heating disulpho-*p*-toluic acid with KOH (Weinreich, B. 20, 981). Needles, v. sol. water, alcohol, and ether.

Di-oxy-toluic acid $C_7H_5Me(OH)_2CO_2H$. *Hydrotoluquinone carboxylic acid*. [206°–210°]. S. 07 at 8°. Formed by heating hydrotoluquinone with $KHCO_3$ and conc. K_2SO_4 aq at 160° (Brunner, M. 2, 458). Trimetric plates (from alcohol) or indistinct crystals (containing $\frac{1}{2}$ aq) (from water), m. sol. hot water and alcohol. $FeCl_3$ gives a blue colour. Reduces ammoniacal $AgNO_3$ in the cold. Yields hydrotoluquinone on fusing. Conc. H_2SO_4 at 160° yields tetra-oxy-di-methyl-anthraquinone, a dark-red powder.— CaA' 2aq.— BaA' 2aq.— PbA' 2aq: crystalline. **Ethyl ether EtA'**: [93°]. Needles.

Di-oxy-*p*-toluic acid $C_7H_5Me(OH)_2CO_2H$. *Orsellinic acid. Orsellinic acid. Orsellinic acid*. [176°]. S. (ether) 22 at 20°. Formed by boiling lecanoric acid or erythrin with lime water, baryta-water, or $NaOHAq$ (Stenhouse, P.M. [3] 82, 800; Pr. 12, 263; A. 68, 61; Hesse, A. 117, 812; 139, 35). Prisms (containing aq.) v. e. sol. alcohol; sol. water. Splits up on fusion, or on boiling with water, into CO_2 and orcin. $FeCl_3$ gives a purple colour. Bromine gives tri-bromo-orcin. $POCl_3$ acting on the anhydrous acid at 90° forms a blue liquid which, when poured into water, ppts. $C_{12}H_8P_3O_{11}$, a blue substance with coppery lustre resembling indigo. The solutions of this 'phosphorsellinic acid' in water and alcohol are intensely blue, and it is pptd. from aqueous solution by HCl , by H_2SO_4 , and by $NaCl$. Phosphorsellinic acid forms $C_{12}H_8Pb_3P_3O_{11}$ and $C_{12}H_8Pb_3P_3O_{11}$, an anilide $C_{12}H_8(NHPh)_3P_3O_{11}$, which gives $C_{12}H_8Pb_3(NHPh)_3P_3O_{11}$, and an acetyl derivative $C_{12}H_8Ac_3P_3O_{11}$ as a dark-violet mass which gives $C_{12}H_8(PbOH)_3Ac_3P_3O_{11}$ (Schiff, A. 228, 56).

Salt.— $Ba(C_7H_5O_4)_2$ 2aq: prisms.

Methyl ether MeA'. Made by boiling

lecanoric acid or erythrin with $MeOH$. Silky needles (from boiling water).

Ethyl ether EtA'. [182°]. Got in like manner (Heeren, Schw. J. 59, 341; Liebig, P. 21, 82; Kane, Tr. 1840, 237, 279; Schunck, A. 41, 260; 81, 72; Rochleder a. Heldt, A. 48, 5; Stenhouse, C. J. 20, 224; Streck, A. 68, 111; Hesse, A. 117, 297). May be prepared by repeatedly exhausting *Roccella tinctoria* with boiling alcohol and evaporating the extract. Thin needles, nearly insol. cold water, v. sol. alcohol and alkalis. Yields $C_7O_4ClMe(OH)_2CO_2Et$ [162°] on chlorination.

Isoamyl ether C_7H_5A' . [76°]. Prisms.

Di-oxy-*o*-toluic acid $C_7H_5Me(OH)_2CO_2H$ [6:4:2:1]. *Paraorsellinic acid*. [172°]. S. 17 in the cold. Formed by heating orcin with a solution of ammonium carbonate, $KHCO_3$, or $NaHCO_3$ (Senhofer a. Brunner, M. 1, 236; Bistrzycki a. Kostanecki, B. 18, 1986), or by heating potassium orcin in a current of CO_2 at 250° (Schwarz, B. 13, 1643). Needles (containing aq.) sl. sol. water, v. sol. alcohol and ether. $FeCl_3$ gives a blue colour. Boiling water decomposes it into CO_2 and orcin. $POCl_3$ followed by water gives $C_7(OH)_5CO_2H$, a chrome-green powder (Schiff, A. 228, 56).— KA' .— BaA' 6aq.— $Ba_2(C_7O_4)_2$ 8aq.— CuA' 4aq.— AgA' : nearly insol. water.

Di-oxy-*m*-toluic acid

$CH_2(OH).C_6H_4(OH).CO_2H$ [3:2:1]. [142°]. Formed by reduction of aldehyde-*o*-oxy-benzoic acid with sodium-amalgam (Reimer, B. 11, 792). Prisms, v. sol. water, alcohol, and ether. $FeCl_3$ gives a violet colour. H_2SO_4 gives a red colour. Boiling $HClAq$ resinifies it.

Di-oxy-*m*-toluic acid

$CH_2(OH).C_6H_4(OH).CO_2H$ [5:2:1]. [above 270°]. Formed by reduction of aldehyde-*p*-oxy-benzoic acid (R.). White powder, sl. sol. water. Not coloured by $FeCl_3$ or by H_2SO_4 .

Di-oxy-*m*-toluic acid

$CH_2(OH).C_6H_4(OH).CO_2H$ [3:6:1]. Made by reducing aldehyde-*o*-oxy-benzoic acid (R.). Prisms (from ether), sl. sol. water, m. sol. alcohol and ether. $FeCl_3$ gives a violet colour. Oxidised by $KMnO_4$ to oxy-isophthalic acid, and by aqueous $K_2Cr_2O_7$ to aldehyde-*oxy*-benzoic acid.

References.—Di-bromo-oxy-toluic acid and Di-iodo-orsellinic acid.

OXY-*o*-TOLUIC ALDEHYDE $C_7H_5O_2$ i.e. $C_6H_4Me(OH)CHO$ [2:4:1]. [110°]. Prepared, together with the (4,2,1)-isomeride, by heating *m*-cresol with chloroform and $NaOHAq$ (Tiemann a. Schotten, B. 11, 773). Flat leaflets (from water), not volatile with steam. $FeCl_3$ gives a red colour.

Phenyl hydrasides

$C_7H_5Me(OH).CH.NHPh$. [161°] (Pascchen, B. 24, 3871).

Oxy-*m*-toluic aldehyde $C_7H_5Me(OH).CHO$ [3:4:1]. [115°]. Formed, together with the (6,2,1)-isomeride, by the action of chloroform and potash on *o*-cresol (Tiemann a. Schotten, B. 11, 772). Long prisms (from water), not volatile with steam. $FeCl_3$ gives a bluish-violet colour. Yields a nitro-derivative [182°].

Acetyl derivative $C_7H_5(OAc).CHO$. [40°]. [275°]. Needles (Staats, B. 18, 138; Barpiere, B. [2] 33, 52; C. R. 90, 87).

Oxy-*m*-toluic aldehyde $C_7H_5Me(OH).CHO$ [3:2:1]. [17°]. [209°]. Formed as above (T. a. S.).

Crystals, volatile with steam. FeCl₃ gives a bluish colour. Forms a yellow solution in NH₄Aq.

Acetyl derivative C₁₁H₁₀O₂. (267°) (B.).

Oxim. [99°] (Paschen, B. 24, 3668).

Phenyl hydrazide. [95°]. Tables.

Oxy-m-toluic aldehyde C₈H₇Me(OH).CHO [8:6:1]. [56°]. (218°). Formed by the action of CHCl₃ and KOH on *p*-cresol (T. a. S.). White leaflets. FeCl₃ gives a green colour. Yields a nitro-derivative [141°].

Acetyl derivative C₈H₇Me(OAc).CHO. [57°]. Long needles. Made by the action of Ac₂O on the ethereal solution of the K salt. Combines with NaHSO₃. With Ac₂O it unites in the cold, forming C₈H₇Me(OAc).CH(OAc)₂, which crystallises in prisms [94°] and does not combine with NaHSO₃.

Methyl derivative C₈H₇Me(OMe).CHO. (254°). Colourless liquid.

Oxim C₈H₇Me(OH).CH.NOH. [105°]. Needles (Goldbeck, B. 24, 3658).

Oxy-p-toluic aldehyde C₈H₇Me(OH).CHO [4:2:1]. [54°]. (223°). Made, together with the (2,4,1)-isomeride, by the action of chloroform and potash on *m*-cresol (T. a. S.). Crystals, volatile with steam. FeCl₃ gives a violet colour.

Di-oxy-o-toluic aldehyde C₈H₆Me(OH)₂.CHO [6:4:2:1]. **Orcyl aldehyde.** [178°]. Formed by heating orcin with chloroform and potash (Tiemann a. Helkenberg, B. 12, 949), and also by potash-fusion from methyl-umbelliferone (Pechmann a. Welsh, B. 17, 1646). Needles, sol. alcohol and hot water. FeCl₃ gives a reddish-brown colour. Aniline forms the compound C₈H₆Me(OH).CH.NPh [126°], crystallising in yellow prisms.

Di-oxy-m-toluic aldehyde. **Methyl derivative** C₈H₇Me(OH)(OMe).CHO [5:2:3:1]. (270°-275°). Formed by the action of chloroform and NaOHAq upon cresol (Tiemann a. Koppe, B. 14, 2026). Oil, sol. alcohol. FeCl₃ colours its alcoholic solution green.

OXY-TOLUQUINE v. AMIDO-CRESOL.

OXY-TOLUQUINOLINE v. OXY-METHYL-QUINOLINE.

DI-OXY-TOLUQUINONE C₈H₆Me(OH)₂O₂. [177°]. Made by digesting oxy-phenylamido-toluquinone anilide with dilute KOHAq (Hagen a. Zinke, B. 16, 1562). Brownish-yellow plates, v. sol. most solvents. May be sublimed.

Tri-oxy-toluquinone C₈Me(OH)₃O₃. Formed from tri-amido-orcin by treatment with FeCl₃, the resulting amido-dimido-orcin being heated with HClAq at 150° (Merz a. Zetter, B. 12, 2014). Dark crystals, nearly insol. cold alcohol. Yields a crystalline tri-acetyl derivative.

Reference.—DI-BROMO- and DI-CHLORO- OXY-TOLUQUINONE.

OXY-TOLUQUINOXALINE

[14] C₈H₆Me < $\begin{smallmatrix} \text{N}:\text{CO}:\text{H} \\ \text{N}:\text{CH} \end{smallmatrix}$ • [267°]. Formed by oxidation of its dihydride [a. 127°], which is got by condensing tolylene-diamine with chloroacetic ether (Hinsberg, B. 18, 2870; A. 248, 76), or by reducing nitro-tolyl-amidoacetic acid (Pfechl, B. 19, 6). Yields a methyl derivative [71°], and an ethyl derivative [67°].

Isomeride v. OXY-METHYL-QUINOXALINE.

Di-oxy-toluquinoxaline C₈H₆Me < $\begin{smallmatrix} \text{N}:\text{CO}:\text{OH} \\ \text{N}:\text{CO}:\text{OH} \end{smallmatrix}$ [above 800°]. Formed by heating tolylene-d-

diamine with oxalic acid at 150° (Hinsberg, B. 15, 2690; A. 237, 348) by reducing nitro-tolyl-oxalic acid, and by heating tolylene-diamine dicyanide with HClAq at 150° (Bladin, B. 18, 670). Needles.—NaHA'.—Ag₂A'.—H₂A' HOAc. Plates.

DI-OXY-DITOLYL

[3:4:1] C₈H₇Me(OH).C₈H₇Me(OH) [1:3:4]. ***o*-Di-cresol.** [157°] (H.); [161°] (G.). Made from di-amido-ditolyl by the diazo-reaction (Gerber, B. 21, 749; Hobbs, B. 21, 1067). Needles, sl. sol. hot water, v. sol. alcohol and ether. Yields a di-nitro-derivative [273°].

Di-acetyl derivative C₁₁H₁₀(OAc)₂. [181°].

Di-benzoyl derivative [185°]. Needles.

Di-ethyl ether C₁₁H₁₂(OEt)₂. [156°]. Made, together with ditolyl, by the action of alcohol on di-amido-ditolyl (Schultz, B. 17, 468). White plates, sol. hot alcohol.

Di-propyl ether. [115°]. Leaflets.

Di-isoamyl ether. [69°].

Tetra-oxy-ditolyl C₈H₆O₄, i.e.

[1:2:5:6] C₈H₆Me(OH)₄. C₈H₆Me(OH)₃:1:2:5. [202° uncor.]. Formed by oxidising hydrotolu-quinone, dissolved in HOAc with MnO₂ and H₂SO₄ in the cold (Brunner, M. 10, 174). FeCl₃ oxidises it to the quinhydrone C₈H₆O₂, crystallising in violet scales [220° uncor.], and finally to the quinone C₁₀H₆O₄ [163°], crystallising in yellow prisms.

Tetra-acetyl derivative

C₁₁H₁₀(OAc)₄. [135°]. Made by heating with NaOAc and Ac₂O at 160°. Needles.

Anhydride C₁₁H₈Me(OH)₂O₂. [232°]. Got by heating C₁₁H₈Me(OMe)₂O₂ with HClAq at 180° (Nietzki, B. 11, 1281). Colourless plates (containing aq) (from dilute alcohol).

Di-methyl ether C₁₁H₁₂Me₂(OMe)₂(OH)₂. [173°]. Formed by partial methylation. Colourless needles, quickly oxidised in alcoholic solution by air. Yields a di-acetyl derivative C₁₁H₁₀(Me(OMe)OAc)₂ [6:1:2:5], crystallising in needles [123°] (Noelting a. Werner, B. 23, 8248).

Dehydride of the di-methyl ether

C₁₁H₈O₂, i.e. C₁₁H₈Me₂(OMe)₂O₂. [158°]. Formed by oxidation of the di-methyl ether of hydrotolu-quinone by chromic acid mixture (Nietzki, A. 215, 161). Dark-red needles (from alcohol).

Tetra-methyl ether C₁₁H₁₆(OMe)₄. [129°].

Di-ethyl ether C₁₁H₁₄(OEt)₂(OH)₂. [188°]. Formed by the action of alcoholic ammonium sulphide on the dehydride (or quinone) C₁₁H₈(OEt)₂O₂, which crystallises in green-black needles [139°], and is made by oxidising C₁₁H₈Me(OMe)₂ with chromic acid mixture (Noelting, B. 23, 3217; Bl. [3] 4, 805). White needles.

***o*-OXY-m-TOLYL-ACETIC ACID** C₈H₇O₃, i.e.

[1:3] C₈H₇Me.CH(OH).CO₂H. ***m*-Methyl-mandelic acid.** [84°]. Formed from *m*-toluic aldehyde, KCr, and HCl (Bornemann, B. 17, 1469). Small plates (from benzene), v. sol. water.

***o*-Oxy-p-tolyl-acetic acid**

[1:4] C₈H₇Me.CH(OH).CO₂H. [146°]. Made by reduction of *p*-tolyl-glyoxylic acid by zinc-dust and ammonia (Claus a. Krosenberg, B. 20, 2050). Tables (from water).—NaA'.—KA' aq.—CaA'.—BaA'. aq.

Ethyl ether EtA'. [77°]. Needles.

***o*-OXYTOLYL-ALLYL-THIO-UREA**

[1:2] C₈H₇(CH₂OH).NH.CO.NH.C₂H₅. Formed from *o*-amido-benzyl alcohol and allyl

OXY-DI-p-TOLYL-PYRAZINE.

Tetrahydride $C_8H_8Me_2N \begin{smallmatrix} <CH_2CH_2> \\ <CH_2CO> \end{smallmatrix} N.C_8H_8Me_2$. *'Ditolylmonocacipiperazine.'* [1885]. Made from *p*-toluidine by successive treatment with ethylene bromide and a mixture of chloro-acetic acid and NaOAc (Bischoff, B. 22, 1785; 28, 2035). Crystals, v. sol. water and ether.

Di-oxy-di-o-tolyl-pyrazine. Dihydride $C_8H_8Me_2N \begin{smallmatrix} <CH_2CH_2> \\ <COCO> \end{smallmatrix} N.C_8H_8Me_2$. *Ditolyl-di-acipiperazine.* [1885]. Formed from di-o-tolyl-ethylene-diamine and oxalic acid at 200° (Bischoff, B. 22, 1805; 28, 2034).

Dioxy-di-p-tolyl-pyrazine dihydride. [2635]. Made by dissolving oxy-di-*p*-tolyl-pyrazine tetrahydride in HOAc and oxidising with nitrous or chromic acid (B.). Colourless plates, v. sol. aniline and alcohol, sl. sol. ether and hot water. Alcoholic potash yields di-tolyl-ethylene-diamine [97°] and oxalic acid.

Di-oxy-s-di-o-tolyl-pyrazine. Dihydride $C_8H_8Me_2N \begin{smallmatrix} <CH_2CH_2> \\ <COCO> \end{smallmatrix} N.C_8H_8Me_2$. [160°].

Formed by heating *o*-tolyl-amido-acetic acid at 220° (Bischoff a. Nastvogel, B. 22, 1787) and by the action of potash on the product of the action of chloro-acetyl chloride on *o*-toluidine (Widman, J. pr. [3] 88, 299, 305). Rectangular plates (from alcohol), insol. water, sol. conc. HClAq.

Reactions.—1. PCl forms the compound $C_8H_8N \begin{smallmatrix} <COCO> \\ <CClCO> \end{smallmatrix} N.C_8H_8$, crystallising from alcohol in white needles [201°].—2. *Alcoholic potash* forms $C_8H_8N(CH_2CH_2CO_2H).CO_2H.NH.C_8H_8$, a white crystalline solid [129°] decomposed by conc. HClAq at 160° into MeCl, *o*-toluidine, and $C_8H_8NH.CH_2.CO_2H$.

Salt.— $(C_8H_8N_2O_2).H_2PtCl_4$ aq. [176°]. **Di-oxy-di-p-tolyl-pyrazine. Dihydride.** [258°]. Formed from oxalic acid and *p*-tolyl-amido-acetic *p*-toluide (B. a. N.). Made also by boiling the bromo-acetyl derivative of *p*-toluidine with alcoholic potash, or by heating *p*-tolyl-amido-acetic acid at 200° (Abenius, J. pr. [2] 40, 433). Long white needles, insol. water, m. sol. alcohol.

Di-oxy-op-di-tolyl-pyrazine. Dihydride

$[1.2]C_8H_8Me_2N \begin{smallmatrix} <CH_2CH_2> \\ <CH_2C(OH)> \end{smallmatrix} N.C_8H_8Me_2$ [1.4].

[180°]. Made by heating *p*-toluidine with the chloro-acetyl derivative of *o*-tolyl-amido-acetic acid at 140° (Abenius, J. pr. [3] 40, 443). White matted needles, v. sol. hot alcohol, insol. ether.

Tetra-oxy-*m*-phenyl-pyrazine. Dihydride of the di-ethyl derivative

$[1.4]C_8H_8(OEt)_2N \begin{smallmatrix} <CH_2CO> \\ <COCH_2> \end{smallmatrix} N.C_8H_8(OEt)_2$ [4:1]. [265°]. Slender needles.

OXY-p-TOLYL-QUINAZOLINE $C_{11}H_{11}N_2O$ i.e. $C_8H_8 \begin{smallmatrix} <N:CH> \\ <COO.N.C_8H_8Me> \end{smallmatrix}$. [146°]. Made by oxidising *p*-tolyl-quinazoline dihydride with KMnO₄ (Ladl a. Busch, B. 22, 2698). Plates (from dilute alcohol) or needles (from ether), sl. sol. hot water. Does not react with hydroxylamine or phenyl-hydrazine.—B'HCl [214°]. Needles.—B'H₂PtCl₄ [above 300°]. Golden plates, sol. alcoholic HCl.

OXY-(Py. 3)-TOLYL-QUINOLINE $C_{11}H_{11}NO$ i.e. $C_8H_8 \begin{smallmatrix} <CH_2OH> \\ <N.C_8H_8Me(OH)> \end{smallmatrix}$. *Flavonol.*

[196°]. Got by the diazo-reaction from (4,3,1)-amido-tolyl-quinoline (Weid a. Bamberger, M. 9, 104). Small plates (from alcohol). Yields (Py. 3)-tolyl-quinoline on distillation with zinc-dust. Reduction followed by potash-fusion yields oxy-isophthalic acid.—B'HCl aq.—B'H₂PtCl₄ (dried at 105°). Yellow needles.

Acetyl derivatives $C_{11}H_{11}NO_2$. [106°]. **Di-oxy-tolyl-quinoline** $C_{11}H_{11}NO_2$. [89°]. Formed, as well as oxy-tolyl-quinoline, by the above method of preparation. Plates (from alcohol), sol. benzene.

DI-OXY-DI-o-TOLYL SULPHIDE $C_{11}H_{11}SO_2$ i.e. $S(C_8H_8Me(OH)(2:1:3))$. *Dioxythiolone.* [185°]. Formed from di-amido-di-tolyl sulphide by the diazo-reaction (Truhlar, B. 20, 676). Amorphous, sl. sol. water, alcohol, and ether.

Di-oxy-di-tolyl sulphide. [210°–215°]. Formed from *m*-cresol by treatment with SO₂ in CS₂ (Tassinari, G. 17, 92; C. C. 1888, 1854). Yields an acetyl derivative [44°], which forms, on oxidation, the corresponding sulphone [263°], which on saponification gives SO₂(C₈H₈OH₂) [133°].

Di-oxy-di-tolyl sulphide. [118°]. Formed from *p*-cresol and SO₂. Yields an acetyl derivative [84°] which is oxidised by KMnO₄ to a sulphone [209°], which on saponification gives SO₂(C₈H₈OH₂) [209°] (Tassinari, Rend. Accad. Linc. [4] 4, 47).

OXY-o-TOLYL-THIO-UREA $C_8H_8N_2SO$ i.e. $C_8H_8Me.NH.OS.NH.OH$. [92°]. Formed from *o*-tolyl-thiocarbimide and hydroxylamine in chloroform solution (Tiemann, B. 22, 1939; Voltmer, B. 24, 381). Slender needles, almost insol. chloroform and water, sl. alcohol, ether, and KOHAq. FeCl₃ colours its alcoholic solution violet. Yields *o*-tolyl-cyanamide on long standing.

Benzylether $C_8H_8Me.NH.OS.NH.OCH_2Ph$. [125°]. Made from benzyl-hydroxylamine and *o*-tolyl-thiocarbimide.

OXY-o-TOLYL-UREA $C_8H_8N_2O$ i.e. $CH_2(OH).C_8H_8.NH.CO.NH_2$. [c. 180°]. Formed from amido-benzyl alcohol, potassium cyanate, and HCl (Söderbaum a. Widman, B. 22, 1668). Tables or prisms, m. sol. boiling water, v. sl. sol. alcohol. Decomposes on fusion, yielding di-oxy-di-tolyl-urea CO(NH.C₈H₈CH₂OH)₂ [108°], which crystallises in needles.

OXYTROPINE $C_{11}H_{11}NO_2$. [242°]. A base occurring in crude belladonna (Merling, B. 17, 884; Ledenburg, B. 17, 153). Crystalline.—B'H₂PtCl₄ aq.; red prisms.

OXY-TRUXILLIC ACID

$(C_8H_8(OH).CH_2CH.CO_2H)_2$. [273°]. Formed by potash-fusion from (*c*)-sulpho-truxillic acid (Liebermann a. Bergami, B. 22, 788). Prisms, m. sol. cold water. Probably a polymeride of *p*-coumaric acid. An isomeric acid, formed from the amido-acid by the diazo-reaction, does not melt at 360°. It yields an acetyl derivative [244°] (Homans, B. 24, 2591).

OXY-URAMIDO-BENZOIC ACID. Methyl derivatives $NH.CO.NH.C_8H_8(OMe).CO_2H$. *Anisuramic acid.* S. 05 at 100°. Formed from potassium cyanate and a solution of the hydrochloride of amido-anisic acid (Menschutkin, A. 158, 99). Needles (from water).—CaH₂ aq.

OXY-UREA $NH.CO.NH.OH$. [180°]. Formed from aqueous hydroxylamine nitrate and potash

sium cyanate in the cold (Dressler a. Stein, *Z.* [2] 5, 202). Needles (from alcohol) v. e. sol. Aq. Decomposed by heating, yielding urea. Reduces AgNO_3 . FeCl_3 gives a blue-violet colour. — $\text{KH}(\text{CH}_2\text{N}_2\text{O}_2)$: crystalline pp., got by adding alcoholic potash to the alcoholic solution (Hodges, *A.* 182, 214). — $(\text{Pb}_2\text{H}(\text{OAc})_2)(\text{CH}_2\text{N}_2\text{O}_2)_2$: crystals. — $(\text{CuCH}_2\text{N}_2\text{O}_2)_2\text{HOAc}$: green mass.

Benzyl ether $\text{NH}_2\text{CO.NH.OCH}_2\text{Ph}$. [138°]. Formed from α -benzyl hydroxylamine hydrochloride and potassium cyanate (Behrend a. Leuchs, *A.* 257, 203). Needles.

Oxy-biuret $\text{C}_4\text{H}_4\text{N}_4\text{O}_4$. [134°]. Formed from conc. hydroxylamine sulphate and potassium cyanate, the mixture being evaporated with alcohol. Minute four-sided prisms, sol. water and alcohol. Gives a white pp. with AgNO_3 . Reduces warm ammoniacal AgNO_3 . FeCl_3 gives no colour. — $\text{KC}_4\text{H}_4\text{N}_4\text{O}_4$: minute needles.

(α)-OXY-UVITIC ACID $\text{C}_6\text{H}_4\text{O}_5$, i.e. $\text{C}_6\text{H}_4\text{Me}(\text{OH})(\text{CO}_2\text{H})$. [1:2:3:5]. *Cresol dicarboxylic acid*. [285°] (B.); [295°] (H. a. R.); [278°] (J.). Formed from α -amido-uvitic acid by the diazo-reaction (Böttiger, *B.* 9, 304; 13, 1934; *A.* 189, 177) and by potash-fusion from sulpho-uvitic acid (Jacobsen, *A.* 206, 187; Hall a. Romsen, *Am.* 2, 137). Needles (from alcohol), v. sol. alcohol, insol. chloroform. Decomposes on fusion. Conv. HClAq at 200° yields α -cresol. FeCl_3 gives a purple colour. — $\text{Ca}(\text{HA})_2$, 2aq. — CaA' , 2aq. — CaA'' , 4aq. — $\text{Ca}_2(\text{C}_6\text{H}_4\text{O}_5)_2$ — AgA' .

Methyl ether MeA' . [128°]. Needles.

Mono-ethyl ether EtHA' aq. Needles.

(β)-Oxy-uvitic acid

$\text{C}_6\text{H}_4\text{Me}(\text{OH})(\text{CO}_2\text{H})$. [1:4:3:5]. [225°–235°] (J.); [220°] (B.). S. 13 at 12°; 5:2 at 100° (J.). Formed by the action of nitrous acid on (β)-amido-uvitic acid (Böttiger). Formed also by potash-fusion from *s*-mesitol $\text{C}_6\text{H}_4\text{Me}_3\text{OH}$ and from oxy-mesitylenic acid (Jacobsen, *A.* 195, 286). Needles (from water), v. sol. alcohol and ether. FeCl_3 gives a red colour. HClAq at 200° forms *p*-cresol (J.). — AgA' : prisms.

Methyl ether MeA'' . [79°]. Needles.

Oxy-uvitic acid $\text{C}_6\text{H}_4\text{Me}(\text{OH})(\text{CO}_2\text{H})$, [1:3:4:6]. Got by saponification of its ether

which is formed from sodium acetoacetic ether by the action, in presence of NaOEt , of chloroform, chloral, trichloro-acetic ether, or CCl_4 , for Penheim a. Effa, *B.* 7, 929; 8, 884; 9, 821; (Opt.) and a. Guthzeit, *A.* 322, 249). Needles, al. Conv. cold water, v. sol. alcohol and ether. FeCl_3 gives a reddish-violet colour. Softens at 290°, gives a red pig. at the same time. Yields *m*-cresol decomposed with lime. PCl_5 forms a mixture on distillation, whence water forms oxyuvitic acid of chlorides. v. crystallising, in needles. — KA' aq. and $\text{C}_6\text{H}_4\text{O}_5$ crystals. — A' , 1aq. — CaA' . — AgA' . — BaA' , 1aq. — CaA'' , MeA'' . [108°]. Plates.

Methyl ether MeA'' . [108°]. Plates.

(α)-OXY-VALERIC ACID $\text{C}_5\text{H}_8\text{O}_4$, i.e.

$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. [31°]. Formed by the action of HClAq on its nitrile, which is the cyanhydrin of α -butyric aldehyde (Menozzi, *G.* 14, 40). Got also by boiling α -bromo-butyric ether with aqueous Na_2CO_3 (Jualia, *B.* 17, 2504). Silky hygroscopic laminae, v. sol. water, alcohol and ether. — BaA' , 1aq. plates. — CaA' . S. 3:6 at 100°. — ZnA' , 2aq. S. 1:01 at 100°. — CdA' . — CuA' . — AgA' : small scales, al. sol. acid water.

Ethyl ether EtA' . (190°). Oil.

α -Oxy-isovaleric acid

$(\text{CH}_3)_2\text{CH}(\text{CH}(\text{OH})\text{CO}_2\text{H})$. [85°].

Formation.—1. By heating bromo-isovaleric acid with Ag_2O and water (Clark a. Fittig, *A.* 189, 159) or with KOH aq (Ley a. Popoff, *A.* 174, 61; Schmidt a. Sachtleben, *A.* 198, 87).—2. By digesting chloro-isovaleric acid with baryta-water (Schlebusch, *A.* 141, 332).—3. From its ether, which is a product of the action of zinc and isopropyl iodide on oxalic ether (Markownikoff, *Z.* 1870, 517).—4. From its nitrile, which is made by combination of HCy with isobutyric aldehyde (Lipp, *A.* 205, 24).

Properties.—Rectangular tables, v. sol. water, alcohol, and ether. No deliquescent. Volatile with steam. Dilut. H_2SO_4 at 140° splits it up into isobutyric aldehyde and formic acid.

Salts.— NaA' . — BaA' . — ZnA' . — CaA' , aq. — CaA' , 1aq. — CaA' , 4aq. — MgA' , 2aq. — CuA' , aq. — AgA' : feathery crystals (from hot water).

Ethyl ether EtA' . (175°). Oil.

Anhydride $\text{C}_5\text{H}_6\text{O}_4$. **Valerolactide**. [126°]. (220°–240°). Made by heating the acid in sealed tubes at 200°. Needles, v. sol. alcohol and ether. Not attacked by dilut. alkaline solutions.

Amide $\text{Pr.CH}(\text{OH}).\text{CONH}_2$. [104°]. Got from the nitrile and HClAq . Crystals.

Nitrile $\text{Pr.CH}(\text{OH}).\text{CN}$. S.G. § 96. Oil, decomposed at 136° into isobutyric aldehyde and HCy .

α -Oxy-valeric acid $\text{CMeEt}(\text{OH}).\text{CO}_2\text{H}$. [68°]

(M.); [66°] (B.).

Formation.—1. By saponification of its ether, which is made by the action of zinc on a mixture of MeI , EtI and oxalic ether (Frankland a. Duppa, *A.* 135, 87).—2. By boiling $\text{CMeEtBr.CO}_2\text{H}$ with baryta-water (Bücking, *A.* 204, 14).—3. From methyl ethyl ketone by combination with HCy and saponification of the resulting nitrile (B.).—4. By oxidation of $\text{CMeEtH.CO}_2\text{H}$ with dilute KMnO_4 (Miller, *A.* 200, 282).

Properties.—Needles (by sublimation), v. e. sol. water, alcohol, and ether. Oxidised to methyl ethyl ketone by chromic acid mixture. Reduced by HI to $\text{CMeEtH.CO}_2\text{H}$. Rotates on water.

Salts.— ZnA' . — AgA' . Nodules.

Ethyl ether EtA' . (165.5°). S.G. 1.2977. V.D. 4.98 (calc. 5.04). Liquid, sol. water.

β -Oxy-isovaleric acid

$(\text{CH}_3)_2\text{C}(\text{OH}).\text{CH}_2\text{CO}_2\text{H}$.

Formation.—1. By oxidation of the alcohol $\text{CMe}_2(\text{C}_2\text{H}_5).\text{OH}$ with cold chromic acid mixture (Saytzeff, *A.* 185, 168; 197, 73), or with KMnO_4 at 0° (Schirokoff, *J. pr.* [2] 23, 206).—2. By the action of zinc on a mixture of acetone and chloro-acetic ether (Reformatsky, *B.* 30, 1310).—3. By oxidation of tri-oxy-hexane by KMnO_4 (Reformatsky, *J. pr.* [2] 40, 404).

Properties.—Syrup, v. sol. water, alcohol, and ether. Not volatile with steam. Reduced by HI to isovaleric acid.

Salts.— CaA' , 12aq. — CuA' . — CuA' , 2aq. — AgA' : monoclinic crystals, al. sol. water.

Ethyl ether EtA' . (180°).

β -Oxy-valeric acid

$\text{CH}_3\text{CH}_2\text{CH}(\text{OH}).\text{CHMe}(\text{CO}_2\text{H})$. Formed by reduction of methyl-acetoacetic ether with sodium amalgam (Bohrbeck, *A.* 188, 229). Syrup, resolved by distillation into water and methyl-crotonic acid [62°]. — NaA' (dried at 100°). [510°] (Miller, *A.*

200, 269). Crystalline powder.—BaA, aq.—AgA: laminae, sl. sol. hot water.

(γ)-Oxy-valeric acid.

$\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. The salts of this acid are made by dissolving the lactone in bases. The free acid quickly changes back to the lactone.

Salts.—The Ba and Ca salts are deliquescent amorphous masses.—AgA': trichlinic needles. Ethyl ether EtA'. Oil.

Lactone $\text{CH}_3\text{CH}(\text{O}-\text{CO})\text{CH}_2\text{CH}_2$. (208° i.v.).

S.G. 2 1-072. Occurs in crude wood-vinegar (Grodski, B. 17, 1369). Prepared by boiling γ-bromo-valeric acid with water (Messerschmidt, A. 208, 96), and by reduction of acetyl-propionic (levulic) acid with sodium-amalgam (Wolff, A. 208, 104). Formed also by heating γ-oxy-propyl-malonic acid (Hjelt, A. 216, 56), and by the action of NaOH aq. on nitroso-oxy-methyl-pyrrole dihydride (Tafel, B. 22, 1864). Liquid, miscible with water. Neutral to litmus. Separated from solution by K_2CO_3 . Reduced by HI and P at 250° to *n*-valeric acid. Oxidised by HNO_3 to succinic acid. Boiling alcoholic NaOEt forms $\text{C}_6\text{H}_8\text{O}_2$ [c. 32°] (Fittig, A. 256, 126). Phenylhydrazine forms $\text{C}_{11}\text{H}_{12}\text{N}_2\text{O}_2$ [76°-79°], crystallising in needles, v. sol. water (W. Wislicenus, B. 20, 402).

Amide $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CONH}_2$ [56°]. Formed by heating the lactone or the ether with NH_3 Ag. Thin plates, v. s. sol. water and alcohol, sl. sol. ether. At 170° it is split up into NH_3 and the lactone (Neugebauer, A. 227, 97).

Di-oxy-valeric acid $\text{CH}_3\text{CH}(\text{OH})\text{CMe}(\text{OH})\text{CO}_2\text{H}$. Di-methyl-glycolic acid. [107°]. Formed by the action of water at 99° on di-methyl-glycidic acid

$\text{CMe}(\text{CO}_2\text{H})_2$ [82°], which is formed from tiglic acid $\text{CH}_3\text{CH}(\text{OH})\text{CMe}(\text{CO}_2\text{H})$ by successive treatment with HOCl and boiling KOH aq. (Mellikoff, A. 264, 238; Bl. [2] 47, 166).—KA'.—AgA'.

Tetra-oxy-valeric acid $\text{C}_6\text{H}_{10}\text{O}_8$ i.e. $\text{CH}_3(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$. Arabinic acid. $[\alpha]_D^{20} = -67^\circ$. Formed by allowing arabinose (10 g.), water (75 g.), and Br (20 g.) to stand for 36 hours (Baues, J. pr. [2] 30, 379; 34, 46; Kiliani, B. 19, 3031; 20, 344). Hygroscopic crystalline mass.—CaA', aq.—SrA', aq.: prisms.

References.—BROMO- and CHLORO-OXY-VALERIC ACID.

TETRA-OXY-VALERIC ALDEHYDE

$\text{CH}_3(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CHO}$. Arabinos. [160°]. Mol. w. 150, by Raoult's method (Brown & Morris, C. J. 53, 619). B.C.p. 557, 100. H.F. 259, 400. (Berthelot, C. R. 111, 12). A product of the hydrolysis of ARABIC ACID (q.v.) (Scheibler, B. 1, 58, 108; 6, 312; 17, 1781; Kiliani, B. 18, 2304; 15, 37; 19, 3031; 20, 344; Claesson, B. 14, 1271; O'Sullivan, C. J. 45, 41). Trimetric prisms, v. sol. hot water, nearly insol. alcohol and ether. Dextrorotatory (v. vol. i. p. 297). Tastes sweet. Does not undergo alcoholic fermentation. Yields a phenylhydrazide [158°]. Arabinin $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ is an anhydride of this aldehyde (O'Sullivan, C. J. 52, 59).

OXY-VALERO-CYAMINE v. α-GUANIDINO-VALERIC ACID.

OXY-VINYL-BENZOIC ACID. Anhydride.

p-METHYLENE-PHTHALIC ACID.

OXY-XANTHONE v. OXY-DIPHENYLENE KETONE OXIDE.

OXY-XYLENE v. XYLENOL and TOLYL-CARBINOL.

Di-oxy-xylene. The (5,3,2,1)-, (5,2,3,1)-, and (5,2,4,1)- di-oxy-xylenes are described as HYDROXYLOQUINONES. OXY-TOLYL-CARBINOL is an α-azo-di-oxy-xylene. (5,3,4,1)-Di-oxy-xylene is described as BERTONIN.

Di-oxy-*m*-xylene $\text{C}_6\text{H}_4\text{Me}_2(\text{OH})_2$ [1:3:4:6]. Xylorcin. Mol. w. 138. [123°]. (278°). Formed from amino-*m*-xylol [161°] by the diazo-reaction (Kostanecki, B. 19, 2324). White monoclinic plates (from chloroform), v. sol. water, alcohol and ether. Not affected by air containing NH_3 .

Di-acetyl derivatives $\text{C}_6\text{H}_4(\text{OAc})_2$ [45°]. (284°). Prisms, insol. cold water.

Di-oxy-xylene $\text{C}_6\text{H}_4\text{Me}_2(\text{OH})_2$ [120°]. Got by potash-fusion from chloro-*m*-xylene sulphonic acid (Gundelach, Bl. [2] 28, 845). Gives a red colour with bleaching-powder solution.

Di-oxy-*m*-xylene $\text{C}_6\text{H}_4\text{Me}_2(\text{OH})_2$ [1:3:2:4] [146°]. Formed from *m*-xylene by heating with H_2SO_4 at 150°; converting the resulting disulphonic acid into chloride and fusing the $\text{C}_6\text{H}_4\text{Me}_2(\text{SO}_2\text{Cl})_2$ with potash (Wischne, B. 23, 8113). White needles (by sublimation), v. sol. water, alcohol, and ether. FeCl₃ colours its solution deep violet. Fusion with phthalic anhydride forms a fluorescein.

Di-*o*-oxy-*o*-xylene $\text{C}_6\text{H}_2(\text{CH}_3)_2(\text{OH})_2$. Phthalalcohol. *o*-Tolylene alcohol. Xylene alcohol. Di-methyl benzene glycol. [64°]. S. (ether) 25 at 18°. Formed by the action of sodium amalgam upon a boiling solution of phthalyl chloride in HOAc (Hessert, B. 12, 646). Formed also by boiling di-*o*-bromo-*o*-xylene with NaCO₃ aq. (Baeyer & Perkin, jun., B. 17, 124; C. J. 53, 6; Colson, C. R. 98, 1548; Bl. [2] 43, 6; 45, 6; A. Ch. [6] 6, 106). Tablets (from ether), v. s. sol. water and alcohol. HBr forms $\text{C}_6\text{H}_2(\text{CH}_3)_2\text{Br}_2$, and HCl acts in like manner. KMnO_4 oxidises it to phthalic acid. Resinified by cold H_2SO_4 . Hot H_2SO_4 forms amorphous insoluble $\text{C}_6\text{H}_2\text{O}_2$, and syrupy $\text{C}_6\text{H}_2\text{O}_3$ (Hjelt, B. 19, 1538). HNO_3 forms phthalide.

Di-acetyl derivatives $\text{C}_6\text{H}_2(\text{CH}_3)_2(\text{OAc})_2$ [37°].

Di-ethyl ether $\text{C}_6\text{H}_2(\text{CH}_3)_2(\text{OEt})_2$ (248°) at 720 mm. Liquid (Leser, B. 17, 1825).

Di-*o*-oxy-*m*-xylene $\text{C}_6\text{H}_2(\text{CH}_3)_2(\text{OH})_2$ [47°]. S.G. (liquid) 1.161; 1.135. Formed by boiling $\text{C}_6\text{H}_2(\text{CH}_3)_2\text{Br}_2$ [77°] (1 mol.) with water containing K_2CO_3 (1 mol.) (Colson, A. Ch. [6] 6, 112; C. R. 99, 40). Got in like manner from $\text{C}_6\text{H}_2(\text{CH}_3)_2\text{Cl}_2$ (Colson & Gautier, Bl. [2] 45, 6). Crystalline solid, with bitter taste, v. s. sol. water and alcohol, m. sol. ether. HBr regenerates di-*o*-bromo-*m*-xylene. Gives isophthalic acid on oxidation.

Ethyl ether $\text{C}_6\text{H}_2(\text{CH}_3)_2(\text{OEt})_2$ (248°) at 712 mm. Got by boiling $\text{C}_6\text{H}_2(\text{CH}_3)_2\text{Br}_2$ with alcoholic potash (Kipping, B. 21, 46; C. J. 53, 46). Oil. Yields isophthalic acid on oxidation.

Di-*o*-oxy-*p*-xylene $\text{C}_6\text{H}_2(\text{CH}_3)_2(\text{OH})_2$. *p*-Xylene alcohol. [113°]. Formed from $\text{C}_6\text{H}_2(\text{CH}_3)_2\text{Cl}_2$ (1 pt.) by heating with water (30 pts.) at 176° (Grimanz, A. 155, 542; Colson & Gautier, Bl. [2] 45, 7). It is one of the products of the action of boiling NaOH aq. upon terephthalaldehyde (Lew, A. 231, 374). Needles, v. sol. water, also

alcohol, and ether. Yields terephthalic acid on oxidation.

Acetyl derivative $C_8H_7(OH)(CH_3CO)_2$. [47°]. Made from $C_8H_7(CH_2Cl)_2$ and $HOAc$ in alcohol.

Benzoyl derivative $C_8H_7(CH_2OBz)_2$. Needles, v. sol. alcohol and ether (Grignaux).

Mono-ethyl ether $C_8H_7(CH_2OH)(CH_2OEt)$. (251°). Oil. Formed from di-*o*-chloro-*p*-xylene and conc. alcoholic potash at 100° (G.). Successive treatment with PCl_5 and water converts it into terephthalic aldehyde (Colson, *C. R.* 99, 975f).

Tri-oxy-xylene $C_8H_6O_3(OH)_3$. [122°]. Formed by reducing oxy-isoxylquinone with aqueous SO_2 (Fittig a. Siepermann, *A.* 113, 37). Crystallises from water in tables (containing aq.). Melts at 90° when hydrated. Colours the skin brown. On spontaneous evaporation of the aqueous solution in air it forms a quinhydrone as dark lustrous needles [143°]. Yields *m*-xylene on distillation with zinc-dust.

Tri-acetyl derivative. [99°]. Prisms.

References.—TETRA-CHLORO-DI-OXY-XYLENE. **DI-OXY-XYLENE CARBOXYLIC ACID** $C_8H_6O_3(OH)_2CO_2H$ [1:3:4:6:5]. *Xylorcin tarboxylic acid*. [196°]. Got by heating *m*-xylorcin with $NaHCO_3$ and some water at 130° (Kostanekski, *B.* 19, 2323). Prisms from dilute alcohol, sl. sol. water. Gives off CO_2 on fusion. $FeCl_3$ gives a deep-blue colour.

Oxy-*m*-xylorcinone $C_8H_6O_3(OH)O$. [103°]. Formed by distilling di-amido-mesitylene with chromic acid mixture and water, Me being displaced by OH (Fittig, *B.* 8, 16; *A.* 180, 27). Orange needles, smelling like quinine; m. sol. hot water, v. sol. alcohol and ether. Volatile with steam. Its alkaline solution is reddish violet. Reduced by SO_2 to tri-oxy-xylene. Acetyl chloride at 100° forms a crystalline body [124°], insol. water. $C_8H_6O_3(OK)$. Small black needles, v. s. sol. Aq, m. sol. alcohol, insol. ether.— $(C_8H_6O_3)_2Ba$. Brownish-red pp.

***o*-OXY-XYLYL-ACETIC ACID** [1:3:4] $C_8H_6Me_2CH(OH)CO_2H$. [119°]. Got by reducing [1:3:4]-xylyl-glyoxylic acid (Claus, *J. pr.* [2] 43, 143). Rhombohedra (by sublimation), v. sl. sol. cold water, v. sol. alcohol and ether.

***o*-Oxy-xylyl-acetic acid** [1:4:2] $C_8H_6Me_2CH(OH)CO_2H$. [114°]. Got in like manner from [1:4:2] $C_8H_6Me_2CO.CO_2H$ (Claus). Needles or prisms, v. sol. hot water.

DI-OXY-XYLYLENE - DI-METHYL-PYRAZOLINE $C_8H_6(CH_2N(COH)CH_3)_2$ [above 250°]. Made from acetoacetic ether and *p*-phenylene-diacyl-imido-ether (Glock, *B.* 21, 2661). Crystalline mass, insol. ordinary solvents.

OXY-XYLYL-METHYL-PYRAZOLE $C_8H_6Me_2N(COH)CH_3$. [159°]. Got from the product $C_8H_6N_2O$ of the action of [1:3:1]-xylyl-hydrazine on isocetoacetic ether by heating with conc. HCl aq. at 150° (Klauber, *M.* 12, 215). Small white needles.— $BHCl$. [185°].— BH_2FeO_2 ; white crystals.

Oxy-xylyl-di-methyl-pyrazole $C_8H_6Me_2N(CO)CH_3$. [118°]. Made by heating the compound $C_8H_6N_2O$ (v. *supra*) with MeI and $MeOH$ at 180° (K.). Small white needles, v. sol. alcohol and ether, sol. cold water.

Reduces Fehling's solution. $FeCl_3$ gives a violet-red colour.— $BHCl$. [95°]. Small crystals.

DI-OXY-DI-XYLYL-PYRAZINE DIBRIDE $C_8H_6Me_2N(CO)CH_3$. [208°]. Formed by boiling bromo-acetyl-(1,4,2)-xylylidine with alcoholic potash (Abenius, *J. pr.* [2] 40, 436). Flat needles, insol. water and ether.

OZONE. A fossil resin, consisting chiefly of a hydrocarbon called lekene (g. v.). On chlorination in presence of $SbCl_5$ at 360° it yields $COCl_2$, C_2Cl_4 , C_3Cl_8 , and C_4Cl_{10} (Hartmann, *B.* 24, 1019). (V. also PARAFFIN.)

OZONE. O_3 . Mol. w. 47.01. A blue gas (Hautefeuille a. Chappuis, *C. R.* 91, 522); it usually occurs mixed with oxygen, and possesses a characteristic odour. (—106°) (Olszewski, *M.* 8, 69; *W.* 87, 387). V.D. 24. S. at 760 mm. 866 at 18° (Schöne, *B.* 6, 1224); 834 at 1° (Carius, *A.* 174, 80); and 2745 at 14° (McLeod, *C. J.* 49, 607). Andrews states that it is insoluble in water.

Occurrence.—Ozone is believed to be a normal constituent of pure air. Häfslly (*Cs J.* 89, 111), Chappuis (*C. R.* 91, 985; 94, 858), and E. Schöne (*J. R.* 1884, 2, 250), who have examined the absorption-spectrum of ozone, have attributed the blueness of the sky to its presence. But the recent observations of Living a. Dewar (*P. M.* [5] 26, 286) show that the absorption-spectrum of compressed oxygen exhibits certain bands identical with those of the solar spectrum, which Ångström found to be equally strong whether the atmosphere was wet or dry, and that daylight when observed through a column of oxygen 18 m. in length and at 90 atmos. possesses a blue tint (v. also Olszewski, *W.* 42, 668). The proportion of ozone in the air varies very considerably, and is supposed by many observers to be greater at high than at low altitudes (v. also Thorpe, *C. J.* Proc. 72). Houzeau judges the maximum proportion at ordinary levels to be $\frac{1}{100,000}$ by volume (*C. R.* 74, 712). Andrews found that a temperature of 250° destroys the constituent of the air which exhibits the reactions of ozone, whereas air containing traces of chlorine, or of the higher oxides of nitrogen, is not so affected by heat (*Pr.* 16, 63). On the other hand, Hoavay (*B.* [8] 2, 377) and Schöne (*B.* 13, 1563) conclude that the presence of ozone in the air is still unproved.

Formation.—1. Ozone is formed in the electrolysis of dilute sulphuric acid (Schönbein, *P.* 50, 816; Magnac, *C. R.* 20, 908; Meldinger, *A.* 89, 57; *C. J.* 7, 251; Baumert, *P.* 89, 38; Andrews, *T.* M6, 1; Stret, *Archives Sciences*, 16, 218; *C. R.* 66 890; Berthelot, *Q. R.* 86, 71; *A. Ch.* [5] 14, 345; Schöne, *B.* 6, 1224; Carius, *A.* 174, 1; Brodie, *C. J.* 17, 293; McLeod, *C. J.* 49, 591). Berthelot and Schönbein also obtained ozone by the electrolysis of other acid solutions. It has been supposed that the ozone formed in electrolysis is accompanied by H_2O_2 , but Brodie (*C. J.* 17, 281), and, more recently, McLeod (*loc. cit.*), have shown that the oxidising body which remains in solution is probably S_2O_8 . The proportion of ozone present in electrolytic oxygen appears to depend to a great extent on current-density. By using a positive electrode of very small area McLeod obtained O containing 17.4 per cent. of ozone; when electrodes of large

very small.—2. When air or oxygen is exposed to the electric discharge, especially if it be the silent discharge, the O is partly converted into ozone. If air be used, oxides of N may be formed and mistaken for ozone. According to Berthelot (C. R. 92, 82) and Hautefeuille a. Chappuis (C. R. 92, 80, and 184), oxides of N may be formed to a slight extent even by the silent discharge, and H. and C. have obtained a new and unstable oxide of nitrogen in this way. Giannetti a. Volta (G. 5, 439) found that with the discharge from a Holtz machine the yield of ozone is increased by using a wire brush as negative electrode. Bichat a. Gunz (C. R. 107, 334; A. Ch. [6] 19, 181), who used an ozone generator consisting of a wire stretched along the axis of a metallic tube, found that the negative effluve produced by far the greatest yield of ozone. This they attribute to its higher temperature. It has been suggested that the production of ozone by the electric discharge is an effect of a condition of electro-static stress. But Thomson a. Threlfall (Pr. 49, 829) find that oxygen is only converted into ozone when there is an actual luminous discharge. This has been confirmed by Bichat a. Gunz; and some experiments by the writer seem to show that even when oxygen is illuminated by the ultra-violet rays ozone is only formed by actual luminous discharge. Dewar has obtained a body giving the reactions of ozone from air by passing a current of water through a glass tube, surrounded by a larger tube of platinum which was heated by the oxyhydrogen flame, the air from the annular space between the hot and cold tubes being sucked into the inner tube by the stream of water through a minute hole in the glass tube, and collected and examined. If the substance thus obtained was really ozone, this result seems to confirm the idea that the action of the electric discharge on oxygen is due to temperature (v. also Elster a. Geitel, W. 39, 321; and Hovsay, Bl. [3] 3, 784).

The formation of ozone from O by electric discharge is greatest at low temperatures and under high pressure (von Babo, A. 1863, Suppl. ii.; Hautefeuille a. Chappuis, C. R. 91, 228). But the exact influence of temperature and pressure have probably not yet been made out. Hautefeuille a. Chappuis have noticed that at a pressure of about 50 mm. ozone is alternately produced and destroyed by the silent discharge (C. R. 94, 646). Von Babo a. Claus, and Hautefeuille a. Chappuis, consider that prolonged action of the discharge is favourable to ozonification. But Brodie, with the apparatus described below, found that the maximum effect was quickly reached. The writer's experience agrees with that of Brodie, and tends to show that observations to the contrary effect have been due to the irregular working of the machine employed.

Bichat a. Gunz, using the apparatus described above, have failed to find any simple quantitative relation between the potential difference of the discharging surfaces and the yield of ozone, though they, and also Giannetti a. Volta (G. 5, 439) and Berthelot, find that an increase of potential produces an increased yield of ozone. (For details on various points v. Marignac & De la Rive, Arch. of Elect. 5, 5; Frémy a. Bec-

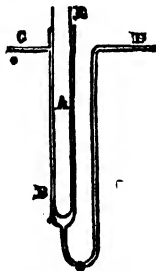

querel, A. Ch. [3] 35, 62; Andrews, T. 146, 1; 150, 113; Brodie, T. 162, 435; Berthelot, C. R. 88, 50; A. Ch. [5] 12, 443; Hautefeuille a. Chappuis, C. R. 92, 80, 184; 94, 646; Shenstone a. Cundall, C. J. 51, 610.) Hautefeuille a. Chappuis (C. R. 91, 762) find that the production of ozone by the action of the electric effluve on oxygen is prevented by the presence of Cl, but that N, H, and SiF₄ are favourable to its production.

3. Brodie (T. 164, 83) by the action of the silent discharge on carbon dioxide, under the most favourable conditions, obtained as much as 88 p.c. of the liberated oxygen in the form of ozone.

4. Ozone has long been regarded as one of the products of various cases of oxidation such as the slow oxidation of P, Et, O, and turpentine, the decay of organic matter, and the combustion of compounds containing H in the air; Thorpe a. Tuton observe that it is not formed in the oxidation of P₂O₅ (C. J. 57, 569). It is possible, however, that ozone is less frequently formed in such changes than has been supposed, and that the reactions attributed to ozone may often have been due to H₂O₂. The experiments of Kingzett (C. J. 87, 792) and McLeod (C. J. 87, 118), however, seem to make it certain that ozone is produced in the slow oxidation of P₂O₅ (v. also Hovsay, Bl. [3] 2, 360; 4, 707; Leeds, C. R. 39, 157; 40, 70; 41, 164; 42, 17; Cundall, C. J. Proc. 78, 26; Loew, B. 22, 3325).

Heat of formation.—80, = 26, = -59,200 (Berthelot, C. R. 82, 1281); -66,720 (Mulder a. van der Meulen, B. 15, 511).

Preparation.—1. From oxygen. The following method, which was introduced by Siemens and Brodie, is perhaps the most convenient. A tube, A, is sealed into a slightly larger tube B,

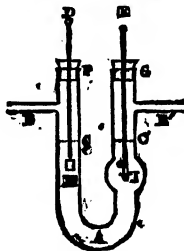

at E, before the blowpipe, or by means of solid paraffin. A and B should be of thick glass, and two narrow tubes, C and D, should be attached to B. A is filled with dilute H₂SO₄, and the apparatus is then immersed in dilute acid to the level C D; the electrodes of a Ruhmkorff coil, or of an electric machine, are respectively connected with the acid in A, and the contents of the cylinder, and a slow current of Q is led through the apparatus from D to C while the discharge passes. The liquid in the cylinder should be cooled by ice, or it may be replaced by a freezing mixture, in which case a platinum wire should be wrapped round the outside of B. The gas which escapes at C is well charged with ozone. The ozonised oxygen may be collected over oil of vitriol. It must not be brought into contact with india-rubber; joints that will bear contact with ozone may be made by slipping a wide tube over the

ends of those that are to be connected, warming them, and running a little melted paraffin between the inner and outer tubes.

The character of the discharge in the ozone generator has been studied by Hautefeuille a. Chappuis (*C. R.* 91, 281), Thomson a. Threlfall (*Pr.* 40, 329), Shenstone a. Cundall (*C. J.* 51, 622), and by Bichat a. Guntz (*A. Ch.* [6] 19, 131).

2. By electrolysis. When dilute H_2SO_4 is electrolysed with electrodes of considerable area the proportion of ozone in the O is, usually small. McLeod (*C. J.* 49, 591) recommends the following method. Place dilute F_2SO_4 (*S. G.* 1.1) in a U tube, A, attach delivery tubes to the

arms B B'. Let the negative electrode H be a sheet of Pt foil suspended by the glass D from a cork closing the mouth at F, and let the positive electrode J consist of two fine wires, sealed into a glass tube E, which is afterwards filled with mercury. On connecting D and E with a galvanic battery, G highly charged with ozone will escape at B'. It is best to immerse the U tube in ice-cold water. McLeod has obtained O containing as much as 17.3 p.c. of ozone by means of this apparatus.

3. To prepare ozone by the oxidation of phosphorus. Place clean sticks of P half submerged in water in a series of flasks, and conduct a rather slow stream of air through the flasks, and then through a little water. A temperature of 24° - 25° gives the best results. H_2O_2 is also formed, but it remains dissolved in the water (Kingzett, *C. J.* 37, 792).

Properties and Reactions.—Ozone is more at 200° magnetic than common oxygen (Becquerel, *R.* 92, 348). Its rate of diffusion is (Mulder, that required for the density 24 (Sorlet, on contact [4] 13, 257). It is entirely destroyed oxidised in (Andrews, *T.* 150, 213) by contact Cundall, *C.* gum black at ordinary temperatures posed by dry gas der Meulen, *B. J.* 167), and oxidised, and by pure H_2 (Hg is not visibly Volta (*G.* 9, 521) be perfectly dry, Shenstone a. Ag are without action silver being but slightly to a similar conclusion in with MnO_2 (Andrews). Cu. Berthelot (*C. R.* 86, 76), Au, Pt, Pd, and dry considered that dry ozone has no action. Brodie came of dissociation. If suddenly compressed to Au, Al, and pressed without cooling, it exploded others have yellowish flame (Hautefeuille a. Chappuis pressfire of, 523). The action of ozone on salts has, or compared by Maquenne (*C. R.* 94, 795), and with a Mallard (*C. R.* 94, 860). The latter has also been

studied its action on S, Se, Te, and several sulphides, and on CH_4 , C_2H_6 , C_2H_4 , C_2H_2 , C_2H_6 , and C_2H_4 (*C. R.* 94, 1186). Ozone oxidises alcohols of small molecular weight more readily than the polyhydric alcohols (A. Renard, *A. Ch.* [5] 16, 239). Liquid ozone explodes violently on coming into contact with C_2H_4 (Olszewski, *A. Ch.* [2] 87, 337). It acts as a strong bleaching agent on vegetable colours, and quickly destroys india-rubber; its action on cork is much less rapid. It does not oxidise CO at 300° (Bamsen, *Am.* 4, 50). It oxidises NH_4Aq , forming ammonium salts of nitrous and nitric acid (Carius, *A.* 174, 31), unless the solution is dilute (Hartley, *C. J.* 39, 123). It is believed to be completely absorbed by turpentine and oil of cinnamon (Sorlet, *A. Ch.* [4] 7, 113), peroxidised compounds being formed which react with water (Kingzett, *C. J.* 37, 800). When ozonised O acts on $KIAq$, I is set free and the ozone is destroyed, but the volume of the gas remains unaltered. With neutral solutions the initial action may correspond to the equation $2KIAq + O_3 = K_2O_2Aq + O_2 + I_2$, but usually KIO is a final product of the change. P glows freely in ozonised air (Thorpe a. Tutton, *C. J.* 57, 571). Ozone oxidises $TiOH$ and As_2O_3 ; the latter action has been used in determining its heat of formation. It is destroyed by solutions of KHO , BaO , and CaO to a certain extent (Andrews). Hartley has observed the formation of peroxide of potassium by its action on solid KOH (*C. J.* 39, 124). But it is unaffected by solution of Na_2CO_3 (Brodie). It readily attacks I, forming periodic acid and lower oxides of I (Ozier, *C. R.* 86, 722). It converts ether into an ozonised substance which acts with water to form H_2O_2 (Kingzett, *C. N.* 84, 127; Berthelot, *C. R.* 86, 71; Dunstan a. Dymond, *C. J.* 57, 584). Several observers have concluded that it arrests putrefaction of animal matter, and have proposed its use as a preservative for meat. When present in the air in large quantities it frequently produces irritation of the mucous membrane.

Although its general action is that of a strong oxidiser, in certain cases ozone acts as a reducing agent. Thus when ozone acts with Na_2O , an expansion occurs which is due to the simultaneous decomposition of the two bodies in equivalent proportions (Brodie, *T.* 162, 454), probably according to the following equation:— $Na_2O_3 + O_2 = Na_2O + 2O_2$. Probably other unstable oxides, such as H_2O_2 , react with it similarly under favourable conditions. Its action on blood has been said to resemble that of a reducing agent (Dogiel, *C. C.* 1875; Pinz, *C. C.* 1882). It changes the red colour of the compound formed when sulphanic acid is mixed with naphthylamine to orange-yellow (Ilosvay, *Bl.* [8] 2, 851).

Detection.—Paper impregnated with $TiOH$ is turned brown by ozone even when dry (Schöne, *B.* 18, 1508). The similar change of colour produced by nitrous acid is destroyed by excess. The colour is also permanent when ozone is mixed with a relatively small proportion of nitrous acid (Ilosvay). The action of ozone on the red compound of naphthylamine and sulphanic acid (*v. Properties*) also affords a test for ozone, even in the presence of traces of nitrous acid (Ilosvay, *Bl.* [8] 2, 860). Ozone may be distinguished from H_2O_2 by not yielding water when strongly heated, and by the absence

also by resisting the action of Na_2CO_3 , which destroys H_2O_2 . Papers saturated with solutions of KI and starch are often used for the detection of ozone, but are only trustworthy when the absence of Cl and of oxides of nitrogen can be assured. Houzeau employed test papers steeped in faintly-acid solution of litmus and then treated with KI. These he found to be insensitive to O_3 to traces of oxides of nitrogen, and to H_2O_2 . When exposed to ozone, however, they are turned blue by the alkali that is set free.

Estimation.—1. Rough estimations of ozone are frequently made by comparing the tints produced by exposing some of the test papers mentioned above with a scale of tints. Such methods are not very satisfactory.—2. Thénard has estimated the proportion of ozone in the air volumetrically by means of a standard solution of As_2O_3 in HClAq of such strength that 1 c.c. is equivalent to 1 mgrm. of O. 10 or 20 c.c. of the solution are thoroughly agitated with the sample of gas, 80 c.c. of a 1 p.c. solution of H_2SO_4 are added, and it is then titrated in the usual manner with permanganate. For 8 grms. of O absorbed 24 grms. of O₂ are destroyed (Berthelot, *C. R.* 82, 1261). As oxides of nitrogen and H_2O_2 are present, tend to reduce the amount of ozone found, this method gives the minimum, and not the maximum amount of ozone present.—3. If a solution of potassium arsenite containing 73 grm. per litre, with an excess of pure KI, be agitated with air containing ozone, part of the arsenite is converted into arsenate by the ozone, and the amount of unaltered arsenite can be found by titrating with very dilute I solution after adding some ammonium carbonate and starch. This method is strongly recommended by Hartley (*C. J.* 89, 120). The solution of the arsenite should be acidified for keeping, and neutralised before use with KHCO_3 .—4. The action of ozone on KIAq may also be employed to estimate ozone. The iodide must be perfectly free from iodate, and must be thoroughly brought into contact with the gas. When the action is complete, and not before, the product must be acidified with dilute HClAq or $\text{H}_2\text{SO}_4\text{Aq}$. The liberated I may then be titrated in the usual manner. The O equivalent to the I liberated, multiplied by three, gives the amount of ozone.—5. The amount of ozone produced in the electrification of oxygen may also be calculated from the contraction that occurs under the influence of the discharge (*v. Babo, A. Suppl.* 2; Andrews, *T.* 150). Shennstone & Cundall (*C. J.* 51, 610) have devised an apparatus for this purpose. S. & C. have shown that if the ozonised gas comes into contact with oil of vitriol in such a process, the acid should be previously thoroughly treated with ozone, otherwise the results are likely to be high.

History.—The earliest known record concerning ozone relates to an observation* by van Marum, 1785, that air or O when submitted to the electric spark acquires a characteristic odour. About fifty years later, 1840, Schönbein, who published about sixty papers on this subject, published his first memoir on ozone in Poggen-dorff's *Annalen*. As the result of his numerous observations, Schönbein recognised ozone as a distinct form of matter, ascertained that it could be obtained by the electrolysis of dilute acid, by

means of the electric discharge on O, and in the slow oxidation of P. And it is interesting to note that these still constitute the chief method for the production of ozone. He also observed many of its chief properties. For several years after Schönbein's original discovery, comparatively little progress was made in ascertaining the nature of ozone till the experiments of Marignac and De la Rive, 1845 (*Arch. of Elect.*) and of Fremy and Bequerel, 1853 (*A. Ch.* [3], 35, 62), showed that the purest O then obtainable could be entirely converted into ozone, provided that the action of the spark took place in the presence of excess of KI, or of moist silver, which appeared to be capable of completely absorbing ozone. But it was not till a much later period that the researches of Andrews (*T.* 146, 1) and Soret (*C. R.* 56, 890) finally showed that ozone from all sources is identical. Although the researches of Marignac, De la Rive, and of Fremy & Bequerel, thus established the character of ozone, and its production from oxygen, the exact relation of the two bodies was still imperfectly understood; and ozone seems to have been regarded as differing from oxygen either in regard to its electrification, or, by some, in being a compound of oxygen and water, until in 1860 Andrews and Tait (*loc. cit.*) examined the volumetric relations of ozone and oxygen, and by a masterly research showed that the ozonising of oxygen is accompanied by a contraction in the volume of the gas, and that, on the other hand, the reproduction of O from the ozone by heat causes the gas to recover its original volume. In this research A. and T. also showed that the iodine titre of a sample of ozonised oxygen corresponds in every case to the contraction that has occurred on ozonising it; a fact which, in the hands of Soret and Brodie, materially contributed to the further elucidation of the subject. Andrews and Tait also observed that when ozonised oxygen acts with KIAq, the gas remains unaltered in volume after the action is complete. The true bearing of these facts was not, however, perceived till Odling (*Manual of Chemistry*) pointed out, in 1861, that they were consistent with the adoption of O₃ as the simplest formula for ozone. This interpretation was afterwards supported by the experiments of Soret and Brodie. The former showed that when ozonised oxygen is allowed to act on turpentine, a contraction occurs that is equal to about twice the iodine titre of the gas, i.e. is about twice as great as the contraction which accompanies its formation, from which, if we assumed that the ozone formed is wholly absorbed by the turpentine, it follows that two volumes of gaseous ozone contain three volumes of gaseous oxygen. Soret's experimental numbers did not agree very closely with this hypothesis. But the hypothesis was confirmed by subsequent experiments, in which he compared the rates of diffusion of ozone, O₂, and CO₂, and found that the rate of diffusion of ozone approximates to that of a gas having the S.G. 24 (*A. Ch.* [4] 13, 257). Finally, in 1873, Brodie (*T.* 162, 435), as one of the results of a beautiful series of experiments, found that, while in some cases, as in that of neutral KIAq, the oxidation caused by ozone is unaccompanied by any contraction in the volume of the gas, in other cases various degrees of con-

traction occur. Thus the oxidation of HIAg is attended by a diminution in the volume of the gas equal to half the volume that would be occupied by the weight of gas that is absorbed, and the action of the gas on turpentine and on $\text{Na}_2\text{S}_2\text{O}_3\text{Ag}$ is accompanied by a diminution of volume equal to two-thirds of the volume that the O absorbed would occupy in the free state.* Intermediate contractions were observed, but in no case did the contraction seem to be greater than in the action of turpentine, a result which afforded strong confirmation of the views of

Soret and Odling. An account of the early work on ozone exists in the *Handwörterbuch der Chemie*, 5, 885 (Braunschweig 1858). (For later work v. Odling, *R. J.* 1872.)

Antozone. This name was formerly given to a substance whose action with ozone resulted in their mutual decomposition. Before the relations of ozone and oxygen were established, these bodies were by some supposed to consist of oxygen in opposite conditions of electrification. Antozone was probably hydrogen peroxide. W. A. S.

P

PACHYMOSE $\text{C}_6\text{H}_8\text{O}_4$. A substance, probably a glucoside, occurring in *Pachyma pincturum*, a Chinese fungus (Champion, *J.* 1873, 789). Insol. water, sol. alkalis, forming a solution ppd. by Ca and Pb salts.

PACHYRHIZIDE. A substance, not containing nitrogen, extracted from the seeds of *Pachyrhizus angulatus* (Greshoff, *B.* 23, 3539). V. sol. alcohol, ether, and CHCl_3 , v. sl. sol. water and KOHAg . Tastes bitter, and is extremely poisonous, especially to fishes. Begins to melt at 61° , and decomposes at 161° . Yields gallicylic and protocatechuic acids on fusion with potash. The alcoholic solution is acid in reaction. Probably identical with a similar body in the root-bark of *Derris* (*Pongamia elliptica*).

PAONOL $\text{C}_{15}\text{H}_{14}\text{O}_4$, i.e. $\text{CH}_3\text{CO}_2\text{C}_6\text{H}_4(\text{OH})(\text{OMe})$ [1:2:4] [50°]. Got from the bark of *Paonol japonica* of Japan (Nagai, *B.* 24, 2847). White needles (from alcohol). Yields an acetyl derivative [48-5°], a phenyl-hydrazide [107°], and a crystalline oxim (Tiemann, *B.* 24, 2855). Potash forms resacetophenone $\text{CH}_3\text{CO}_2\text{C}_6\text{H}_4(\text{OH})$, HIAg at 160° forms the same body.

PALISANDER RESIN $\text{C}_{15}\text{H}_{14}\text{O}_4$? [95°]. S.G. 1.266. Extracted by alcohol from palisander wood, a red dye-wood from Madagascar (Terreil a. Wolf, *Bl.* [3] 33, 485; cf. Arnaudon, *Cimento*, 8, 278).

PALLADIUM. Pd. At. w. 106.8. Mol. w. unknown. Melts between 1860° and 1880° (Bequaupel, *C. R.* 57, 855) at c. 1500° (Violle, *C. R.* 87, 981). S.G. 11.4 at 275° (Devil a. Debray, *P. M.* [4] 50, 651). For other numbers v. Clarke's *Table of Specific Gravities*, 2nd edit., 15. S.H. = -0.882 at 0° , = -0.582 + .00002t at t° (Violle, l.c.). Heat of fusion = 368 cal. C.E. (linear) = .00001176 at 40° (Fizeau, *C. R.* 68, 1125). E.C. 12.64 at 17.2° (Ag at 0° 100) (Matthiessen, *P.* 103, 428). Volatilises in green vapour at c. 2000° . S.V.S. c. 9.8. For chief lines in emission-spectrum v. *B. A.* 1884, 434.

Occurrence.—In small quantities, about 2 p.p.m. as metal alloyed with Pt, Ir, Os, Ru, and Rh. Certain kinds of South American gold contain from 5 to 10 p.p. Pd. Occurs also, with gold and lead soluble, in the Harz (Zinken, *P.* 16, 491), and in small quantities in some specimens of silver (Rösler, *A.* 180, 240). In 1808 Wollaston (*T.* 15 A. 428; 1808. 215) separated 470

new metals from Pt ore; to one of these metals he gave the name *palladium*, in allusion to the discovery, made about the same time, of the planet Pallas, and the other he called *rhodium*, because of the rose-coloured solutions of its salts (*rhodon* = a rose).

Formation.—1. By heating PdCy_2 .—2. By heating $\text{PdCl}_2 \cdot 2\text{KCl}$ and washing out the residual KCl .—3. By ppn. from solutions of its salts by means of Zn, Cu, or Fe.—4. By reducing $\text{PdCl}_2 \cdot 2\text{KClAg}$ by oxalic or formic acid.

Preparation.—When Pt ore is heated in *aqua regia*, the Pd goes into solution, along with most of the Pt, as PdCl_2 . From this solution Pd is obtained by various processes. 1. The solution is made as nearly as possible exactly neutral by Na_2CO_3 , and HgCy_2Ag is added; PdCy_2 is ppd., along with CuCy_2 , if the ore contained Cu; the pp. is washed, dried, and strongly heated, whereby Pd is obtained, mixed with Cu; the metallic residue is dissolved in HNO_3Ag , the solution is neutralised by Na_2CO_3 , and heated with HCO_2KAg and $\text{H}_2\text{C}_2\text{O}_4\text{Ag}$, whereby CO_2 is evolved plentifully, and Pd is deposited in lustrous plates, while Cu remains in solution (Dobereiner); or the metallic residue obtained by heating the cyanides may be dissolved in HNO_3Ag , the solution evaporated to dryness, and the residue strongly heated. By now treating with conc. HClAg , CuO is dissolved away, while Pd remains.—2. NH_4Cl is added to the solution in *aqua regia*, and the liquid is filtered from $\text{PtCl}_2 \cdot 2\text{KCl}$; the filtrate may contain Ir, Rh, Ru, some Pt and Cu, besides Pd. These metals are ppd. by addition of Zn or Fe. The pp. is treated in various ways. Wilm (*B.* 15, 741; v. also *B.* 13, 1198; 14, 629) recommends to dissolve the ppd. metals in *aqua regia*, to boil the solution with excess of NaOHAg (von Schneider, *A. Suppl.* 5, 261), whereby the perchlorides of the metals, except that of Pt, are reduced to the lower chlorides, to acidify with HClAg , and add excess of NH_4Cl in order to ppt. $\text{PtCl}_2 \cdot 2\text{KCl}$. The filtrate from this pp. is boiled with excess of NH_4Ag , filtered, and excess of HClAg is added. After some time a yellow pp. forms, which is either almost pure $\text{PdCl}_2 \cdot 2\text{NH}_4\text{Cl}$, or if somewhat dirty-yellow in colour, it may contain $\text{RhCl}_2 \cdot 10\text{NH}_3$. This pp. is treated with cold NH_4Ag , in which the Rh salt is insoluble.

pure $\text{PdCl}_2 \cdot 2\text{NH}_4\text{Cl}$ is pptd. by adding HCl to the solution. The ppt. is collected, washed with absolute alcohol, dried, and heated strongly: a gray spongy mass of Pd is obtained.

This process may be used for purifying commercial Pd.

For other methods of preparing Pd v. Bunsen (A. 146, 285); Philipp (D. P. J. 220, 35); Guyard (C. R. 56, 1177); Bössler (Z. 1866, 175); Opifious (D. P. J. 224, 414).

Pd may be prepared from palladium containing gold by dissolving in *aqua regia*, ppg. with HgO , Ag , and proceeding as described under 1 above. Or the ore may be fused with an equal weight of Ag and some KNO_3 , the regulus granulated, and treated with HNO_3 (Cook, P. M. [3] 23, 16), Ag pptd. by addition of NaCl , and Pd pptd. with other metals by Zn ; the Pd may then be separated from this ppt. as described under 2 above.

Properties.—As prepared by heating $\text{PdCl}_2 \cdot 2\text{KCl}$ or PdCl_2 , or by pptn. from solutions, Pd forms a gray metallic sponge which can be pressed together more easily than Pt, to a compact mass. This compact form is also obtained by melting spongy Pd; Pd is a white metal, fairly malleable, ductile, and hard (somewhat softer than Pt). Compact Pd may be polished highly; it can be hammered into thin plates, and drawn into fine wire. In Brazilian gold ore Pd is found in regular octahedra, and in specimens of ore from the Harz it forms hexagonal plates. Joly (N. 43, 541) obtained it in cubic octahedra by dusting Pd ribbon with powdered topaz and heating to bright redness for some time by an electric current. Heated in the O-H flame to c. 2000°, Pd volatilises in greenish vapours, and condenses again to a brownish sublimate which is a mixture of metal and oxide. When the metal is melted in presence of O it absorbs O, which it gives up again on cooling (Deville a. Debray, A. Ch. [3] 56, 385). When strongly heated in air Pd is oxidised superficially, but the film of oxide is reduced at a higher temperature. Heated in an alcoholic flame, Pd black absorbs O and increases largely in volume. Pd absorbs H; it causes the combination of H and O when brought into electrolytic gas. Heated Pd foil brought into a mixture of NH_3 and O causes formation of NH_4NO_3 and NO . Pd is more easily acted on by acids than any other of the Pt metals; it is dissolved by cold HNO_3 , Ag .

The at. w. has been determined by analysing $\text{PdCl}_2 \cdot 2\text{KCl}$ (Berzelius, P. 13, 455); and by estimating Pd in $\text{PdN}_2\text{H}_4\text{Cl}_2$ by reducing in H (Keiser, Ann. 11, 398).

In its chemical relations Pd is closely allied to Ru and Rh, and less closely to Os, Ir, and Pt (v. NOBLE METALS, this vol. p. 628).

On account of its silver-like appearance, and its resistance to the action of H_2S , Pd is used for making scales and division-marks on scientific instruments, and also for coating and preserving silvered metallic ware. Pd wire is used in dentistry; an alloy with steel is used in making parts of physical instruments; and an alloy with steel, Cu, and small quantities of Au, Ni, Pt, Rh, and Ag is used in watch-making, as it is non-oxidisable, hard, and non-magnetic. Finely-divided Pd is used in gas-analysis for absorbing H from mixtures, and for effecting

the gradual combination of H or hydrocarbons with O (Hempel, B. 23, 686, 1006).

Reactions and Combinations.—1. When Pd is heated in air or oxygen Pd_2O is formed, but this oxide is reduced to Pd and O at a higher temperature.—2. Heated in hydrogen to c. 100° much H is absorbed, probably with formation of a hydride Pd_2H (v. HYDROGEN, vol. ii. p. 720).—3. Brought into a mixture of hydrogen and oxygen, in the ratio $2\text{H}_2\text{O}$, Pd black causes formation of H_2O without explosion (Coquillon, C. R. 83, 709).—4. Heated with sulphur PdS is formed.—5. PdSe is formed by heating Pd with selenium.—6. Digested with bromine and water, PdBr_2 is produced.—7. With iodine tincture PdI_2 is produced.—8. Glowing Pd wire causes decomposition of many hydrocarbons into C and H (Coquillon, C. R. 84, 1503; Wilm, B. 14, 874).—9. In an alcoholic flame Pd becomes covered with C; spongy Pd increases largely in volume, probably with formation of a carbide (Wöhler, A. 184, 128).—10. Heated Pd foil brought into a mixture of ammoniac and oxygen causes formation of NH_4NO_3 and NO without explosion (Kraut, B. 20, 1113).—11. Pd is oxidised to PdSO_4 by fusion with potassium hydrogensulphate.—12. Pd dissolves in acids more easily than any other of the Pt metals: in nitric acid, even in the cold, it dissolves to $\text{Pd}(\text{NO}_3)_2$; in hydrochloric acid, especially when Cl_2 is passed in, PdCl_2 is formed; in hydroiodic acid, PdI_2 is produced; PdBr_2 is obtained by dissolving in hydriobromic acid, with a little HNO_3 ; Ag ; in sulphuric acid, with a little HNO_3 , PdSO_4 is produced; Pd dissolves in *aqua regia* to form PdCl_4 , PdCl_2 being perhaps produced at first.

Qualitative discrimination between palladium and platinum. If a drop of an alcoholic solution of I is dropped on to Pd, a black stain of PdI_2 is formed, and this stain disappears on heating; as Pt is not acted on by I tincture, this reaction serves to distinguish between the two metals.

Palladium, alloys of. Alloys of Pd with several metals have been prepared. The alloy formed by heating equal weights of Pd and lead, and removing the excess of Pb, is a steel-grey powder S.G. 11.255, agreeing in composition with the formula Pd_2Pb (Bauer, B. 4, 451). Tin forms an alloy which seems to be a compound Pd_2Sn (Deville a. Debray, A. Ch. [3] 56, 385). Alloys with Sb, As, Ba, Bi, Cu, Au, Hg, Ni, Pt, and Ag have been described (v. GRAHAM, C. R. 68, 1511; Mallet, C. N. 46, 210; Fischer, S. 51, 197).

Palladium, ammonio-salts of, or Pallad-ammonium salts. (Palladamines. Ammoniacal palladium bases.) When HCl is added to PdCl_4 containing an excess of NH_3 , the salt $\text{PdCl}_2 \cdot 2\text{NH}_3$ separates; by treatment with Ag_2O and H_2O this salt gives the strongly alkaline base $\text{Pd}(\text{OH})_2 \cdot 2\text{NH}_3$, and by neutralising this base with acids various salts are obtained, e.g. $\text{PdSO}_4 \cdot 2\text{NH}_3$, $\text{PdCO}_3 \cdot 2\text{NH}_3$, &c. When a large excess of NH_3 is added to PdCl_4 and the solution is evaporated, or when a solution of $\text{PdCl}_2 \cdot 2\text{NH}_3$ in NH_4Ac is evaporated, the salt $\text{PdCl}_4 \cdot 4\text{NH}_3$ separates. Similarly, when PdSO_4 is dissolved in a large excess of NH_4Ac , the salt $\text{PdSO}_4 \cdot 4\text{NH}_3$ is obtained by evaporating this solution; decomposition of the sulphate with

BaOAg, and evaporation, gives the strongly alkaline base $\text{Pd}(\text{OH})_2 \cdot 4\text{NH}_3$, which yields salts by neutralisation with acids, e.g. $\text{PdCO}_3 \cdot 4\text{NH}_3$, $\text{PdSO}_4 \cdot 4\text{NH}_3$, &c. The compounds $\text{Pd}(\text{OH})_2 \cdot 2\text{NH}_3$ and $\text{Pd}(\text{OH})_2 \cdot 4\text{NH}_3$ represent the two series of palladium ammonio-salts. The reactions of these compounds and their derivatives lead to their representation as, in one case, compounds of the radicle PdN_2H_5 —derived from N_2H_5 by replacing 2H by Pd—and, in the other case, compounds of the radicle PdN_2H_3 —derived from PdN_2H_5 by replacing 2H by 2NH. The two series of salts may be called *pallados-diammonium compounds*, $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2$, &c.; and *ammonium pallados-diammonium compounds*, $\text{Pd}(\text{NH}_2\text{NH}_2 \cdot \text{NH}_2\text{NH}_2)_2\text{Cl}_2$, &c. The members of the first series are also sometimes called *palladosamine compounds*, and those of the second series *pallado-diamine compounds*. It is to be observed that both series are obtained from palladosochloride, PdCl_2 (cf. Iridium ammonio-salts, this vol. p. 47). The palladium ammonio-salts have been examined chiefly by Kane (T. 1842, 275); Fehling (P. 13, 466); Fischer (P. 71, 484; and Hugo Müller (A. 86, 341).

I. PALLADOS-DIAMMONIUM COMPOUNDS:
 $\text{N}_2\text{H}_5\text{PdX}_2$, or $(\text{NH}_2\text{NH}_2)_2\text{PdX}_2$, or perhaps $\text{NH}_2(\text{NH}_2)\text{PdX}_2$.

Pallados-diammonium chloride, $\text{N}_2\text{H}_5\text{PdCl}_2$ (simplest formula $\text{PdCl}_2 \cdot 2\text{NH}_3$ = *di-ammonio-palladium dichloride*). This salt is known in two forms: 1. *Yellow crystals* are obtained by adding HClAg to PdCl_2 in excess of NH_3Ag ; these crystals are scarcely sol. water, sol. with difficulty in cold acids, more sol. hot acids, easily sol. NH_3Ag , from which solution acids reprecipitate the salt unchanged. The salt dissolves in KOHAg, but no NH_3 is evolved even on heating; when the salt is suspended in water and Cl is passed in, solution is effected; addition of NH_3Ag now ppt. the red form of the salt, and boiling with KOHAg evolves NH_3 and leaves a liquid from which crystals of $\text{PdCl}_2 \cdot 2\text{NH}_3\text{Cl}$ separate. The continued passage of Cl produces $\text{PdCl}_2 \cdot 2\text{NH}_3\text{Cl}$, and finally PdCl_2Ag . 2. A *red salt* of the same composition is obtained by dissolving the yellow salt in conc. HClAg and adding NH_3Ag , also by adding a slight excess of NH_3Ag to a rather dilute cold solution of PdCl_2Ag . The yellow salt is produced by dissolving the red variety in NH_3Ag and adding excess of HClAg; also by heating the red salt to 200° . Jørgensen (Gm.-K. 8, 1242) regarded the red salt as polymeric with the yellow, and gave it the formula $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2\text{Pd}$. The salts may be isomeric, one being $\text{Pd}_2\text{NH}_2\text{CFNH}_2\text{Cl}$ and the other $\text{Pd}_2\text{NH}_2\text{Cl}_2\text{NH}_2$.

Pallados-diammonium hydroxide, $\text{N}_2\text{H}_5\text{Pd}(\text{OH})_2$ (simplest formula $\text{Pd}(\text{OH})_2 \cdot 2\text{NH}_3$ = *di-ammonio-palladium hydroxide*). This base is obtained by decomposing the corresponding chloride with moist Ag_2O in presence of water, or the sulphate with BaOAg; the solution thus obtained is yellowish, odourless, and has a strongly alkaline taste and reaction. The base is obtained as a dirty crystalline mass by evaporating at the ordinary temperature in absence of air. The solid rapidly absorbs CO_2 from the air, forming $\text{N}_2\text{H}_5\text{PdCO}_3$; it is decomposed by heating to somewhat above 100° . The base is sol. water; the solution decomposes NH_3 salts,

and ppts. $\text{CuO} \cdot \text{H}_2\text{O}$ and Ag_2O from solutions of salts of Cu and Ag. The solution may be boiled with very slight change; on boiling with alcohol, Pd is pptd. The other salts of this series which have been described are as follows: M = PdN_2H_5 , — bromide MBr , carbonate MCO_3 , fluoride $\text{MF} (?)$, iodide MI , nitrate $\text{M}(\text{NO}_3)_2$, nitrite $\text{M}(\text{NO}_2)_2$, sulphate MSO_4 , and sulphite MSO_3 .

II. AMMONIUM PALLADOS-DIAMMONIUM COMPOUNDS: $\text{N}_2\text{H}_5(\text{NH}_2)_2\text{PdX}_2$, or perhaps $(\text{NH}_2\text{NH}_2)_2\text{PdX}_2$.

Ammonium pallados-diammonium chloride $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2$; (or $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2$ = *pallado-diamine chloride*, simplest formula $\text{PdCl}_2 \cdot 4\text{NH}_3$ = *tetrammonio-palladium dichloride*). This salt is obtained in large, colourless, monoclinic prisms, with one molecule of water of crystallisation, by evaporating a solution of yellow $\text{N}_2\text{H}_5\text{PdCl}_2$ with excess of NH_3 , or a solution of PdCl_2 in considerable excess of NH_3Ag . Heating the salt to 120° , or adding acid to a solution of the salt, causes formation of yellow $\text{N}_2\text{H}_5\text{PdCl}_2$. Addition of PdCl_2 to a solution of the salt causes pptn. of flesh-red $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2\text{PdCl}_2$ (Kane, Fehling). Treatment of $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2$ with NH_3Cl and *aqua regia* is said to produce $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2\text{PdCl}_2$ (Croft, C. N. 16, 58).

Ammonium pallados-diammonium hydroxide $\text{Pd}(\text{NH}_2\text{NH}_2)_2(\text{OH})_2$; (or $\text{Pd}(\text{NH}_2\text{NH}_2)_2(\text{OH})_2$ = *pallado-diamine hydroxide*; simplest formula $\text{Pd}(\text{OH})_2 \cdot 4\text{NH}_3$ = *tetrammonio-palladium dichloride*). Obtained as a crystalline mass by decomposing a solution in water of the sulphate $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{SO}_4 \cdot \text{H}_2\text{O}$, produced by adding large excess of NH_3Ag to PdSO_4Ag and evaporating with BaOAg, filtering and evaporating. The solution is odourless; it is strongly alkaline, and ppts. hydroxides from solutions of salts of Al, Co, Cu, Fe, and Ni, but not from salts of Ag; it sets NH_3 free from NH_3ClAg . The solution absorbs CO_2 from the air; it is decomposed by boiling with organic matter. If this base is neutralised exactly by acids, salts of the base are obtained, e.g. $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{CO}_3$, $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{SO}_4$, &c.; excess of acid, especially of a haloid acid, causes decomposition into a pallados-diammonium salt and a salt of NH_3 , e.g. $\text{Pd}(\text{NH}_2\text{NH}_2)_2(\text{OH})_2 + 4\text{HClAg} = \text{PdN}_2\text{H}_5\text{Cl} + 2\text{NH}_3\text{ClAg} + 2\text{H}_2\text{O}$. The other salts of this series which have been described are as follows: M = $\text{Pd}(\text{NH}_2\text{NH}_2)_2$, — bromide MBr_2 , and the double compound $\text{MBr}_2\text{PdBr}_2$, carbonate MCO_3 , fluoride $\text{MF} (?)$, iodide MI , nitrate $\text{M}(\text{NO}_3)_2$, double nitrite $\text{M}(\text{NO}_2)_2$, $\text{Pd}(\text{NO}_2)_2$, silicofluoride $\text{MSiF} (?)$, sulphate $\text{MSO}_4 \cdot \text{H}_2\text{O}$, sulphite MSO_3 .

The reactions of such substituted ammonias as NH_2Me , NH_2Et , and NH_2Ph on salts of Pd produce compounds analogous with the ammoniacal bases described above, e.g. *pallados-diethylammonium chloride* $\text{N}_2\text{H}_5\text{Et}_2\text{PdCl}_2$, and *pallados-diphenylammonium chloride* $\text{N}_2\text{H}_5\text{Ph}_2\text{PdCl}_2$, have been described (Müller, A. 86, 341).

The substitution of *tri-ethylarsine* and *tri-ethylphosphine* for ammonia, in the reactions with Pd salts, produces compounds similar to the N-containing bases; e.g. *pallados-diethylphosphonium chloride* $\text{P}_2\text{Et}_3\text{PdCl}_2$.

of H. The other chlorpalladites which have been described are: $\text{PdCl}_2 \cdot 4\text{Cl}_2 \cdot 10\text{H}_2\text{O}$ (Wolkow, B. 7, 803); $\text{BaPdCl}_2 \cdot 6\text{H}_2\text{O}$ (von Bonsdorff, P. 19, 347, 431); $\text{BePdCl}_2 \cdot 6\text{H}_2\text{O}$ (W., l.c.); CdPdCl_2 ; CaPdCl_2 ; MgPdCl_2 ; MnPdCl_2 ; NiPdCl_2 ; ZnPdCl_2 ; $\text{Co}_2\text{Cl}_2 \cdot 10\text{NH}_3 \cdot 2\text{PdCl}_2$ (Gibbs, Am. S. [2] 87, 58); $\text{Co}_2\text{Cl}_2 \cdot 10\text{NH}_3 \cdot 2\text{PdCl}_2$ (Carstensen, Gm.-K. 3, 1254); $\text{PdCl}_2 \cdot \text{Hg}_2\text{Cl}_2 \cdot 5\text{NH}_4\text{Cl}$ (Wilm, B. 18, 1202).

Palladium, bromide of. Only one bromide of Pd is known, and that has not been prepared free from impurities.

PALLADIUM DIBROMIDE PdBr_2 (*Pallados* or *palladoso-bromide*). The brownish solid obtained by dissolving Pd in a mixture of HBrAq and HNO_3Aq , or digesting finely-divided Pd with BrAq , and evaporating, probably has the composition PdBr_2 , but it has not been obtained pure. *Double compounds* of PdBr_2 with bromides of Ba, Mn, K, and Zn have been prepared, but not fully examined, by von Bonsdorff (P. 19, 347, 431); the K salt, K_2PdBr_4 crystallises in thick rhombic forms (Joannis, C. R. 95, 295).

Palladium, chlorides of. Two chlorides of Pd have been isolated, PdCl and PdCl_2 ; a third, PdCl_3 , is known in combination. As none of these chlorides has been gasified, the formulæ are not necessarily molecular (v. PALLADIUM, HALOID COMPOUNDS OF; post). None of the chlorides has been formed by the direct union of Pd and Cl.

PALLADIUM DICHLORIDE PdCl_2 (*Pallados* or *palladoso-chloride*). By dissolving Pd in HClAq , Cl being passed into the liquid or a little HNO_3 being present, evaporating repeatedly with HClAq to remove HNO_3 , and finally concentrating, red-brown prismatic needles of $\text{PdCl}_2 \cdot 2\text{H}_2\text{O}$ are obtained; at a moderate temperature H_2O is given off, and PdCl_2 remains as a black-brown crystalline solid (Kane, T. 1842, 275; Böttger, F. 106, 495). PdCl_2 is also obtained, partly as a sublimate and partly as a garnet-red crystalline residue, by heating Pd in a stream of Cl (Schneider, P. 141, 519). PdCl_2 dissolves in water to form a dark-red liquid, from which some oxychloride, $\text{Pd}_2\text{O}_2\text{Cl}_2$, separates on evaporation. In water containing HCl , PdCl_2 dissolves very readily. The solution is dark brown, and on treatment with bases it gives salts of the form M^+PdCl_4 —*chlorpalladates* (v. infra); this solution may be supposed to contain *pallados-chlorhydric acid* H_2PdCl_4 .

Double salts; chlorpalladates $\text{PdCl}_2 \cdot 2\text{M}^+\text{Cl}$ or M^+PdCl_4 . These salts are obtained by the reaction of various oxides with PdCl_2 in dilute HClAq , or by adding various chlorides to conc. PdCl_2Aq .

Ammonium-palladium dichloride or *Ammonium chlorpalladate* $\text{PdCl}_2 \cdot 2\text{NH}_4\text{Cl}$ or $(\text{NH}_4)_2\text{PdCl}_6$. Olive-green needles with a bronze-coloured lustre; e. sol. water, insol. conc. alcohol. When strongly heated gives residue of finely-divided Pd. Obtained by adding NH_4Cl to PdCl_2Aq containing HCl (Kane, T. 1842, 275; Wilm, B. 18, 1202).

Potassium-palladium dichloride, or *Potassium chlorpalladate* $\text{PdCl}_2 \cdot 2\text{KCl}$ or K_2PdCl_6 . Golden-yellow needles formed by adding KOH to conc. PdCl_2Aq . The crystals are quadratic prisms (Joannis, C. R. 95, 295); they are fairly sol. in cold water, and much more sol. in hot water. Alcohol ppt. the salt from a hot conc. aqueous solution. An aqueous solution boiled with alcohol or SO_2 gives a pp. of Pd; the dry salt is very slowly decomposed by heat to KCl and Pd, the decomposition is slow even in presence of oxalic acid (Rössler, Z. 1866, 175), but rapid in a stream

of H. The other chlorpalladites which have been described are: $\text{PdCl}_2 \cdot 4\text{Cl}_2 \cdot 10\text{H}_2\text{O}$ (Wolkow, B. 7, 803); $\text{BaPdCl}_2 \cdot 6\text{H}_2\text{O}$ (von Bonsdorff, P. 19, 347, 431); $\text{BePdCl}_2 \cdot 6\text{H}_2\text{O}$ (W., l.c.); CdPdCl_2 ; CaPdCl_2 ; MgPdCl_2 ; MnPdCl_2 ; NiPdCl_2 ; ZnPdCl_2 ; $\text{Co}_2\text{Cl}_2 \cdot 10\text{NH}_3 \cdot 2\text{PdCl}_2$ (Gibbs, Am. S. [2] 87, 58); $\text{Co}_2\text{Cl}_2 \cdot 10\text{NH}_3 \cdot 2\text{PdCl}_2$ (Carstensen, Gm.-K. 3, 1254); $\text{PdCl}_2 \cdot \text{Hg}_2\text{Cl}_2 \cdot 5\text{NH}_4\text{Cl}$ (Wilm, B. 18, 1202).

PALLADIUM SUBCHLORIDE PdCl or Pd_2Cl_3 . Small quantities of this chloride are said to be formed, as a dark reddish-brown crystalline solid, when PdCl_2 is heated to redness; the chloride deliquesces in air, and always contains PdCl_2 and Pd (Kane, T. 1842, 285).

PALLADIUM TETRACHLORIDE PdCl_4 (*Palladi-* or *palladic-chloride*). This chloride probably exists in a solution of Pd in *acqua regia*, or of PdO , in conc. HClAq ; the compound has not been isolated. As this solution yields salts of the form M^+PdCl_4 , when treated with various metallic chlorides, it perhaps contains *palladic-chlorhydric acid* H_2PdCl_6 .

Double salts; chlorpalladites $\text{PdCl}_2 \cdot 2\text{M}^+\text{Cl}$ or M^+PdCl_4 . These salts are formed by adding metallic chlorides to a solution of Pd in *acqua regia*, or of PdO , in conc. HClAq , or to a solution of PdCl_2 in HClAq into which Cl has been passed; some of them are also produced by passing Cl into a solution of the corresponding chlorpalladite.

Ammonium-palladium tetrachloride or *Ammonium chlorpalladate* $\text{PdCl}_4 \cdot 2\text{NH}_4\text{Cl}$ or $(\text{NH}_4)_4\text{PdCl}_6$. A bright-red pp. obtained by adding NH_4Cl to conc. PdCl_2Aq saturated with Cl or treated with conc. HNO_3Aq . S.G. 2.18 (Topsoe, J. 1870, 893). Reduced with difficulty; treated with NH_3Aq , N is evolved and $\text{PdCl}_2 \cdot 2\text{NH}_3$ is formed (H. Müller, A. 86, 841).

Potassium-palladium tetrachloride or *Potassium chlorpalladate* $\text{PdCl}_4 \cdot 2\text{KCl}$ or K_4PdCl_6 . A cinnabar-red powder, consisting of small regular octahedra, S.G. 2.738; obtained by mixing KClAq with PdCl_2Aq saturated with Cl, or with Pd in *acqua regia*; also formed by treating $\text{K}_2\text{PdCl}_6\text{Aq}$ with Cl (Topsoe, J. 1870, 893; Croft, C. N. 16, 58). When the aqueous solution is treated with NH_3Aq , N is evolved and K_2PdCl_6 is formed.

The other chlorpalladates which have been described are: $\text{BePdCl}_4 \cdot 6\text{H}_2\text{O}$ (Wolkow, B. 7, 38); $\text{MgPdCl}_4 \cdot 6\text{H}_2\text{O}$ (Topsoe, J. 1870, 898); $\text{NiPdCl}_4 \cdot 6\text{H}_2\text{O}$ (T., l.c.); $\text{ZnPdCl}_4 \cdot 6\text{H}_2\text{O}$ (T., l.c.). Palladium, cyanides of; and Double cyanides; v. vol. II p. 843.

Palladium, fluoride of, PdF_2 . This compound is produced, according to Berzelius, by adding HFAq to conc. $\text{Pd}(\text{NO}_3)_2\text{Aq}$; it is described as a brown pp. scarcely sol. water or HFAq , and as forming double salts with alkali fluorides.

Palladium, haloid compounds of. The haloid compounds of Pd have not been fully investigated. The following table presents the compositions of those which have been isolated:

PdX	PdX_2	PdX_3
PdCl	PdF	PdCl
	PdBr	PdI
		in solution and combination.

The compounds PdX_2 form double salts $\text{PdX}_2 \cdot 2\text{MX} = \text{M}_2\text{PdX}_4$, and PdCl_2 forms $\text{PdCl}_2 \cdot 2\text{MCl} = \text{M}_2\text{PdCl}_4$; the acids H_2PdCl_6 and

H. PdCl, probably exist in solution. The chlorpalladates M. PdCl, are not very easily reduced; the chlorpalladites M. PdCl, are readily oxidised to chlorpalladates. None of the haloid compounds has been gasified; the formulae are the simplest that express the composition, but they are not necessarily molecular. PdBr, is formed by digesting together finely-powdered Pd and Br in presence of water. PdCl, and PdCl, are easily soluble in water; PdBr, PdBr, and PdI, are insoluble or but slightly soluble in water.

Palladium, hydride of. Pd absorbs H very freely. A piece of Pd foil which has been strongly heated in *vacuo* absorbs 6.3 times its volume of H at 90°-97°. When electrolytically ppd. Pd is used as the negative pole in the electrolysis of water, it absorbs 832 vols. H. The physical properties of Pd charged with H make it very probable that a definite compound is formed, and that this compound has the composition Pd.H (for details v. HYDBOGEN, vol. ii. p. 720).

• Palladium, hydroxide of. v. Palladium, oxides and hydrated oxides of.

Palladium, iodide of. PdI. When KIAt is added to PdCl₂Aq or Pd(NO₃)₂Aq, an almost black pp. of PdI₂H₂O is obtained, which loses H₂O in *vacuo* (Laessaigne, *J. Chim. med.* 11, 57). PdI, is scarcely sol. water, alcohol, or ether, slightly sol. HIAq, easily sol. KIAq, from which it is a dark-red deliquescent crystals of potassium iodopalladate, K₂PdI₄, separate on concentration. As PdI, is scarcely sol. water, the ppn. of this salt may be used in the quantitative estimation of I in presence of Cl and Br. PdI, is decomposed to Pd and I at somewhat above 550°; the last traces of I are not removed by heat alone, but by heating in H (Berzelius).

Palladium, oxides and hydrated oxides of. Three oxides have been isolated, PdO, PdO, and PdO₂; another, PdO₂, intermediate between PdO and PdO₂, seems to exist. PdO and PdO₂ seem to form hydrates, but the exact composition of these is not settled. These oxides all react with acids to form salts corresponding with PdO, PdO at the same time forming Pd, and PdO₂ evolving O. It is, however, possible that some salts may be obtained corresponding with PdO₂. All the oxides are reduced to Pd when strongly heated. The examination of the oxides of Pd is very incomplete.

PALLADIUM SUBOXIDE Pd₂O. A black powder obtained by heating to low redness the pp. formed by adding Na₂CO₃ to solution of a salt of PdO (Kane, *T.* 1842. 276), or by heating Pd black in a stream of air (Wilm, *B.* 15, 2225). Decomposed to Pd and O by heating to full redness; reduced by H at ordinary temperatures; reacts with acids to form salts of Pd₂O with separation of Pd.

PALLADIUM MONOXIDE PdO (*Palladous oxide*). A black powder, prepared by heating Pd(NO₃)₂ or by very gently heating a Pd salt with K₂CO₃, or Na₂CO₃, and washing the residue with water. Reduced very easily by H (Wöhler, *A.* 174, 160); gives Pd and O when heated to full redness. Soluble in acids with difficulty, forming salts PdX (X = SO₄, 2NO₃, CO₃, &c.).

Hydrated palladium monoxide. The dark-brown pp. obtained by adding K₂CO₃ or Na₂CO₃ to solution of a salt of PdO was described

by Berzelius as PdO.H₂O, but it may be a basic carbonate; heated to low redness this pp. gives Pd₂O.

PALLADIUM DIOXIDE PdO₂ (*Palladic oxide*). A black powder, obtained by ppg. PdCl₂Aq or K₂PdCl₄Aq with excess of KOHAq, washing and boiling with water, and drying at 100°; also by the action of ozone on compounds of Pd, and by the decomposition of water using Pd as the positive pole (Wöhler, *A.* 146, 375; Mailfert, *C. R.* 84, 860, 1184). At low red heat gives PdO and O, and at a higher temperature all O is given off. Treated with dilute HClAq, gives PdCl₂Aq and Cl, with conc. HClAq, probably forms PdCl₄. No corresponding salts have been isolated with certainty.

Hydrated palladium dioxide. The pp. obtained by adding excess of KOHAq to PdCl₂Aq or K₂PdCl₄Aq is probably PdO₂.H₂O, but the exact composition of this pp. is not known.

PALLADO-PALLADIC OXIDE Pd₂O₃ = 4PdO.PdO. According to Schneider (P. 141, 519), an oxide of this composition is obtained by melting K₂PdS₂ or Na₂PdS₂ with KNO₃ and KOH, washing with water, and treating the residue with *aqua regia*. It is described as a dull-brown powder, which gives off all its O when heated to redness in air, and is reduced by H at the ordinary temperature.

• Palladium, salts of. Compounds obtained by replacing hydrogen of acids by Pd. All the salts of Pd which have been isolated with certainty correspond with the oxide PdO; the salts of Pd are generally obtained by dissolving Pd in the various acids, with a little HNO₃Aq added, or in some cases by double decomposition from PdCl₂Aq or Pd(NO₃)₂Aq. Only a very few salts have been examined; besides the salts of the haloid acids, the carbonate, nitrate, nitrite, sulphate, and sulphite have been isolated (v. CARBONATES &c.). PdCl₂, corresponding with PdO₂, probably exists in solution, and several compounds of this salt—the chlorpalladates—have been obtained (v. Palladium tetrachloride, p. 705).

Palladium, selenide of. PdSe. A grey infusible solid, resembling osmium, with which it is perhaps isomorphous (Bösler, *A.* 180, 244); formed by heating together Pd and Se (Berzelius).

Palladium, sulphides of. Three sulphides are known, corresponding with the three oxides. The highest sulphide, PdS₂, reacts with sulphides of more positive elements as a sulphanyhydride, forming sulpho-palladates M.PdS₂.

PALLADIUM SUBSULPHIDE Pd₂S. A grey, hard solid; S.G. 7.803 at 15°. Prepared by fusing together, for 15-20 minutes over a blow pipe, 100 parts yellow H₂PdCl₂ (p. 794), or 5 parts PdS, with 6 parts dry K₂CO₃, or Na₂CO₃, 6 parts S, and 3 parts NH₄Cl; the fused mass is treated with water, and the lustrous blue-violet crystals of K₂Pd₂S₂, which are mixed with the Pd₂S, are removed by agitating with water. Pd₂S is very stable; it is not acted on by acids, scarcely by *aqua regia*, melts at a red heat without change, loses S slowly when very strongly heated (Schneider, P. 141, 519).

PALLADIUM MONOSULPHIDE PdS (*Palladous sulphide*). Obtained by heating Pd, or certain

Pd salts, with S; also by ppg. a salt of PdO by H₂S. Prepared in the dry way, PdS forms a blue-white, lustrous, metal-like, very hard solid; prepared in the wet way, it is a black powder. Heated in air, slowly oxidises to a basic sulphate; heated in Cl forms PdCl₂ and S₂Cl₂ (Göllenberg, P. 50, 65). A colloidal soluble form of PdS was obtained by Winssinger (Bl. [2] 49, 452) by ppg. from an extremely dilute solution and dialysing.

PALLADIUM SULPHIDE PdS, (*Palladic sulphide*). A dark-brown powder, scarcely acted on by HNO₃, aqueous soluble *aqua regia* without separation of S (Schneider, P. 141, 519); heated in a stream of CO₂ forms PdS and then Pd₂S. Obtained by decomposing solution of a sulphopalladate by dilute HClAq. and washing the pp.: e.g.

$\text{Na}_2\text{PdS}_2\text{Aq} + 2\text{HClAq} = 2\text{NaClAq} + \text{PdS} + \text{H}_2\text{S}$. This sulphide reacts as an acid anhydride with the sulphides of several of the more positive metals.

Sulphopalladates. These salts belong to two series, M_2PdS_2 and $\text{M}_2\text{Pd}_2\text{S}_3 = \text{M}_2\text{PdS}_2 \cdot \text{Pd}_2\text{S}_3$ (Schneider, P. 141, 519; 148, 625).

Sodium sulphopalladate Na₂PdS₂ (*Sodium-palladium sulphide*). This salt has not been obtained pure; as prepared by fusing 1 part N₂H₄Pd₂Cl₂ (p. 794), or 5 part PdS, with 6 parts dry Na₂CO₃, and 6 parts S, to a redness, and washing the residue with water, it forms reddish-brown needles, which dissolve in water to form a brown liquid decomposed by HClAq with ppp. of PdS.

Silver sulphopalladate Ag₂PdS₂. A black-brown powder obtained by adding the Na salt to an alcoholic solution of AgNO₃.

The members of the other series of sulphopalladates, $\text{M}_2\text{Pd}_2\text{S}_3$, may be looked on as double compounds of M_2PdS_2 and Pd₂S, or as the salts of a hypothetical sulphopalladic acid H₂Pd₂S₃. These salts may perhaps be termed *meta-sulphopalladates*.

Potassium meta-sulphopalladate, K₂Pd₂S₃, or K₂PdS₂Pd₂S₃. Formed by melting 2 parts N₂H₄Pd₂Cl₂ (p. 794), or 1 part PdS, with 12 parts K₂CO₃, and 12 parts S, at a red heat, and washing the fused mass with water (Schneider, P. 141, 519). Six-sided, blue-violet, metal-like crystals; insol. water, treated with HClAq, K is removed but no H₂S is evolved, and the crystals become steel-grey; perhaps H₂Pd₂S₃ may be formed, but if so this soon decomposes, and a sulphide, said to be Pd₂S₃, remains (Schneider, P. 141, 625). Another compound, which may perhaps be K₂Pd₂S₃ (corresponding with the hypothetical acid Pd(SH)₃), is formed, along with Pd, by heating in H.

Silver meta-sulphopalladate Ag₂Pd₂S₃, or Ag₂PdS₂Pd₂S₃. A white-grey, lustrous, crystalline pp. obtained by treating the K salt with an alcoholic solution of AgNO₃.

Palladium, sulphocyanides of, v. vol. ii. p. 850.

Palladium, thio-salts of, v. *Sulphopalladates* under *Palladium, sulphides of*, supra.

M. M. P. M.

PALM OIL. Extracted from the fruit of *Elais guineensis*. Soft orange mass containing palmitic and oleic acids and their glycerides (Pelouze & Boudet, A. 29, 43; Guibourt, v. *Chim. Med.* 1, 177; Henry, J. Ph. 51, 241).

From palm kernels an oil is obtained containing the glycerides of oleic, stearic, palmitic, myristic, lauric, decolic, ooleic, and hexoic acids (Oudemans, J. pr. [2] 8, 893).

PALMELLIN. A substance resembling hæmoglobin, which occurs in *Palmella cruenta*, a red fungus (Phipson, C. R. 89, 316, 1078; C. N. 41, 216).

PALMITIC ACID C₁₆H₃₂O₂. Mol. w. 256. [60-75°] (Reissert, B. 23, 2248). (271-5° i.v. at 100 mm.) (Kraft, B. 12, 1670; 16, 1721). (839°-856°) (Carnelley & Williams, B. 12, 1360). S.G. (liquid) 0.853. S. (alcohol) 9.2 at 19.5° (C. a. S.). H.O. (solid) 2,371.783 (Lougumaine, A. Ch. [6] 17, 223). Occurs as glyceride in a very large number of animal and vegetable fats and fixed oils (Chevreul, *Recherches sur les corps gras*; Fremy, A. 36, 44; Stenhouse, A. 36, 50; Sthamer a. Meyer, A. 43, 835; Schwarz, A. 60, 69; Heintz, A. 80, 299; 88, 298; 92, 291; von Böck, J. pr. 49, 295; Berthelot, A. Ch. [3] 41, 216, 402; 47, 297; Maskelyne, C. J. 8, 1). Its myricyl ether occurs in bees-wax (Brédie, A. 71, 150), and in human fat (Heintz), and its cetyl ether in spermaceti (L. Smith, A. 42, 241). Occasionally occurs in the free state, as in palm oil, and in *Lygodium* spores (Langer, Ar. Ph. [3] 27, 625).

Formation.—1. By saponification of palmitin, spermaceti, and melissin.—2. By heating cetyl alcohol with potash-lime (Bumag a. Stas, A. Ch. [2] 73, 113).—3. Together with acetic acid by fusing oleic or elaidic acid with potash (Varentz, A. 85, 209).—4. By saponifying bird-lime with alcoholic potash (Divers a. Kawakita, C. J. 53, 271).—5. By saponifying the wax of *Myrica cerifera* (Chittenden a. Smith, A. 6, 217).

Preparation.—1. Japanese wax (3 pfs.) is saponified with KOH (1 pt.) and water (1 pt.), the solution ppd. by HClAq. and the acid rectified *in vacuo* (Kraft, B. 21, 2265).—2. The fatty acids obtained by saponifying fats are dissolved in alcohol, and fractionally ppd. with an alcoholic solution of lead acetate or a conc. aqueous solution of barium or magnesium acetate (v. vol. i. p. 56).

Properties.—Small hard crystals (from alcohol), insol. water, v. sol. boiling alcohol and ether. Slightly decomposed on distillation. Chlorination, in presence of SbCl₅, yields OCl₂, C₂Cl₄, and C₃Cl₈ [224°] (Hartmann, B. 24, 1018). Oxidation by alkaline KMnO₄ yields oxalic, succinic, adipic, acetic, butyric, hexoic, oxyvaleric, and dioxypalmitic acids (Gröger, M. G. 4, 486). Oxidation by nitric acid (S.G. 1-36) yields succinic and glutaric acids (Garrett, C. R. 102, 692). The Ba salt distilled with NaOMe yields pentadecane (Mai, B. 22, 2188).

Salts.—(NH₄)HA.—KA': pearly scales (from alcohol), insol. ether. Dissolves in a small quantity of water, but a larger quantity ppts. KHA', which crystallises from alcohol in pearly scales [100°] (Schwarz).—NaA'. Lamine.—NaHA'. Got by adding hot water (1500 pts.) to NaA'. Insol. water, v. sol. hot alcohol.—BaA'. S. (alcohol) 0.0035 at 20°. Pearly crystalline powder.—CaA'. S. (alcohol) 0.103 at 20°.—MgA'. [120°] (H).—PhA'. [120°]. Powder.—CuA': greenish-blue powder.—AgA': amorphous, sl. sol. water. Blackened by light.

Methyl ether MeA'. [28°] (Berthelot).

Ethyl ether EtA' . [24°] (Heints).
Isomyl ether $\text{C}_5\text{H}_{11}\text{A}'$. [9°] (Berthelot); [18-6°] (Duffy, *C. J. & S.*, 814). Waxy.

Octyl ether $\text{C}_8\text{H}_{17}\text{A}'$. [8-6°]. Formed from the octyl alcohol of castor oil.

Dodecyl ether $\text{C}_{12}\text{H}_{25}\text{A}'$. [41°] (K.).

Tetradecyl ether $\text{C}_{14}\text{H}_{29}\text{A}'$. [48°].

Hexadecyl ether $\text{C}_{16}\text{H}_{33}\text{A}'$. [54°] (Kraft, *B.* 16, 8028). Probably identical with the *cetyl ether* $\text{C}_{18}\text{H}_{37}\text{A}'$ [49°], which is the chief component of spermaceti, from which it is prepared by crystallisation from boiling alcohol.

Octadecyl ether $\text{C}_{18}\text{H}_{39}\text{A}'$. [59°].

Ceryl ether $\text{C}_{20}\text{H}_{41}\text{A}'$. [79°]. The chief constituent of poppy wax (Hesse, *B.* 3, 630).

Myricyl ether $\text{C}_{20}\text{H}_{41}\text{A}'$. [72°]. The constituent of bees-wax that is insoluble in alcohol (Brodie, *A.* 71, 159).

Glyceryl derivatives or Palmitins v. vol. ii. p. 621.

Phenyl ether $\text{C}_6\text{H}_5\text{A}'$. [45°]. (250° at 15 mm.) (Kraft & Burger, *Z.* 17, 1879).

p-Tolyl ether $\text{C}_6\text{H}_4\text{A}'$. [47°]. (258° at 15 mm.).

Chloride $\text{C}_{16}\text{H}_{33}\text{OCl}$. [c. 120°]. (192-5° at 15 mm.) (Kraft & Bürger).

Amide $\text{C}_{16}\text{H}_{31}\text{CONH}_2$. [107°]. Formed by the action of NH_3 on the chloride or ether, and also by heating tetradecyl-malonic amide (Carlet, *Bl.* 1859, 175; Kraft & Stauffer, *B.* 15, 1730; Hell & Jordanoff, *B.* 24, 990).

Anilide $\text{C}_{16}\text{H}_{29}\text{CONHPh}$. [90-5°]. (283° at 17 mm.). Made by boiling palmitic acid with excess of aniline (Hell & Jordanoff, *B.* 24, 943). Silky needles (from alcohol), v. e. sol. ether.

Anhydride $(\text{C}_{16}\text{H}_{31}\text{O})_2$. [64°] (Villier, *B.* 9, 1932).

Nitrile $\text{C}_{16}\text{H}_{31}\text{CN}$. [31°]. (252° at 100 mm.). S.G. $\frac{4}{4}$ 8186; $\frac{100}{4}$ 776. Formed by distilling the amide with P_2O_5 (K. a. S.), and also by heating cyano-palmitic acid (H. a. J.). Six-sided tables. Reduced by alcohol and sodium to hexadecylamine (Kraft, *B.* 22, 811).

References.—DI-BROMO-PALMITIC ACID and HEXADECANOIC ACID.

PALMITIC ALDEHYDE $\text{C}_{16}\text{H}_{32}\text{O}$. [58°]. (193° uncor. at 22 mm.). Prepared by distilling a mixture of calcium palmitate and calcium formate (Kraft, *B.* 13, 1416; 16, 1714). Plates, sl. sol. ether. Combines with NaHSO_4 .

Palmitic aldehyde $\text{C}_{16}\text{H}_{32}\text{O}$. [47°]. S. (alcohol) 64 at 16°; 12 at 78°. S. (ether) 16 at 16°. Got by oxidation of cetyl alcohol with chromic acid mixture (Fridau, *A.* 83, 23; Dollfus, *A.* 187, 287). Crystalline.

PALMITIN v. GLYCERIN.

PALMITOLIC ACID $\text{C}_{17}\text{H}_{34}\text{O}_2$. Mol. w. 252. [42°]. Formed by the action of alcoholic potash at 180° on di-bromo-palmitic acid (Schröder, *A.* 143, 22). Silky needles (from alcohol), insol. water, v. sol. ether. Br forms $\text{C}_{17}\text{H}_{33}\text{BrO}_2$ and $\text{C}_{17}\text{H}_{33}\text{Br}_2\text{O}_2$. Fuming nitric acid oxidises it to suberic acid and suberic aldehyde. — BaA' . — AgA' : amorphous powder blackened by light.

Reference.—BROMO-PALMITOLIC ACID.

PALMITONE $(\text{C}_{17}\text{H}_{33})_2\text{CO}$. *Di-pentadecyl ketone*. [83°]. S.G. $\frac{4}{4}$ 299; $\frac{100}{4}$ 794. Formed by distilling calcium or barium palmitate with lime (Piria, *C. R.* 84, 140; Maskelyne, *C. J.* 8, 1; Kraft, *B.* 16, 1714). Got also by heating palmitic acid with P_2O_5 at 210° (Kipping, *C. J.*

87, 986). Silvery plates, v. sol. alcohol and benzene. Does not unite with NaHSO_4 (Limpricht, *A.* 94, 246). Bromine forms $\text{C}_{17}\text{H}_{33}\text{Br}_2\text{O}$ [55°] (Herez, *A.* 186, 269).

Oxim $(\text{C}_{17}\text{H}_{33})_2\text{C:NOH}$. [59°]. Needles.

PALMITOXYLIC ACID $\text{C}_{17}\text{H}_{34}\text{O}_3$. [87°]. Formed, together with suberic acid and suberic aldehyde by the action of fuming HNO_3 on palmitic acid (Schröder, *A.* 143, 35). Laminæ (from alcohol), insol. water, v. sol. ether. — AgA' : white pp., turned violet by light.

PANAQUILONE $\text{C}_{20}\text{H}_{40}\text{O}_8$. Occurs in the root of *Panax quinquefolius* (Garrigues, *A.* 90, 231). Amorphous powder, v. sol. water and alcohol, insol. ether. Has a bitter-sweet taste. Its solution is ppd. by tannin. H_2SO_4 forms a purple solution from which water ppts. panacone $\text{C}_{17}\text{H}_{34}\text{O}$, (?) a crystalline powder. HClAq also forms CO_2 and panacone on heating.

PANICOLE $\text{C}_{17}\text{H}_{34}\text{O}$ i.e. $\text{C}_{17}\text{H}_{33}\text{OMe}$. [285°]. A crystalline substance in oil of millet (Kassner, *Ar. Ph.* [2] 25, 895; 26, 586), HClAq at 160° forms MeCl and $\text{C}_{17}\text{H}_{33}\text{O}$ [78°].

PAPAIN v. PROTEIDS.

PAPAVERINE $\text{C}_{17}\text{H}_{21}\text{NO}_4$.

$\text{C(OMe):CH.C.CH:CH}_2$
 $\text{C(OMe):CH.C} \quad \text{C.CH}_2\text{C}_6\text{H}_4\text{(OMe)[1:8:4]}$
 (Goldschmidt, *M.* 9, 330, 849). [147°]. S. (ether) 4 at 10°. Occurs in opium (Merck, *A.* 66; 125; 73, 50; Anderson, *T. E.* 21 Pt. 1; Hesse, *A.* 153, 75; *Suppl.* 8, 261; *Z.* [2] 7, 641).

Preparation.—1. The aqueous extract of opium is ppd. with Na_2CO_3 , the pp. dissolved in ether and shaken with dilute HOAc . The acetic acid solution is ppd. by NaOH . The pp. digested with oxalic acid solution yields crystalline papaverine oxalate. It is better, however, to dissolve the pp. in acetic acid, remove the base by tartaric acid, ppt. the mother-liquor with ammonia, wash the pp. with alcohol, and then treat with oxalic acid. The oxalate is recrystallised from hot water, ppd. by CaCl_2 , the filtrate ppd. by NH_3 , and the papaverine recrystallised from alcohol (Hesse).—2. A solution of the hydrochlorides of the opium bases is ppd. with conc. NaOAc . The pp., consisting of narcotine and papaverine, is dissolved in HClAq , and diluted till it contains only 25 p.c. of narcotine. K_2FeCy_4 is then added and, after 24 hours, the pp. of papaverine ferricyanide is collected and decomposed by NaOH (Plügge, *Ar. Ph.* [3] 26, 343).

Properties.—Trimetric prisms (from ether-alcohol); $\alpha:b:c = 32:1:42$. Narcotic. Nearly insol. hot water, v. sol. hot alcohol and chloroform, m. sol. hot benzene. Cannot be sublimed. Inactive to light (Goldschmidt, *M.* 9, 42). Conc. H_2SO_4 forms a colourless solution, becoming dark-violet on warming. On adding dilute H_2SO_4 , HCl , or HNO_3 to a solution of papaverine in acetic acid, the sulphate, hydrochloride, or nitrate is ppd. A solution of papaverine in conc. H_2SO_4 gives a pp. of sulphate on adding water. Papaverine is a weak base; its solutions do not affect litmus. With ammonium selenite dissolved in conc. H_2SO_4 , it gives a bluish colour changing to red (Ferreira da Silva, *Bl.* [3] 6, 67; *C. R.* 119, 126).

Reactions.—1. *Potash-fusion* yields methylamine, $\text{C}_{17}\text{H}_{33}\text{Me(OMe)[1:8:4]}$, and protocatechic acid (Goldschmidt, *M.* 4, 704; 6, 909).—2. *Yields*

with HClAq. — 5. Aqueous KMnO_4 oxidises it to papaveric, veratric, hemipic, pyridine (a)-tri-carboxylic, dimethoxy, sinchonic, dimethoxy-phthalic, and oxalic acids, hemipic iso-imide NH_2 , papaveraldine and CO_2 . Papaveric acid (*q. infra*) is the main product (Goldschmidt, *M.* 6, 372; 8, 510).

Salts.— $\text{B}^+\text{H}^-\text{Cl}$. [220°]. *S.* 2.7 at 18°. Large monoclinic crystals; *a:b:c* = 83:1:58; β = 92° 20' (Foullon, *M.* 6, 675).— $\text{B}^+\text{H}^-\text{Cl}$. 2aq. [198°].— $\text{B}^+\text{H}^-\text{ZnCl}_2$: white, dimetric crystals; *a:c* = 1:84.— $\text{B}^+\text{H}^-\text{ZnCl}_2$: plates (from alcohol).— $\text{B}^+\text{H}^-\text{CdCl}_2$. [176].— $\text{B}^+\text{H}^-\text{CdCl}_2$. [185°] (Jahoda, *M.* 7, 506).— $\text{B}^+\text{H}^-\text{CdCl}_2$. [180°].— $\text{B}^+\text{H}^-\text{HgCl}_2$: triclinic prisms.— $\text{B}^+\text{H}^-\text{Br}$. [214°]. Monoclinic crystals; *a:b:c* = 88:1:58; β = 92° 60'.— $\text{B}^+\text{H}^-\text{I}$. [200°]. Monoclinic, sometimes isomorphous with the hydrochloride, but when crystallised from alcohol *a:b:c* = 1:81:2:12; β = 91°.— $\text{B}^+\text{H}^-\text{I}$. Purple, monoclinic prisms.— $\text{B}^+\text{H}^-\text{I}$: thin reddish needles.— $\text{B}^+\text{H}^-\text{HgI}$.— $\text{B}^+\text{H}^-\text{NO}_3$: monoclinic tables; *a:b:c* = 82:1:55; β = 94° 9'.— $\text{B}^+\text{H}^-\text{SO}_4$: monoclinic prisms; *a:b:c* = 83:1:38; β = 92° 29'.— $\text{B}^+\text{H}^-\text{Cr}_2\text{O}_7$. Flat orange needles.— $\text{B}^+\text{H}^-\text{C}_2\text{O}_4$. *S.* 26 at 10°. Prisms.— $\text{B}^+\text{H}^-\text{C}_2\text{H}_3\text{N}_3\text{O}_6$. [79°]. Golden tables (from alcohol).—Succinate $\text{B}^+\text{H}^-\text{C}_4\text{H}_4\text{O}_4$. [171°].—Benzoyl $\text{B}^+\text{H}^-\text{C}_6\text{H}_5\text{O}_2$. [145°].—Salicylate $\text{B}^+\text{H}^-\text{C}_7\text{H}_5\text{O}_3$. [130°].—Meconate $\text{B}^+\text{H}^-\text{C}_8\text{H}_7\text{O}_4$ aq. prisms, sl. sol. alcohol.—Ferrocyanide $\text{B}^+\text{H}^-\text{FeC}_6$ (Plugge, *Ar. Ph.* [3] 25, 793).

Methylo-iodide B^+MeI 4aq. Melts at 195° when anhydrous; 55°–60° when hydrated. Insol. ether, sol. water and alcohol. Moist Ag_2O forms a caustic hydrate, capable of giving a carbonate (Claus, *J. pr.* [2] 38, 496; Goldschmidt, *M.* 10, 673). The following compounds have been prepared from the methylo-iodide (Stransky, *M.* 9, 751): B^+MeOH 2aq. Melting at 215° when anhydrous, B^+MeCl (75°), $\text{B}^+\text{Me}_2\text{PtCl}_2$ 8aq, $\text{B}^+\text{Me}_2\text{Cr}_2\text{O}_7$ (85°), and the picrate $\text{B}^+\text{MeO}_2\text{C}_6\text{H}_3\text{N}_3\text{O}_6$. [205°].

Ethyl-bromide B^+EtBr 4aq. [140°–145°] (Goldschmidt, *M.* 6, 667) or B^+EtBr 4aq. [111°] (Claus a. Huetlin, *B.* 18, 1576). Trimetric needles; *a:b:c* = 70:1:64. Boiling KOHAq forms the alkaline oxide ($\text{B}^+\text{Et}_2\text{O}$), sl. sol. cold water.

Ethyl-chloride B^+EtCl 4aq: prisms. [80°]. Gives $\text{B}^+\text{Et}_2\text{PtCl}_2$ 8aq [223°].

Ethyl-iodide B^+EtI . [216°].

Ethyl-nitrate B^+EtNO_3 8aq. Prisms.

Ethyl-chromate $\text{B}^+\text{Et}_2\text{Cr}_2\text{O}_7$. [78°].

Ethyl-picrate $\text{B}^+\text{EtO}_2\text{C}_6\text{H}_3\text{N}_3\text{O}_6$. [175°].

Benzyl-chloride $\text{B}^+\text{C}_6\text{H}_5\text{Cl}$ 4aq. [165°]. KMnO_4 oxidises it to veratric acid, benzyl-papaveraldine, papaveraldine, and hemipic-iso-benzyl-imide. Aqueous (20 p.c.) KOH forms benzyl-imide. Aqueous ($\text{B}^+\text{C}_6\text{H}_5$) $_2\text{O}$ [165°].— $\text{B}^+\text{C}_6\text{H}_5$ (C_6H_5) $_2\text{PtCl}_2$: crystalline pp.— $\text{B}^+\text{C}_6\text{H}_5$ (C_6H_5) $_2\text{Cr}_2\text{O}_7$ [185°].— $\text{B}^+\text{C}_6\text{H}_5$ (C_6H_5) $_2\text{Cr}_2\text{O}_7$. [85°].

o-Nitro-benzyl-chloride $\text{B}^+\text{C}_6\text{H}_4(\text{NO}_2)\text{Cl}$. Crystallises with 4aq, 6aq, and 8aq (Seutter, *M.* 9, 859).—($\text{B}^+\text{C}_6\text{H}_4(\text{NO}_2)\text{Cl}$) $_2\text{PtCl}_2$: crystalline pp.— $\text{B}^+\text{C}_6\text{H}_4(\text{NO}_2)\text{NO}_3$ 11aq: prisms.—($\text{B}^+\text{C}_6\text{H}_4(\text{NO}_2)$) $_2\text{Cr}_2\text{O}_7$: yellow prisms.— $\text{B}^+\text{C}_6\text{H}_4(\text{NO}_2)\text{C}_6\text{H}_4\text{N}_3\text{O}_6$: yellow prisms (from alcohol).

Phenyl-bromide $\text{B}^+\text{C}_6\text{H}_5\text{Br}$ 2aq. Efflorescent pyramids (Seutter, *M.* 9, 1035). Forms the derivatives: $\text{B}^+\text{C}_6\text{H}_5\text{BzCl}$ 6aq: yellow

needles.—($\text{B}^+\text{C}_6\text{H}_5\text{Bz}$) $_2\text{PtCl}_2$.— $\text{B}^+\text{C}_6\text{H}_5\text{BzNO}_3$ 2aq.—($\text{B}^+\text{C}_6\text{H}_5\text{Bz}$) $_2\text{Cr}_2\text{O}_7$ and $\text{B}^+\text{C}_6\text{H}_5\text{BzC}_6\text{H}_4\text{N}_3\text{O}_6$ [182°]. An aqueous solution of the phenacyl-bromide gives with dilute NaOH aq a pp. $\text{B}^+\text{C}_6\text{H}_5\text{BzOH}$, whence boiling alcohol produces ($\text{B}^+\text{C}_6\text{H}_5\text{Bz}$) $_2\text{O}$ [188°], crystallising in colourless needles.

Tetrahydride $\text{C}_{20}\text{H}_{22}\text{NO}_4$. [201°]. Made by reducing papaverine with tin and HCl (Goldschmidt, *M.* 7, 497). Small prisms from dilute alcohol), m. sol. hot water, sl. sol. ether.— $\text{B}^+\text{H}^-\text{Cl}$ 8aq [290°]. Monoclinic needles, with very bitter taste; causes albuminuria when injected internally.—**Salts:** $\text{B}^+\text{H}^-\text{PtCl}_2$ 8aq.— $\text{B}^+\text{H}^-\text{SO}_4$ 7aq.— $\text{B}^+\text{H}^-\text{C}_2\text{O}_4$ 7aq.— $\text{B}^+\text{H}^-\text{C}_2\text{H}_3\text{N}_3\text{O}_6$. [270°]. Yellow needles, v. sl. sol. alcohol.

Bromo-papaverine $\text{C}_{20}\text{H}_{22}\text{BrNO}_4$. [145°]. Got by adding bromine-water to a solution of papaverine hydrochloride. Monoclinic crystals, insol. water, v. sl. alcohol and ether.— $\text{B}^+\text{H}^-\text{Br}$.

Nitro-papaverine $\text{C}_{20}\text{H}_{22}\text{N}_2\text{O}_8$ aq. [168°]. *S.* (ether) 0.3 at 12°. Made by boiling papaverine with dilute nitric acid (S.G. 1.06) (Hesse, *A. Suppl.* 8, 292). Pale-yellow prisms (from dilute alcohol). Violently decomposes when quickly heated.—**Salts:** $\text{B}^+\text{H}^-\text{Cl}$ 11aq. *S.* 35 at 16°.— $\text{B}^+\text{H}^-\text{PtCl}_2$.— $\text{B}^+\text{H}^-\text{I}$: v. sl. sol. hot water.— $\text{B}^+\text{H}^-\text{NO}_3$ aq.— $\text{B}^+\text{H}^-\text{SO}_4$ 8aq.— $\text{B}^+\text{H}^-\text{C}_2\text{O}_4$ 2aq: yellow prisms, v. sl. sol. water.

Papaveraldine $\text{C}_{20}\text{H}_{22}\text{NO}_4$. [4:8:1] $\text{C}_6\text{H}_5(\text{OMe})_2\text{CO}_2\text{C}_6\text{H}_4(\text{OMe})_2\text{N}$. [210°]. Made by oxidation of papaverine with KMnO_4 and dilute H_2SO_4 (Goldschmidt, *M.* 6, 954; 7, 486). Yellowish crystalline powder (from alcohol), insol. water and alkalis, v. sol. hot HOAc . H_2SO_4 gives a red colour, changing to dark violet on warming. Potash-fusion splits it up into veratric acid and dimethoxyisoquinoline. Tin and HCl reduces it to papaverine tetrahydride.— $\text{B}^+\text{H}^-\text{NO}_3$ 2aq: lemon-yellow needles.— $\text{B}^+\text{H}^-\text{Cl}$ 2aq: yellow crystals, decomposed by water.— $\text{B}^+\text{H}^-\text{PtCl}_2$ aq: orange prisms. $\text{B}^+\text{H}^-\text{SO}_4$.— $\text{B}^+\text{C}_6\text{H}_5\text{N}_3\text{O}_6$. [209°].

Methylo-iodide B^+MeI 8aq. [185°].

Ethyl-bromide B^+EtBr 8aq [above 270°].

Benzyl-hydroxide $\text{B}^+\text{C}_6\text{H}_5\text{OH}$ or its anhydride ($\text{B}^+\text{C}_6\text{H}_5$) $_2\text{O}$ is a product of the oxidation of papaverine benzyl-chloride by dilute (2 p.c.) KMnO_4 at 45° (Goldschmidt, *M.* 9, 327). It crystallises from boiling water or alcohol in slender colourless needles [184°], converted by boiling HClAq into papaveraldine.

Quin $\text{C}_{20}\text{H}_{22}\text{NO}_4(\text{NOH})$. [245°]. White needles, sol. hot benzene.

Phenyl-hydroxide $\text{C}_6\text{H}_5\text{NO}_4(\text{NHPH})$. [81°]. Reddish-yellow nodules (from alcohol).

Papaveroline $\text{C}_{20}\text{H}_{22}\text{NO}_4$. *t.s.* [4:8:1] $\text{C}_6\text{H}_5(\text{OH})_2\text{CH}_2\text{C}_6\text{H}_4(\text{OH})_2\text{N}$. Formed by boiling papaverine (3 pts.) with HClAq (25 pts. of S.G. 1.96) and red P for 10 hours (G.; Krauss, *M.* 1, 851). White crystalline powder (containing 2 aq), insol. water, m. sol. alcohol, sl. sol. ether, v. sol. acids. Yields (a)-methyl-isoquinoline on distillation with zinc dust.—**Salts:** $\text{B}^+\text{H}^-\text{Cl}$: white needles.— $\text{B}^+\text{H}^-\text{SO}_4$ 8aq.— $\text{B}^+\text{H}^-\text{I}$ 2aq.— $\text{B}^+\text{H}^-\text{C}_2\text{O}_4$ 8aq: needles, m. sol. hot water.

Papaveric acid $\text{C}_{20}\text{H}_{22}\text{NO}_8$. *t.s.* [238°]. Formed by oxidising papaverine with KMnO_4 (Goldschmidt, *M.* 6, 880; 10, 158, 691). Miny-

right-angled tables (containing aq.), al. sol. water, alcohol, and ether, m. sol. dilute alcohol. Its solutions are acid in reaction. Decomposes on fusion into CO_2 and pyropapaveric acid $\text{C}_{10}\text{H}_7\text{NO}$. [280°]. Potash-fusion forms protocatechuic acid.

Salts.— KHA' 2½aq.: white leaflets, v. d. sol. water. — KHA' aq.: needles. — CaA' 1½aq. — BaA' . — CuA' (OH), 6aq. — $\text{Ag}_2\text{A}'$ 2½aq. — $\text{AgH}_2\text{A}'$, aq. — $\text{HA}'\text{HCl}$ 2½aq.: yellow needles.

Anhydride. [170°]. Got by boiling papaveric acid with Ac_2O (Goldschmidt, *M.* 10, 159).

Mono-ethyl ether EAHA' . [188°]. Got by boiling the ar hydride with alcohol. Converted by NH_4Aq into the amic acid.

Oxim $\text{O}_2\text{H}_7\text{NO}(\text{NOH})$. [a. 156°]. Small needles (from alcohol) (Goldschmidt, *M.* 10, 62°).

Phenyl-hydraside $\text{C}_{10}\text{H}_7\text{NO}(\text{NHPH})$. [190°]. Yellow needles (from dilute alcohol).

Nitro-papaveric acid $\text{C}_{10}\text{H}_7(\text{NO}_2)\text{NO}$. [215°]. Formed by dissolving papaveric acid in conc. HNO_3 . Golden needles (containing aq.). — $\text{Ag}_2\text{A}'$.

Pyropapaveric acid $\text{C}_{10}\text{H}_7\text{NO}$. [280°]. Formed by fusing papaveric acid. Minute white leaflets. — CaA' , 4aq.: groups of needles. — BaA' , 4aq. — $\text{HA}'\text{HCl}$ aq.: orange-red needles. — AgA' : crystalline pp.

Oxim $\text{O}_2\text{H}_7\text{N}_2\text{O}$. [226°]. Needles (from alcohol). — $\text{B}'\text{HCl}$ aq.: yellow needles.

Phenyl-hydraside $\text{C}_{10}\text{H}_7\text{NO}(\text{NHPH})$. [223°]. Yellow prisms. — $\text{B}'\text{HCl}$.

PARAVEROSINE. An alkaloid in dried poppy heads of *Papaver somniferum* (Desshamps, *A. Ch.* [4] 1, 453). Nacreous needles (from alcohol). Coloured red by H_2SO_4 .

PAPAYOTIN. An amorphous hygroscopic powder ppd. by adding alcohol to an aqueous extract of the juice of *Carica papaya* (Peckholt, *Ph.* [8] 10, 843). It has an astringent, slightly sweet taste.

PARABANIC ACID $\text{C}_6\text{H}_7\text{N}_2\text{O}_4$, i.e.

$\text{CO} \begin{smallmatrix} \text{NH} \cdot \text{CO} \\ \text{NH} \cdot \text{CO} \end{smallmatrix}$ Oxalyl-urea. Mol. w. 114. S. 47 at 8°. H.C. 212,700. H.F. 2,200 (Matignon, *C. R.* 118, 198).

Formation.—1. By dissolving uric acid (1 pt.) in nitric acid (7 pts. of S.G. 1.3) at 70° and evaporating to a syrup, when parabanic acid crystallises out on cooling (Liebig a. Wöhler, *A.* 26, 285; Menschutkin, *A.* 172, 74).—2. By oxidation of alloxan.—3. A product of the action of HOCl on guanife (Strecker, *A.* 118, 156).—4. From uric acid by heating with MnO_2 and dilute H_2SO_4 (Wöhler, *Bl.* [2] 7, 521) or with KNO_3 and H_2SO_4 (Gibbs, *B.* 1, 841).—5. A product of the action of HCl and KClO_3 on uric acid (Laurent a. Gerhardt, *A. Ch.* [8] 24, 175).—6. By the action of POCl_3 on oxaluric acid $\text{NH}_2\text{CO.NH.CO.CO.H}$ at 200° (Grimaux, *C. R.* 77, 1548).—7. By the action of POCl_3 on a mixture of oxalic acid and urea (Ponomareff, *Bl.* [2] 18, 97).—8. By heating nitro-pyruvic uride with bromine and water (Grimaux, *C. R.* 79, 1478).—9. By the action of Br and water on uric acid (Hardy, *Bl.* [2] 1, 445; Magnier, *Bl.* [2] 22, 56).

Properties.—Monoclinic laminae (from water or alcohol); α : b : c = 1:685:478; β : γ = 81° 39'. Decomposed above 300°, forming a white sublimate. Completely oxidised by KMnO_4 and H_2SO_4 to CO_2 and NH_3 . Not attacked by HNO_3 in the cold. Its solution is not rend. by Ca -salts,

but on boiling with alkalis it is split up into oxalic acid and ammonia. In the same way lead salts and a little NH_3 give a pp. of lead oxalate (Maly, *M.* 2, 284).

Reactions.—1. In aqueous solution the salts rapidly change to oxalurate. —2. Zinc and HCl reduce it to oxalantin. —3. Alcoholic NH_3 at 100° forms oxaluramide. —4. Alcoholic BaI at 100° forms $\text{C}_6\text{H}_7\text{NO}_2$, crystallising from alcohol in green prisms, nearly insol. cold water (Hlasiwetz, *A.* 108, 200). —5. Urea (1 pt.) at 180° forms $\text{C}_6\text{H}_7\text{N}_2\text{O}_4$, a sparingly-soluble powder (Grimaux, *Bl.* [2] 82, 120).

Salts.— $\text{NH}_4\text{A}'$. Crystalline powder, got by adding alcoholic ammonia to a solution of parabanic acid in absolute alcohol. Gives off its NH_3 at 100°. Warm water converts it into ammonium oxalurate. — NaA' . — KA' . Got by using alcoholic KOEt . — AgA' . Crystalline pp. got by adding AgNO_3 to a solution of KA' . — $\text{Ag}_2\text{O}_2\text{N}_2\text{O}_4$ aq. Got by ppg. a solution of parabanic acid with AgNO_3 . Insol. water, sol. HNO_3 . — Urea salt: $\text{CON}_2\text{H}_4\text{HA}'$. Four-sided tables, al. sol. cold water. — Phenyl-hydrasine salt ($\text{N}_2\text{H}_5\text{Ph}$) A' aq. [170°]. Insol. alcohol and ether. Boiling water converts it into $\text{NH}_2\text{CO.NH.CO.CO.N}_2\text{H}_5\text{Ph}$ [215°] (Skinner a. Ruhemann, *C. J.* 53, 550). — Aniline salt. [250°] (S. a. R.).

Hydrate $\text{C}_6\text{H}_7\text{N}_2\text{O}_4$ aq. S. 18.5 at 6°. Formed from uric acid (1 pt.) and nitric acid (3 pts. of S.G. 1.3) at 60°. The mixture is kept at 85°–55°, and finally heated to 70°, when the hydrate separates in large crystals (Tollens a. Wagner, *A.* 166, 321; 175, 227). Formed also by the action of POCl_3 on a mixture of urea and oxalic acid, heat not being applied (P.). At 150°–160° it loses water and changes to ordinary parabanic acid.

Methyl parabanic acid $\text{CO} \begin{smallmatrix} \text{NHMe} \cdot \text{CO} \\ \text{NH} \cdot \text{CO} \end{smallmatrix}$

Methyl-oxalyl-urea. Oxalyl-methyl-urea. [149°].

Formation.—1. By heating nikroso-creatinin with HCl at 100° (Dessaignes, *A.* 97, 842; Märcker, *A.* 135, 315). —2. From methyl-uric acid and HNO_3 (Hill, *B.* 9, 1098; 18, 789). —3. By the action of AgNO_3 on methyl-thioparabanic acid (oxalyl-methylthio-urea) (Andreasch, *B.* 14, 1449; *M.* 2, 279). —4. By oxidation of theobromine or caffeine with chromic acid mixture (E. Fischer, *A.* 215, 397; Maly a. Hinteregger, *B.* 14, 737; *M.* 2, 94).

Properties.—Colourless trimetric prisms, sol. hot water. Acid in reaction. Not volatile with steam. Decomposed by alkalis, even in the cold, into methyl-urea and oxalic acid.

Salt.— AgA' . Needles, sol. hot water.

Di-methyl-parabanic acid $\text{CO} \begin{smallmatrix} \text{NHMe} \cdot \text{CO} \\ \text{NHMe} \cdot \text{CO} \end{smallmatrix}$

Cholestrophane. [146°]. [276°]. S. 1.87 at 30°.

Formation.—1. The final product of the action of chlorine on caffeine in water (Bohlender, *A.* 78, 128). —2. By boiling caffeine with nitric acid (Stenbuse, *A.* 45, 371; 46, 329). —3. By heating dry silver parabanate with MeI at 100° (Strecker, *A.* 118, 174). —4. By oxidation of caffeine with chromic acid mixture (Maly a. Hinteregger, *B.* 14, 728). —5. By the action of AgNO_3 on $\text{CS} \begin{smallmatrix} \text{NHMe} \cdot \text{CO} \\ \text{NHMe} \cdot \text{CO} \end{smallmatrix}$ (Andreasch, *M.* 2, 283). —6. By the action of dilute HCl aq. on murexide.

oxygen through water-gain which caffeine is suspended (Leipen, *M.* 10, 184).

Properties.—Triangular prisms (from alcohol). May be sublimed. Completely decomposed by alkalis. Gives no pp. with lead acetate until ammonia is added, when lead oxalate is pptd. Pure HNO₃ has no action (Franchimont, *R. T. O.* 6, 217).

Reactions.—1. Alcoholic NH₃ forms dimethyl oxalamide [226°] on heating.—2. HClAq at 200° splits it up into oxalic acid, CO₂, and methylamine (Calm, *B.* 12, 624).—3. Cold alcoholic soda decomposes it into oxalic acid and dimethyl-urea (M. & H.).—4. Zinc and dilute H₂SO₄ reduce it to di-methyl-glyoxyl-urea $\text{CO} < \begin{smallmatrix} \text{NMe}.\text{CH.OH} \\ \text{NMe.CO} \end{smallmatrix}$. Crystalline body melting below 100°, decomposed by heating with baryta into glycollic acid, oxalic acid, methylamine, and CO₂ (Andreasch, *M.* 5, 139).—5. On warming with water containing BaCO₃ it yields di-methyl-oxamide (Maly & Hinteregger, *M.* 2, 88, 132).

Phenyl-parabanic acid $\text{CO} < \begin{smallmatrix} \text{NH}.\text{CO} \\ \text{NPh.CO} \end{smallmatrix}$ [208°].

Made from phenyl-urea and ClCO.CO₂Et (Stojentin, *J. pr.* [2] 82, 11). Silky plates, v. sol. alcohol, ether, and hot water.

Di-phenyl-parabanic acid $\text{CO} < \begin{smallmatrix} \text{NPh.CO} \\ \text{NPh.CO} \end{smallmatrix}$.

[204°]. Formed by boiling an alcoholic solution of diphenyl-guanidine dicyanide (dicyanomel-anilide) C₁₂H₁₁N₅ or (α)-tri-phenyl-guanidine dicyanide with HClAq (Hofmann, *Pr.* 11, 275; *B.* 8, 764). Formed also by warming thiocarbonyl-dithio-oxamide with alcoholic AgNO₃, and by the action of ClCO.CO₂Et on di-phenyl-urea (Stojentin). Needles, insol. water, v. sol. alcohol and ether. Decomposed by boiling KOHAq into oxalic acid, aniline, and CO₂. Yields with fuming HNO₃ a di-nitro-di-phenyl-parabanic acid crystallising in needles.

PARACONIC ACID v. *Lactone of Oxytartaric acid*.

PARAFFIN. Solid, wax-like, fatty mixture of hydrocarbons of the C_nH_{2n+2} series, very rich in carbon and characterised by a very marked indifference to most reagents.

Analysis.—

	1	2	3	4	5
C	85.15	84.9	85.31	84.86	85.5

1. Anderson, *J.* 1857, 480; 2. B. Brodie, *P.M.* [8] 38, 178; 4. Pawlewski, *B.* 23, 327; 5. Gill & Meusel, *C. S. J.* 6, 466. Beilstein states (Bn. 1, 189) that commercial paraffin usually contains 1 p.c. oxygen, which can be removed by heating with Na in a tube. Lippmann & Hawliczek (*B.* 12, 69), from a sample of brown coal paraffin v. al. sol. alcohol [87°] by heating with PCl₅, formed C₁₂H₂₂Cl₂; hence give formula C₁₂H₂₂. Bolley (*A.* 106, 280), by heating hot paraffin with Cl, formed C₁₂H₂₂Cl₂. C₁₂H₂₂Cl₂; hence gives formula C₁₂H₂₂. Gill & Meusel (*Z.* 1869, 65) have formed from paraffin by oxidation with CrO₃, cerotic acid C₂₆H₅₄O₂, hence formula C₁₂H₂₂. Pawlewski by Raoult's method, using glacial acetic acid, finds C₁₂H₂₂. C₁₂H₂₂, by dilute benzene and *p*-xylene C₁₀H₁₈. C₁₀H₁₈, and with saturated solutions in benzene and *p*-xylene

(C₁₀H₁₈)-(C₁₂H₂₂). It behaves as a colloid in most other solvents.

Melting-point [45°-65°]. By the action of solvents, small quantities of fractions [88°-45°] have also been obtained (Albrecht, *D. P. J.* 218, 280). Ozokerite paraffin [64°].

Boiling-point. Above 300°. In crude petroleum the portion (300°-400°) solidifies on cooling. On fractionating, Bolley and Tuschschmid found that the portion [53°] (300°) gave the following fractions [150°] [45°]; (200°) [44-5°] and residue [53-5°].

Specific gravity varies from 0.872-0.912 at 17° (Albrecht). Ozokerite paraffin [64°]. S.G. 22 0.917, [88°]. S.G. 21 0.874 (Beilby, *C. J.* 43, 388). Paraffins expand considerably on melting.

Occurrence.—Occurs native as fossil wax, hachettine, and ozokerite. The latter is the most abundant, and is found in Galicia, Roumania, on the island of Tschelken on the east coast of the Caspian Sea, and on the island of Swjatoi at Baku. When bleached it is called ceresine. According to Zawadzki, ozokerite contains a crystalline and amorphous paraffin. It is also found in Etna lava to the extent of 43 p.c. in certain geodes (Silvestri, *G.* 12, 9). It is obtained by the distillation of brown coal, turf, boghead coal, shales, schists, and natural bitumens, wood, wax, and wax and lime. It can also be obtained from brown coal tar. Details of various methods are given by von Boyen, *Z. f. Angew. Chem.* 1891, 261). Paraffin is also obtained in large quantities from American petroleum, being present in the high-boiling portions which form a residue after the lighting oils have been distilled off. Other mineral oils contain appreciable quantities of solid paraffin, e.g. Rangoon oil of Burma, 6 p.c. For the preparation of commercial paraffin from these bodies v. Thorpe's *DICTIONARY OF APPLIED CHEMISTRY*, and for a theory for its formation in nature by the decomposition of animal matter, vide Zawadzki, *D. P. J.* 280, 69, 85, and 138.

Properties.—Paraffin, when pure, is a solid, colourless, translucent substance, perfectly inodorous and tasteless, somewhat resembling spermaceti. It readily melts, forming a colourless oil; burns from a wick with a bright flame, but does not burn easily in the mass. It is insol. water, sol. hot alcohol, v. sol. ether and oils. The solubility of paraffin from ozokerite has been studied by Pawlewski & Fillmonowicz (*B.* 21, 2973), who show that the liquid constituents are mostly sol. glacial acetic acid, whereas vaseline, ceresine, ozokerite and paraffin are almost insoluble. Pawlewski (*B.* 23, 327) also states that ozokerite paraffin is sol. formic acid, acetic acid, benzene, *p*-xylene, and chloroform. Thorpe & Young (*A.* 165, 1), by heating paraffin in closed vessels at a high temperature, have resolved it into a little gas and hydrocarbons of the C_nH_{2n+2} series (C₁₂H₂₂-C₁₈H₃₈), and others of the C_nH_{2n+2} series (C₁₂H₂₂-C₁₈H₃₈). Higher solid and liquid hydrocarbons were also obtained. Long heating at 150° causes an increase of weight, attributed by Bolley and Tuschschmid to oxygen absorption (*Z.* 1868, 500; Jasnnowitch, *B.* 8, 768). Oxidised products can also be obtained by the action of oxidising agents. Champion (*C. R.* 75, 1576) has shown that nitrosulphuric acid slowly transforms it etc.

90° into a liquid oil of the composition $C_{11}H_{22}NO_2$ (called paraffinic acid), from which ethereal salts have been obtained, and at the same time yields a white solid $C_{11}H_{22}NO_2$ sol. Aq. Fuming nitric acid, according to Poudret, also acts upon paraffin at 110° forming a true paraffinic acid $C_{11}H_{21}O_2$ [46°] together with other fatty acids. The acid has a wax-like odour, is insol. water, but sol. alcohol, ether, and benzene; is easily decomposed by heat, and forms deliquescent salts of the alkaline metals, and yellow, cheesy plates with the earths, and magnesia. It is carbonised by sulphuric acid (B. 23, 121; C. R. 79, 320) and nitric acid converts it into nitro-compound and sulfuric acid. Champion has also shown that chlorine is absorbed by paraffin in sunlight, producing hydrochloric acid. According to Gill & Meusel (Z. 1869, 65), CrO_3 and dilute HNO_3 oxidise paraffin to a mixture of cerotic $C_{26}H_{54}O_2$, succinic, and other fatty acids. According to Beilstein & Wiegand (B. 16, 1548), ozokerite contains a solid hydrocarbon of the olefine series. It is formed by distilling the ozokerite *in vacuo*, and, after removing the first portions of oily distillate, crystallising the solid portion from a solution of alcoholic benzene. It is called *lekene* [79°] S.G. 0.9392, and is a very stable compound, being unacted upon by CrO_3 , HNO_3 , and $KMnO_4$. It is, however, completely oxidised by acid $KMnO_4$, and slowly forms a bromo-compound when heated with Br and H_2O in a sealed tube. For methods of analysis of paraffin scale, and determination of impurities therein, vide B. Redwood, S. C. I. 3, 430; Journ. Soc. Arts, 1886, 56; Sutherland, S. C. I. 6, 123, 171; and Stuart Thomson, *ibid.* 10, 352 *et seq.*

PARAFFIN^o HYDROCARBONS v. HYDROCARBONS.

PARAFFIN OIL v. PETROLEUM.

PARAGLOBIN v. PROTEIDS.

PARAHÆMOGLOBIN v. HÆMOGLOBIN.

PARALBUMIN v. PROTEIDS, Appendix C.

PARALDEHYDE v. ALDEHYDE.

PARANILINE C_6H_7N [192°]. A base found by Hofmann (Pr. 12, 314) in the preparation of crude aniline on a large scale. Long, silky needles (from dilute alcohol). EtI yields $C_{12}H_{15}EtN_2$ and $C_{15}H_{19}EtN_2$.—B" H_2Cl_2 aq: six-sided plates (from conc. HCl aq) converted by water into yellow needles of B" HCl aq, sl. sol. water.—B" H_2EtCl : yellow prisms.—B" HNO_3 .—B" H_2SO_4 .—B" H_2SO_4 .

Benzoyl derivative $C_{12}H_{11}BzN_2$. Needles.

PARAPEPTONE v. PROTEIDS.

PARALLELIC ACID $C_6H_7O_2$? An acid sometimes obtained in the preparation of lecanoric acid (Schunck, A. 54, 274). Needles (containing aq), v. al. sol. cold water, sol. alcohol and ether. Tastes bitter. Reddens litmus.—PhA??: white flocculent pp.

PARALINE v. CINCHONA BASES.

PARIDIN $C_{11}H_{21}O_2$. S. 1-5; S. (alcohol) 2. A neutral glucoside extracted by alcohol from the leaves of *Paris quadrifolia* (Wals, Rharm. Cent. 1841, 690; N. Jahres. Pharm. 13, 174; Delfs, *ibid.* 60, 25). Formed also, together with a sugar, by boiling paristyphein with dilute H_2SO_4 . Thin laminae (containing 4mg) (from water) or tufts of needles (from alcohol). Conc. H_2SO_4 turns it red. Boiling HCl aq decomposes

it, in alcoholic solution, into a sugar and resinous paridol $C_{11}H_{21}O_2$.

PARILLIN $C_{11}H_{21}O_2$ or $C_{11}H_{21}O_2$. [210°]. S. 008 in the cold; 5 at 100°. Ppd. by adding water to an alcoholic extract of sarsaparilla root (Flückiger, Ph. [3] 8, 488). Plates or prisms, sol. hot alcohol and chloroform. Conc. H_2SO_4 gives a yellow solution. Dilute HCl gives green fluorescence and splits it up into a sugar and pariganil $C_{11}H_{21}O_2$, which is insol. boiling water.

PARISTYPHEIN. An amorphous body which accompanies paridin, and may be ppd. by tannin. Boiling dilute acids split it up into a sugar and paridin.

PARPEVOLINE. Name given to the hexahydrate of β -methyl-ethyl-pyridine, and to pyridine bases isomeric therewith.

PARSLEY. The volatile oil of parsley contains a terpene (162° i.v.), S.G. 12.865 (Gerichten, B. 9, 259; Sauer & Grünling, A. 208, 76). The seeds contain apiol (q. v.). Water extracts APIIN (q. v.) from the plant.

PARSENEP. The volatile oil of parsnep seeds contains octyl *n*-butyrate (Benesse, A. 166, 80).

PARVOLINE C_6H_7N . (c. 200°). A product of the putrefaction of horse-flesh (Gautier, Bl. [2] 48, 11). Oil, smelling like hawthorn blossom, v. sol. alcohol and ether. Resinifies in air. Its platinumchloride forms sparingly-soluble flesh-coloured crystals.

Parvoline C_6H_7N . (c. 220°). A product of the distillation of cinchonine with potash (Oechsner de Coninck, C. R. 91, 296).—B" H_2PtCl_4 : brownish-yellow powder.

Parvoline C_6H_7N . (188°). A product of the dry distillation of the bituminous shale of Dorsetshire (Greville Williams, C. J. 7, 97).

Parvoline C_6H_7N . (188°). S.G. 21.986. Got by distillation of coal (Thenius, J. 1861, 502).

Parvolines of known constitution v. DIETHYL-PYRIDINE, DI-METHYL-ETHYL-PYRIDINE, TETRA-METHYL-PYRIDINE, and METHYL-PROPYL-PYRIDINE.

PASSIVE STATE OF METALS v. Passivity of iron, art. IRON, p. 52.

PATCHOULI. The volatile oil of patchouli, obtained from the leaves of *Pogostemon Patchouli*, contains a sesquiterpene (which yields $C_{15}H_{24}Cl$ [118°]), and a camphor $C_{15}H_{24}O$ [56°], (298°), S.G. 1.051 (Gal. O. R. 68, 406; Montgolfier, C. R. 84, 83; B. 10, 234; Wallach, A. 258, 81). Patchouli camphor crystallises in hexagonal prisms, insol. water, v. sol. alcohol and ether. It is levorotatory $[\alpha]_D = -118^\circ$. On distillation with $ZnCl_2$, or on heating with $HOAc$ and Ac_2O , it yields patchoulene $C_{15}H_{24}$ (254°), S.G. 0.946; $[\alpha]_D = -42^\circ$.

PA TEL LARIC ACID $C_{11}H_{21}O_2$. [above 100°]. Occurs in the lichen *Patellaria* (or *Parmelia*) *scruposa*, from which it can be extracted by ether (Knop; Weigelt, Z. [2] 5, 298). Crystalline mass, insol. water, v. sol. alcohol and ether. Tastes bitter. Decomposed on fusion or on boiling with baryta, with formation of orcin and oxalic acid. $FeCl_3$ gives a purple colour. Cold baryta-water forms a salt with transient blue colour.

PAVIN v. PAVINE.

PAYTINE $C_{11}H_{19}N_2O$. [156°]. [$\alpha_D^{20} = -49.5^\circ$] in a 45 p.c. alcoholic solution. An alkaloid extracted by alcohol from a white bark of an *Aspidosperma* from Payta in Peru (Hesse, *A.* 154, 287; 186, 259; 211, 280; Wulfsberg, *Ph.* [3] 11, 269; Arata, *G.* 11, 246; *C. J.* 40, 622). Prisms (containing aq. sol. water, and ether, benzene, chloroform, and (unlike aspidospermine) ligroin). Tastes bitter; is not poisonous. When heated with soda-lime it yields paytone, a non-nitrogenous substance. Conc. HNO_3 forms a colourless solution, changing through red to yellow. $FeCl_3$ and conc. H_2SO_4 give no colour. Chloride of gold gives a purple pp. $HgCl_2$ gives a yellow amorphous pp. Bleaching powder produces, in an acid solution, a red colour changing through blue to yellow.

Salts.— $BHCl$. S. 6 at 15° . Prisms.— $B'H_2PtCl_6$: dark-yellow amorphous pp.; dissolves in hot $HClAq$, forming a red solution changing to blue and depositing a blue pp.

Paytamine $C_{11}H_{19}N_2O$. An amorphous alkaloid accompanying paytine. Unlike paytine, KI does not ppt. it from neutral solutions. Its salts are amorphous, and it does not yield paytone.

PECTOLACTIC ACID $C_8H_8O_6$. An acid got by boiling milk-sugar with $NaOH$ and less O_2 than is needful for complete oxidation (Boedeker, *A.* 100, 281). Brownish syrup, drying up to a gummy (containing 2 aq.). Miscible with water and alcohol, insol. ether. Reduces ammoniacal $AgNO_3$, forming a mirror.— BaA'' 4½ aq.: powder, insol. alcohol.

PECTOUS SUBSTANCES. Unripe fleshy fruits and fleshy roots (e.g. pears, carrots, and turnips) contain a substance (pectose) insoluble in water, alcohol, and ether, transformed under the influence of acids into pectin, which is soluble in water, and is ppd. as a jelly on adding alcohol or on boiling (Vauquelin, *A. Ch.* 5, 100; 6, 282; [2] 41, 46; Braconnot, *A. Ch.* [2] 28, 173; 30, 96; 47, 266; 72, 433; Guibourt, *J. Chim. Med.* 1, 27; Mulder, *J. pr.* 16, 277; 16, 280; Fremy, *A. Ch.* [3] 24, 9; Soubeiran, *J. Ph.* [3] 11, 417; Poumarède, *A. Figuier, J. Ph.* [3] 11, 458; 12, 81; Chodoff, *A.* 51, 356; Scheibler, *Z.* [2] 4, 433; Reichardt, *Ar. Ph.* [3] 10, 116; Giraud, *C. R.* 80, 477; Stude, *A.* 181, 244; Rochleder, *Z.* [2] 4, 381).

Pectin, obtained from the juice of ripe pears and apples by removing albuminoids by tannin and calcium by oxalic acid, and then ppg. with alcohol, is, according to Bauer (*J. pr.* [2] 30, 370), a mixture of carbohydrates. Different analyses of pectin give C 39.5 to 46 p.c.; H 5.5 p.c.; O 48.5–55 p.c. Pectous substances differ from cellulose in being stained by methylene-blue, but, unlike lignin, the colour is destroyed by acids (Mangin, *C. R.* 103, 579). By boiling with water pectin is converted into 'parapectin,' a solution of which, unlike pectin, gives a pp. with lead acetate. Nitric acid yields mucic acid by oxidation. Boiling dilute acids convert pectin into 'metapectin,' which is acid in reaction and gives a pp. with $BaCl_2$ (unlike pectin and parapectin). Boiling alkalis convert pectin into pectic acid.

Pectic acid $C_{11}H_{19}O_{11}$? (Fremy). *C* 41.4 to 44.9 p.c.; *H* 4.71 to 5.4; *O* 49.7 to 53.8. Got by boiling an aqueous extract of carrots with K_2CO_3 and ppg. with HCl . Produced also from

pectin in fruit by the action of a ferment (pectase). Jelly, drying up to a horny mass. Acid in taste and reaction; insol. cold water, alcohol, and ether. Converted by boiling water, first into parapectic acid and then into metapectic acid. Boiling dilute acids yield arabic acid.

Salts.— $Na_2C_{11}H_{19}O_{11}$.— $PbC_{11}H_{19}O_{11}$.— $AgC_{11}H_{19}O_{11}$. (Chodoff).— $AgC_{11}H_{19}O_{11}$. (Fremy).

Arabic acid, when prepared by hydrolysis of pectic acid, is called metapectic acid, and the arabinose got by the action of $HClAq$ upon it is called pectinose. Pectinose or stabinoses is tetra-oxo-valeric aldehyde (*q. v.*).

References.—ARABIN and CELLULOSE.

PELARGONIC ACID *v. ENNOIS AND.*

PELLETIERINE $C_{15}H_{27}NO$. (195°). S.G. 0.988. V.D. 4.88 (calc. 4.66). S. 5. Occurs, together with methyl-pelletierine, pseudo-pelletierine, and copelletierine in the bark of the pomegranate (Tanret, *C. R.* 86, 1270; 87, 358; 88, 716; 90, 695; *J. Ph.* [4] 28, 168, 384). It may be extracted from the powdered bark by shaking with chloroform and milk of lime. If the chloroform is decanted and shaken with a dilute acid, the alkaloids will be taken up by the acid solution. The acid solution is mixed with $NaOH$ and shaken with chloroform, which extracts pelletierine and pseudo-pelletierine, which may be separated by crystallisation of their sulphates; the pelletierine is finally distilled in a current of H .

Properties.—Colourless liquid, partially decomposed at 195° , but may be distilled *in vacuo*. M. sol. water, miscible with alcohol, ether, and $CHCl_3$. The sulphate is levogyrate; [$\alpha_D^{20} = -30^\circ$]. Resinified by absorption of oxygen. Fumes with HCl .

Methyl-pelletierine $C_{14}H_{25}NO$. (215°). S. 4 at 12° . Extracted from an acid solution of the mixed bases by adding $NaHCO_3$ and shaking with chloroform. Liquid, forming very deliquescent salts. V. sol. alcohol, ether, and chloroform. Its hydrochloride is dextrorotatory [$\alpha_D^{20} = +22^\circ$].

Pseudopelletierine $C_{14}H_{25}NO$. [46°] (when hydrated). (246°). S. 40 at 0° . S. (ether) 11 at 10° . Crystallises from water in prisms (containing 2 aq.), v. e. sol. water, alcohol, and $CHCl_3$. Inactive as regards light. Powerful base, expelling NH_3 from its salts. Gives the alkaloidal reactions. Like pelletierine, it gives an intense green colour with H_2SO_4 and $K_2Cr_2O_7$.— $BHCl$: rhombohedra. S. 100 at 10° .— $B'H_2PtCl_6$: needles.— $B'H_2SO_4$ 4 aq.: v. sol. water.

Isopelletierine $C_{14}H_{25}NO$. An inactive liquid, resembling pelletierine in other respects.

PELOSINE $C_{11}H_{19}NO$, 1 aq. An alkaloid contained in the root of *Pareira brava* or *Cissampelos Pareira* (Wiggers, *A.* 27, 29; 33, 81; Bödeker, *A.* 69, 53; Flückiger, *N. J. P.* 81, 254). Extracted by dilute H_2NO_3 and ppd. by Na_2CO_3 , and dissolved in ether or CS_2 . Amorphous powder, almost insol. water. Strongly alkaline in reaction. Yields methylamine, dimethylamine, and a derivative of pyrrole on distilling with KOH (Wiggers, *Chem. Gas.* 1858, 321).— $B'HCl$ aq.: amorphous hygroscopic powder.— $B'H_2PtCl_6$: amorphous.— $B'H_2CrO_4$ aq.: According to Flückiger, pelosine is identical with buxine and bebeserine.

Pelutela $C_{15}H_{27}NO_2$? A yellow base, insol. ether, either formed from pelosine by aspheroic oxidation or occurring in *Parina*.— B^1 , $PtCl$.

PENDECANAPHTHENE * or **Pentadecanaphthene** $C_{15}H_{22}$. (247° cor.) S.G. 17.829. Occurs in Russian petroleum (Maszknikoff, *J. R.* 15, 889). Liquid.

PENNYROYAL. The oil of pennyroyal from *Mentha pulegium* contains pulegone, which may be purified by fractional distillation *in vacuo* (Bekmann, *A.* 262, 3; e^1 Kané, *A.* 32, 286).

Pulegone $C_{15}H_{26}O$. (181° at 60 mm.). S.G. 22.982. $[a]_D = +22.9^\circ$. Somewhat viscid oil, smelling like peppermint. Darkens in colour even in closed tubes. When reduced by Na it gives 40 p.c. of menthol.— $C_{15}H_{26}BrO$. (40.5°). $[a]_D = -33.8^\circ$. Made by passing HBr into pulegone dissolved in ligroin. Whetstone-shaped crystals, v. sol. alcohol and ether. This hydrobromide is converted by hydroxylamine into an oxim (38°) crystallising in four-sided plates, which on standing lose Br and then melt at 110°. This oxim also forms the hydrated oxim (157°) (*v. infra*) by taking up water. The hydrobromide is re-converted into pulegone by treatment with Ag_2O , while zinc dust reduces it to pulegone hydride ($\alpha = -17.4^\circ$), which yields an oxim (93°), and can be converted, by the action of Na on its ethereal solution, into levorotatory menthol $[a]_D = -21.3^\circ$, giving a benzoyl derivative (54°).

Hydrated oxim $C_{15}H_{28}O(NOH)$. (157°). $[a]_D = -83.4^\circ$ in alcoholic solution. Formed by the action of hydroxylamine on pulegone. Long matted needles, sl. sol. ether, cold alcohol, and benzene. Yields an acetyl derivative $C_{15}H_{28}AcNO$, (149°) and a benzoyl derivative (138°).— B^1 , HCl . (118°). $[a]_D = -32.4^\circ$. Trimetric crystals; $\alpha:b:c = 605:1:1.048$.— B^1 , HBr . (111°).

Pulegonamine $C_{15}H_{27}NO$. Made by reducing the foregoing oxim with HI and P. Amber-coloured liquid, sl. sol. water, v. sol. alcohol and ether. Tastes bitter. Boiling Mel forms $C_{15}H_{27}MeNO$. Phenyl thiocarbimide forms $PhNH.OS.N(C_6H_5)_2O$ (198°). Yields a benzoyl derivative $C_{15}H_{27}BzNO$ (101°).— $(C_{15}H_{27}NO)HCl$. (117°). Long needles, v. sol. water.

PENTADECANE $C_{15}H_{32}$. (107°). (270°). (186° at 10 mm.). S.G. $\frac{1}{4}$ 772; $\frac{1}{2}$ 769; $\frac{3}{4}$ 718. Made by reduction of $C_{15}H_{27}CCl_2CH_3$ or of pentadecic acid with HI and P (Krafft, *B.* 15, 1730). A pentadecane (114° at 15 mm.) is got by distilling Barium palmitate with $NaOMe$ (Mal, *Bz* 22, 2184).

Pentadecane $C_{15}H_{32}$. (260°). S.G. 12.825. Occurs in American petroleum. It yields decane when passed through red-hot tubes (Cahouze & Cahours; Vohl, *J.* 1865, 841).

PENTADECENOIC ACID $C_{15}H_{28}O_2$? *Dimethylvaleric acid*. (300°–306°). A product of the action of Ca^{+2} at 160° on a mixture of sodium isovalerate and $NaOOC.H_{11}$ (Geuther & Fröhlich, *A.* 202, 804). Liquid.

PENTADECENYL ALCOHOL? $C_{15}H_{31}O$? (78°). The portion of the wax of *Ficus gumiflua* that is readily soluble in ether (Kessel, *B.* 11, 2114). Nodes (from ether).

PENTADECENE $C_{15}H_{30}$. (230°–240°). Got by heating the acetyl derivative of di-oxy-penta-

decane (triampylene acetate) with potash (Bauer, *A.* 187, 249). Thick liquid. Unites with bromine.

PENTADECIOIC ACID $C_{15}H_{28}O_2$. (62°).

Formed by oxidation of cocceryl alcohol $C_{15}H_{32}(OH)_2$, or of cocceryl acid $C_{15}H_{30}O_2$ with CrO_3 and acetic acid; the yield is about 40 p.c. (Liebersmann & Bergham, *B.* 20, 964). Crystalline solid. V. sol. alcohol, ether, acetic acid, and benzene, less readily in ligroin.— A^1 , Ca and A^1 , Ba ; granular pps.

Methyl ether A^1Me : (68°); crystalline solid.

Pentadecic acid $C_{15}H_{28}O_2$. (51°). (257° at 100 mm.). Made by oxidation of methyl pentadecyl ketone with chromic acid mixture (Krafft, *B.* 12, 1671; 19, 2983). Pearly scales.— BaA^1 , AgA^1 .

Pentadecic acid $C_{15}H_{28}O_2$. (70°). Occurs, together with mannite, in the fungus *Agaricus integer* (Thörner, *B.* 12, 1636). Small needles, v. s. sol. ether and boiling alcohol, insol. water.

Isomerides of Octic acid and Isotario acid.

PENTADECENE $C_{15}H_{30}$. (220°). Made from $C_{15}H_{28}Br_2$ and alcoholic potash (Bauer, *A.* 147, 255).

Pentadecene (235°–245°). Made from santonin acid and HI (Cannizzaro & Amato, *B.* 7, 1104).

DI-PENTADECYL-CARBINOL

$(C_{15}H_{31})_2CH(OH)$. (85°). Made by reducing palmitone in boiling alcohol by adding sodium (Kipping, *C. J.* 57, 987). Silky needles or plates (from alcohol), sol. ether, insol. water. With boiling Ac_2O it yields $(C_{15}H_{31})_2CH.OAc$ (49°), a granular powder, v. sol. ether.

DI-PENTADECYL KETONE v. PALMITONE.

n-PENTANE C_5H_{12} , *etc.*
 $CH_3.CH_2.CH_2.CH_2.CH_3$. Mol. w. 72. (37°). S.G. $\frac{17}{4}$ 6282 (Schiff); $\frac{18}{4}$ 6337; $\frac{19}{4}$ 6250 (Perkin); μ_2 1.3607 at 6.5°; $\mu_D = 1.3649$; $\mu_N = 1.3769$ (Gladstone, *C. J.* 59, 290). M.M. 5.638 at 17.2°. Occurs in American and in Galician petroleum, in coal-tar oil, and in resin oil (Greville Williams, *C. J.* 15, 130; Schorlemmer, *C. J.* 25, 1085; *Pr.* 15, 131; Lachovitch, *A.* 220, 190; Renard, *A. Ch.* [6] 1, 225). Oil. Yields on chlorination two amyl chlorides (106° and 104°), and finally $C_5H_9Cl_2$ (230°–240°) (Bauer, *C. R.* 51, 572; Schorlemmer; Lachovitch). CrO_2Cl_2 followed by water, yields $CH_3Cl.OCl_2.H_2$ (Etard). At a red heat it is decomposed with formation of ethylene, propylene, and butene (Norton & Andrews, *Am.* 3, 1).

Isopentane $(CH_3)_2CH.CH_2.CH_3$. *Tri-methyl-ethane*. V.D. 2.50 (calc. 2.48). (30°). S.G. $\frac{17}{4}$ 6248; $\frac{18}{4}$ 6159 (Perkin); $\frac{19}{4}$ 6122 (Schiff, *A.* 220, 87); $\frac{18}{4}$ 6375 (Just, *A.* 220, 158). S.V. 117.2 (Schiff). M.M. 5.750 at 16.4°. Occurs in American and in Galician petroleum (Warren, *A.* 1865, 668; Lachovitch). Formed by the action of water on zinc isoamyl, or by heating isoamyl iodide with zinc and water at 140° (Frankland, *A.* 74, 47). It is also a product of the action of $ZnCl_2$ on hot isoamyl alcohol, and of zinc on dry isoamyl iodide.

The same pentane can be obtained from active amyl iodide by treatment in alcoholic solution, with zinc and HCl in the cold (Just). Oil with characteristic odour, unlike benzoline. Not attacked by Br or HNO_3 . Chlorine yields

an amyl chloride (100%). Isopentane (1 c.c.) is oxidised by $K_2Cr_2O_7$ (4 g.) and CrO_3 (20 g.) in water (2000 c.c.) in five weeks at $15^\circ-20^\circ$ to isovaleric acid (Berthelot, *C. R.* 79, 1435).

Pentane $C(CH_3)_4$. Tetra-methyl-methane. [e. -20°]. (9.5%). H.F.p. 47.850. H.B.p. 44.950 (Thomsen, Th.). Formed by the action of $ZnMe_2$ on *tert*-butyl iodide (Lwow, *Z.* [2] 6, 520; 7, 257; Naumann, *B.* 7, 178). Appears also to be formed from $CH_3COCl \cdot CH_3$ and $ZnMe_2$ (L.). Oil or gas.

References.—Di-bromo-, Di-chloro-, and Iodo-pentane.

PENTANE CARBOXYLIC ACID v. HEXOIC ACID.

Pentane dicarboxylic acids. BUTYL-MALONIC, ETHYL-GLUTARIC, DI-METHYL-MALONIC, DI-METHYL-GLUTARIC, PIMELIC, and PROPYL-SUCCINIC ACIDS.

n-Pentane tricarboxylic acid $CPr(CO_2H)_3 \cdot CH_2 \cdot CO_2H$. [148°]. Got by saponifying its ether with alcoholic potash. Slender needles, v. sol. water, alcohol, and ether. Splits up at 175° into CO_2 and propyl-succinic acid.

Ethyl ether $Et.A'''$. (280°). S.G. 1.052. Made from ethane tricarboxylic ether $CO_2Et \cdot CH_2 \cdot CH(CO_2Et)_2$, NaOEt, and PrI (Waltz, *B.* 15, 608; *A.* 244, 58). Oil, miscible with alcohol and ether.

Mono-nitrile of the diethyl ether $CPr(CN)(CO_2Et) \cdot CH_2 \cdot CO_2Et$. (205° at 45 mm.). Formed from sodium cyano-succinic ether and *n*-propyl iodide (Barthe, *B.* [3] 1, 305; *C. R.* 103, 297). Oil.

Pentane tri-carboxylic acid. Ethyl ether $C_2H_5 \cdot CH(CO_2Et) \cdot CHMe(CO_2Et)_2$. Methylbutenyl tricarboxylic ether. (281.5° cor.). S.G. 1.0575; $\mu_D = 1.4347$ at 20° . Formed by the action of Na on a mixture of α -bromo-butyric ether and sodium methyl-malonic ether (Bischoff, *B.* 22, 1817, 8180; 23, 647). Apparently the same acid (281.8° cor.), S.G. 1.0523; $\mu_D = 1.4340$ at 20° is got from sodium butane tricarboxylic ether and MeI. Both acids yield, on saponification by H_2SO_4 , two methyl-ethyl-succinic acids [88°] and [168°].

Pentane tri-carboxylic acid. Ethyl ether $C_2H_5 \cdot C(CO_2Et) \cdot CHMe \cdot CO_2Et$. (272.8° cor.). S.G. 1.0609. $\mu_D = 1.4374$ at 20° . Formed by the action of Na on a mixture of α -bromo-propionic ether and sodium ethyl-malonic ether (Bischoff a. Mintz, *B.* 23, 648). The same, or an isomeric ether (282.8° cor.), S.G. 1.0607; $\mu_D = 1.4373$ at 20° is got from sodium propane tricarboxylic ether and EtI. Both acids yield, on saponification with H_2SO_4 , methyl-ethyl-succinic acid [168°]; the acid prepared by the second method yields also the isomeric acid [88°].

Pentane tri-carboxylic acid $CH_3(CO_2H) \cdot CH_2 \cdot CH(CO_2H) \cdot CH_2 \cdot CO_2H$. [107°]. Formed from pentane tetra-carboxylic ether by saponifying with alcoholic potash, and boiling the product with conc. $HClAq$ (Emery, *B.* 24, 284). Mass of needles.— $Ag.A'''$: white pp.

Pentane tri-carboxylic acid $C_2H_5 \cdot CH(CO_2H) \cdot CH(CO_2H) \cdot CH_2 \cdot CO_2H$. [148°]. Made by the action of fumaric ether on sodium ethyl-malonic ether, the product being saponified (Auer, *B.* 24, 810). V. sol. water and alcohol.

Isopentane tri-carboxylic acid $(CH_3)_2CH \cdot C(CO_2H) \cdot CH_2 \cdot CO_2H$. [145°] (Hjelt, *B.* 16, 2822). Formed from its ether, which is

made from ethane tricarboxylic ether, NaOEt, and PrI (Waltz, *A.* 214, 60). Yields isopropyl succinic acid on fusion.

Ethyl ether $Et.A'''$. (270°-290°). Isopentane tri-carboxylic acid $(CH_3)_2CH \cdot CH(CO_2H) \cdot CH(CO_2H)_2$. Carbopimelic acid. [160°]. Got from its ether by cold alcoholic potash. Monoclinic (?) crystals (from water), v. sol. water, alcohol, and ether. Decomposes on fusion into CO_2 and isopropyl-succinic (pimelic) acid.— $Ba.A'''$: sticky pp.

Ethyl ether $Et.A'''$. (277°). Made from α -bromo-isovaleric ether and sodium-malenic ether (W. Roser, *A.* 220, 274). Liquid, with bitter taste.

Isopentane tricarboxylic acid. Ethyl ether $CMe_2(CO_2Et) \cdot CHMe(CO_2Et)_2$. (284.3° cor.). S.G. 1.0524. $\mu_D = 1.4333$ at 20° . Made from sodium methyl-malonic ether and α -bromo-isobutyric ether (Bischoff a. Mintz, *B.* 23, 649). Yields, on saponification by H_2SO_4 , tri-methyl-succinic acid [105°] and a small quantity of a substance melting between 108° and 122° . The same, or an isomeric ether (277.3° cor.), S.G. 1.0515, $\mu_D = 1.4341$ at 20° is got from sodium isobutane tricarboxylic ether and MeI. It yields, on saponification, tri-methyl-succinic acid [105°] and *n*-di-methyl-succinic acid [140°].

Pentane tetracarboxylic acid $(CO_2H)_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CO_2H$. Oil; split up by heat into CO_2 and *n*-pimelic acid $CO_2H \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CO_2H$.

Ethyl ether $Et.A'''$. (260° at 100 mm.). Got from sodium malonic ether and trimethylene bromide (Perkin, junr, *C. J.* 51, 247; *B.* 18, 3248). Disodium salt $CH_2(CO_2Na)_2 \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CO_2Na$. Amorphous powder; converted by bromine into pentamethylene tetracarboxylic ether.

Pentane tetra-carboxylic acid $CH_2(CMe(CO_2H))_2$. [164°]. Got by boiling its ether with alcoholic potash (Dressel, *A.* 256, 183). Crystalline mass, v. sol. water, m. sol. ether. Converted by heating, by itself or in aqueous solution, into $CH_2(CHMe \cdot CO_2H)_2$ [90°].

Ethyl ether $Et.A'''$. (191° at 12 mm.). Made by the action of MeI on a solution of di-sodium propane tetra-carboxylic ether in alcohol. Oil.

Pentane tetra-carboxylic acid. Ethyl ether $C(CO_2Et)_2 \cdot (CH_2)_2 \cdot CO_2Et$. (215° at 13 mm.). S.G. 1.1084. A by-product in the action of NaOEt on a mixture of β -bromo-propionic ether with malonic ether (Emery, *B.* 24, 283). Colourless oil.

PENTANE PHOSPHONIC ACID v. ISOCAMPYL PHOSPHINIC ACID.

PENTANE SULPHONIC ACID $C_5H_{11} \cdot SO_3H$. Formed by the action of nitric acid on isocampyl mercaptan, disulphide, or sulphocyanide (Gerathewohl, *J.* pr. 34, 447; Henry, junr., *A. Ch.* [3] 25, 246; Medlock, *A.* 69, 225). Deliquescent crystalline mass. Chlorine acting on it in sunlight forms $C_5H_9 \cdot Cl \cdot SO_3H$ (Spring, Winssinger, *B.* [2] 41, 201). ICl_3 at 180° forms the same body together with tri- and tetra-chloro-pentanes and $C_5H_9 \cdot Cl_2 \cdot (SO_3H)$.

Salts. BaA' , (dried at 100°). Gyrates on water.— PbA' , aq: colourless laminae.— CuA' , AgA' : plates. Double salts with chloro-pentane sulphonates $BaA'(C_5H_9 \cdot ClSO_3) \cdot aq$.

$Ba.A'$ $(C_5H_9 \cdot ClSO_3)_2 \cdot Cl_2 \cdot 2aq$. Chloride $C_5H_9 \cdot SO_3Cl$. Liquid.

Pentane disulphonic acid $\text{C}_5\text{H}_{12}(\text{SO}_3\text{H})_2$. Formed from $\text{CCl}_3\text{SO}_3\text{H}$ and ZnEt_2 in ether (Ise, *A.* 147, 146). Syrup.— KA' 2aq: needles (from alcohol).— BaA' 2aq. S. 14 in the cold, c. 30 at 100° .— PbA' .— ZnA' 4aq: plates.

PENTA-THIIONIC ACIDS. *Thioic acids* under SULPHUR, OXYACIDS OF, vol. iv.

n-PENTATRIACONTANE $\text{C}_{37}\text{H}_{76}$ [75°]. (331° at 15 mm.). S.G. $\frac{1}{4}$ 7816; $\frac{2}{4}$ 777; $\frac{10}{4}$ 766. Formed by reduction of the dichloride of stearone with H and P (Krafft, *B.* 15, 1715).

PENTENE *v.* AMYLENE. The name pentene is also given sometimes to pentamethyl-tri-hydride.

Dipentene v. TERPENES.

PENTENOIC ACID $\text{C}_5\text{H}_8\text{O}_2$, i.e.

$\text{CH}_3\text{CH}:\text{CH}.\text{CO}_2\text{H}$. *Propylidene-acetic acid.* (196°). S.G. $\frac{1}{4}$ 988. Made by heating propionic aldehyde with malonic acid, and HOAc at 100° (Kommenos, *A.* 218, 166; Zincke & Küster, *B.* 22, 494). Oil.— BaA' : plates [270°].— CaA' 2aq: nodules, v. sol. water and alcohol.— CuA' : green pp. [91°]. Yields CuO at 175° .— AgA' : bulky pp. The same acid (S.G. $\frac{1}{4}$ 983) appears to be got by adding sodium-amalgam to an alkaline solution of $\text{CCl}_3\text{CCl}:\text{CCl}:\text{CCl}.\text{CO}_2\text{H}$ derived from pyrocatechin or o-amido-phenol. It combines with bromine.

Pentenoic acid $\text{CMe}_2.\text{CH}.\text{CO}_2\text{H}$. *Dimethyl-acrylic acid.* [70°]. (195).

Formalida.—1. From $\text{CH}_3\text{Pr}.\text{CO}_2\text{H}$ by oxidising to $\text{CMe}(\text{OH}).\text{CH}_2.\text{CO}_2\text{H}$ and heating the product with dilute H_2SO_4 (Neubauer, *A.* 106, 62; W. von Miller, *A.* 200, 261).—2. From di-methyl-allyl-carbinol by oxidising to β -oxy-valeric acid and distilling this acid with dilute H_2SO_4 or treating its ether with PCl_5 (Semljanzin & Saytzeff, *A.* 197, 72; Ustinoff, *J. pr.* [2] 34, 478; *Bl.* [2] 45, 265).—3. A product of the action of alcoholic NaOEt on α -bromo-isovaleric ether (Duvillier, *C. R.* 88, 913, 1209; 112, 1012; *A. Ch.* [5] 19, 428).—4. The chief product of the action of iodoforn on sodium isobutylate (Gorboff, *J. pr.* [2] 41, 228).

Properties.—Monoclinic prisms; $a:b:c = 1.53:1.71$; $\beta = 74^\circ 13'$. Sl. sol. water, v. sol. alcohol and ether. Bromine combines, forming $\text{C}_5\text{H}_8\text{Br}_2\text{O}_2$ [108°]. Converted into isobutylene and CO , by heating for 30 hours at 220° .

Salts.— NaA' .— BaA' 2aq: groups of needles.— CaA' .— CaA' 4aq.— ZnA' 4aq.— CuA' 2aq.— PbA' 4aq.— AgA' .

Isomerides.—ALLYL-ACETIC, ANGELIC, TETRAMETHYLENE CARBOXYLIC, and TIGLIC ACID.

PENTENYL ALCOHOL $\text{C}_5\text{H}_{10}\text{O}$, i.e.

$\text{CH}_3.\text{CH}:\text{CH}.\text{CH}_2.\text{OH}$. *Vinyl-ethyl-carbinol.* (114°). S.G. $\frac{1}{4}$ 856; $\frac{10}{4}$ 840. Formed from β -brolein by successive treatment with ZnEt_2 and water (Wagner, *J. R.* 76, 319; *B.* 24, 334q; *Bl.* [2] 42, 330). Pungent liquid. Yields on oxidation by KMnO_4 , propionic and formic acids, CO , and tri-oxy-pentane.

Acetyl derivative $\text{C}_5\text{H}_9\text{OAc}$ (132°) at 748 mm. S.G. $\frac{1}{4}$ 913; $\frac{10}{4}$ 893. Liquid.

Pentenyl alcohol $\text{CH}_3.\text{CH}:\text{CH}.\text{CHMe}.\text{OH}$. *Methyl-allyl-carbinol.* (116°). Formed by the action of pipe on a mixture of allyl iodide and acetic aldehyde (Wagner, *B.* 21, 3850). Yields on oxidation a tri-oxy-pentane, formic and acetic acids, and acetic alkylide.

Pentenyl alcohol $\text{C}_5\text{H}_{10}\text{O}$. *Valerylene hydrate.* (115°–120°). Got by treating its acetyl derivative with solid KOH .

Acetyl derivative $\text{C}_5\text{H}_9\text{OAc}$. (135°). A product of the action of AgOAc on $\text{C}_5\text{H}_{11}\text{Cl}_2$ obtained by combination of valerylene with HCl (Reboul, *Z.* 1867, 174).

Pentenyl alcohol $\text{CH}_3.\text{CH}:\text{CH}.\text{CHMe}.\text{OH}$. *Methyl-propenyl-carbinol.* (118°). Formed by the action of water on the corresponding pentenyl chloride, which is a product of chlorination of $\text{CHMe}:\text{CHEt}$ (Kondakoff, *B.* 24, 931).

Pentenyl alcohol $\text{CH}_3.\text{CH}:\text{CH}.\text{CHMe}.\text{OH}$. *Di-methyl-vinyl-carbinol. Isoprenic alcohol.* (99°). Formed from $\text{C}_5\text{H}_7\text{Cl}$, which is obtained from isoprene and HCl (Gradziatsky, *Bl.* [2] 47, 168). Smells like camphor. Dilute H_2SO_4 at 100° forms a hydrocarbon.

Acetyl derivative $\text{C}_5\text{H}_9\text{OAc}$. (121°).

A pentenyl alcohol (125°–136°) is a product of reduction of tiglic aldehyde (Lieben & Zeisel, *M.* 7, 57).

References.—Bromo- and Chloro-PENTENYL ALCOHOL.

PENTENYL-AMIDO-PHENYL MERCAPTAN

$\text{C}_6\text{H}_5.\text{N}(\text{S})\text{C}_5\text{H}_9\text{Pr}$. Liquid, formed from o-amido-phenyl mercaptan and isovaleryl chloride (Hofmann, *B.* 13, 8, 1223).— $\text{B}'\text{H}_2\text{P}(\text{Cl})$: needles.

PENTENYLAMINE $\text{C}_5\text{H}_{11}\text{N}$, i.e. $\text{CH}_3.\text{CH}:\text{CH}.\text{CH}_2.\text{NH}_2$. (85°). Got by reducing nitro-amylene with zinc and HCl (Ghl, *J.* 1873, 333).

Pentenylamine $\text{C}_5\text{H}_{11}\text{NH}_2$. *Valerylamine.* A product of the action of NH_3 on chloro-amyl alcohol (amylene chlorhydrin) at 100° (Wurtz, *A. Suppl.* 7, 89).— $\text{B}'\text{H}_2\text{P}(\text{Cl})$: orange crystals.

PENTENYL-BENZENE $\text{C}_5\text{H}_9.\text{C}_6\text{H}_5$. (173°–177°). S.G. $\frac{1}{4}$ 84. Formed, together with a polymeride $\text{C}_{22}\text{H}_{24}$ (c. 210°), S.G. $\frac{23}{4}$ 96, by boiling bromo-amyl-benzene $\text{C}_5\text{H}_9.\text{CH}(\text{Br}).\text{CH}_2.\text{C}_6\text{H}_5$, with water (Dafert, *M.* 4, 153, 616). Yields benzoic and acetic acids on oxidation.

PENTENYL BROMIDE *v.* Bromo-AMYLENE.

PENTENYL THIOCARBIMIDE $\text{C}_5\text{H}_9\text{NCS}$.

(190°). Formed from isoamylene bromide by successive treatment with alcoholic NH_3 and CS_2 (Hofmann, *B.* 12, 950). Liquid.

PENTENYL-THIO-UREA $\text{C}_5\text{H}_9\text{NH}.\text{CS}.\text{NH}_2$.

(103°). Formed from pentenyl thiocarbimide and alcoholic NH_3 at 100° (Hofmann, *B.* 12, 991).

PENTHIOPHENE. The homologue of thiophene $\text{CH}(\text{CH}:\text{CH})_2\text{S}$, known in some of its derivatives (Kräcker, *B.* 19, 3270).

PENTIC ACID $\text{C}_5\text{H}_8\text{O}_4$, i.e. $\text{CH}(\text{CH}:\text{CH})_2.\text{CO} > \text{O}$?

(128°). A product of the action of alcoholic potash on bromo-ethyl-acetoacetic ether (Demarçay, *Bl.* [2] 27, 483; *C. R.* 88, 128). Got also by heating bromo-ethyl-acetoacetic ether at 100° (Wedel, *A.* 219, 104). Trimetric crystals, v. sol. hot CHCl_3 .

Salts.— NaA' 4aq.— KA' 4aq. v. s. sol. water. MgA' 5aq.— CaA' 5aq.— BaA' 2aq.— ZnA' 5aq.— MnA' 4aq.

Ethyl ether $(\text{Et}-\text{CO})_2\text{O}$. Mol. w. 158

(obs. by Raoult's method); (calc. 156) (Moschelen a. Cornelius, *B.* 21, 2607; 22, 244). Liquid.

Phenyl-hydroxide $C_6H_5O_2(N_2HPh)$. Crystals (from alcohol).

PENTINENE $C_{10}H_{16}$. *Pentylene*. *Pentiness*. Mol. w. 68. Of the eight possible isomerides, three are derived from acetylene and precipitate ammoniacal silver and cuprous solutions; the remaining five, so far as they are known, give no metallic derivatives. The following are known:

1. *Propyl-acetylene* $CH_3 \cdot CH_2 \cdot CH_2 \cdot C \equiv CH$. (48°-49°). Methyl-propyl-ketone, by action of PCl_5 , gives a dichloride, from which alcoholic potash withdraws $2HCl$ (Friedel, Z. 1869, 124). Forms liquid dibromide (140°) and tetrabromide (275°) (Bruylants, B. 8, 411).

2. *Isopropylacetylene*, $(CH_3)_2CH \cdot C \equiv CH$. (28°-29°). The chloride from isovaleryl aldehyde (Bruylants, B. 8, 413) or isopropyl-ethylene bromide, is decomposed by alcoholic potash (Eltekow, Flawitzky, Krywlow, B. 10, 707 and 1102). Oxidised by chromic liquor into acetone, acetic, and isobutyric acids. Bromides liquid, C_4H_5Br , (175°), $C_4H_5Br_2$, (275°) (Bruylants, B. 8, 407). The silver compound C_4H_5Ag is white, dissolves slightly in ammoniacal silver nitrate solution, and crystallises therefrom in small prisms. Converted by a solution of iodine in KI into the compound C_4H_5I (140°).

3. Eltekow (B. 10, 1904), by treating commercial amylene with sulphuric acid (dil. with 1 vol. H_2O) at 0°, obtained an insoluble amylene bromide of which, by the action of KHO , yielded a mixture of two hydrocarbons, of which one, the smaller amount (35°), gave a pp. with ammoniacal silver solution. This he believed to be isopropylacetylene, though differing from the compound described above in b.p.

4. *Valerylene*. This name was given to the liquid (44°-46°) obtained by Reboul (A. 131, 238) from the dibromide prepared from commercial amylene. This substance is a mixture from which Eltekow obtained the hydrocarbon described under 3, and a larger quantity of another (51°-52°), which is stated (B. 10, 2057) to yield acetic and propionic acids by treatment with chromic acid. Hence Eltekow ascribes to it the formula, $C_4H_5 \cdot C \equiv C \cdot CH_3$, although it does not yield metallic derivatives. Reboul's valerylene, heated to 250°-260°, yields a terpene $C_{10}H_{16}$, (180°) (Bouchardat, Bl. [3] 33, 24). Strong sulphuric acid converts it into a hydrate $C_{10}H_{18} \cdot H_2O$ and polymerides $C_{10}H_{18}$, &c. (Reboul, A. 143, 372). Yields a dibromide, which on treatment with alcoholic potash gives C_4H_5Br , C_4H_5 (valylene), and valerylene (Reboul, A. 135, 372). Valerylene tetrabromide $C_4H_5Br_2$ is liquid.

5. *Piperylene* (42°) (Hofmann, B. 14, 663). Distinguished by the production of a crystalline tetrabromide, fusible [114-5°] and volatile without decomposition. Gives no pp. with solutions of silver or copper, and probably has the constitution $(CH_3)_2C \cdot C \equiv CH$, or β -dimethylallene.

6. *Isoprene* (about 37°). Originally obtained (v. Gr. Williams, Tr. 1860, 241), along with caoutchouc and hevea, by destructive distillation of caoutchouc (q.v.). Formed also in notable quantity by the action of very low red heat upon turpentine oil and its isomerides (Tilden, C. J. 46, 410). A colourless, limpid liquid, S.G. .823 at 30°. Oxidises rapidly on exposure to air,

forming a syrupy compound which, on being quickly heated, often explodes. Contact with strong acids in the cold converts it into a substance apparently identical with caoutchouc. Combines violently with bromine, forming a tetrabromide which remains liquid at -20° and is decomposed by distillation. Absorbs hydrochloric acid, forming a mixture of mono- and di-hydrochlorides: $C_4H_5 \cdot 2HCl$ (145°-150°), unstable liquid. Oxidised by chromic acid to carbonic, formic, and acetic acids; by nitric acid to oxalic and a small quantity of undetermined acid.

Heated to 280° isoprene is converted into dipentene $C_{10}H_{16}$, identical with the product from turpentine (v. TERPENE) (Bouchardat, C. R. 87, 664 a. 89, pp. 361, 1117). W. A. T.

PENTINENE CARBOXYLIC ACID v. **HEXINIC ACID**.

Pentinene tricarboxylic acid $C_{10}H_8O_6$, i.e. $C_4H_5 \cdot C(CO_2H)_2 \cdot CH_2 \cdot CO_2H$.

Allyl-ethane tricarboxylic acid, [151°]. Got from its ether, which is made from sodium ethane tricarboxylic ether and allyl bromide (Hjelt, B. 16, 333). At 160° it splits up into allyl-succinic acid and CO_2 .

Ethyl ether Et.A''' (c. 282°).

PENTINOIC ACID $C_8H_8O_4$, [208°]. A product of the oxidation of oil of turpentine by HNO_3 (Roser, B. 15, 293). Tables (from water); sl. sol. water.

PENTINYL ETHYL OXIDE $C_7H_{10}O$, i.e. $C_4H_5 \cdot C \equiv C \cdot CH_2$. (125°-180°). Formed from $C_4H_5Br \cdot OEt$ and alcoholic potash at 155° (Reboul, A. 133, 86). Light oil. Combines with bromine.

PENTOIC ACID v. **VALERIC ACID**.

PENTONENE $C_{10}H_{16}$. (42-5°). S.G. .806. V.D. 2-45. Occurs in oil deposited by compressed gas derived from bituminous shale (Etard & Lambert, C. R. 112, 945). Oil polymerises in the cold, becoming $C_{10}H_{12}$, which forms crystalline $C_{10}H_{12} \cdot 2H_2SO_4$.

PENTONYL ETHYL OXIDE $C_8H_{10}O$, i.e. $CH_3 \cdot C \equiv CH \cdot C(OEt) \cdot CH_2$. (155°). V.D. 3-87. Got by heating di-chloro-pentinene $CH_2(CCl) \cdot CH_2$, with alcoholic potash (Combes, A. Ch. [6] 12, 223). Colourless liquid, with unpleasant smell.

PENTOSE. Name given to compounds resembling glucose but having only 5 atoms of carbon in the molecule; e.g. tetra-oxy-valeric aldehyde.

PENTYL. Another name for the radical **AMYL**.

PENTYLENE v. **AMYLENE** and **PENTINENE**.

PENTYLENE-OLYCOL v. **DI-OXY-PENTANE**.

PENTYLIC ACID is **VALERIC ACID**.

PENTYLIDENE v. **AMYLIDENE**.

PENTYLIDENE-ACETONAMINE v. **ACETON-AMINE**.

PEPPER OIL. S.G. .875. The oil of black pepper is lavoratory (a = -8.2°) and contains a terpene (165°) which is lavoratory (a = -7.8°) and gives a crystalline tetrabromide (Eberhardt, Ar. Ph. [3] 25, 515; cf. Dumas, A. 15, 159; Soubeiran, A. 54, 327).

PEPPERMINT OIL. The essential oil from *Mentha piperita* contains menthol, $C_{10}H_{18}O$, and a liquid terpene. The oil obtained by distilling *M. arvensis* deposits crystals of menthol, and appears also to contain $C_{10}H_{18}O$, an inactive product

of oxidation of menthol (Moriya, *C. J.* 89, 89). The oil from *M. viridis* contains a terpene and $C_{10}H_{16}O$ [225°] (Gladstone, *C. J.* 17, 1).

PEPSIN. The digestive ferment of the stomach (Schwann; Brücke, *Sitz. W.* 43, 401; Schmidt, *A.* 61, 841). It also occurs sometimes in the urine (Stadelmann, *Zeit. Biol.* 25, 208).

Preparation.—1. The glandular layer of the stomach is extracted with dilute phosphoric acid;

with alcohol (Wittlich, *J.* 1870, 894; Podwyssosky, *Pf.* 89, 62).

Properties.—Amorphous. Does not give the xanthoproteic reaction, and is not coloured by H_2SO_4 and sugar. It renders insoluble proteins soluble, converting them into peptones; this action is greatly enhanced by the presence of 0.5 p.c. HCl . Digestion is more rapid at 37° than at 24°. Dry pepsin does not lose its power by heating to 100° (Huppe, *C. J.* 44, 101). According to Gautier (*C. R.* 94, 1192), pepsin contains some insoluble amorphous granules which also possess digestive power in presence of $HClAq$ (cf. Béchamp, *C. R.* 94, 970).

PEPTONES v. PROTEIDS.

PER. Use of this prefix applied to inorganic compounds; for per-compounds and per-salts v. the element the per-compound of which is sought for, or the salts to the name of which per- is prefixed. Thus peroxides are dealt with under OXIDES; peroxide of nitrogen under NITROGEN, oxides of; perchloric acid under CHLORINE, oxyacids of; permanganates under MANGANESE, oxyacids of.

PEREIRINE $C_{12}H_{15}N_3O$ [124°]. An alkaloid, occurring with geissospermine in the bark of *Pao Pereiro* (*Geissospermum Vellozii*, Reckolt). It is separated from geissospermine by ether (Hesse, *A.* 202, 147). Amorphous powder, nearly insol. water, v. sol. alcohol and ether. Conc. H_2SO_4 gives a violet-red and HNO_3 a purple red colour. — H_2PtCl_6Aq : yellowish amorphous pp.

PERIODIC LAW. In the history of modern chemistry we find several attempts to trace connections between the properties of the elements and their atomic weights. Döbereiner (*G. A.* 26, 331) was the first to show that a simple relation exists between the atomic weights of closely related elements. Ca, Sr, and Ba are very closely related elements, and the atomic weight of Sr is the mean of those of Ca and Ba. Again, Se has an atomic weight equal to the mean of the atomic weights of the closely related elements S and Te. This doctrine of triads groups was further extended by Dumas (*J.* 1851, 291), Kremers (*P.* 85, 56), and Lenssen (*A.* 103, 121). Lenssen endeavoured to embrace all the elements in a classificatory system composed of 20 triads. Pettenkofer (*A.* 105, 188) pointed out that the atomic weights of analogous elements, e.g. the alkali metals, form simple arithmetical series, and he emphasised the analogy between such natural families of the elements and the homologous series of organic compounds. Kremers (*P.* 85, 56), Gladstone (*P. M.* [4]

5, 513), Cooke (*Am. S.* [2] 17, 887), and Dumas (*C. R.* 45, 709) followed with generalisations differing only in detail from that of Pettenkofer.

These discoveries did not, however, herald any immediate great advance. It was, of course, interesting to find that elements showing gradational similarity of properties possess atomic weights, which are also, so to speak, numerically similar; but the newly discovered relationships

the acid ppd. in lime-water, and the pp. dissolved in dilute $HClAq$; the solution is then dialysed (Maly, *J. pr.* [2] 11, 104).—2. The mucous membrane of pigs' stomachs is macerated with water containing $HClAq$ and the pepsin separated from the filtrate by adding $NaCl$ (Scheffer, *Pf.* [5] 2, 761, 739, 843).—3. The mucous membranes are kept 24 hours after death, and then extracted with glycerin. The extract is ppd.

did not result in immediate practical applications, and did little more than emphasise pre-existing natural classifications. The investigations altogether failed to afford a generalisation capable of embracing the groups of related elements in a complete classificatory system. Instead of furnishing one inclusive scheme dealing with all the elements, they rather favoured a classification consisting of a number of isolated and partial systems, each system comprising only very closely allied elements, a classification similar in its imperfections to that which would have resulted in organic chemistry had chemists been content to differentiate empirically alcohols, aldehydes, and acids, without any knowledge of the relationships existing

between them from which it has but lately been drawn to the light of day, (v. N. Dec. 26, 1889; C. N. 68, 51).

Newlands was the first to look beyond the relations of analogous bodies merely, and to insist on a relationship of a higher order, connecting the properties and atomic weights of all the elements taken collectively.

This relationship, first roughly indicated by Newlands in 1864 (C. N. 10, 94), was further developed in 1865 under the title of the *law of octaves* as follows:—

'If the elements are arranged in order of their equivalents, with a few slight transpositions, as in the accompanying table, it will be observed that elements belonging to the same group usually appear on the same horizontal line:—

H	1	F	8	Cl	15	Co and Ni	22	Br	29	Pd	30	I	42	Pt and Ir	50
Li	2	Na	9	K	16	Cu	23	Rb	30	Ag	37	Cs	44	Tl	53
Be	3	Mg	10	Ca	17	Zn	25	Sr	31	Cd	38	Ba and V.	45	Pb	54
B	4	Al	11	Cr	19	Y	26	Sc and La	33	U	40	Ta	46	Th	56
C	5	Si	12	Ti	18	In	28	Zr	32	Sn	39	W	47	Hg	57
N	6	P	13	Mn	20	As	27	Di and Mo	34	Sb	41	Nb	48	Bi	58
O	7	S	14	Fe	21	Se	28	Rh and Ru	35	Te	43	Au	49	Ce	51

between these distinct, but closely connected, classes of bodies.

The idea of arranging all the elements in the order of their atomic weights with a view to a more comprehensive classification based on the relations of these magnitudes and the salient properties of the elements, both chemical and physical, seems first to have suggested itself to M. A. E. Béguyer de Chancourtois in the year 1862. His method of exhibiting the relationship was a geometrical one. On a right cylinder with circular base he traced his 'telluric helix' at a constant angle of 45° to the axis. On this curve lengths corresponding to the 'characteristic numbers' (atomic weights) were measured in terms of a unit equal to one-sixteenth of the turn of the helix. The extremities of these lengths were the 'characteristic points' for the elements. De Chancourtois enunciated the principle that the relations between the properties of different bodies are manifested by simple geometrical relations between the positions of their characteristic points. For instance, elements with analogous properties fall together on vertical lines parallel to the generatrix. This relation becomes apparent when the cylinder is plane developed as in fig. on p. 803. It follows from this that the atomic weights of any natural group of elements are expressible in terms of the general algebraic formula $(n + 16m)$, where m is an integer; in other words, that the differences between the atomic weights of allied bodies are, in general, multiples of 16.

Other similar relations were developed by means of secondary helices.

De Chancourtois, evidently absorbed in the numerical relations exhibited by members of the individual groups, omitted to consider sufficiently the relations of the various groups, and so he failed to give clear expression to the periodicity of properties which his telluric helix implies. A mathematician and geologist, de Chancourtois expressed himself in terms not at all calculated to attract the attention of the chemical world at large; consequently his work fell into ar-

restion from which it has but lately been drawn to the light of day, (v. N. Dec. 26, 1889; C. N. 68, 51).

It will also be seen that the numbers of analogous elements generally differ by 7 or some multiple of 7; in other words, members of the same group stand to each other in the same relation as extremities of one or more octaves in music (C. N. 12, 83).

As will be seen, Newlands' law was retrospective rather than prophetic; it recapitulated and co-ordinated old facts, but did not suggest new ones. Though Newlands admitted the probability of the discovery of new elements, his rigid disposition into 8 octaves of the 62 elements then known neither admitted of interpolations nor suggested additions. In his development of the conception of chemical octaves there was a too evident subordination of fact; and chemists gave but little heed to a classificatory scheme which formed octaves at the cost of grouping together elements chemically dissimilar, and then only succeeded in producing octaves varying in range from 8 to 10 constituent elements.

In March 1869 Mendeléeff read a paper on the periodic law before the Russian Chemical Society. This periodic law was nothing else than a generalised and developed form of the law of octaves, the conceptions underlying both laws being practically identical. Yet Mendeléeff's law was the law of octaves so elaborated and expanded that it at once attracted general attention. Operative not only in the realm of the known, but boldly presuming to deal with the unknown, this periodic law clearly indicates methods of testing its own validity. The law states that the properties of the elements, as well as those of their compounds, are periodic functions of the atomic weights of the elements. That is to say, if in a co-ordinate system atomic weights be measured along one axis, and any measurable property along the other, a line joining the loci of the intersections of corresponding abscissæ and ordinates will form a sinuous curve showing maxima and minima. As the atomic weight increases the property considered will not increase or diminish indefinitely, but will exhibit periodical waxing and waning in intensity.

The predictions to which Newlands lays claim in the preface to his pamphlet 'The Periodic Law' are founded on theoretical considerations at which he arrived independently of, and prior to, his law of octaves, and which, therefore, do not involve any idea of periodicity.

Contemporaneously with the enunciation of the periodic law by Mendeléeff, but quite independently, L. Meyer (*A. Suppl.* 7, 354) showed that such a periodic curve results when the relatively measurable property considered is atomic volume (at. wt. + S.G. in solid state). In fact, nearly every measurable property—physical and chemico-physical—has been investigated, and in every case the law has been substantiated. On examination of the characteristic ultra-violet spectra of the elements, Hartley (*C. J.* 11, 84) found these to vary periodically in such a way that elements belonging to the same group have analogously disposed spectra; in fact, Hartley made use of this generalisation in assigning *Do* (*vide infra*) a place in the periodic system (*C. J.* 43, 316; see also Leocq de Boissaudran, *C. N.* 1886 (2) 4). Laurie (*P. M.* [5] 15, 42) obtained periodic curves when he plotted out the values of the heats of formation of haloid compounds of the elements in diagrams in which atomic weight was taken as the other variable. In this connection also Carnelley investigated the melting-points, boiling-points, and heats of formation, of the halogen compounds of the elements (*P. M.* [5] 8, 1); the colours of corresponding compounds of the elements (*P. M.* [5] 13, 130); the occurrence of the elements in nature (*P. M.* [5] 18, 194); the salient physical properties of the compounds of the elements with alkyl radicles (*P. M.* [5] 20, 259); and finally the magnetic properties of the elements (*B.* 12, 1958). Carnelley and Walker have examined the relation of the phenomenon of the complete dehydration of hydrated oxides to the periodic law (*C. J.* 53, 59). Prud'homme (*C. R.* 112, 236) found that the shades produced by using different metallic oxides to fix one and the same colouring matter varied periodically with the atomic weights of the metals. Brauner and Watts found confirmation of the law in studying the molecular volumes of the oxides (*B.* 14, 48). Roberts-Austen experimented with a like result on the tenacity of gold when alloyed with about 2 per cent. of other metals (*Pr.* 43, 425). Recently, Sutherland (*P. M.* [5] 80, 818) has asserted a periodicity of the vibration-periods of the atoms of elements at their melting-points.

For a fairly complete summary of such investigations showing that the atomic weights of the elements are the true variables which determine the properties of matter v. Meyer's *Modern Theories of Chemistry*, pp. 119-152.

At first sight it might seem that the best method of giving detailed expression to this periodic law would be the geometrical one of tracing periodic curves as above indicated, but in the present state of science this is impossible, for we have yet to learn methods of measuring chemical properties. Further, the periodicity which Mendeléeff asserts is peculiar in its discontinuity, and contrasts strongly with the continuous periodic curves of the geometer, such, for instance, as the curve of sines. Conclusions respecting any point on such a curve as the curve of sines, where the periodicity may be called continuous, are warranted; but unless geometrical analysis be modified in a special manner

¹ It should be noted, however, that the specific heats of the elements in the solid state do not vary periodically with the atomic weights.

the connecting by a continuous curve of the loci of intersection of ordinates and abscissae in a co-ordinate system, of which properties and atomic weights are the variables, amounts to a virtual negation of the indivisibility of atoms, and to an assertion that the number of elements is infinite. No elements intermediate between, e.g., silver and cadmium, and with atomic weights between 107.6 and 112 are known. Even if they existed, we could not for a moment suppose that they would form oxides with formulae containing a fractional number of oxygen atoms. Yet, as will be seen later on, if the periodic law were represented and interpreted geometrically it would certainly involve not only the existence of such intermediate elements, but also the existence of oxides and other compounds incompatible with the fundamental conception of modern chemistry—the conception of the atom.

For these and similar reasons it is not only desirable but imperative that the periodic law should have a non-geometrical representation at present. Let the elements (hydrogen excepted) be arranged in order of their atomic weights. It will then be found that the properties vary gradually as the value of the atomic weight increases; that when the eighth element is reached we have reproduced in varying intensity many of the properties characterising the first. The same is true of the fifteenth element. Similarly, in the ninth and sixteenth elements we have the recurrence of the properties of the second in the series, and so on.

If now, instead of this linear disposition, we arrange the elements in two dimensions, placing elements with analogous properties in the same vertical lines, and if we suppose that certain elements exist which have not yet been isolated, we obtain the table on the following page (taken from Brauner (*C. J.* 41, 68), and differing in slight details from the one first proposed by Mendeléeff), consisting of twelve horizontal rows and eight vertical columns.

The horizontal rows are called 'series,' and consist of elements whose properties vary gradually from one member to the next. It will be seen that hydrogen, on account of the anomalous relations between the value of its atomic weight and those of succeeding elements, is regarded as constituting a series in itself. The vertical columns are called 'groups,' and comprise elements with similar properties, i.e. elements which would occur at comparable points on periodic curves, could such be traced as already indicated. The similarity in properties shown by members of a group is a regularly graduated one, and while in a series the properties of the elements vary in kind, in a group the variation is, speaking widely, one of degree only.

It will be noticed that the perfect symmetry of the table and the analogy which for the first few series it shows with the notes of the diatonic scale disappear when the end of the fourth series is reached. The three elements Fe, Ni, and Co, following upon Mn, and showing no analogies with the elements of Groups I, II, and III, respectively (where, guided solely by considerations of symmetry, we should be inclined to locate them), inaugurate the eighth group of Mendeléeff's table; a group containing many of the more important industrial metals, all very

closely allied from a chemical point of view (A. Suppl. 8, 147), and a group anomalous in that even series only are represented, three elements occurring in each series. According to Mendelëff, the metals Cu, Ag, and Au, similar in many respects to the elements of Group I, nevertheless show, in their higher oxidation forms and physical properties, such analogies with the members of Group VIII. as to warrant their double representation in the table (A. l.c. p. 152). It should also be noticed that the table is so constructed as to indicate a subdivision of each of the groups I.-VII. into two sub-groups or 'families,' one family in each case being constituted of members of even series only, the other of members of odd series only. This subdivision is more apparent in the following tabular ar-

the Hydroxyl derivatives of the paraffins into the minor classes of primary, secondary, and tertiary alcohols—is that, although there is a general similarity between all the members of a group, yet there is a more pronounced similarity between the members of odd series and the members of even series respectively; in other words, alternate members of a group are in general more closely related than successive members.

Nevertheless the advisability of a rigid subdivision of all the groups as indicated is open to question. In the case of Group II. this division is undoubtedly warranted. Mg, Ca, Zn, Sr, Cd, Ba, Hg have all certain properties in common. But the family Ca, Sr, Ba, on the one hand, and the family Mg, Zn, Cd, Hg, on the other, have respectively so many similarities that we are

(In this Table O=16 is the starting-point of atomic weights. See F. W. Clarke, C. N. 63, 76.)

range of the elements which Mendelëff suggests as a truer representation than the foregoing table of the peculiarly compounded periodicity which obtains. The reason for this subdivision—which may be compared with the subdivision of

justified in making the subdivision in this case (v. CLASSIFICATION, vol. ii. p. 204). But in the case of Group V. the 'family characteristics' do not so predominate over those of the group. N, P, V, As, Sb, &c., are all so much alike in properties that here a resolution

into families is by some regarded as superfluous; this group, it is said, is more conveniently studied as a whole, for now the 'group characteristics' predominate over those of the families (v. vol. ii. p. 210).

The elements constituting the eighth group have so many characteristic properties in common that subdivision of the group in any way would be artificial and unnecessary.

There have been various other methods (di- and tri-dimensional) suggested for representing the periodicity in properties of the elements, but none of them perhaps sums up the facts known more simply and clearly than Mendeleëff's table (v. Meyer's *Modern Theories*, p. 120; Reynolds, N. 84, 423; Crookes, C. J. 53, 503; Rayley, P. M. [5] 13, 26; Kremers, *Physikalisch-chemische Untersuchungen*, Wiesbaden, 1869-70; Baumhauer, *Die Beziehungen zwischen den Atomgewichte und der Natur der Elemente*, Braunschweig, 1879).

On inspecting his table in the light of known facts, Mendeleëff was led to make the following generalisations:—

(i.) Excluding Series 2, the most marked non-metallic elements occur in odd series.¹

Type	Li	Be	B	C	N	O	F	—	—	—	Na	Mg	Al	Si
P " S " Cl	K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	—
As Se &c.														

(ii.) Omitting Series 2, only members of odd series form compounds with organic radicals (the organo-metallic compounds).² Just as the hydrides of Pd, Cu, and Nb contrast strongly with the hydrides of elements belonging to odd

				Li	Be	B	C										
N	C	F	Na	Mg	Al	Si											
P	S	Cl	K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	—	
As	Se	Br &c.															

series, so organic compounds of members of even series (should such be hereafter discovered) will possess properties very different from those of similar compounds with which we are at present acquainted.

Mendeleëff expressly omits Series 2 in making these generalisations. If, excluding the very incomplete Series 10 and 12, we tabulate the differences between the atomic weights of corresponding elements of Series 2 and 4, 4 and 6, 6 and 8, we find that, whereas the mean difference of corresponding elements of consecutive series is about 2, the mean difference for Series 2 and 4 is only 84.5. Since properties and atomic weights are dependent, we should expect from the above relations that the properties of the elements of Series 2 would contrast with the general properties exhibited by the other members of the families which they head. Such is actually the case to a greater or less extent with all the members of Series 2, e.g. Li differs from the other alkali metals, and approaches the alkaline earths in its insoluble phosphate, its easily soluble

bicarbonate, its difficultly soluble carbonate, and in the formation of diglycollic acid by the inter-
action of LiOH and monochloroacetic acid. N is more closely related to P than to V; O to S than to Cr. Again F and Mn contrast very strongly. On this account Mendeleëff has styled the elements composing Series 1 and 2 *Typical Elements*. Though the differences (averaging about forty) between the atomic weights of Na and Mg (Series 3) and those of the corresponding elements Cu and Zn (Series 5) are greater than those derived from a consideration of Series 2 and 4, yet the properties of Na and Cu on the one hand, and of Mg and Zn on the other, contrast so strongly, in Mendeleëff's opinion, as to induce him to ex-
clude Na and Mg also among the typical elements. It is open to question whether the differences between Mg and Zn are sufficient to justify the classification of the former as a typical element; most chemists would probably find in Na the limit of the typical elements. Meyer, however, insists that the differences between Mg, Al, Si, and the other members of the corresponding groups is such as to justify the enrolment of these three substances among the typical elements, as follows:—

Yet the typical elements after nitrogen exhibit so little analogy with the groups placed below them in the above scheme that Meyer proposes the following as perhaps a more scientific disposition of the typical elements:—

Some go still further than Meyer, and regard H to Cl inclusive as typical elements; but such extreme views can scarcely be regarded otherwise than as unwarranted subordination of fact to considerations of symmetry suggested by Mendeleëff's table.

Mendeleëff compares his so-called typical elements to the lower members of homologous series in organic chemistry, which, as is well known, possess many properties peculiar to themselves and unrepresented in the higher members. In this connection contrast H_2O and CH_3O with the higher alcohols of the $C_nH_{2n+1}O$ series.

While some disapprove of the title 'typical elements,' maintaining that this nomenclature connotes exactly the opposite of what it should, seeing that the typical elements are by no means types (as this word is generally understood) of the groups or even of the families which they head, others attempt to justify Mendeleëff's nomenclature. The former would rechristen the typical elements as anomalous elements; the latter would either find in the typical element of the group a combination of individual characteristics of each of the constituents of the sub-groups (vide vol. ii. p. 207), or in the typical elements as a class a representation of the gamut of variations of chemical properties.

(iii.) The passage from even to odd series is

¹ To render these generalisations unconditional Walker (C. N. 83, 251) has proposed that H to F be regarded as constituting Series 1, Series 2 being regarded as wanting. If this proposal is adopted, it becomes hardly necessary to differentiate typical elements (v. supra).

² Recently it has been shown by Winkler (Z. 24, 872, 1904) that the same generalisation can scarcely be applied to the hydrides also.

accompanied by a more gradual change in the properties of the elements than is the passage from an odd to an even series. This fact is in a manner emphasised in Mendeleëff's second table.

(iv.) As the at. wt. increases in each group:—

(a) The elements become more electropositive, and their oxides become more basic. This is well exemplified by the oxides of the types R_2O and R_2O_3 formed by the elements of Gr. V.

(b) Corresponding compounds of the elements become more easily reduced. This is well instanced in the triplets S, Se, Te, and Cu, Ag, Au.

(v.) There is a tendency to form stable oxides (and the salts corresponding to these) containing less O than the maximum salt-forming oxide characteristic of the group (*vide infra*). Thus, the characteristic oxide of Gr. V. is of the type R_2O_3 , and the haloid and oxyhaloid salts of the lower members of the group P, V, Nb, belong to this form, e.g. PF_3 , $VOCl_3$, $NbCl_5$; but Bi, which is the highest known member of Gr. V., forms salts corresponding to the oxide R_2O_5 . Again in Gr. IV. no oxide of Si having the formula SiO_3 is known; SnO is known but is unstable; while PbO figures as the stable oxide of lead.

(vi.) Periodicity of valency and limiting forms. It has long been admitted that the atoms of those elements which form hydrides are limited with respect to the maximum number of H atoms which they can hold in combination, but it was only with the introduction of the periodic law that it was noticed that this limited power of combining with H atoms varies in a regularly periodic manner with the atomic weights. Little is as yet known of metallic hydrides, so that we have to look to Groups IV.—VII., consisting of what may broadly be called the non-metals, for a confirmation of this periodicity.

For instance:—

Gr. IV. furnishes us with CH_4 , SiH_4 ;
Gr. V. " " NH_3 , PH_3 , AsH_3 , SbH_3 ;
Gr. VI. " " OH_2 , SH_2 , SeH_2 , TeH_2 ;
Gr. VII. " " FH , ClH , BrH , and IH .

In the same way, but more perfectly, the law teaches us that the maximum number of oxygen atoms with which the elementary atoms can severally combine to form definite salt-forming oxides—either acidic or basic, as the case may be—also varies periodically with the atomic weights of the elements. The oxides characteristic of Gr. IV. are of the type R_2O , (or RO), those of Gr. V. of the type R_2O_3 , and so on regularly till we come to the eighth group, which has maximum salt-forming oxides of the type R_2O_7 (or RO_4). In carrying back this regularity to the groups I.—IV., consisting for the greater part of metals, we find that it assigns to each of these groups exactly that type of oxide which we know to be characteristic of the individual members of the group. Hence we are justified in broadly asserting that the types of the hydrides (so far as they are already known), as well as those of definite salt-forming oxides, are periodic functions of the atomic weights of the elements. At the present time they are merely considerations of a regular periodicity, and not facts actually known, that lead us to assign R_2O_7 to Group VII. as its characteristic oxide. Fluorine, so far as we know, forms no oxides at all; and

the highest halogen oxide is of the type R_2O_7 . In fact, Mn is the only member of the group that has an oxide conforming to the type R_2O_7 . Yet, having regard to the successes (to be detailed later) attendant on other predictions of the law, founded only on considerations of symmetry and general plan, all this is simply tantamount to admitting that the conditions of the existence of such oxides as ClO_2 , IO_2 , &c., are legitimate subjects for research. Again, in Gr. VIII. the only oxides of the form RO , yet isolated are RuO and OsO ; but chemistry is by no means so completely worked-out science wanting nothing, and the periodic law would be a fault did it fail to mirror forth such shortcomings and imperfections as still exist. The forms of complex oxyacids are determined by the forms of the maximum oxides, and may be derived from these by replacing O by its equivalent (OH), or H . Thus from SO_3 we can derive the chief oxyacids of S: $SO_3(OH)$, $SO_3H(OH)$, and SO_3H_2 .

The highest compounds of the elements with halogens also correspond in type to the maximum oxide forms, and therefore exhibit a regular periodicity. In many cases, however, e.g. $TeCl_4$, ICl_3 , $AsCl_3$, only haloids lower in type than the maximum oxides are known; but in no case is a simple haloid known of higher type than the maximum oxide of the element considered.

Against the doctrine of a maximum oxide-form peculiar to all the members of each group, and of the types assigned (Table, top p. 811), the existence of such oxides as K_2O_2 , BaO_2 , &c., has been adduced. In reply it has been pointed out that these oxides belong to the class of peroxides, all of which are distinguished by their instability in the presence of the so-called 'contact agents,' as well as by their inability to form corresponding salts with a given basic or acidic oxide, as the case may be; and that a generalisation explicitly extending only to salt-forming oxides, strictly so called, cannot be impugned by considerations originating in the study of a class of bodies lying wholly without the pale of its jurisdiction.

Yet this reply is scarcely satisfactory; for in certain cases we are bound, in order to justify the principle advanced, to recognise such bodies as PbO_2 and Bi_2O_3 —oxides currently regarded as peroxides. But PbO_2 is undoubtedly an acidic oxide, forming with basic oxides the corresponding plumbates, and Bi_2O_3 would also seem to have the power of forming with strong basic oxides unstable bismuthates—so unstable, in fact, that their true composition is still very doubtful. Hence Mendeleëff (*l.c.* 15, 242) asserts that the oxides in question are not peroxides; for, according to him, true peroxides such as BaO_2 , CrO_2 , TiO_2 , H_2O_2 , cannot form corresponding salts, and must of necessity contain relatively

* Some of the recently isolated acetyl compounds of the elements of Group VIII. conform to type MO , (*G. Z.* 87, 743; 89, 1900; *C. Z.* 113, 1481).

* It seems more than probable that a wider study of the higher forms of oxidation will result not only in the discovery of several new peroxides, but also of a distinct periodicity of type amongst this class of bodies also.

* The recent isolation of permanganates, MnO_4 , by Berthelot (*C. R.* 113, 1481) and Marshall (*C. J.* 38, 771) does not harmonize with Mendeleëff's view. Nor does Péchard's work (*C. R.* 113, 798, 1060) on higher oxidized compounds of Mo and W.

more Θ than to the maximum salt-forming oxides (acidic or basic) as defined by the periodic law (v. also Piccini, *B.* 18, *Ref.* 255). Still the case of CuO (which cannot be regarded as a peroxide) presents a difficulty, if Cu is rightly placed in Gr. I.; for, in accordance with this position of Cu among the elements, the principle under discussion would lead us to expect a maximum salt-forming oxide of the formula Cu_2O .

In conclusion it may be said that although there undoubtedly is some connection between the at. wts. of the elements and the types of oxides they form, yet with the imperfect methods which we have of representing the periodic law, and in the absence of any firmly grounded and generally recognised classification of oxides, it is impossible to give a hard-and-fast enunciation of this connection.

We may assert that, so far as we are aware, a single atom of an element combines with at most four atoms of O or four atoms of H . The periodic law teaches us that the hydrogen-holding power of the non-metals decreases regularly with increasing at. wt., while the oxygen-holding power, as measured by the group-oxides, increases regularly in such a way that the sum of the number of equivalents of both is equal to eight. For instance, S combines with two equivalents of H to form H_2S ; it cannot, therefore, form a higher salt-forming oxide than SO_2 , which contains six equivalents of O .

Some chemists have proposed to extend this principle to the metals, i.e. to Groups I., II., and III. Since Na combines with one equivalent of O to give a salt-forming oxide, it must, they argue, combine with not more than seven equivalents of H or its equivalent. Similarly Ba combining with two equivalents of O must combine with six equivalents of H ; and so on. But Brauner (*Sitz. W., Math.-naturwiss. Classe.* 84, 1165) would go still further. Let X denote a single equivalent of any element or radicle

($\text{X} = \text{H}, \frac{\text{O}}{2}, \frac{\text{S}}{2}, \frac{\text{N}}{3}, \text{OH}, \&c.$); then he asserts

that the whole of the compounds of Na will be constituted on the types NaX or NaX_2 , or on types intermediate between these two; that all the compounds of Ba will be constituted on some of the types included in the scheme $\text{BaX}_2 \dots \text{BaX}_8$, and so on. In short he would make out that there are certain limiting forms defining the complexities not only of the binary, but, of all the compounds formed by each element, and that the range of these limits varies regularly and periodically with the atomic weights. In order to substantiate this view, recourse has been had to formulae not yet authorised by Avogadro's law, and sweeping assumptions are made as to the dispositions of the constituent atoms or atomic groups in the molecules or reacting masses of the bodies taken to exemplify this doctrine of limiting forms. Thus, out of all the numerous compounds of the alkali metals, the only one that can be found conforming to the type RX_2 is the substance $\text{NaOH} \cdot 3\text{H}_2\text{O}$, and then only provided we manipulate the constituent atoms as follows: $\text{Na}(\text{OH})(\text{OH}), \text{H}_2$. Si belongs to Group IV; therefore, according to Brauner, all its compounds ought to be of the type RX_4 .

Its oxide SiO_2 , certainly conforms to the rule, but the highly characteristic body SiH_4F_2 does not. Again, can such compounds of Pt as $\text{PtCl}_2 \cdot 8\text{H}_2\text{O}$, $\text{PtCl}_2 \cdot 2\text{HCl} \cdot 6\text{H}_2\text{O}$, &c., be regarded as belonging to the type RX_4 ? These are one or two examples, out of very many, of the kind of difficulties that stand in the way of a full recognition of Brauner's extension of Mendeléeff's views (v. CLASSIFICATION, vol. ii. pp. 210-18).

The idea that the valencies of the atoms vary regularly and periodically with their weights is one which has often been mooted, but in the absence of any recognised definition of valency it is an idea difficult to criticise.

If, as was originally done, the valency of an element be referred back to some congenitally objective attribute of the atom, and measured by the number of H atoms with which the given atom can combine, a partial periodicity involving only groups IV.-VII. is undoubtedly apparent.

Group	IV.	V.	VI.	VII.
	CH_4 SiH_4	NH_3 PH_3 AsH_3	OH_2 SH_2 SeH_2	FH ClH BrH
Valency	IV.	III.	II.	I.

This conception of constant valency not only lacks in generality (since out of the 70 or so elements only some 17 combine with H), but for the establishment of its validity demands a division of compounds into the two classes of atomic and molecular—a division altogether too artificial to be admitted. If we forgo the idea of constant valency, and merely attempt to define the valency of an element as a number expressing the maximum number of monovalent atoms (H , F , Cl , Br , I) with which a single atom of the element in question combines to form true gaseous molecules, i.e. if we give a mere name to the maximum number of 'equivalents' represented in an atom, the alleged periodicity is still far from being perfect, as the table on the following page, embracing the latest results, shows.

Regarding this question of valency in the light of what has been said of limiting hydride and oxide forms, it is at least apparent that our crude conceptions of valency do not admit of a satisfactory quantitative interpretation. The sulphur atom fixes 2 equivalents of H and 6 of O ; the arsenic atom fixes 3 equivalents of H and 5 of O . Why, we may ask, should we decide to overlook these essential relations exhibited by the oxides, to say nothing of the peroxides, and regard the valencies as deduced from the hydrides and haloids merely as fundamental properties of the atoms?

Mendeléeff himself regards the theory of valency as extreme and not very valuable. Originating in the study of carbon compounds, valency finds in the domain of organic chemistry its only legitimate application; for the carbon atom, in accordance with its position in the periodic scheme, combines with equal number of equivalents of H and O , and, further, carbon compounds do not form so-called molecular compounds. He maintains that the forms of chemical compounds (including here isomerism, and therefore structural formulae) are fully explained, without the spurious aid of a statal

theory of valency, in terms of the periodic principle together with more generalised views on substitution involving the recognition of Newton's third law; which states that action and reaction are equal (v. A. *Suppl.* 8, 211; N. 40, 354).

Uses of the Periodic Law.—An induction of any value should be suggestive of deductions admitting in their turn of experimental confirmation. Judged from this standpoint, the periodic law is well worthy the exalted position accorded it among the principles of chemistry; for it has opened up immense fields of research which deduction has already, to a small extent, successfully explored.

In order to maintain a general identity of properties in the vertical columns or groups of Mendeléeff's table, it was found necessary to make gaps here and there, to leave certain series unrepresented in the various groups. It was asserted that these empty places in the scheme were the positions of undiscovered elements for which Mendeléeff proposed a provisional and temporary nomenclature. Thus, in the year 1869, the element next to Ca=40 with a higher atomic weight was Ti=48; but Ti could not find a place in Group III. Series 4, as its properties resemble those characterising Group IV. and show no analogies with those of the other members of Group III. Ti was accordingly placed in Group IV. Series 4, and the vacancy in Group III. Series 4 was assigned to a then unknown element provisionally styled *ekaboron*. The principles of this nomenclature are very simple. The predicted element takes its temporary name from the one immediately above it in the group-family, the Sanskrit prefixes *eka*, *dvi*, *tri*, &c. being prefixed according as the unknown element is one, two, &c., removes lower down in the family than the name-determining element.

Those elements of a family which stand immediately above and below a gap, together with those which immediately precede and succeed it in the series, are called the *atom-analogues* of

the element to which the gap corresponds. Thus B, Yt, Ca, and Ti are the atom-analogues of ekaboron. Now it follows from the very nature of the law that the properties of any given element must be determinable from those of its atom-analogues; that the properties of ekaboron, for instance, must be similar to, but intermediate in intensity between, those of B and Yt, and at the same time while dissimilar from those of Ca and Ti, they must show an intermediacy in their dissimilarity. Hence it becomes possible to predict the properties of still undiscovered elements; the mean of means of the properties of the atom-analogues forming the basis of the prophecy. How closely the properties of ekaboron thus predicted by Mendeléeff tallied with the properties of Sc experimentally investigated ten years later by Nilson is shown in the article ATOMIC AND MOLECULAR WEIGHTS (vol. i.). Even were this case of ekaboron an isolated one, the wonderfully exact concordance between prediction on the one hand and experimental realisation on the other would go far to establish the periodic law as a generalisation of the highest order. But ekaboron is not an isolated example of the prophetic infallibility of the law which has as strikingly asserted itself in connection with the two recently discovered elements Ga and Ge (q. v. vol. ii. 597, 610). The periodic law is and will be to the science of chemistry what Newton's law of gravitation was and is to the sciences of astronomy. Neptune had its place assigned in the world around us before it was seen; before they were discovered Sc, Ga, and Ge had their properties detailed and their places assigned them among the elements, which by means of the periodic law have been raised from the level of 'mere fragmentary and incidental facts in nature.'

The validity of Mendeléeff's generalisation has also been confirmed in connection with the question of atomic weights. Before the ann-

It yet remains to be seen whether the new element, austriacum, separated by Brauner from uranium ores, will identify itself with dvi-tellurium, whose properties have recently been specified by Mendeléeff.

elation of the periodic law the values for the atomic weights formed a series of isolated and purely empirical numbers; the atomic weight of an element once ascertained, there was nothing in the actual numerical value itself, even when considered along with the properties, either to confirm or cast doubt on it as the true atomic weight. But the periodic law teaches that the atomic weights are by no means disconnected quantities, but that, taken in connection with the properties of the elements, their values constitute a series of mutually corrective numbers; in short, the law gives significance to the expression 'the probability of an atomic weight.'

α. In dealing with this aspect of the law it will be well to distinguish two sets of cases:—

a. Those in which the law has actually fixed certain atomic weights indeterminate at the time by other means.

β. Those in which the law has merely served to correct the values of atomic weights inaccurately determined by the usual methods.

As illustrative of α we may consider the case of Be. The equivalent of Be having by accurate experiment been fixed at 4.54, it follows that the atomic weight must be numerically equal to $n \times 4.54$, where n is an integer. At first chemists were led to assign the formula Be_2O_3 to the oxide of Be on account of its isomorphism and many points of similarity with Al_2O_3 . This taken in conjunction with the analysis of the oxide makes $n = 3$, and consequently fixes the atomic weight as 13.5. But Brauner repeatedly emphasised the view that the oxide of Be has the formula BeO , and that Be has therefore the atomic weight 9. The keynote of the many arguments advanced by Brauner in favour of his views was the incompatibility of the existence of an element with an atomic weight of 13.5, and having the properties of Be, with the system of the elements as arranged and classified by the periodic law.

In this system he argued that, not only was there no room for an element at wt. 13.5, but that the proved existence of such an element would be totally subversive of the law. On the other hand, he pointed out that a vacancy existed in Series 2, Group II., for an element with an atomic weight equal to 9; and a careful examination of the relations of the members of Series 2 as a whole to those of other series, taken along with the known relations of beryllium to the magnesium group, absolutely demanded in his opinion the filling up of this vacancy with the element beryllium. Brauner's views were fully confirmed by Nilson and Petersson, who succeeded in taking the vapour density of beryllium chloride; the application of Avogadro's law to their results gave the atomic weight of Be equal to 9 and the formula of the oxide BeO .

We are inclined to wonder that the question of the atomic weight of so rare and comparatively unimportant an element as Be has originated such a large amount of work and stimulated such lively discussion, unless we remember that a question of much greater import than the atomic weight of Be was at issue; the validity of the periodic law itself was at stake. And it is of interest to note that Mendeleëff regards the substantiation of Brauner's views on Be as a confirmation of the law.

β. In what immediately follows the values given for atomic weights and equivalents are only approximate.

mation of his law of the same order as the discovery by Nilson of Be, the harbinger of prophecy. In a similar way the suggestions thrown out by the periodic law as to the atomic weights of U, Ce, and In have all met with corroboration. Up to the date of the periodic law, Pélignot's value 120 (= three times the equivalent 40) was received as the atomic weight of U; but Mendeleëff (l.c. 178) suggested six times the equivalent, or 240, as the correct atomic weight, thus conferring on U the distinction, which it is now universally admitted to hold, of being the element with the highest known atomic weight.

In 1870 the recognised atomic weight of Ce was 92 (2×46). Mendeleëff (l.c. 186), however, showed that no place existed in the system for an element with this atomic weight, and showing the properties of Ce, but that a suitable vacancy existed in Group IV. Series 8, if Ce was regarded as having an atomic weight one and a half times the then accepted value. Mendeleëff's proposal has been fully justified by later work on the cerite metals (C. J. 41, 68).

The equivalent of In is 37.8, and formerly its atomic weight was taken equal to twice this, or 75.6. But Mendeleëff (l.c. 174) showed the necessity of trebling the equivalent, thus assigning the value 113.4, which is now accepted, to the atomic weight of this metal. Similarly Mendeleëff suggested, what has not yet been very satisfactorily settled, that the atomic weight of yttrium is three times its equivalent number, 29.87 (v. EARTHS).

The investigations on tellurium are fairly illustrative of the cases summed under the heading β. The adoption of the value 128 for the atomic weight of Te as determined by Berzelius would necessitate iodine (at. w. 126.5) taking precedence of Te in Series 7 of the periodic scheme; iodine being thus separated from the rest of the halogens and falling into Group VI. with such elements as S and Se, with which it shows no analogies, and Te falling into Group VII. with such elements as Cl, Br, and Mn, with which it in turn shows no kinship. This violation of the principle of identity of chemical behaviour in the groups suggested some grave error in the accepted atomic weight of Te; an error causing this element to succeed iodine in the series instead of preceding it, as the general plan of the law requires. The subject has recently been investigated by Brauner (C. J. 55, 882), who for a second time has vindicated the law in a most striking manner by showing that the *ci-devant* tellurium is probably not elemental, and that the atomic weight of unalloyed tellurium is considerably lower than that of iodine, being equal to about 125.

In much the same way the law has led to the correction of the previously accepted atomic weights of osmium, platinum, and gold.

Formerly the accepted atomic weights of Os, Ir, Pt, and Au were in accordance with the scheme

But from the analogies existing between Os, Ru, and Fe, and the disposition of the first two series represented in Group VIII. Mendeleëff (A. L.) predicted alterations of the atomic weights in accordance with the scheme

This prediction has been fully confirmed by recent researches; it has not, however, yet been found possible to verify and substantiate the results now accepted for the last three metals by the application of Avogadro's law.

As will be seen from the case of tellurium, the periodic law in its relation to atomic-weight determinations is broadly suggestive rather than accurately definitive. It may be that ere long the discovery of the exact character of the periodicity, which at present we comprehend only vaguely, will raise Mendelëff's law to the rank of an instrument for the absolute evaluation of atomic weights.

Mendelëff has repeatedly emphasised the great advantage accruing to students and chemists generally from an adoption of the eridic classification as a working basis—the

atomic weights of elements constituting some of the natural families, and the analogy between the relations so obtained and those found between the molecular weights of members of homologous series, led Dumas (*C. R.* 45, 46, 47) and Gladstone (*P. M.* [4], 5, 816) to suggest that the so-called elements are not primary, but are composed of two or more simpler elements.

Felopidas (*B.* 16, 1868) called attention to the fact that the residues of hydrocarbons and nitrogenous organic bodies can be arranged in a periodic system, exhibiting in the number of members constituting the period, as well as in the gradual passage in each period from basic to acidic characters, a close analogy to Mendelëff's periodic arrangement of the elements. The following are examples of the periods arranged by Felopidas:—

I.	II.	III.	IV.	V.	VI.	VII.	VIII.
$\begin{array}{c} \text{C}_2\text{H}_4 \\ \text{C}_2\text{H}_2 \\ \text{NH}_3\text{O} \\ \text{or} \\ \text{NH}_2(\text{OH}) \end{array}$	C_2H_4	C_2H_4	C_2H_4	C_2H_4	C_2H_4	C_2H_4	C_2H_4
	NH_3O	NH_3O	NH_3O	NH_3O	NHO	NO	O

advantage lying in the great mnemonic power of the law, which, introduced into the disheartening mass of accumulated chemical fact, at once reduced the complexities of the apparent and rearranged them so as to exhibit the simplicities of the real. With one mental effort we commit memory a large mass of facts which previously demanded so many independent but severally no less taxing mental exertions. No longer is phosphorus studied as an element apart from arsenic, but the general scheme of properties of the whole fifth group is learnt, and the facts about P, As, V, &c., are easily mastered by remembering their small individual deviations from this general scheme.

The law is also useful in that it points out the directions which should be taken by future research on the as yet unknown compounds of well-known elements. It is well called 'the finger-post of modern chemistry.' Examples of its utility in this respect have been indicated when treating of the law in its relation to limiting forms and to atomic-weight determinations. In fact, and to generalisation made in connection with the law suggests new work; organo-metallic compounds of In and Tl, and of the form MR_x (where B = organo radical) must be forthcoming (*v. supra*, ii.)? a suboxide of Cd having the formula Cd_2O is looked for (*v. iii.*), while various new peroxides of Mo and W, also a true peroxide of lead (Pb_2O_2) are very probable realisations of the future (*v. v.*).

Theories having their origin in the Periodic Law.—Although, according to Mendelëff (*C. J.* 55, 684), the periodic law, solely founded as it is on the solid rock of well-ascertained chemical fact, in no way indicates the nature of the elements nor predicated the existence of a unique matter, yet many have made it a peg whereon to hang theories respecting either the compound nature of our elements or the existence of a primordial matter.

The simple relations holding between the

The existence of Curtius' amide H_2N_2 was forecasted by Mendelëff (*A.* 24, 366).

The monovalent radicals $\text{NH}_2(\text{OH})$ and C_2H_5 undoubtedly show many analogies with the alkali metals; and CN has always been compared with the halogens of Group VII. Sulphur, Group VI, forms the acid $\text{SO}_3(\text{OH})$; so the radicle C_2H_5 forms the acid $\text{C}_2\text{H}_5\text{O}_3(\text{OH})$, and so on.

Cannell (*C. N.* Nos. 1376 and 1378), from a consideration of the fact that the salient physical properties of the normal halogen and alkyl compounds of hydrocarbon-radicles exhibit relationships similar to those of corresponding compounds of the elements, develops the view that elements are analogous to the hydrocarbon radicles both in form and function. On the supposition that C and H are true elements, he then attempts to draw up a scheme of compounds of two primary elements, A and B, corresponding to Mendelëff's scheme of the alleged elements, the compounds possessing the same 'atomic weights' and showing the same periodicity as the accepted elements. In this scheme the elements appear as bodies of the type A_xB_y , where x is the group and y the homologous series to which the element belongs; A is a tetrad element identical with carbon, and B, 'probably the ethereal fluid of space,' is a monad element with atomic weight 21. These views of Cannell are as much in advance of the earlier ones of Dumas and Gladstone as is the periodic law in advance of their disconnected schemes of classification; but they cannot be regarded otherwise than as ingenious and bold speculations indicating the directions in which investigations on the rationale of the periodic law, and on the nature of the elements, will probably be prosecuted before we arrive at anything approaching the truth, either concerning the law on the one hand or the elements on the other.

The attempt to discover some kind of unity in the sea of apparent diversities by which we are surrounded, or, rather, the natural inclination to assume such a unity, is as old as philosophy itself. Prout merely gave scientific definiteness to the views of the early Greek philosophers when he suggested that the atoms

weights of all the elements were whole multiples of that of hydrogen, which he identified with the primary matter; and in later years many have in turn thought to find in the periodic law a warranty for resuscitating the principle underlying Prout's law, at the same time either shifting the primary matter lower down in the scale, so that hydrogen itself appears as a highly condensed form of matter, or not attempting in any way to particularise concerning the primary matter.

The application of recent developments in spectroscopy, combined with improved methods of fractionation, has resulted in the view that many of our so-called rare elements at least are not strictly elemental (v. METALS, RARE, and ELEMENTS). At first sight the large increase in the number of recognised elements which this recent work involves would seem to militate against the indications of the periodic law. But Crookes (*C. J.* 53, 487) has attempted to show that the new views may be brought into complete harmony with the periodic law if we will but admit into chemistry the principle of evolution. Granted that the different forms of matter have been cyclically evolved from a primitive formless fluid (protyle), and that the units of Mendeleëff's generalisation are rather 'elementary groups' than true elements, then the periodic law with its limited accommodation necessarily follows (v. also Mills, *infra*).

Some attempts have recently been made to express the atomic weights of the elements by means of general algebraic formulæ. While it must be allowed that we are more likely to arrive at clear views regarding the periodicity of the elements through methods founded on the theory of numbers than through methods of a purely geometrical nature, yet many of the researchers so far undertaken in this direction do not even promise to help towards the final solution of the periodic law. In a few cases expressions have been obtained which, as they involve constants numerically equal to some of the important constants occurring in the principles of chemistry, may on a more detailed study culminate in a clearer understanding of the nature of the elements and the rationale of the law. Mills (*P. M.* [5] 18, 893; 21, 151) arranges all the elements according to their atomic weights, and then subdivides this arrangement into sixteen groups. He then finds that all atomic weights are involved in the logarithmic expression $15.p - 15.69875^x$, in which x is an integer and p is the group-number of the element considered. This expression arrived at empirically is, according to Mills, such as we should expect, we regard the elements as stable, but more or less incomplete, stages in the polymerisation of the primary matter as it cooled. It is also noteworthy that the above expression, in that it points to the existence of an upper limit to our existing system of atomic weights, confirms views originally expressed by Mendeleëff.

Carnelley's attempt (*P. M.* [5] 29, 97) to give a general expression to the atomic weights of the elements is of more interest in that it is founded, not on a conveniently assumed and artificial

periodicity, but on the natural periodicity as this finds expression in Mendeleëff's scheme.

Carnelley's equation is $\Delta = \frac{1}{2}(m + \sqrt{v})$, where Δ = approximate atomic weight; m = a member of an arithmetical progression depending on the series to which the element belongs; v = number of the group of which the element is a member; and c is a constant.

Excluding the elements of the first three series (typical elements), the expression for the atomic weights of all the other elements may be thrown into the more convenient form

$$\Delta = c(3\frac{1}{2}a - 9 + \sqrt{v}),$$

where a is the number of the series to which the element belongs. In his paper, Carnelley notes the following points of interest: the mean value of $c = 6.64$ is nearly identical with the mean value of the atomic heats of the elements. Assume that c in the above formula actually represents atomic heat, then it follows that the specific heats of the elements should be given by the expression $\frac{1}{m + \sqrt{v}}$; and this is

found actually to be the case. It should be noted, however, that these coincidences may be purely accidental and meaningless, being simply the result of the particular units adopted. D. C.

PERSEITE $C_8H_{12}O_7$. [188⁵]. S. 5 at 18°.

Mol. w. (by Raoult's method) 179 (calc. 212). A body resembling mannite, occurring in the fruit and leaves of *Laurus persea* growing in the tropics (Müntz & Marciano, *C. R.* 99, 38; *A. Ch.* [6] 3, 279; Maquenne, *A. Ch.* [6] 19, 5; *C. R.* 106, 1235; 107, 683, 658; Dehérain, *C. R.* 108, 101; cf. Avequin & Melsens, *A. Ch.* [2] 72, 109). Extracted by water at 60°, the extract treated with lead acetate, filtered, freed from lead by H_2S , concentrated, and mixed with $MeOH$. Formed by reduction of mannoheptose by sodium-amalgam (E. Fischer & A. Passmore, *B.* 23, 2228). Small needles (from alcohol), sl. sol. cold, v. sol. hot water and alcohol. Its solution becomes dextrorotatory when borax is added. Does not reduce Fehling's solution or undergo alcoholic fermentation. On oxidation by nitric acid it yields mannoheptose $C_8H_{12}O_7$, and finally oxalic acid. Boiling HI and P give C_8H_{12} (c. 104°) and $C_8H_{12}I$ (190°-200°). HCl yields C_8H_{12} (92°). An alcoholic solution treated with HCl and benzoic aldehyde yields $C_8H_{12}(OHPh)_2O$ (c. 219°).

Acetyl derivative $C_8H_{12}(OAc)_2$. [119°]. Crystalline powder, insol. water, sol. alcohol.

Butyryl derivative $CH_3(C_2H_5O)_2C_8H_{12}$. (a. 300° in vacuo). Syrup.

Nitrate $C_8H_{12}(NO_3)_2$. [188°]. Made from perseite (1 pt.), fuming HNO_3 (5 pts.) and conc. H_2SO_4 . White needles, insol. water, sol. hot alcohol. Explodes when struck.

PETROCENE. The highest boiling portion of American petroleum contains, according to Hemilian (*B.* 9, 1604), a hydrocarbon $C_{26}H_{54}$ (above 800°) crystallising from benzene in yellow laminae. Prunier (*A. Ch.* [5] 17, 28) found carbopetroleum $C_{26}H_{54}$ [268°] which yielded $C_{26}H_{54}O_2H_2N_2O$ [185°] and $C_{26}H_{54}O_2H_2N_2O$ [185°]. Prunier also found, in petroleum, petrocene $C_{26}H_{54}$ [102°] yielding $C_{26}H_{54}O_2H_2N_2O$ [98°] and a hydrocarbon $C_{26}H_{54}$ [119°]. V. also Petrocenum.

PETROLEUM. Earth-oil, Rock-oil, Naphtha, Mineral oil, Erdöl, Steinöl, Petroleum, Erdöl de

G. J. Stoney has also arrived at a logarithmic expression for the atomic weights (*G. J. Proc.* 1884, 55).

Petro, Bitume liquide. Petroleum is the general name given to the natural oily liquids occurring in the earth at different depths and in many localities. The natural oil is a mixture of several hydrocarbons, has a strong bituminous smell, but differs very considerably in its physical properties and chemical composition. It is found in large quantities in the United States, in the Caucasus, and in the country situated at the mouth of the Danube, in considerable quantities in Burmah and in Galicia, and has been found in Persia, the West Indian islands, Italy, parts of Germany, Switzerland, China, India, France, and England. Its specific gravity ranges from 77 to 1.1, and its colour from pale yellow to brown, dark green, and black. The colour of crude petroleum not only varies with the locality, but varies from time to time in the same district. B. Redwood has recorded the colours of various kinds of crude petroleum (*Journ. Soc. Arts*, 34, 823, 878), and Lovibond's tintometer is used for determining the colour of commercial samples. Crude petroleum varies considerably in its composition, that from North America consisting chiefly of hydrocarbons of the C_nH_{2n+2} series, while that from Baku (Caucasus) contains in addition the hydrogenised, aromatic hydrocarbons of the general formula C_nH_m (Bailstein a. Kurbatow, *B. 13*, 1818, 2028) and small quantities of other hydrocarbons (Markownikow a. Oglobine, *J. R. 15*, 237, 307). Galician petroleum contains hydrocarbons of the series C_nH_{2n+2} and C_nH_{2n-2} (Fround, *A. 115*, 19), and also the hydrogenised aromatic hydrocarbons of the formula C_nH_m (Lachawicz, *A. 220*, 168). Crude petroleum also contains small quantities of compounds containing sulphur, nitrogen, and oxygen. 0.23 per cent. of nitrogen has been found in petroleum from Ohio, and 1.11 per cent. in that obtained from California. Beilby has also found 0.5 per cent. of nitrogen in Baku oil and 0.188 per cent. in Galician ozokerite. Crude American petroleum contains at least 0.008 per cent. of nitrogen (*S. C. I.* 10, 120). Sulphur amounts to 1.87 per cent. in certain Russian petroleum, and is present in that obtained from California, Lima, Ohio, and Canada, but is absent from Pennsylvanian and West Virginian oils (Vohl, *D. P. J.* 216, 47; Woodman, *A. C. J.* [1891] 13, 179). From the variable composition of crude petroleum it follows that its volatility will be very different, the several constituents of crude petroleum extending from the gaseous members of the marsh-gas series to solids which boil at 400°. As a rule, the petroleum with lowest specific gravity is the most volatile and inflammable. Crude petroleum also may contain water and sediment, and is tested commercially for its specific gravity, odour, colour, its feel when rubbed between the fingers, and the percentage of naphtha (or portion volatile below 160°) yielded on fractional distillation (Allen, 'Commercial Organic Analysis,' 11, 369; Nawratie, *D. P. J.* 246, 228, 423). The flashing-point and burning-point of petroleum are also important factors for ascertaining its commercial value, but these tests are usually applied only to the refined petroleum or kerosene, which consists of the more volatile portions of the crude oil which can be burned with a wick (*Petroleum Act*, 1871, 84 and 85 Vict. cap.

195; *Petroleum Amendment Act*, 1879; and for variation of flashing-point with climate *S. C. I.* 1, 471; *C. N.* 40, 805; 49, 196). For calorific values of petroleum, see Deville, *C. R.* 72, 195, and 68, 348. Co-efficient of absorption of oxygen is higher for petroleum than for water (*Zeit. Phys. Chem.* 1, 70). When crude petroleum is distilled, the various fractions are separately collected and used for a variety of commercial purposes. In America the distillation is conducted in large stills, and the first fractions, known as 'cymogene' and 'rhigolene,' are condensed by artificial cold and pressure. The fraction which next comes over, having a density increasing from 636 to 725 at 750, is separately collected, and when redistilled is termed 'gasoline,' 'naphtha,' and 'benzine.' The next fraction consists of oils of S.G. 75 to 84, and is known as 'kerosene' or 'photogene'; while the residue is distilled in other retorts for lubricating oils, S.G. 84-9, and solid paraffin, until coke is left as a residue combustible with difficulty. Petroleum ether is the fraction containing hydrocarbons of S.G. 625-665, and consists of 'rhigolene' and 'gasolene,' while petroleum spirit or benzoline consists of the 'naphtha' and 'benzine' fractions, S.G. 665-745.

In Russia the petroleum is distilled in a series of stills in a continuous process, and yields three fractions: light benzine, S.G. 75; 'gasolene' or heavy benzine, S.G. 787; and kerosene, S.G. 825. The residue on further distillation yields (1) lubricating oils, (2) solar oil, and (3) 'astakki,' which last is either used as fuel or distilled at a red heat, yielding benzenes and anthracene. Baku petroleum contains only traces of solid hydrocarbons, while that from the Caucasus yields about 6 per cent. of paraffin (*B. Redwood, S. C. I.* 4, 74).

In Germany the crude naphtha is refined into four distinct products:

- Petroleum ether (40°-70°). S.G. 0.640-0.650.
- Benzine (70°-120°). S.G. 0.700.
- Ligroin (120°-135°). S.G. 0.730.
- Cleaning oil (135°-160°). S.G. 0.745-0.750.

(Schenkel, *Chem. Ind.* 13, 512).

Further details on the petroleum industry, and the properties and uses of these commercial products, will be found in Thorpe's *DICTIONARY OF APPLIED CHEMISTRY*.

Early Literature.—Before 1864 very little accurate knowledge of the chemical constitution of the various petroleum oils was known, the earlier investigations chiefly recording the localities in which the oil had been found, its physical properties, and its behaviour on distillation.

On the next page is a list of the more important of these examinations.

AMERICAN PETROLEUM. Pelouse a. Cabours (*O. R.* 54, 124; 56, 505; 58, 62) made a systematic investigation of the Pennsylvanian oil in 1864, and showed that it contained hydrocarbons of the formula C_nH_{2n+2} , including representatives of every member of the series from C_2H_6 to $C_{18}H_{38}$. Ronalds added C_2H_4 , C_2H_2 , and C_2H to this list (*O. J.* 18, 529). Above 280°, the boiling-point of the highest of these hydrocarbons, the oil yielded fusible paraffin (45°-66°), and they when distilled in closed vessels were resolved into other C_nH_{2n+2} and C_nH_{2n-2} hydro-

carbons. Schorlemmer found small quantities of benzene and its homologues, and Beilstein a Kurbatoff a hydrogenised aromatic hydrocarbon of the C_nH_{2n} series, which they isolated and determined to be hexahydro-metaxylene.

The paraffin hydrocarbons above alluded to have also been examined in detail, and in many cases their constitution determined.

In the neighbourhood of the North American oil wells methane is evolved, and is associated with ethane in the gases which issue from the De la Mater well at Pittsburg (Sadler, *Am. Ch.* 1876, 98; Fouqué, *C. R.* 67, 1015). Ethane, propane, and *n*-butane exist dissolved in the petroleum. Of the higher paraffins the following have been isolated:

C_5H_{12} , *n*-pentane, dimethyl-propane;
 C_6H_{14} , *n*-hexane, ethyl-iso-butane;
 C_7H_{16} , *n*-heptane and an isomeric;
 either dimethyl-diethyl-methane or
 methyl-ethyl-isopropyl-methane (Schorlemmer, *C. J.* 26, 319);
 C_8H_{18} , *n*-octane and an isomeric;
 C_9H_{20} , two isomerides exist (Lemoine, *Bl.* [2] 41, 164):

α (136°) S.G. $\frac{1}{4}$ 0.742
 β (130°) S.G. $\frac{1}{4}$ 0.784.

$C_{10}H_{22}$, constitution not known (160°). Pelouze & Cahours; (156°) Wurtz, *Bl.* 1863, 300; (160°) S.G. $\frac{1}{4}$ 0.758 Lemoine. The solid paraffins $C_{10}H_{22}$, $C_{11}H_{24}$, and $C_{12}H_{26}$ have also been separated. (P. also Greville Williams, *Tr.* 1857, 787; *C. J.* 16, 130; Pelouze & Cahours, *A. Ch.* [4] 1, 5; *J.* 1862, 410; Warren, *Z.* 1865, 668; *J.* 1868, 880; Warren & Storer, *Z.* 1868, 228; Lefebvre, *Z.* 1869, 185; Schorlemmer, *Tr.* 1872, 111; Ronalds, *Z.* 1865, 523; *C. J.* 18, 54; *J. pr.* 95, 421; Wurtz, *A.* 96, 872; and for the occurrence of the same hydrocarbons in boghead coal and canal oil, Schorlemmer, *A.* 125, 109; Williams, *A.* 125, 107; and for a comparative table showing the C_nH_{2n} hydrocarbons found in petroleum, or by distilling paraffin and reducing the fatty acids, Beilstein, vol. I. 186.) Warren also obtained the olefines C_6H_{10} , C_7H_{12} , and C_8H_{14} from American petroleum, and traces of volatile benzene hydrocarbons and the hydro-benzene compounds present in Caucasian oil have also been detected in this oil. Canadian petroleum contains a somewhat greater percentage of aromatic

hydrocarbons, and is further characterised by its large amount of sulphur derivatives.

The action of heat on American petroleum products has been studied by many observers. When the crude oil is heated alone the lower members of the C_nH_{2n} series of hydrocarbons are evolved as gas. As the temperature increases the higher paraffin hydrocarbons distil over; but at the same time vapours are evolved which are absorbable by bromine. Le Boer examined this product, and found it to consist of bromides of the olefines C_6H_{10} , C_7H_{12} , C_8H_{14} , C_9H_{16} , $C_{10}H_{18}$, and that there are isomeric compounds of the higher members of the series. They have been separated either by fractionating the bromides obtained in this way, or by their different behaviour towards cold HCl. Acetylene and crotonylene are also formed, and other less hydrogenised hydrocarbons. When the vapour of petroleum ether, or the fraction (50°-80°) and containing chiefly C_5H_{12} , C_6H_{14} , and C_7H_{16} , is passed through a red-hot tube it yields C_2H_2 and C_2H_4 and hydrocarbons absorbable by bromine. These, according to Prunjer, are acetylenes consisting of crotonylene C_4H_6 and traces of C_6H_8 , C_8H_{10} , and C_8H_{12} .

Petroleum spirit (70°-120°) contains the hydrocarbons C_5H_{12} , C_6H_{14} , and C_7H_{16} , and the rectified oil (150°-280°) the paraffins from C_7H_{16} to $C_{12}H_{26}$; the crude fraction, however, contains hydrocarbons which are dissolved by sulphuric acid. The heavy oil (above 400°), used for lubricating purposes, has not been carefully examined. Vaseline is the next product obtained on distilling the crude oil, the distillation for heavy oil being stopped as soon as acid vapours begin to be evolved. Little is known as to the constitution of its hydrocarbons. When vaseline is not manufactured the distillation is continued until solid paraffin distils over. The solid residue, rich in carbon, also contains hydrocarbons, and in it or in the solid paraffin have been found, besides the higher paraffins, anthracene, phenanthrene, chrysene, pyrene, chrysogen (Fritzsche, *C. R.* 54, 910), sparschrysene (Basenack), benzerythrene (Schultz), and fluoranthrene (Prunjer, *Bl.* [2] 81, 293). A hydrocarbon $C_{10}H_{18}$, isomeric with acenaphthalene, has also been isolated, and there are indications of the presence of quinones. From the coke Prunjer and Vaseline have also succeeded, by the action of solvents, in extracting

a very high percentage of carbon.

From a green solid (190°-240°) obtained from Pittsburg, and called 'petrocene' or the 'new product,' formed by the distillation of the residue after the ordinary paraffin had come over, Pannier isolated hydrocarbons which are called carbocene, carbopetrocene, and thallene. Analysis shows that they contain 96-97 p.c. of carbon, and have formulae, therefore, falling from $(C_2H_2)_n \dots (C_2H_2)_n$, where n is variable but higher than 4.

Gustavson has studied the action of $AlBr_3$ and HBr on the different fractions of petroleum ether. The fraction (67°-70°), and chiefly flexane, gave by this treatment a solid from which he obtained an orange liquid $C_8H_{16}AlBr_3$, which decomposes above 120° and on addition of water. It is insoluble in the hydrocarbons from which it is derived, and in CH_2 , but soluble in $EtBr$. The other fractions give similar results, but not such a good yield.

Beilstein and Kurbatoff, by the action of HNO_3 on the fraction (95°-100°), obtained a nitro-compound $C_{11}H_9(NO_2)$ (195°), and soluble in KOH. The fraction (115°-120°) similarly treated also gave acid nitro-products, called by the authors trinitro-isoxylene.

Russian petroleum. The Baku oil has been the subject of much investigation, and it apparently is a more complicated mixture than the American product. Its density, according to Mendeleeff, varies from .881-.886 at 15°, and its variation with temperature is given by the

$$\text{equation } \frac{d\Delta}{dt} = -[0.00635d - 0.000015d^2 - 1.44],$$

since the co-efficient of variation of density with temperature can be considered constant for any given hydrocarbon. The densities d range between .750 and .900.

Baku petroleum gives off a large volume of inflammable gas, and leaves on distillation a vaseline having all the properties of the American product save that its density is higher. The low-boiling portions of the oil contain some hydrocarbons of the C_2H_{2n} series, and marsh gas is evolved in the neighbourhood of the Caspian Sea; but Schutzenberger and Ionine found that the major portion of the hydrocarbons present were characterised by great inertness, and had a composition represented by the formula C_2H_{2n} , being isomerides of the olefine series of hydrocarbons. The hydrocarbons were called paraffenes (C. R. 91, 823), and were found not to form addition products with Br, fuming HNO_3 , nor H_2SO_4 . They found that the vapours, when passed through a red-hot tube, produced aromatic hydrocarbons, and at a dull redness gave products which unite energetically with Br, and are converted into resins by H_2SO_4 . Chlorine and a little iodine convert them into unstable chloro-compounds, which cannot be distilled without decomposition. Of the several hydrocarbons present they isolated two, (231°) and (281°), and found that the latter had a V.D. corresponding to the formula $C_{11}H_9$. Subsequent investigations have concluded that these paraffenes are the hexahydrides of the benzene series of hydrocarbons which are now called naphthenes, similar to those obtained syn-

thetically by Wreden (A. 367, 161), who described the following:—

C_6H_{12} , hexahydrobenzene, S.G. .76 (69°);
 C_7H_{12} , hexahydrotoluene, S.G. .772 (97°);
 and C_8H_{14} , hexahydroisoxylene, S.G. .771 (117°).
 Beilstein & Kurbatoff have found the isomeric hexahydrometaxylene (B. 18, 1820; C. 9, 40, 159; also Markownikoff & Spady, B. 20, 1850) in Russian petroleum, and subsequent investigations have established the presence of a series of naphthenes from C_6H_{12} to $C_{11}H_{18}$. Markownikoff (A. 234, 88-115) has also obtained similar results, and has shown that the naphthenes are the chief constituents of the oil boiling below 800°. The fraction distilling (210°-330°) under 20 mm. also contains a large percentage of these $C_{11}H_{18}$ hydrocarbons. In addition, he isolated in the fraction (85°-250°) the following aromatic hydrocarbons: C_6H_6 , $C_6H_5(CH_3)$, C_8H_8 , isoxylene, p-xylene, C_8H_{10} , pseudo-cumene and mesitylene, $C_{10}H_8$, durene, isodurene, and another (diethylbenzene?), $C_{11}H_{16}$, diethyl-toluene and isomerides, and hydrocarbons of the formulae $C_{11}H_{14}$ (styrene?), C_8H_{12} , C_8H_{14} , and $C_{11}H_{16}$. Markownikoff and Oglobine, from the fraction (210°-330°) under 20 mm. obtained evidence of the presence of oxygenated compounds of both acid and neutral characters (B. [2] 41, 258), and obtained a denser naphthene $C_{11}H_{18}$. Engler has also confirmed the presence of mesitylene and pseudo-cumene (B. 18, 2234) in Caucasian petroleum (v. also Le Bel, C. R. 103, 1017-1019).

Aschan has isolated from the Baku oil, acids of low carbon percentage derived from hexa-, hepta-, and octo-naphthenes. From the heptanaphthene carboxylic acid by P and HI he has prepared an octonaphthene (117°) under 742 mm. S.G. 2 0.7706, identical with that obtained by Markownikow from the Caucasian oil (B. 24, 2710; and Zaloziecki, B. 24, 1808). On the formation of acid compounds in petroleum v. Zaloziecki, Z. f. Angew. C. 1891, 410.

The oil of still higher boiling-point consists of naphthines $C_{10}H_{18}$, or hydrocarbons probably derived from the naphthenes by the high temperature, together with $C_{10}H_{16}$ hydrocarbons and about 10 p.c. of true benzene compounds, which are homologues of styrene. When the naphtha residues are distilled at temperatures above 400°, dissociation of the high boiling products takes place, and fresh low-boiling hydrocarbons are formed. According to Lisseffko & Rosenblatt, the best yield of low-boiling products is obtained at a temperature 434°-437° (Berg, A. R. 1887, 349), but Nobel gives 400° as the best temperature for maximum dissociation (D. P. J. 266, 226). The Nobel brothers obtain benzene, naphthalene, and anthracene from their petroleum residues at Baku (D. P. J. 246, 426-432). Beilstein & Kurbatoff have studied the action of nitric acid upon Russian petroleum. They find that the fraction (95°-100°) is oxidised to succinic and several volatile acids, and at the same time a nitro-compound $C_{11}H_9(NO_2)$ (212°) is formed. The corresponding fraction of American petroleum, under like treatment yields a nitro-body $C_{11}H_9(NO_2)$ (195°). The fraction (115°-130°) gives crystals of trinitro-isoxylene. Markownikoff & Oglobine isolated the above-mentioned

hydrocarbons chiefly by treating the several fractions of the oil with concentrated H_2SO_4 and separating the sulphonates produced. About 15-20 per cent. of the fractions ($180^\circ-280^\circ$) is converted into these sulphonates. Chiefly mono- and di-acids derived from the hydrocarbons C_nH_{2n-2} , C_nH_{2n-4} , C_nH_{2n-6} , C_nH_{2n-8} , and C_nH_{2n-10} . The naphthenes are not attacked by conc. H_2SO_4 , but fuming acid converts them into resins. The principal sulphonates isolated are $C_{11}H_{21}SO_3H$, 2 isomers $C_{11}H_{21}SO_3H$, $C_{11}H_{21}SO_3H$, $C_{11}H_{21}SO_3H$, $C_{11}H_{21}SO_3H$ and $C_{12}H_{23}SO_3H$. Schutzenberger has shown that a bright-red heat dissociates the low-boiling naphthenes into benzene derivatives, while a dull heat determines the formation of butylene, and crotonylene and its homologues. The oil obtained from Tiflis appears to be intermediate in character to that of the American and Baku products. Beilstein & Kurbatoff (*C. J.* 40, 1020) isolated from samples of this petroleum, *n*-pentane, isopentane, and a butane in the ($30^\circ-35^\circ$) fraction, a hexane and naphthenes in the ($70^\circ-75^\circ$) fraction, and a heptane, benzene, and toluene in the ($95^\circ-100^\circ$) fraction. They also obtained from this oil, by the action of HNO_3 , a dinitro-compound $C_{12}H_{18}(NO_2)_2$, [95°] (*v. also* Le Bel, *C. R.* 103, 1018).

The petroleum found in Germany and Galicia is characterised by a large amount of aromatic hydrocarbons, and Kraemer & Böttcher hold that the hydrocarbons of German petroleum and Baku oil differ from coal tar and shale tar oils only in the relative proportions of those hydrocarbons which are attacked by conc. H_2SO_4 and HNO_3 , (*B.* 20, 595-629).

Engler has made a very systematic investigation into the composition of the German oils, and has isolated or identified the following substances: gases CH_4 , CO , CO_2 , N , C_2H_2 , and homologues; in the first fraction (below 150°) C_2H_4 , C_2H_6 , and C_3H_8 ; in the fraction ($160^\circ-182^\circ$) pseudo-cumene and mesitylene; and in the higher-boiling portion solid paraffin. The oil from Oelheimer and Wietzer contains saturated hydrocarbons, naphthenes, but no solid paraffin nor volatile products below 150° . The Tegernsee oil, especially rich in aromatic hydrocarbons (Engler, *D. P.* 2, 267, 550-570; 592-597; 268, 78-90). Engler has also detected phenols and fatty and oleic acids in many specimens. Boussingault has also isolated from Alsatian petroleum, petroleum, and a black colouring matter similar to that found in Alsatian bitumen and in Galician oil (Le Bel, *Bl.* 1888, 359).

Galician petroleum contains hydrocarbons of the C_nH_{2n+2} and C_nH_{2n-2} series (Fround, *A.* 116, 91). It has also been examined by Laghows (A. 226, 168), who finds in the low-boiling fraction ($80^\circ-125^\circ$) the following hydrocarbons: isopentane (30°), *n*-pentane (37°), hexane (60°), *n*-heptane (99°), octane (148°), S.G. 0.742, decanes (152°), S.G. 0.7187 and (162°). S.G. 0.7324; benzene, toluene, xylene, and mesitylene, but no olefins. From the high S.G. of the benzene fractions he also infers the presence of naphthenes (hexahydro-toluene and hexahydro-isoxylene). Pawlowski has also found 2 p.c. of aromatic hydrocarbons, principally benzene and *p*-xylene, in Galician oil. According to Bandrowski, this

petroleum contains a small quantity of a basic body resembling the alkaloids (*M.* 8, 235), and Weller has also detected the presence of bases in the yellow oil (S.G. 85) obtained from Saxon petroleum (*B.* 20, 2098). On the Galician petroleum industry *v.* Redwood, *S. Q. I.* 1892.

BURMA PETROLEUM has only been imperfectly examined. Romanis has found gases, benzene, and solid paraffin in the crude oil and 5 p.c. of solid paraffin in that refined at Rangoon. It solidifies at 24° , and has a S.G. 85-9. From another district in Burma (Arracan) a mineral oil is obtained which contains benzene and its homologues, but does not solidify. Its S.G. is also lower, 825 (*C. N.* 59, 292).

The origin of petroleum.—Mendeleeff has given considerable attention to this subject, and has advanced strong reasons for believing that mineral oils have not been produced like coal from the decomposition of past vegetation. He believes that it is formed in the depths of the earth beneath the very site on which it is found, since it cannot be water-borne. The absence of any large masses of organic matter in the oil districts negatives the vegetable origin of petroleum. In Europe the oil wells belong to Tertiary and late geological periods, but in America and Canada the oil-bearing sands are found in the Devonian and Silurian formations, and hence below the carboniferous beds. The oil beds also always run parallel to mountain ranges, and Mendeleeff believes that water has found its way through the fissures formed at the upheaval of these ranges to the heated metallic carbides below, resulting in the formation of metallic oxides and hydrocarbons, the chemical composition of which depends upon the conditions of temperature and pressure under which they are formed. This origin of petroleum is supported by the frequent presence of sulphur in crude oils, by the asphaltene containing a mineral ash consisting of oxides of Fe, Al, Cu; Ca (Ag), and by the non-saturated nature of many of the hydrocarbons. The occurrence of petroleum in the lavas of Etna lends additional support to this theory (Silvestri, *G.* 1877, 1). Hoefer, Engler, Leopold v. Buch, Störry Hunt, and many geologists believe that petroleum has been formed by the decomposition of organic matter of animal origin, and advance the presence of nitrogen compounds and direct experiments with animal fats in support of their view. On the origin of petroleum see *Neues Wörterbuch*, iii. 39; Byasson (*M. S.* 1876, 1077); Mendeleeff (*Revue Scientif.* 1877, 409); Anderson (*B. A. address*, 1889); Engler (*B. G.* 1, 1816-1827); Hoefer (*Mineralindustrie in Bolley's Technologie*); Alzoizecki (*D. P.* 2, 280, 69, 85, 183); Watson Smith (*S. Q. I.* 10, 979).

PETROLEUMIC ACID *v.* **HEXDECENOIC ACID**.
PETTENKOFER'S REACTION. A blood-red colour on warming with cane-sugar and conc. H_2SO_4 . The colour is produced by the bile acids, cholic acid, and many other bodies. Furfuraldehyde may be used instead of sugar (Mylins, *H.* 11, 492; *v. also* vol. i. p. 508).

PEUCEDANIN *v.* **LEPHTHODIN**.

PEWTER. An alloy of Pb and Sn; *v.* this vol. p. 225.

PHACONIN *v.* **PROTANIN**.

PHASEOMANNITE *v.* **IKONITE**.

PHASOL $C_{10}H_8O$. [190°]. $[\alpha]_D = -30.6^\circ$ in a 4 p.c. chloroform solution. Found in the husks of peas (*Pisum sativum*) (Likernik, B. 24, 188). Groups of tables (from alcohol), insol. water, v. sol. hot alcohol and ether. Gives a purple colour on shaking its chloroform solution with $FeSO_4$ of S.G. 1.76.

PHELLANDRENE. A dextrorotatory modification of this terpene occurs in oil of elemi, a levorotatory variety in Australian eucalyptus oil (Wallach, A. 246, 234). The dextrorotatory variety occurs also in the seeds of *Phellandrium aquaticum*, and in oil of fennel (v. TERPENES).

PHENACETURIC ACID $C_9H_7NO_3$, i.e. $CH_3Ph.CO.NH.CH_2.CO_2H$ [143°]. S. 7 at 11°. Occurs in horses' urine (Salkowski, B. 17, 3010). Found in urine after taking phenyl-acetic acid (Salkowski, H. 7, 162). Prepared by digesting phenyl-acetic anhydride with glycoll and benzene (Hotter, J. pr. [W] 88, 97; B. 20, 84). White laminae (from water) or cubes (from alcohol). On titration it gives p-nitro-phenacetic acid [173°].— CaA' , 2aq. 8, (of CaA') 3 at 11°.— CuA' , aq.— AgA' : amorphous insoluble pp. *Methyl ether* MeA' . [86.5°]. Needles. *Ethyl ether* EtA' . [79°]. Prisms. *n-Propyl-ether* PrA' . [81°]. Plates. *Amide* [178°]. Pearly tables.

PHENACONIC ACID. A name given by Carius to a mixture of maleic and fumaric acids.

PHENACYL. The radical $C_6H_5.CO.CH_2$.

DI-PHENACYL-ACETIC ACID v. DI-BENZOTYL-ISOBUTYRIC ACID.

DI-PHENACYL-ACETOACETIC ETHER $(CH_3Bz)_2CAc.CO_2Et$. [83°]. Made from acetoacetic ether, $NaOEt$, and phenacyl bromide (Paal & Hoermann, B. 22, 3225). Monoclinic crystals, sl. sol. cold alcohol, v. sol. CS_2 . Alcohol NH_3 at 125° forms two bodies [136°] and [192°].

Mono-oxim. [63°]. Flakes.

Di-oxim. [63°]. Flakes.

Tri-oxim. [68°]. Flakes.

Di-phenyl-di-hydrazide $C_{18}H_{14}N_4O_2$. [88°–92°]. From the ether and phenyl-hydrazine.

PHENACYL- α -AMIDO-BENZOIC ACID.

Formyl derivative

$CH_3Bz.N(OH).C_6H_4.CO_2H$. [184°]. Got by oxidising quinoline phenacylo-bromide with $KMnO_4$ (Bamberger, B. 20, 3342). Tables (from alcohol), sl. sol. cold water.

PHENACYLAMINE $C_6H_5.CO.CH_2.NH_2$. *α -Amido-acetophenone*. Got by decomposing phenacyl-phthalic acid [140°] with conc. $HClAq$ (Goedeckemeyer, B. 21, 2687). Converted by NH_3 into di-phenyl-pyrazine.— $B'HCl$. [188°].— $B'H.PtCl_4$. [c. 210°].— $B'C_6H_5N_3O_4$. [175°]. Yellow needles.

PHENACYL-ISOAMYL-MALONIC ACID $C_6H_5.CO.CH_2.C(O_2C_4H_9)(CO_2H)$. [160°]. Made from sodium isoamyl-malonic ether and phenacyl bromide, the product being saponified (Paal & Hofmann, B. 23, 1500). Needles, v. sol. alcohol. Yields $CH_3Bz.CH(O_2C_4H_9).CO_2H$ [103°] on heating.— $NH_3.C_6H_5O_4$. [165°]. Needles.

Ethyl ether EtA' . Oil.

Amide. Crystalline.

PHENACYL-BENZYL-ACETIC ETHER $CH_3Bz.CH_2.CO_2Et$. *Di-benzoyl-propionic ether*. [c. 59°]. Made from α -bromo-acetophenone and sodium benzoyl-acetic ether (Kapt

a. Paal, B. 21, 1485, 1053). Crystals (from ether), insol. water. With aqueous potash it gives benzoyl-propionic acid; while alcoholic potash yields $OPhC_6H_5.CO_2H$ [185°] and $CH_3Bz.CH_2Bz$ [145°].

PHENACYL BROMIDE v. α -BROMO-ACETOPHENONE.

PHENACYL CHLORIDE v. α -CHLORO-ACETOPHENONE.

PHENACYL CYANIDE v. BENZOTYL-ACETONITRILE.

DI-PHENACYL-MALONIC ACID v. DI-BENZOTYL-DI-METHYL-MALONIC ACID.

PHENACYL-PHTHALIC ACID $C_6H_5.CO.CH_2.CO_2C_6H_4$. [160°]. Made by the action of alcoholic potash on phenacyl-phthalimide (Goedeckemeyer, B. 21, 2686). Needles, insol. water. Decomposed by boiling $HClAg$ into phthalic acid and amido-acetophenone.

Phenacyl-phthalimide $C_6H_5.CO_2.N.CH_2Bz$. [167°]. Made by heating α -bromo-acetophenone with potassium phthalimide at 150° (Goedeckemeyer, B. 21, 2685). Dimetric plates, sol. alcohol and ether, almost insol. water and ligroin.

Phenyl-hydrazide $C_6H_5.CO.N.CH_2.C(N_2HPh).C_6H_5$. [155°]. Orange needles, insol. water.

PHENACYL SULPHIDE $S(CH_2.CO.C_6H_5)_2$. [77°]. Made by adding α -bromo-acetophenone (100 pts.) in alcohol (400 pts.) to a solution of Na (12 pts.) in alcohol (400 pts.) saturated with H_2S (Tafel & Moritz, B. 23, 8474). Prisms (from hot alcohol). Reduces Fehling's solution. Yields a di-oxim [151°] and a diphenyldihydrazide [147°].

PHENACYL SULPHOCYANIDE

$C_6H_5.CO.CH_2.S.CN$. *Sulphocyanacetophenone*. [74°]. Made by mixing alcoholic solutions of barium sulphocyanide and α -bromo-acetophenone (Arapides, A. 849, 10). Needles or prisms, v. sol. ether, insol. water. Hot HCl converts it into $CH_3Bz.S.CONH_2$ and finally oxy-phenylthiazole.

PHENACYL THIOCARBAMATE

$CH_3Bz.S.CONH_2$. A very unstable body got by boiling phenacyl sulphocyanide with conc. $HClAq$ until crystallisation begins (Arapides, A. 249, 12). Yields oxy-phenyl-thiazole on boiling with $HClAq$.— $B'HCl$. [c. 177°]. Silky needles.— $B'H.PtCl_4$. [c. 200°]. Yellow crystalline powder.

PHENACYL TOLUIDINE v. TOLYL-AMIDO-ACETOPHENONE.

Di-phenacyl-p-toluidine $C_6H_4.Me.N(CH_2Bz)_2$. [255°]. Formed from p-toluidine and α -bromo-acetophenone in alcohol (Schumann & Donner, B. 23, 168). Needles, v. sol. alcohol.

PHENAMYLAMINE v. AMIDO-AMYL-BENZENE.

Diphenamylamine $NH(C_6H_5)_2$. *Di-isoamyl-di-phenylamine*. [820°].

Formed, together with amido-isoamyl-benzene $C_6H_4(QH_2)_2NH_2$ (260°) by heating $C_6H_5(QH_2)_2OH$ with ammoniacal $ZnBr_2$ or with $ZnCl_2$ and NH_4Br or NH_4Cl ; the yield being 18 to 25 p.c. (Lloyd, B. 20, 1257).— $B'H.PtCl_4$. *Acetyl derivative* $NAc(C_6H_5)_2$. [81°]. White glistening plates.

PHENANTHRAQUINONE $C_{14}H_8O$, i.e.

$C_6H_4.CO$ or $C_6H_3.CO_2$. Mol. w. 208. [202°]

(Hayduck, *A.* 167, 184) (above 360°). Formed by oxidising the residue left after evaporating the alcoholic washings from the distillate got in preparing anthracene from *o*-bromo-benzyl bromide and Na (Jackson & White, *Am.* 2, 392).

Preparation.—1. By warming phenanthrene (1 pt.) with $K_2Cr_2O_7$ (1 pt.), water (8 pts.) and H_2SO_4 (1 pt.) and crystallising the product from diluted HOAc (Fittig & Ostermayer, *B.* 5, 938; *A.* 166, 365).—2. By adding a solution of CrO_3 in $HQAc$ to a hot solution of phenanthrene in $HQAc$ (Graebe, *B.* 5, 861; *A.* 167, 189). The product is purified by solution in aqueous $NaHSO_3$, followed by pptn. with HCl and crystallisation from $HQAc$.—3. By oxidising crude phenanthrene (310°–340°), the following bodies being obtained at the same time; methyl-anthraquinone, diphenic acid, carbazole, acridine, and diphenylene-ketone (Anschütz & Schultz, *A.* 196, 32).

Properties.—Orange needles or prisms (from solvents) or tables (by sublimation), almost insol. cold water, sl. sol. hot water and cold alcohol, m. sol. hot alcohol, ether, $HQAc$, and benzene. Conc. H_2SO_4 forms a dark-green solution but does not sulphonate it, even at 100°. A solution of phenanthraquinone (1 g.) in $HQAc$ (20 c.c.) mixed with toluene (4 c.c.) containing methyl-thiophene gives on shaking with H_2SO_4 (16 c.c.) a bluish-green liquid which, when poured into water and extracted with ether, imparts a purple colour to the ether (Laubheimer, *B.* 8, 224; *V.* Meyer, *B.* 16, 1624). The colouring matter $C_{14}H_{10}SO$ formed in this reaction gives anthraquinone on distilling with $PbCrO_4$ (Odermayer, *B.* 17, 3338). A solution of phenanthraquinone in wet ether when exposed in closed tubes to direct sunshine is readily reduced to phenanthrahydroquinone, with formation of aldehyde (Klinger, *B.* 19, 1869).

Reactions.—1. Oxidised by chromic acid to diphenyl di-*o*-carboxylic acid.—2. Alkaline $KMnO_4$ gives oxy-diphenylene-acetic acid and diphenylene-ketone (Anschütz & Japp, *B.* 11, 212).—3. Reduced to dihydride by warming with aqueous SO_2 .—4. Sodium-amalgam acting on its alcoholic solutions forms diphenic acid [226°] (*A.* 1, 8).—5. Boiling aqueous $NaOH$ yields $C_{14}H_8O(OH).CO_2H$ (*A.* & J.). Boiling bar-tar-water forms, besides oxy-diphenylene-acetic acid, diphenylene ketone and fluorene alcohol.—6. Alcoholic potash gradually forms diphenic acid, the solution meanwhile giving out phosphorescent light on shaking (Lachovitch, *B.* 16, 332).—7. By passing the vapour over heated lead oxide di-phenylene-ketone is formed (Wittenberg & Meyer, *B.* 16, 502).—8. Distillation with dry soda-lime gives diphenyl. When the soda-lime is moist, fluorene, fluorene alcohol and diphenylene ketone are also formed.—9. Distillation with stick-lime gives fluorene and diphenylene ketone (Anschütz & Schultz, *B.* 9, 1400).—10. Distillation with zinc dust yields phenanthrene.—11. An ethereal solution of $ZnEt_2$ decolourises it. On adding alcohol, boiling, and filtering, crystals of $C_{14}H_8O.HOEt$, (77°), are formed. These are rectangular plates, insol. water. Ac_2O converts it into $C_{14}H_8O_2.Ac$, [103°] (Japp, *O. J.* 38, 526).—12. With PCl_5 it gives $C_{14}H_8OCl$; benzene may be used as diluent. The

product 'di-chloro-phenanthrone' may be recrystallised from benzene & it melts at [165°], although at 140° it begins to get brown. Alkali convert it into phenanthraquinone. Shaken with alcoholic potash, it is oxidised to diphenic acid, the solution phosphorescing meanwhile. Iron and acetic acid reduce it first to chloro-

phenanthrone, $C_{14}H_8O(OH).CO$ [123°], and then to phenanthrone, $C_{14}H_8O.CO$, [149°]. Chloro-

phenanthrone may be recrystallised from glacial acetic acid, and is not decomposed even by boiling alkalis, but HNO_3 (S.G. 1.5) converts it into nitro-phenanthraquinone. Phenanthrone may be crystallised first from glacial acetic acid, then from butyl bromide (B. Lachovitch, *J. pr.* [2] 28, 168).—13. By exhaustive chlorination with $SbCl_5$ it yields perchloro-diphenyl together with a very small quantity of per-chloro-benzene (Mers & Weith, *B.* 16, 2870).—14. Benzoic aldehyde (free from HCl) at 260° forms benzalquin of phenanthrene $C_{14}H_8O$ [329°], which crystallises from CS_2 in rectangular plates and yields benzoic acid and phenanthraquinone on oxidation. It gives off no gas with $ZnEt_2$, hence contains no hydroxyl (Japp & Wilcock, *O. J.* 37, 661).—15. Heating with PCl_5 followed by addition of water forms $C_{14}H_8O(OH).PO(OH)_2$, crystallising

in flesh-coloured plates, sol. water, alcohol, and ether (Fossek, *M.* 7, 86).—16. Acetone at 200° forms acetone-phenanthraquinone $C_{14}H_8O_2$ (vol. 1 p. 58). By the action of H_2SO_4 on this body, a small quantity of $C_{14}H_8O_2$ [238°] is formed (Wadsworth, *C. J.* 59, 105).—17. Ammonia passed into an alcoholic solution forms phenanthraquinonimide $C_{14}H_8NO$. On heating with alcoholic NH_3 in sealed tubes there are formed diphenanthrylene azotide $C_{14}H_8N_2$, two compounds $C_{14}H_8N_2O$ [282°] and [over 300°] and a compound $C_{14}H_8N_2$ [above 285°] (Schmidt, *B.* 7, 1865; Anschütz & Schultz, *A.* 196, 49; Zincke, *B.* 12, 1641; Sommeruga, *M.* 1, 146; Japp, *O. J.* 49, 845; 51, 98).—18. Benzoic aldehyde and aqueous NH_3 at 100° quickly forms $C_{14}H_8NO$ or $C_{14}H_8O \begin{smallmatrix} \diagup N \diagdown \end{smallmatrix} C_6H_5$.

This 'benzenyl-amido-phenanthrol' crystallises from benzene in tufts of silky needles, [202°], v. sl. sol. alcohol, sol. conc. HCl and conc. H_2SO_4 without change. It yields benzoic acid and phenanthraquinone on oxidation. HCl at 200° forms benzoic acid. It does not act on $ZnEt_2$ (Japp, *O. J.* 37, 666; 39, 225).—19. *Oumic* aldehyde and NH_3 forms, in like manner, cumenyl-amido-phenanthrol $C_{14}H_8 \begin{smallmatrix} \diagup N \diagdown \end{smallmatrix} C(C_6H_5)_2$, [186°], crystallising from benzene-ligroin in silky needles, and forming in conc. H_2SO_4 a yellowish-green fluorescent liquid (Japp & Wilcock, *O. J.* 39, 326).—20. *Furfuraldehyde* and aqueous NH_3 give $C_{14}H_8 \begin{smallmatrix} \diagup N \diagdown \end{smallmatrix} C(C_2H_5O)_2$ [331°], crystallising from isomyl alcohol in needles (*J. & W.*).—21. *Salicylic aldehyde* (1 mol.) and conc. NH_4Ac form, on warming, *o*-oxy-benzenyl-di-amido-phenanthrene $C_{14}H_8O.NH_2 \begin{smallmatrix} \diagup N \diagdown \end{smallmatrix} C(C_2H_5O)_2$ (Japp & Streetfield, *O. J.* 41, 146). This body crystallises from $HQAc$ in slender needles [370°].

1768], and is bl. sol. alcohol, v. sol. HOAc. It dissolves in boiling KOHAc, and is ppd. by CO₂. Boiling alcoholic potash gives salicylic acid. HOAc at 200° has no action. BzCl yields a benzoyl derivative [220°].—22. *o*-Methoxybenzoic aldehyde (15g.) heated with phenanthraquinone (30 g.) and excess of NH₄Ac at 100° deposits yellow crystals of C₁₄H₈N₂H₂O₂·C₆H₅OMe [208°], while the mother-liquor contains

white needles, v. sol. hot benzene [Japp a. Streteild, C. J. 41, 154].—23. *p*-Oxybenzoic aldehyde and aqueous NH₃ form *p*-oxy-benzoyl-di-amido-phenanthrene [above 350°], crystallising from HOAc in slender needles. It yields an acetyl derivative [205°-210°] (J. a. S.).—24. Aldehyde-ammonia yields an amorphous base (J. a. W.).

25. Alcoholic methylamine forms, on warming, yellow crystals. The mother-liquor deposits C₁₄H₈N₂ or C₁₄H₈(NMe)₂, crystallising in colourless prisms [186°], and yielding B'HCl, v. sol. water, and B'HNO₃, B'H₂SO₄, B'H₂CO₃, all crystallising in needles (Zincke, B. 12, 1648).—

26. Ethylene-diamine and HOAc form the azine C₁₄H₈ <N> C₆H₄, which crystallises from alcohol in needles [181°]. It yields a platinumchloride B'H₂PtCl₆, nearly insol. alcohol (Mason, B. 19, 112; 20, 248).—27. Propylene-diamine yields C₁₄H₈N₂, crystallising in needles [128°] and yielding B'H₂PtCl₆ (Strache, B. 21, 2362).—28. Trimethylene-diamine forms C₁₄H₈NO₂, a lemon-yellow powder, not melted at 250°. Its alcohol solution is coloured violet by acids. 29. Tetra-amido-phenazine and HOAc give

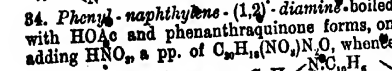

a green crystalline pp., forming a bluish-green solution in H₂SO₄, changing on dilution through red to orange (Nietzki a. Müller, B. 22, 460).—

30. Phenylene-*o*-diamine gives phenanthrazine C₁₄H₈ <N> C₆H₄, [217°], insol. water, v. sol. alcohol (Hinsberg, A. 237, 340°).—31. Toluylene-*o*-diamine forms C₁₄H₈ <N> C₆H₄Me [218°].—

32. Heating with acylamide and HOAc forms the azine C₁₄H₈ <N> C₆H₄, crystallising in yellowish-brown flat needles, [400°], sol. aniline, nitro-benzene, and phenol (Mason, C. J. 55, 108).—33. Naphthylene-(1,2)-diamine yields C₁₄H₈ <N> C₆H₄ [264°] (Leuckart, B. 19, 174).—

34. Phenyl-naphthylene-(1,2)-diamine-boiled with HOAc and phenanthraquinone forms, on adding HNO₃, a pp. of C₁₄H₈(NO)₂N₂O, whence

which forms a yellow solution in ether. It forms a blue solution in H₂SO₄ turned orange by dilution (Witt, B. 20, 1285).—35. Nitro-*o*-phenylene-diamine and HOAc give, on heating, C₁₄H₈N₂O₂ [251°] (Heim, B. 21, 2301).—36.

Isobutyl-phenylene-diamine in HOAc forms

pale-yellow needles, coloured cherry-red by H₂SO₄ (Gelzer, B. 20, 8253; 21, 2351). The compound C₁₄H₈N₂·C₆H₅Br·C₆H₅ [154°] also

forms yellow needles. 38. Isobutyl-phenylene-diamine gives an isomeric azine [144°].—

37. (5,4,2,1)-Bromo-toluylene-diamine in HOAc forms C₁₄H₈N₂·C₆H₄MeBr [210°] crystallising in yellow needles (Hartmann, B. 28, 1050).—

38. Tri-amido-benzene (from chrysoidine) yields C₁₄H₈N₂·C₆H₄NH₂ as brown crystals [179°] (Witt, C. J. 49, 402; Heim).—39. Aceto-

acetic ether forms, in presence of KOH, phenanthroxyene acetoacetic ether C₁₄H₈EtO, [185°] crystallising in white needles (Japp a. Streteild, C. J. 43, 27).—40. Acetone and NH₄Ac form C₁₄H₈N₂, crystallising in colourless laminae [130°]. This body forms a yellow

solution in HOAc, which deposits a dark-blue substance and gives, on addition of water to the filtrate, needles of C₁₄H₈O₂ (Japp a. Streteild, C. J. 41, 272).

Combinations.—C₁₄H₈O₂·NaHSO₄·2aq. Small colourless plates, v. s. sol. water, which slowly decomposes it.—(C₁₄H₈O₂)₂HgCy₂. [223°]. Red crystals with green lustre, deposited from a hot

saturated solution of phenanthraquinone and HgCy₂ in acetone (Japp a. Turner, C. J. 57, 7).—(C₁₄H₈O₂)₂HgCl₂. [223°]. Red prisms (from boiling acetone).—C₁₄H₈O₂·ZnCl₂. Dark reddish-brown needles got by adding a hot solution of

ZnCl₂ in HOAc to a hot solution of phenanthraquinone in HOAc (Japp a. Turner, C. J. 57, 6).

Hydrocyanide C₁₄H₈O₂(HCN): tufts of needles, formed by action of 30 p.c. HCN solution. Decomposed by heat into its components.

Conc. HCl decomposes it, giving off CO₂ and forming C₁₄H₈NO [241°] and C₁₄H₈NO₂ [183°]. The latter separates from benzene in slender needles. Both dissolve in sodium carbonate, expelling CO₂; the compound [241°] producing

C₁₄H₈·NaNO₂·4aq. and also the corresponding C₁₄H₈(NO)₂·Ba²⁺aq. whence HCl liberates C₁₄H₈NO (Japp a. Miller, C. J. 51, 29).

Mono-oxim C₁₄H₈NO i.e. C₆H₅·C·NOH

[158°]. Formed by boiling phenanthraquinone with alcoholic hydroxylamine hydrochloride for an hour (Goldschmidt, B. 16, 2178). Small yellow needles, v. sol. hot alcohol. Forms coloured pps. with metallic salts (Kostanecki, B. 22, 1847).

Boiling NaOHAc forms a green liquid. Conc. H₂SO₄ forms a blood-red solution and at 100° converts it into diphenylene ketone carboxylic amide. HCl, Ac₂O, and HOAc at 100° convert it, by intra-molecular change, into a weak base

[217°] probably C₁₄H₈·CO·NH₂, and also form prisms [92°] (Wegerhoff, A. 252, 17). Ac₂O forms C₁₄H₈N₂O crystallising in small brownish tables [247°] nearly insol. alcohol and ether (Zincke).

Di-oxim C₁₄H₈·C·NOH [202°]. Formed

by heating an alcoholic solution of phenanthraquinone (1 mol.) with hydroxylamine hydrochloride (4 mols.) for 30 hours at 100° (Answers a. V. Meyer, B. 22, 1998). Minute yellow prisms (from alcohol or HOAc), insol. water, al. sol. hot alcohol and ether. Conc. H₂SO₄ forms a blood-red solution. NaOHAc forms a yellow solution, depositing the Na salt as pearly plates. Alcohol

at 150° forms the anhydride C₁₄H₈·C·N

which crystallises in long yellow needles, insol. NaOHAc. A solution of the dioxim in HOAc

at 150° forms the anhydride C₁₄H₈·C·N

which crystallises in long yellow needles, insol. NaOHAc. A solution of the dioxim in HOAc

at 150° forms the anhydride C₁₄H₈·C·N

which crystallises in long yellow needles, insol. NaOHAc. A solution of the dioxim in HOAc

at 150° forms the anhydride C₁₄H₈·C·N

which crystallises in long yellow needles, insol. NaOHAc. A solution of the dioxim in HOAc

at 150° forms the anhydride C₁₄H₈·C·N

which crystallises in long yellow needles, insol. NaOHAc. A solution of the dioxim in HOAc

at 150° forms the anhydride C₁₄H₈·C·N

which crystallises in long yellow needles, insol. NaOHAc. A solution of the dioxim in HOAc

and Ac_2O saturated with HCl in the cold gives the acetyl derivative. $\text{C}_{12}\text{H}_7\text{O}_2\text{NOAc}$ separating from alcohol in minute crystals [184°].

Phenyl-hydrazide $\text{C}_{12}\text{H}_7\text{N}_2\text{O}_2$ [165°]. Formed by warming an alcoholic solution of phenanthraquinone with aqueous phenyl-hydrazine hydrochloride (Zincke, B. 16, 2564). Red needles or plates (from alcohol). Gives a violet solution in H_2SO_4 .

Di-bromo-phenanthraquinone $\text{C}_{12}\text{H}_5\text{Br}_2\text{O}_2$ [230°] (H.); [233°] (Ostefmayer, B. 7, 1090). Made by heating the quinone with Br and a little water for six hours at 180° (Haycock, A. 167, 185). Yellow nodules (from HOAc), sl. sol. alcohol. Yields di-bromo-diphenyl dicarboxylic acid on oxidation by chromic acid mixture.

Nitro-phenanthraquinone

[1:2] $\text{C}_{12}\text{H}_6\text{NO}_2$ —CO [257°]. Formed from the quinone and boiling HNO_3 (S.G. 1.4) (Anschütz a. Schulz, B. 9, 1404; Strasburger, Z. 16, 2346). Orange plates (from HOAc) yields nitro-diphenyl dicarboxylic acid [217°] on oxidation. By oxidation of (a)-, (β)-, and (γ)-nitro-phenanthrene with CrO_3 and HOAc there are formed (a)-, (β)-, and (γ)-nitro-phenanthraquinones [215°-226°], [260°-266°], and [263°] respectively (Schmidt, B. 12, 1156).

Nitro-phenanthraquinone. [282°]. Made by warming chloro-phenanthrene with nitric acid (S.G. 1.8) (Lacofvitch, J. pr. [2] 28, 172). Orange plates, sl. sol. HOAc .

Di-nitro-phenanthraquinone

$\text{C}_{12}\text{H}_4(\text{NO}_2)_2\text{CO}$ [294°]. Made by boiling phenanthrene with fuming HNO_3 or with a mixture of HNO_3 and H_2SO_4 . Obtained also, together with a more soluble isomeride, by nitration of phenanthraquinone and of nitro-phenanthraquinone [257°] (Graebe, A. 167, 144; Schultz, A. 203, 108; Strasburger, B. 16, 2346). Yellow plates, v. sl. sol. alcohol. Yields di-nitro-diphenyl dicarboxylic acid [258°] on oxidation.

Amido-phenanthraquinone

[1:2] $\text{C}_{12}\text{H}_7\text{NH}_2$ —CO [c. 200°]. Formed by reduction of nitro-phenanthraquinone [257°] with tin and HCl (Anschütz a. Meyer, B. 18, 4943). Violet-black needles, sl. sol. hot water, forming a reddish-violet solution.— B^{HCl} : yellowish-red feathery needles.

Di-amido-phenanthraquinone

[1:4:2] $\text{C}_{12}\text{H}_6(\text{NH}_2)_2\text{CO}$ Formed by reduction of [1:4:2] $\text{C}_{12}\text{H}_6(\text{NH}_2)_2\text{CO}$ the di-nitro-compound with tin and HCl (A. a. M.; Kleemann a. Wense, B. 18, 2168). Violet-black needles, not melted at 310°. The hydrochloride forms yellow plates.

Oxy-phenanthraquinone

$\text{C}_{12}\text{H}_6\text{O}_3$ —CO $\text{C}_{12}\text{H}_5(\text{OH})\text{CO}$ **Phenanthrolquinone**. Formed by the action of nitrous acid on amido-phenanthraquinone. Brownish-red needles. May be sublimed. Forms a yellowish-green solution in NaOHAq .

Acetyl derivative.

[200°-210°]. **Di-oxy-phenanthraquinone** $\text{C}_{12}\text{H}_4(\text{OH})_2\text{O}_2$ Formed by the action of nitrous acid on di-amido-phenanthraquinone (A. a. M.). Minute dark-brown needles. Yields a di-acetyl derivative crystallising in yellowish-red needles.

Hydro-phenanthraquinone $\text{C}_{12}\text{H}_8\text{O}_2$ / i.e. $\text{C}_6\text{H}_4\text{OH}\text{C}_6\text{H}_4\text{OH}$ Phenanthraquinone dihydride.

Phenanthrenehydroquinone. Mol. w. 210. Formed by heating phenanthraquinone with aqueous SO_2 or by passing SO_2 into a warm alcoholic solution of the quinone (Graebe, A. 167, 146). Colourless needles, m. sol. hot water, v. e. sol. alcohol, ether, and benzene. Absorbs oxygen when moist, or in aqueous solution, forming the quinhydrone $\text{C}_{12}\text{H}_{10}\text{O}_2$, which crystallises in black needles [189°], and finally phenanthraquinone. FeCl_3 , HNO_3 , and CrO_3 oxidise it in the same way.

Mono-acetyl derivative

$\text{C}_{12}\text{H}_7(\text{OH})(\text{OAc})$ [170°]. Got by boiling phenanthraquinone with HOAc , HI , and red P (Japp a. Klingemann, C. J. Proc. 6, 81). Formed by the action of sunlight on phenanthraquinone in aldehyde (Klinger, A. 249, 188). Flat needles.

Di-acetyl derivative $\text{C}_{12}\text{H}_6(\text{OAc})_2$

[202°]. Formed from the dihydride and Ac_2O . Colourless plates (from benzene), not oxidised by boiling chromic acid mixture. Not attacked by heating with KOHAg , unless the solution has a higher S.G. than 1.8.

Benzoyl derivative $\text{C}_{12}\text{H}_6(\text{OH})(\text{OBz})$

[178°]. Got by action of sunlight on phenanthraquinone and benzoic aldehyde (K.). White needles (from HOAc).

Valeryl derivative $\text{C}_{12}\text{H}_6(\text{OH})(\text{OOC}_4\text{H}_9\text{O})$ [149°]. Got by using isovaleric aldehyde.

Ethyl derivative $\text{C}_{12}\text{H}_6(\text{OH})(\text{OEt})$ [80°]. On treatment of phenanthraquinone with ZnEt_2 and alcohol successively the compound $\text{C}_{12}\text{H}_6\text{O}_2\text{EtOH}$ [77°] is got, from which EtOH can be removed by standing for some months *in vacuo* over H_2SO_4 (Japp, C. J. 87, 408). Gives a mono-acetyl derivative $\text{C}_{12}\text{H}_7\text{AcO}_2$ [103°].

Isomeride of hydro-phenanthraquinone $\text{C}_{12}\text{H}_8(\text{OH})_2$ [143°]. Got by heating its diacetyl derivative with alcoholic NH_3 (Fischer a. Gerichten, B. 19, 792). Needles; very oxidisable; its alkaline solution turning green and finally red.

Acetyl derivative $\text{C}_{12}\text{H}_7(\text{OAc})_2$ [159°]. Made by boiling morphine methylo-iodide with Ac_2O , adding dry AgOAc , filtering, and heating the filtrate at 180°. Needles (from ether).

Di-amido-hydro-phenanthraquinone $\text{C}_{12}\text{H}_6(\text{NH}_2)_2(\text{OH})$. Formed by reduction of di-nitro-phenanthraquinone with SnCl_2 (Kleemann a. Wense, B. 18, 2168). Very readily oxidised by air, FeCl_3 , or CrO_3 to violet-black needles of di-amido-phenanthraquinone.— B^{HCl} , 3aq.

Tetra-acetyl derivative $\text{C}_{12}\text{H}_4(\text{NHAc})_2(\text{OAc})_2$. Colourless needles, solid at 300°, sl. sol. alcohol and HOAc .

Phenanthraquinone carboxylic acid $\text{C}_{12}\text{H}_7\text{O}_3$ —CO $\text{C}_{12}\text{H}_6(\text{CO}_2\text{H})\text{CO}$ [315°]. Made by oxidation of phenanthrene carboxylic acid with CrO_3 in HQAe (Japp a. Schultz, B. 10, 1661; A. 196, 14).

Orange substance, sol. NaHSO_4Ag .

Phenanthraquinone sulphonie acid $\text{C}_{12}\text{H}_6(\text{SO}_3\text{H})_2\text{O}_2$. Formed from phenanthraquinone and SO_3 (Graebe). Gives a colouring matter resembling alizarin when fused with potash.

Phenanthrene $\text{C}_{12}\text{H}_{10}$ [149°]. Formed as above (Reaction 13). Brownish-red plates, v.

sol. alcohol and ether; does not combine with NaHSO_4 . Its alkaline solution is green.

Diphenanthryleneazotide $\text{C}_{14}\text{H}_8\text{N}_2\text{O}_2$. [above 400°]. Formed from phenanthraquinone and alcoholic NH_3 at 100°, and also by heating tetraphenylazine with soda-lime to red heat (Japp & Burton, *C. J.* 49, 845; 51, 98). Yellow crystalline powder or yellow needles (by sublimation); v. sol. ether. Its solution in H_2SO_4 is deep blue, becoming orange on dilution.

Isophenanthraquinone $\text{C}_{14}\text{H}_8\text{O}$. [156°]. Formed by the further action of CrO_3 and HOAc on an oil formed in the oxidation of phenanthrene, which remains in the alcoholic liquid from which phenanthraquinone has separated (Hayduck, *A.* 167, 185). Yellow crystals (from alcohol), sl. sol. water, v. sol. hot alcohol.

PHENANTHAZINE v. **PHENANTHAQUINONE**, Reaction 29.

PHENANTHRENE $\text{C}_{14}\text{H}_{10}$, i.e.
[1:2] $\text{C}_6\text{H}_4\text{CH}_2$. Mol. w. 178. [100°] (Graebe; Schiff); [103°] (Reissert, *B.* 23, 2244). (3402 i.v.). S. (alcohol) 2.62 at 16°, 10.08 at 78°. S. (toluene) 33 at 16.5° (Böhl, *B.* 12, 1978). S.V. 167.05 (Schiff). S.V. 186.2 (Lossen, *A.* 254, 54); 196.7 (Ramsay). H.F. (from diamond) -39,400 (Berthelot & Vieille, *A. Ch.* [6] 10, 446; *B.* [2] 47, 864); -32,500 (Stohmann, *J. pr.* [2] 40, 94). H.C.v. 1,699,000 (B. a. V.); 1,652,000 (S.). H.C.p. 1,700,400 (B. a. V.); 1,693,500 (S.). Occurs in coal-tar oil (Graebe, *B.* 5, 861; *A.* 167, 181; Fittig & Ostermayer, *B.* 5, 933; *A.* 166, 361; Hayduck, *B.* 6, 532; *A.* 167, 177) and in 'idryl' got by distillation of an Idrian ore of mercury.

Formation.—1. Together with toluene by passing *s*-di-phenyl-ethylene through a red-hot tube (Graebe).—2. From *s*-di-phenyl-ethane, from toluene (Graebe, *B.* 7, 48), from a mixture of diphenyl and ethylene, from di-methyl-diphenyl, and from phenyl-tolyl-methane (Barbier, *C. R.* 79, 121) by passing the vapours through red-hot tubes. Other hydrocarbons are also formed in these reactions.—3. Together with anthracene in the action of sodium on [1:2] $\text{C}_6\text{H}_4\text{BrCH}_2\text{Br}$ (Jackson & White, *Am.* 2, 3919).—4. By heating coumarone and benzene to a high temperature (Kraemer & Spilker, *B.* 23, 85).

Preparation.—By fractional distillation of the portion of hydrocarbons (310°–360°) from coal-tar oil, followed by crystallisation from alcohol. A solution of crude phenanthrene (3 pts.) in hot toluene mixed with picric acid (4 pts.) deposits on cooling the picric acid compound in golden needles, which may be subsequently decomposed by alkalis. The mixture of phenanthrene and anthracene may also be crystallised from toluene, when anthracene separates first (Wense, *B.* 19, 761). Chromic acid mixture attacks anthracene more readily than phenanthrene, so that a small quantity of anthracene may be removed by its means (Anschütz & Schultz, *A.* 196, 35).

Properties.—Small colourless plates (from alcohol), sl. sol. cold alcohol, v. sol. ether, benzene, HOAc , and CS_2 . May be sublimed. Exhibits slight blue fluorescence. Its absorption spectrum in the ultra-violet has been studied

by Hartley (*C. J.* 59, 164). Not reduced in alcoholic solution by sodium-amalgam.

Reactions.—1. Oxidised by chromic acid mixture and by CrO_3 in HOAc to phenanthraquinone.—2. HIAq and P at 200° form a tetrahydride.—3. Bromine added to its solution in ether or CS_2 forms unstable $\text{C}_{14}\text{H}_8\text{Br}_2$, crystallising in four-sided prisms (F. a. O.; Hayduck, *A.* 167, 185). This dibromide melts with effervescence at 98°, and its alcoholic solution gives a pp. of AgBr on adding AgNO_3 . By alcoholic KCy it is reconverted into phenanthrene (Anschütz, *B.* 11, 1217).—4. By exhaustive chlorination with SbCl_5 it yields per-chloro-benzene (Merz & Weith, *B.* 16, 2869).

Combinations.— $\text{C}_{14}\text{H}_8\text{O}_2\text{H}_2\text{N}_2$. [148°]. S. (95 p.c. alcohol) 2.7 at 15°. Golden prisms.— $\text{C}_{14}\text{H}_8\text{O}_2\text{H}_2\text{Cl}(\text{NO}_2)$. [1:2:4] [44°]. Orange needles (Willgerodt, *B.* 11, 604).— $\text{C}_{14}\text{H}_8\text{O}_2\text{H}_2\text{Cl}(\text{NO}_2)_2$. [88°]. Lemon-yellow needles (Liebemann, *B.* 8, 378).

Tetrahydride $\text{C}_{14}\text{H}_{14}$. [0°] (110° i.v.). S.G. 1.067. Got by reducing phenanthrene with HIAq and P , or by isomeric alcohol and sodium (Bamberger & Lottet, *B.* 20, 8076). Liquid, v. sol. hot alcohol. Yields phenanthraquinone on oxidation by CrO_3 and HOAc .

Octohydride $\text{C}_{14}\text{H}_{18}$. (below 390°). Got by heating phenanthrene with HIAq and P at 240° (Graebe). Liquid.

Perhydride $\text{C}_{14}\text{H}_{22}$. [–5°]. (270°–275°). S.G. 0.933. Made, together with a hydride (290°), by heating phenanthrene with HIAq and red P at 250° (Liebemann & Spiegel, *B.* 22, 779). Yields phenanthrene and anthracene when distilled with zinc-dust. Not attacked by H_2SO_4 , HNO_3 , or Br .

Chloro-phenanthrenes. By passing chlorine into a solution of phenanthrene in HOAc the compound $\text{C}_{14}\text{H}_9\text{Cl}$ [170°] is formed, together with oily $\text{C}_{14}\text{H}_7\text{Cl}$ and $\text{C}_{14}\text{H}_5\text{Cl}$. Alcoholic potash converts $\text{C}_{14}\text{H}_9\text{Cl}$ into $\text{C}_{14}\text{H}_8\text{Cl}$. By heating phenanthrene with SbCl_5 the compounds $\text{C}_{14}\text{H}_7\text{Cl}$ [172°], $\text{C}_{14}\text{H}_5\text{Cl}$ [250°], and $\text{C}_{14}\text{H}_3\text{Cl}$ [270°–280°] may be obtained (Zetter, *B.* 11, 165), the final products being C_6Cl_4 and CCl_4 .

Bromo-phenanthrenes. Bromine acting on phenanthrene dissolved in ether forms $\text{C}_{14}\text{H}_9\text{Br}$, which at 100° splits up into HBr and $\text{C}_{14}\text{H}_8\text{Br}$ [63°], above 360°. Bromo-phenanthrene crystallises in thin prisms, v. sol. HOAc and CS_2 , and is converted by oxidation into phenanthraquinone (Zetter; Hayduck; Anschütz). Bromine (4 mols.) acting on phenanthrene in ethereal solution also forms two di-bromo-phenanthrenes $\text{C}_{14}\text{H}_8\text{Br}_2$ [148°] and [156°]. A third di-bromo-phenanthrene [202°] is a crystalline powder insol. ether. By heating phenanthrene with bromine the compounds $\text{C}_{14}\text{H}_7\text{Br}$ [126°] and $\text{C}_{14}\text{H}_5\text{Br}$ [185°] may be got. By heating phenanthrene with bromine and iodine the compounds $\text{C}_{14}\text{H}_7\text{BrI}$ [245°] and $\text{C}_{14}\text{H}_5\text{BrI}$ [above 270°] are obtained. All these bromo-phenanthrenes crystallise in needles.

(a) **Nitro-phenanthrene** $\text{C}_{14}\text{H}_9\text{NO}_2$. [75°]. Made, together with the two following isomerides, by filtration of phenanthrene (Schmidt, *B.* 12, 1158). Yellow needles. Gives β -nitro-phenanthraquinone [215°–220°] on oxidation.

(β)-Nitro-phenanthrene. [127°]. Less soluble than the (α)-isomeride. Yields nitro-phenanthraquinone [260°-268°] on oxidation.

(γ)-Nitro-phenanthrene. [171°]. Small yellow leaflets. Less sol. alcohol than either of its isomerides. Yields on oxidation a nitro-phenanthraquinone [268°].

Di-nitro-phenanthrene $C_{14}H_8(NO_2)_2$. [150°-160°]. Made by prolonged action of HNO_3 of phenanthrene (Graebe). Yellow crystals.

Bromo-nitro-phenanthrene $C_{14}H_7(NO_2)Br$. [196°]. Made by nitration of bromo-phenanthrene (Anschütz, B. 11, 218). Long spls.

(α)-Amido-phenanthrene $C_{14}H_9NH_2$. Got by reduction of (α)-nitro-phenanthrene (Schmidt, B. 12, 1156). Small leaflets, insol. water. $BHCl$: crystalline pp.— $B'H_2SO_4$: powder.

(β)-Amido-phenanthrene. Small leaflets.— $BHCl$: sl. sol. water.

(γ)-Amido-phenanthrene. Got, like the preceding bodies, by reduction of the corresponding nitro-phenanthrene.— $BHCl$: glistening needles.

Oxy-phenanthrene v. PHENANTHROL.

Di-oxy-phenanthrene v. Hydro-phenanthraquinone.

Pseudophenanthrene $C_{14}H_{12}$. [115°]. Occurs in crude anthracene (Zeidler, A. 191, 295). Large white plates, yielding on oxidation a quinone [170°] which is v. sol. alcohol and benzene. The picric acid compound [147°] separates in bright-red needles on mixing saturated alcoholic solutions of pseudophenanthrene and picric acid.

A hydrocarbon $C_{14}H_{10}$ or $C_{14}H_{12}$ [104°], possibly a mixture of phenanthrene with pseudophenanthrene, was got by Zeidler (A. 191, 292) from crude anthracene. It yields an orange picrate [142°], a quinone [205°-209°], insol. $NaHSO_4$ (difference from phenanthraquinone), and a bromide [95°] which changes on fusion to a compound [85°], and on boiling with alcoholic potash forms yellow needles [250°]. The quinone gives Laubenheimer's reaction.

(α)-PHENANTHRENE CARBOXYLIC ACID $CO_2H.C_{14}H_9$. [266°]. Formed by the action

of alcoholic potash on the nitrile which is got by distilling sodium phenanthrene (α)-sulphonate (2 pts.) with K_2FeCl_4 (8 pts.) (Japp a. Schultz, B. 10, 1461; C. J. 87, 86). Colourless curved blades (from $HOAc$), or fern-shaped leaves (by sublimation), almost insol. water. Yields phenanthraquinone carboxylic acid on oxidation by CrO_3 and $HOAc$.— NaA' 4aq. S. (of NaA') 6-8 at 20°.— BaA' 7aq. S. (of BaA') 0-66 at 20°, 56 at 100°.

Phenanthrene (β)-carboxylic acid $C_{14}H_9.CO_2H$. [c. 262°]. Formed in like manner from a sodium phenanthrene sulphonate contained in the mother-liquid from which its (α)-isomeride has crystallised (Japp). Stellate groups of straight needles (from $HOAc$), insol. water, sol. alcohol, ether, and $HOAc$. Yields phenanthraquinone on oxidation.— NaA' 5aq: laminae. S. (of NaA') 6-2 at 20°; v. e. sol. boiling water.— BaA' 6aq: rectangular laminae. S. (of BaA') 27 at 20°; 8-7 at 100°.

PHENANTHRENE (α)-SULPHONIC ACID $SO_3H.C_{14}H_9$. Made, together with a (β)-acid $C_{14}H_9.SO_3H$

which forms more soluble salts, by heating phenanthrene (1 pt.) with H_2SO_4 (1 pt.) at 100° (Gräbe, ed. 187, 152; Japp, C. J. 87, 88; B. 11, 218). Crystalline mass, m. sol. water. Yields phthalic acid on oxidation.— CaA' 4aq: small plates, v. sol. hot water.— PbA' 2aq: crystalline.

Phenanthrene sulphonic acid $C_{14}H_9.SO_3H$. Got by heating phenanthrene (8 pts.) with H_2SO_4 (2 pts.) at 170° (Morton a. Geyer, A. C. J. 2, 203; B. 18, 1870). Pearly needles, sol. water and alcohol. Its salts are less soluble than those of the (α)-acid.— KA' .— BaA' 3aq.— PbA' 3aq.

Phenanthrene disulphonic acid $C_{14}H_8(SO_3H)_2$. Formed by heating phenanthrene with fuming H_2SO_4 (E. Fischer, B. 18, 814; Hazura a. Julius, M. 5, 188). Syrup.— KA' 2aq: powder, v. sol. water.— BaA' .— AgA' : yellowish powder.

Bromo-phenanthrene sulphonic acid $C_{14}H_8Br(SO_3H)$. Made by sulphonating bromo-phenanthrene (Anschütz a. Siemensky, B. 18, 1179).— KA' : needles, sl. sol. water.— BaA' : insoluble pp.— AgA' : glistening needles.

PHENANTHRIDINE $C_{14}H_9N$ i.e. $C_{14}H_8NH$.

V.D. 6-5. [104°]. (360°). Made by passing the vapour of benzylidene-aniline through a red-hot tube (Pictet a. Ankersmit, Z. 22, 8539). White needles, v. e. sol. alcohol, sl. sol. hot water. Its aqueous solution shows blue fluorescence. $NaNO_2$ gives a bulky pp. of the nitrite. Tin and HCl give a hydride crystallising in needles [100°].— $BHCl$: needles, v. sol. water.— $B'H_2PtCl_6$: needles.— $B'H_2AuCl_4$.— $B'H_2HgCl_4$. [190°].— $B'O_2H_2N_2O_3$: needles.— $B'H_2CrO_4$.

Methylo-iodide $B'MeI$. [201°].

Oxy-phenanthridine $C_{14}H_9CO$. Got by reducing o-nitro-o-phenyl-benzoic acid with zinc-dust and ammonia. It yields phenanthridine on distillation with zinc-dust.

PHENANTHROL $C_{14}H_9.OH$. [112°]. Formed by potash-fusion from phenanthrene sulphonic acid (Rehs, B. 10, 1253). Thin laminae (from benzene-ligroin), with bluish fluorescence. V. sol. alcohol and ether, sl. sol. water, v. sol. alkalis.

Acetyl derivative $C_{14}H_9.OAc$. [118°].

PHENANTHROLINE $C_{14}H_9N$ i.e. $OH.CH.C_{14}H_8.CO$. N:CH. [78°]. (above 860°).

Prepared by heating m-phenylenediamine or (B)-3-amido-quinoline with nitro-benzene, glycerol, and H_2SO_4 (Skraup, B. 15, 896; M. 3, 578; 5, 532; La Coste, B. 16, 674). Got also by heating its carboxylic acid [209°] (Gerdeissen, B. 22, 252). Colourless anhydrous four-sided tables [78°] or needles (containing aq) [66°]. M. sol. hot water, v. sol. alcohol, v. sl. ether. Bromine gives in a solution of its hydrochloride a crystalline pp. $C_{14}H_9N.Br$ [149°], converted by hot alcohol into $C_{14}H_9N_2.Br$ [178°]. $KMnO_4$ oxidises it to dihydridyl dicarboxylic acid.

Salts.— $B'H_2Cl$ 2aq: colourless prisms. Its aqueous solution yields on evaporation long prisms of $B'HCl$ aq.— $B'H_2Br$ 4aq. [380°].— $B'H_2CrO_4$: golden needles.— $B'O_2H_2N_2O_3$ [368°].— $B'H_2PtCl_6$ aq.— $B'HNO_3$: prisms, m. sol. in water.

Methyl-iodide $B'MeI_{2aq}$. Golden prisms, sol. water, sl. sol. alcohol, insol. ether.

Oxy-phenanthroline $C_{12}H_7N_2O$. [160°]. Formed in small quantity, together with phenanthroline, by heating *m*-nitro-aniline with glycerin, nitro-benzene, and H_2SO_4 (see Coite). Needles (from benzene).— $B'H_2P:Cl_{2aq}$.

Methyl-phenanthroline v. p. 355.

Di-methyl-phenanthroline
 $CH:CH.C:CH.C:CH.C.N.CMe$
 $OMe:N.O$ — $C:CH:CH$. [98°]. Formed by the action of paraldehyde and $HClAq$ at 100° on *m*-phenylene-diamine or (*B.3*)-amido-(*Py.3*)-methyl-quinoline (Von Miller a. Niederländer, *B. 24*, 1740; Schiff, *B. 24*, 2127). Colourless needles (from water). Melts at 78° when containing water of crystallisation. V. sol. alcohol, volatile with steam. Yields on reduction a base whence $BzCl$ forms $C_{14}H_{11}BzN_2$. [164°].— $B'H_2P:Cl_{2aq}$.

Di-hexyl-di-amylo-phenanthroline
 $C_6H_{11}.C:CH.C:CH.C:CH.C.N.C.C_6H_{13}$
 $C_6H_{13}.C:N.O$ — $C:CH.C:C.C_6H_{13}$. [51°]. Formed by the action of emanthol on an alcoholic solution of *m*-phenylene-diamine or of amido-hexyl-amylo-quinoline at 100° (Von Miller a. Gerdesen, *B. 24*, 1731; cf. Schiff, *A. 253*, 322). Needles. Its alcohol solution does not fluoresce.— $B'HCl$.— $B'H_2P:Cl_{2aq}$. [201°-210°]. Orange powder.— $B'C_6H_5.N_2O$. [104°]. Needles.

Pseudo-phenanthroline $C_{12}H_{12}N_2$, i.e.
 $CH.N.C:CH.C:CH.C.N:CH$
 $CH:CH.C$ — $C:CH:CH$. [173°]. Made from *p*-phenylene-diamine, glycerin, H_2SO_4 , and nitro-benzene (Skraup a. Vortmann, *M. 4*, 569), and from $Ph.N_2.C_6H_5.NH_2$, glycerin, and H_2SO_4 (Lellmann a. Lippert, *B. 24*, 2623). Obtained also as a by-product in the preparation of (*B.3*)-nitro-quinoline from *p*-nitro-aniline (Bornemann, *B. 19*, 2377). Crystallises from water in needles (containing 4aq), v. sol. alcohol, sl. sol. ether. Oxidised by $KMnO_4$ to dipyrrolyl dicarboxylic acid.

Salts.— $B'HCl$ 2aq: plates.— $B'H_2Cl_2$: monoclinic prisms.— $B'H_2P:Cl_{2aq}$.— $B'H_2Br_2$.— $B'HBr$.— $B'Br$.— $B'I$.— $B'HI$.— $B'H_2CrO_4.2\frac{1}{2}aq$: orange needles, sl. sol. cold Aq .

Methyl-iodides $B'MeI_{2aq}$: lemon-yellow needles.— $B'MeI_{2aq}$: red tables.

PHENANTHROLINE - (*B.*) - CARBOXYLIC ACID $C_{12}H_7(CO_2H)N_2$. [277°]. Formed by oxidation of (*B.*)-methyl-phenanthroline with chromic acid (Skraup a. Fischer, *M. 5*, 527). Minute needles, sl. sol. water and alcohol, sol. alkalis and acids.— $Ca_2HA.10aq$: needles. Yields phenanthroline on distillation with alkalis.

Phenanthroline - (*Py.3*) - carboxylic acid $C_{12}H_7(CO_2H)N_2[N:CO_2H=1.2]$. [209°]. Formed by oxidation of (*a*)-methyl-phenanthroline with $KMnO_4$ and H_2SO_4 (Gerdesen, *B. 22*, 250). Pale-yellow needles (containing aq), v. sl. sol. cold water.

Phenanthrone v. PHENANTHROQUINONE.

PHENANTHROXYLENE - ACETOACETIC ACID. *Ethyl ether* $C_{16}H_{11}O_5$, i.e.
 $O.H.C:CAc.CO_2Et$. Mol. w. (by Raoult's method) $C_{16}H_{11}O_5$.

[285°]. Formed by heating 287 (calc. 824).—[285°]. Formed by heating phenanthroquinone with acetoacetic ether and NH_4Aq or $KOHAq$ (Japp a. Streatfield, *C. J. 43*, 47; Japp a. Klingemann, *C. J. 59*, 2). White silky needles, v. sol. hot benzene and alcohol.

Reactions.—1. *Alcoholic potash* forms $C_{12}H_7O_2$, crystallising from alcohol, after solution at 100° in sealed tubes, in needles [259°].—2. *Alcoholic ammonia* at 100° yields lustrous yellow laminae [168°] of $C_{12}H_{11}N_2O_2$.—3. *Alcoholic HCl* yields $C_{12}H_7ClO_2$ [146°], whence alcoholic NH_3 produces $C_{12}H_{11}NO_2$.—4. Heating with $HOAc$ forms three compounds, $C_{12}H_7O_2$, decomposing at 285° without melting, $C_{12}H_{11}AcO_2$ [165°-171°], and $C_{12}H_{11}O_2$ [227°].—5. *Propionic acid* at 140° yields silky needles $C_{12}H_{11}O_2$ and crystalline $C_{12}H_{11}O_2$, which body is also got by heating with propionic anhydride at 150°.—6. *HI* and $BzCl$ with $C_{12}H_{11}O_2$ [133°], whence potash forms an acid $C_{12}H_{11}O_2$ [295°], which gives BaA'' 2aq and AgA'' .—7. Heated on the water-bath with alcohol containing a few drops of H_2SO_4 , it forms $C_{12}H_7O(OEt)(CO_2Et)$ [144°], which yields, with phenyl-hydrazine, $C_{12}H_{11}(N.HPh)(OEt)(CO_2Et)$ [220°] and, on hydrolysis, $C_{12}H_{11}(OEt)(CO_2H)$ [203°], crystallising in colourless needles.—8. Alcohol containing a large quantity of H_2SO_4 forms $C_{12}H_{11}O_2$ [144°], sol. boiling alcohol, and $C_{12}H_{11}O_2$ [277°], insol. alcohol.

Isophenanthroxylene-acetoacetic acid $C_{12}H_{11}O_5$. [269°]. Formed by saponifying its ether with $NaOH$ (Japp a. Klingemann, *C. J. 4*, 59, 14). Flat needles (from alcohol). Cong. $KOHAq$ at 150° yields $C_{12}H_{11}O_2$. $Ac.O$ at 150° forms $C_{12}H_{11}O_2$, insol. alcohol, and $C_{12}H_{11}O_2$. [226°].— CaA' 9aq.

Ethyl ether EtA'. [177°]. Formed from phenanthroxylene-acetoacetic ether by heating with formic acid (S.G. 1.22) at 130° for an hour, or by boiling with H_2SO_4 diluted with twice its weight of water (Japp a. Klingemann, *C. J. 4*, 59, 3). Colourless triclinic prisms (from $EtOAc$); $a:b:c = 96.4:1:507$; $\alpha = 78^\circ 6'$; $\beta = 72^\circ 0'$; $\gamma = 83^\circ 18'$; sol. alcohol, benzene, and light petroleum.

Reactions.—1. Ac_2O at 150° forms the acetyl derivative $C_{12}H_{11}AcO_2$ [165°-170°], crystallising from benzene in needles.—2. *Phenyl-hydrazine* in alcoholic solution at 135° yields the compound $C_{12}H_{11}(N.HPh)O_2$, crystallising in yellow needles [212°].—3. *Zinc* and HCl yield a crystalline compound [165°-170°], and also $C_{12}H_{11}O_2$ [128°], a body which yields a phenyl-hydrazide $C_{12}H_{11}(N.HPh)O_2$.—4. *Bromine* in $CHCl_3$ yields $C_{12}H_{11}BrO_2$ [212°] crystallising in yellow prisms and tables.—5. $HIAq$ at 100° forms $C_{12}H_{11}O_2$ [215°] crystallising in slender flat needles.

PHENAZINE $C_{12}H_8N_2$, i.e. $O.H.C \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} N.C.H$. *Asophenylene*. [171°]. (above 360°). (sol. alcohol) 2 in the cold.

Formation.—1. By distilling *m*- or *p*-azobenzoic acid with excess of lime (Claus, *B. 5*, 367, 610; 6, 723; 8, 39, 600; 10, 1893; 4, 168, 1).—2. By passing aniline over red-hot PbO (Schichutzky, *J. R. 8*, 248), or merely through a red-hot tube (Bernthsen, *R. 19*, 3256).—3. By heating equal weights of pyrocatechin and *o*-phenylene-diamine at 205°, followed by atmospheric oxidation of the resulting dihydride (Ris, *B. 19*, 2206).—4. By heating *o*-amido-phenol and oxidising in the same way (Ris).—5. From di-amido-phenazine by the diazo-reaction (O. Fischer a. Hepp, *B. 22*, 658; Nietzki, *B. 23*, 1855).

Properties.—Long yellowish needles (by sub-

PHENISOBUTYL - PHENETHYL - THIO - UREA v. **ETHYL-PHENYL-ISOBUTYL-PHENYL-THIO-UREA**.

PHENOCAPRYLAMINE v. **AMIDO-PHENYL-OCTANE**.

PHENENYL TRIBENZOIC ACID $C_{21}H_{12}O_6$. [261°]. Got by potash-fusion from tri-benzoylene-benzene (Gabriel a. Michael, B. 11, 1008). Prisms, v. sol. alcohol, ether, and H_2O . Yields C_6H_5Ph , when distilled with lime. M_p 261°.

PHENENYL TRI-METHYL TRIKETONE $C_9H_6O_3$. [163°]. Formed by the spontaneous condensation of acetoacetic aldehyde (Claisen, Stylos, B. 11, 1144). Small needles, v. sol. H_2O , al. sol. alcohol, ether, and water. Oxidised by nitric acid to trimelic acid.

PHENETHYLAMINE v. **AMIDO-PHENYL-ETHANE**.

PHENETHYL - PHENISOBUTYL - THIO - UREA v. **p-ETHYL-PHENYL-p-ISOBUTYL-PHENYL-THIO-UREA**.

PHENETIDINE v. *Ethyl derivative of AMIDO-PHENOL*.

PHENETOL v. *Ethyl ether of PHENOL*.

DIPHENIC ACID v. **DIPHENYL DICARBOXYLIC ACID**.

PHENNAPHTHAZINE $C_{12}H_8N_2$, i.e. $C_{12}H_8N_2$. [142°].

Formation.—1. By mixing equal mols. of o-phenylene-diamine and (β)-naphthoquinone in 50 p.c. acetic acid. 2. By oxidation of equal mols. of o-phenylene-diamine and (β)-naphthol with alkaline potassium ferricyanide. 3. By the decomposition of sulpho-benzene-azo-(β)-naphthyl-phenyl-amine by treatment with boiling dilute mineral acids: $C_6H_5(SO_3H)N=N.C_{10}H_7.NHC_6H_5 = C_6H_5.N_2.C_6H_5 + C_{10}H_7(NH_2)SO_3H$.

Preparation.—Fifty grms. of the dyestuff are dissolved in 500 c.c. of boiling water, and 125 c.c. of conc. H_2SO_4 is slowly added to the hot solution; the colour acid, which is first precipitated, re-dissolves, and on cooling the sulphate of the azine crystallises out in red needles, whilst sulphuric acid remains in solution.

Properties.—Glistening yellow needles or prisms. Sublimes at about 200° in long flat needles. Distils undecomposed above 360°. Sl. sol. alcohol, ether, and cold benzene; v. sol. hot benzene. Dissolves in conc. H_2SO_4 with a brownish-red colour, becoming yellow on dilution.

Salts.—With each acid it forms two different salts.—B'HCl*: long reddish-yellow needles and warty crystals.—B' H_2SO_4 *: red needles and thick garnet-red prisms.—B'HN O_3 *: yellow and red needles, both sparingly soluble (Vitt, B. 20, 673).

PHENOCYANINE $C_{12}H_8NO$ or $C_{12}H_8NO_2$. Dark-blue mass with coppery lustre, got by atmospheric oxidation of a mixture of phenol and NH_3 (Phipson, B. 6, 823). Insol. water, sol. alcohol. Coloured red by acids.

PHENOL C_6H_5O i.e. C_6H_5OH . *Carbolic acid*. *Phenyl hydrate*. Mol. w. 94. [41°]. (181.5°) (Dale a. Schoedegemmer) (182.0°) (Pinette, A. 243, 32). S. 6.6 at 17°. S.G. 1.0702 (Brühl); 1.0906 (P.). S.V. 101.8. C.E. (0.5-10°) 0.0083 (P.). 1.5636 (B.). 45-71. H.C.v. 736,500 (Berthelot, A. Ch. [6] 10, 452; 13, 329). H.C.p. 737,100.

H.F. 47,341 (Stonmann, J. pr. [2] 33, 471; 38,000 (Von Rechenberg). Occurs in castoreum (Wöhler, A. 67, 860), and in small quantities in urine of cows, horses, and men (Städeler, A. 77, 18; Lieben, A. Suppl. 7, 240; Hoppe-Seyler, C. J. 25, 628; Munk, B. 9, 1596; Salkowski, B. 9, 1595; Baumann, B. 9, 54, 1389, 1715). Contained in considerable quantity in coal-tar (Runge, P. 31, 69; 32, 308; Laurent, A. Ch. [3] 3, 195), and in the products of the dry distillation of gum benzoin, quinic acid, wood, and bones.

Formation.—1. By distilling o-, m-, or p-, oxybenzoic acid alone or with lime (Gerhart, Rev. scient. 10, 210; Rosenthal, Z. [2] 5, 627). 2. A product of the distillation of glycerin with $CaCl_2$ (Linnemann a. Zotte, A. 174, 37; Suppl. 6, 254). 3. By heating anisole with conc. $HClAq$ or $HClAq$ at 140° (Graebe, A. 139, 149). 4. From aniline by the diazo-reaction (Griess, A. 137, 89). 5. From benzene sulphonic acid by potash-fusion (Wurtz, Bl. [2] 8, 3197; cf. Degener, J. pr. [2] 17, 394). 6. From phenol p-sulphonic acid by distillation with dilute H_2SO_4 and superheated steam at temperatures above 116° (Armstrong a. Miller, C. J. 45, 148). 7. By heating acetylene with fuming H_2SO_4 and fusing the product with potash (Berthelot, C. R. 68, 539). 8. By shaking benzene with palladium that has absorbed hydrogen and air (Hoppe-Seyler, B. 12, 1552). 9. By the direct action of hydrogen-peroxide on benzene (Leeds, B. 14, 975). 10. In small quantity by the action of dry oxygen on boiling benzene containing $AlCl_3$ (Friedel a. Crafts, A. Ch. [6] 14, 435; C. R. 86, 884). 11. A product of fermentation of proteids (Baumann) B. 10, 685; Wegl, H. 1, 339; Brieger, J. pr. [2] 17, 184).

Preparation.—The aqueous solution got by stirring coal-tar oil with $NaOHAq$ is diluted with water as long as naphthalene separates. The liquid is then exposed to the air, with frequent stirring, for several days, and then fractionally ppd. by acid (e.g. CO_2), the last fraction being nearly pure phenol. The phenol is dried by heating to boiling in a current of air, and further purified by crystallisation (Hugo Müller, Z. [2] 1, 270; cf. Williamson a. Sprugham, C. J. 7, 232). Phenol may also be dried by distilling over dried $CaSO_4$ (Bickerdike, C. N. 16, 188; cf. Gladstone, C. N. 2, 98).

Properties.—Long deliquescent needles, with strong smell, m. sol. water, miscible with alcohol and ether. Attacks the skin. Does not redden litmus. Neely insol. Na_2CO_3Aq , m. sol. NH_4Aq , v. sol. K_2OHAq and $NaOHAq$. Antiseptic. Not affected by distillation with P_2O_5 , lime, or BaO . A solution of phenol even in 43,000 pts. of water gives a pp. of tri-bromo-phenol on addition of bromine-water (Landolt, B. 4, 770). $FeCl_3$ gives a violet colour to an aqueous solution; the reaction is prevented by acetic acid and by alcohol (Hess, A. 182, 161). Conc. H_2SO_4 poured beneath a solution containing phenol and nitric acid (1 p.c.) gives an intense red ring; with nitrous acid, red and green rings are got; with chlorates, a pale-yellow ring with blue below (Lindlo, C. N. 253, 1, 15). An aqueous solution of phenol (4 vols.) mixed with ammonia (1 vol.) gives on warming with a few drops of bleaching-powder solution a blue colour.

which becomes red on addition of acids (Salkowski, *Fr.* 11, 816). Boiling aqueous mercurous nitrate gives a deep-red colour (Plogge, *Fr.* 11, 178). Millon's reagent gives on boiling a yellow pp. which dissolves in nitric acid forming a deep red liquid; salicylic acid behaves in like manner (Almén, *J.* 1878, 1079). On adding *p*-oxybenzoic aldehyde and an equal volume of H_2SO_4 , a yellow liquid is got, turned crimson by potash (aurin). Phenol is poisonous (Wöhler, *A.* 65, 344; Duplay & Carin, *C. R.* 112, 627).

Reactions.—1. Decomposed by passing through a red-hot tube yielding benzene, toluene, xylene, naphthalene, anthracene, and phenanthrene (Kramers, *A.* 189, 129). When crude phenol is used the product depends on a crystalline hydrocarbon $C_{12}H_{10}$ (82.9°), S.G. 1.019 (63° at 9 mm.). This hydrocarbon is volatile in the cold, smells like camphor, and is sol. alcohol, ether, and petroleum spirit. It is reoxidised by atmospheric oxygen. It absorbs bromine, yielding a liquid bromide. By heating for 4 hours at 100° *in vacuo* the hydrocarbon is polymerised, yielding a solid (200°–220°) (Hbace, *C. J.* 47, 669).—2. Chlorine forms *o*- and *p*-chloro-phenol (4,2,1)-di-chloro-phenol, (6,4,2,1)-tri-chloro-phenol, and tetra-, pent-, and hexa-chloro-phenols. Exhaustive chlorination gives C_6Cl_6 , CCl_4 , C_2Cl_4 , and CO_2 (Rösch, *B.* 9, 1483). An intermediate body is C_6Cl_4O (828°) (Hugouenq, *C. R.* 109, 300). $KClO_4$ and HCl yield tri-chloro-phenol and tri- and tetra-chloro-quinone.—3. Chlorine acting on phenol in alkaline solution forms the acid $C_6(OH)_2CCl_2 > C_6(OH)_2CO_2H$ (Hantzsch, *B.* 20, 278; 32, 1282).—4. Bromine-water forms tri-bromo-phenol. Heat (68492 units) is given out in the reaction. Br in excess gives $C_6H_2Br_4O$ (Werner, *C. R.* 100, 799; *Bl.* [2] 46, 280).—5. Iodine and alkali at 60° form $C_6H_2I_4O$ (157°), which is violet-red, insol. water, and forms a red solution in alcohol and ether. It is converted into tri-iodo-phenol by boiling with KOH aq (Messinger & Vortmann, *B.* 22, 2313).—6. Chloride of iodine forms mono- and di-iodo-phenol (Schützenberger, *C. R.* 54, 197).—7. Oxidised by nitro-benzene and dilute $NaOH$ in the cold to oxalic acid and CO_2 (Siegfried, *J. pr.* [2] 81, 542).—8. If a rapidly alternating electric current be passed through a solution containing phenol, magnesium sulphate, and magnesium bicarbonate, the following bodies are formed, owing to the rapidly alternating oxidation and reduction: *p*-procatechin, hydroquinone, di-oxy-diphenyl, formic acid, succinic acid, and oxalic acid (E. Drechsel, *C. pr.* [3] 29, 249). Another product is C_6H_5O , an oil (168°–178°) with aromatic smell which forms a phenyl hydrazone C_6H_5N (108°). By continuing the alternating current this oil is converted in *n*-hexoic acid.—9. Electrolysis with carbon electrodes in aqueous solution rendered slightly alkaline by KOH yields a di-oxybenzoic acid $C_6H_4O_2$ (98°) and an amorphous acid $C_6H_5O_2$, insol. water and ether, sol. alcohol. The amorphous acid yields picric acid with HNO_3 , and on protracted boiling with dilute HCl aq it yields amorphous insoluble $C_6H_5O_2$, and amorphous C_6H_5O (60°), sol. water, alcohol, and ether. In like manner $NaOPh$ yields on electrolysis C_6H_5O , separable by hot HCl aq into insoluble $C_6H_5O_2$, insol. water and ether, and

C_6H_5O (78°), sol. water (Bartoli & Pappagalli, *G.* 12, 96).—10. Taken internally it is partly oxidised to hydroquinone and pyrocatechin (Nencki & Giacombo, *H.* 4, 825).—11. H_2O_2 oxidises it to pyrocatechin, hydroquinone, and quinone (Martinson, *Bl.* [2] 48, 156). When treated in aqueous solution with NH_3 , H_2O_2 , Na_2CO_3 , and hydroxylamine hydrochloride it yields phenolquinonimide, which colours the liquid bright blue (Wurst, *B.* 20, 2934).—12. CrO_3 , followed by water, gives $O(C_6H_4OH)_2$ (Etard). CrO_3 and $HOAc$ give tri- and tetra-chloroquinone (Carstenjen, *J. pr.* [2] 2, 82).—13. Fusion with $NaOH$ yields resorcin, pyrocatechin, and phloroglucin. Potash-fusion gives *o*- and *p*-oxybenzoic acids and two di-oxy-diphenyls (Bornh. a. Schrader, *B.* 11, 1832; 12, 417).—14. PCl_5 forms $PCl_2(OPh)$, $PCl(OPh)_2$, and $P(OPh)_3$, which may be separated by fractional distillation *in vacuo* (Noack, *A.* 218, 85; Anschütz & Emery, *A.* 238, 310; *A.* 258, 110). The compound $PCl_2(OPh)$ (90° at 11 mm.), (216° at 760), S.G. 1.354, is converted by chlorine into $PCl(OPh)_2$, whence SO_2 produces $POCl(OPh)$ (123° at 11 mm.). Bromine converts $PCl_2(OPh)$ into $PClBr(OPh)$, which is crystalline but very unstable. Sulphur at 190° converts $PCl(OPh)_2$ into $P_2S_2Cl_2(OPh)_2$, a colourless liquid (120° at 11 mm.), S.G. 1.4059. The compound $PCl(OPh)_2$ (172° at 11 mm., 295° at 760 mm.) is converted by chlorine into $PCl_2(OPh)_2$, which is crystalline, and insol. ether. Bromine converts $PCl(OPh)_2$ in ether into orange-yellow crystals of $PClBr_2(OPh)_2$. Sulphur and $PCl(OPh)_2$ at 190° yield $PSCl(OPh)_2$, crystallising in colourless needles (64°), (104° at 11 mm.). Tri-phenyl phosphite $P(OPh)_3$ combines with chlorine, forming $PCl(OPh)_2$, whence water produces tri-phenyl-phosphate $PO(OPh)_3$ (45°) (245° at 11 mm.). $P(OPh)_3$ with sulphur at 190° yields $PS(OPh)_3$ (50°) (245° at 11 mm.). S.G. 1.2341.—15. PCl_5 forms hardly any chloro-benzene (Otto, *A.* 145, 317; cf. Glutz, *A.* 143, 181).—16. P_2S_5 forms, on heating, phenyl mercaptan, diphenylenedisulphide $C_6H_5S_2$, and some Ph_2S (Kekulé, *O. R.* 64, 752; Graebe, *B.* 7, 61, 397; Geuther, *A.* 221, 57). P_2S_5 forms benzene, Ph_2PO , and H_2S .—17. Aqueous $KMnO_4$ oxidises it to oxalic acid and CO_2 (Tollens, *Z.* [3] 4, 715).—18. Distillation over heated zinc dust yields benzene.—19. H_2SO_4 (1 pt.) forms *o*- and *p*-sulphonic acids (Kekulé, *Z.* [2] 8, 197). H_2SO_4 (1½ pts.) at 160° forms di-oxy-di-phenyl sulphone (Glutz, *A.* 147, 52). $K_2S_2O_8$, heated with a solution of KOC_6H_5 at 65°–70°, forms $C_6H_5O_2SO_3OK$, which crystallises in scales, S. 14 at 15°, sol. hot alcohol. This salt occurs in urine. It is decomposed by boiling with water and dilute acids into phenol and H_2SO_4 . At 150° the dry salt changes to the isomeric potassium phenol *p*-sulphonate. Phenyl sulphuric acid is also a product of the passage of a rapidly-alternating electric current through a solution of phenol, $MgSO_4$, and magnesium bicarbonate. The free acid is very unstable (Baumann, *B.* 11, 1907; Brieger, *H.* 8, 811; Drechsel, *J. pr.* [2] 29, 240).—20. SO_2Cl_2 at 150° forms chloro-phenol (Dubois, *Z.* [2] 2, 705). $S_2O_3Cl_2$ forms *o*- and *p*-chloro-phenols and their sulphonic acids (Armstrong & Pike, *C. N.* 29, 383).—21. Nitric acid forms *o*- and *p*-nitro-, di-nitro, and tri-nitro-phenols.

hydrogen and sodium dissolve, giving off CO_2 and forming phenylates. These absorb CO_2 , forming $\text{PhO.CO}_2\text{K}$ and $\text{PhO.CO}_2\text{Na}$, which yield oxy-benzoates when strongly heated (v. o-Oxy-benzonitrile) (Kolbe, *J. pr.* [2] 10, 39).—23. CrO_3 forms phenokquinone $\text{C}_6\text{H}_4\text{O}_2$ (Wohlfahrt, *B.* 5, 248, 846).—24. Nitrous acid forms nitroso-phenol, the mono-oxim of quinone (Baeyer, *B.* 7, 967). H_2SO_4 , to which 6 p.c. of KNO_3 has been added, gives when shaken with a mixture of phenol (1 vol.) and H_2SO_4 (1 vol.) a brown colour changing to green, and finally to a magnificent blue. On pouring into water brown flakes are deposited (Liebermann, *B.* 7, 248, 1098). In the action of H_2SO_4 and nitrous acid on phenol there is formed (a) phenol-dichroin $\text{C}_6\text{H}_4\text{NO}_2$ or $\text{C}_6\text{H}_4\text{O}_2\text{N}_2\text{O}$, a brown powder, sol. ether, and also phenoxychroin $\text{C}_6\text{H}_4\text{NO}_2$, which is black and insol. ether (Kramer, *B.* 17, 1877; Brunner a. Chuit, *B.* 21, 250). (a) Phenol-dichroin is also formed from quinone mono-oxim and H_2SO_4 (Baeyer a. Caro, *B.* 7, 966). Each body yields an amorphous acetyl derivative. Phenol-dichroin forms a blue solution in alkalis and H_2SO_4 . Phenol-oxychroin forms a green solution in H_2SO_4 , and a brown solution in alkalis.—25. NOCl gives chlorinated quinones (Tilden, *C. J.* 27, 851).—26. Distillation with PbO yields diphenylene oxide $\text{C}_{12}\text{H}_8\text{O}$ and $\text{C}_{12}\text{H}_6\text{O}$, crystallising in needles [174°] (Graebner, *B.* 7, 396; Behr a. Van Dorp, *B.* 7, 398).—27. COCl_2 at 150° forms CO(OPh) , and COCl(OPh) (Kempff, *J. pr.* [2] 1, 402).—28. Ammoniacal zinc chloride at 290° forms aniline, diphenylamine, and Ph_2O (Merz a. Weith, *B.* 13, 1299).—29. Hydrazine solution in excess forms a white unstable substance [57°], possibly $\text{C}_6\text{H}_4\text{O(NH}_2)_2$ (Cottius a. Thun, *J. pr.* [2] 44, 190).—30. TiCl_3 acting on a benzene solution of phenol forms dark-red crystals of $\text{Ti(OPh)}_3\text{HCl}$, decomposed by water into phenol, titanous acid, and HCl (Schumann, *B.* 21, 1079).—31. AlCl_3 gives the solid $\text{AlCl}_3\text{(OPh)}$, v. sol. hot CS_2 , insol. ligroin, decomposed at once by water into phenol, alumina, and HCl (Claus a. Mecklin, *B.* 18, 2933). On heating phenol (2 pts.) with AlCl_3 (1 pt.), benzene, Ph_2O , and diphenylene-methane oxide are formed (Merz a. Weith, *B.* 14, 191). Phenol (5 g.) added to AlBr_3 (10 g.) forms amorphous $\text{AlBr}_3\text{(OPh)}$, which is quickly decomposed by water (Gustavson, *J. R.* 16, 242).—32. AlCl_3 and CCl_4NO_2 followed by water give aurin.—33. Heating with oxalic acid and H_2SO_4 gives rosolic acid. 34. Cyanic acid vapour is absorbed by dry phenol forming phenyl allophanate, which crystallises from hot alcohol in lustrous crystals (Tuttle, *J.* 1857, 451).—35. Benzyl chloride and zinc form $\text{PhCH}_2\text{C}_6\text{H}_4\text{OH}$ on heating (Pater, *G.* 2, 17).—36. Phenol (10 g.) boiled with Ac_2O (20 g.) and ZnCl_2 (26 g.) forms phenacetin, a red dye $\text{C}_{12}\text{H}_{10}\text{O}$, which is insol. benzene, sol. alcohol, ether, and HOAc . Its solution in alkalis is raspberry-red (Rasiński, *J. pr.* [2] 26, 54).—37. $\text{C}_6\text{H}_5\text{COCl}$ forms benzaurin.—38. Phthalic anhydride and H_2SO_4 form phenol-phthalic $\text{C}_{12}\text{H}_8\text{O}_4$ on heating (Baeyer, *B.* 4, 658).—39. Acetamide and benzamide on heating form, respectively PhOAc and PhOBz , while NH_3 is given off (Guaracchi, *A.* 171, 140).—40. Heated in alcoholic solution with CCl_4 and KOH or NaOH it yields o- and p-oxybenzoic acids.

Vol. III.

41. Paraldehyde and stannic chloride form $\text{CH}_3\text{CH(Ph)OH}$.—42. Benzoin aldehyde, alcohol, and a few drops of HCl form white resinous $\text{C}_{12}\text{H}_{10}\text{O}_2$, whence amorphous $\text{C}_{12}\text{H}_{10}\text{AcO}$ may be got (Michael a. Ryder, *Am.* 9, 180).—43. Benzene sulphochloride added to a slightly-alkaline solution of phenol forms $\text{C}_6\text{H}_5\text{SO}_2\text{OPh}$ as very stable colourless crystals [86°], sol. alcohol, sl. sol. ether, saponified by alcoholic potash (Georgesen, *B.* 24, 417).—44. Acetoacetic ether and H_2SO_4 form (8) methyl-coumarin.—45. Chloroacetal and alcoholic NaOPh at 160° form $\text{C}_6\text{H}_5\text{OCH}_2\text{CH}_2\text{O(Ph)}$ (255°) (Antenrieth, *B.* 24, 432).—46. CCl_4COCl and AlCl_3 give diphenyl carbonate (Heitschel, *J. pr.* [2], 86, 835).—47. o-Oxybenzoic aldehyde, HOAc , and H_2SO_4 form, on warming, oxyaurin $\text{C}_{12}\text{H}_8\text{O}_4$, which greatly resembles aurin (Liebermann, *B.* 9, 801; 11, 1486). Zulkowsky (*M.* 5, 111) obtained a dyestuff $\text{C}_{12}\text{H}_{10}\text{O}_4$ soluble in aqueous NaHSO_4 , and another dyestuff insol. NaHSO_4 .—48. CH_2Cl_2 and dilute caustic soda form $\text{CH}_2\text{C(OPh)}_2$ [98-5°], crystallising in plates, v. sl. sol. water (Heiber, *B.* 24, 3678).

Estimation.—1. Titrated by adding bromine water till the solution is yellow, or by adding excess of bromine, KI , and starch, then titrating with $\text{Na}_2\text{S}_2\text{O}_3$. The bromine solution contains 40 grms. Br and 20 grms. KBr per litre (Degener, *J. pr.* [2] 17, 380; cf. Landolt, *J. pr.* [2], 86, 506; Koppschaar, *Fr.* 15, 233; Weinreb a. Bondi, *M.* 6, 506; Giacosa, *H.* 6, 45).—2. 14 to 15 grms. of pure KOH are dissolved in 1 litre of water and 10 grms. of bromine gradually added; the solution is then diluted till 50 c.c. corresponds to 0.05 grm. of pure phenol. To ascertain the strength of any phenol solution 50 grms. of the above solution are taken and the phenol added till a drop of the solution ceases to give a blue colouration with KI and starch (Chandelon, *Bl.* [2] 88, 69).—3. 2 or 3 grms. phenol are dissolved in three times the molecular proportion of caustic soda. The solution is made up to 500 c.c., and 10 c.c. are put into a small flask warmed to 60°, and one-tenth normal iodine solution is allowed to flow in until it is coloured strongly yellow by excess of iodine; by shaking, a red pp. is formed. The excess of iodine is estimated by sodium thio-sulphate. The quantity of iodine taken up by the phenol multiplied by 0.123518 gives the amount of pure phenol (Messinger a. Vortmann, *B.* 23, 2758).—4. To separate phenol from mixtures in poisoning cases the substance is triturated with dilute H_2SO_4 and extracted with alcohol, the alcohol evaporated, and the residue extracted with benzene (Dragendorff a. Jacobson, *J. C.* 1886, 828), or the alcoholic extract may be mixed with NaOH aq., evaporated to a small bulk, filtered, and the phenol p.p. by HCl aq. in a graduated tube (Muter a. De Koningh, *Am.* 12, 191; cf. Staveley, *Chem. Zeit.* 18, 1126).—5° Phenol may be titrated by adding standard NaOH to a solution containing s-tri-nitro-benzene as indicator until a red colour appears (Bader, *Fr.* 81, 56).

Salts.—Phenol behaves as a very weak acid. It dissolves in KOH aq., but does not expel CO_2 from sodium carbonate in the solid— $\text{C}_6\text{H}_5\text{OK}$. White hygroscopic needles, v. sol. alcohol, ether, and water. Oxidises rapidly in air— $\text{C}_6\text{H}_5\text{ONa}$. Yields Ph_2O and $\text{C}_{12}\text{H}_{10}\text{O}$ when distilled with NaPO_3 (Niederhäusern, *B.* 15, 8 H

1128). Sulphur at 206° gives $S_2(C_6H_5OH)_2$.— $Ca(O_2C_6H_4)_2$, 8aq. Crystalline crusts, got by boiling phenol with baryta-water and evaporating *in vacuo*.— $Ca(O_2C_6H_4)_2$. Yields diphenylene oxide and a little benzene on distillation.— $Pb(OH)OC_6H_4$. Made by boiling phenol with litharge (Calvert, *C. J.* 18, 68).— $TiO_2C_6H_4$. Crystals, al. sol. cold water (Kuhlmann, *J.* 1864, 254).— $Hg(O_2C_6H_4)_2$. $HgCl_2$ 4aq. Pp. got by adding mercurous chloride to a solution of $NaOPh$ (Pouchet, *C. R.* 106, 276).— $Al(OC_6H_4)_3$. Made by heating phenol with aluminium and Al_2O_3 and pouring off the liquid product (Gladstone, *A. Tribbe, C. J.* 39, 9; 41, 5; Hodgkinson, *C. N.* 1877, 257). Split up on distillation into Al_2O_3 and Ph_2O , other products being phenol and a ketone $C_{12}H_{10}O$ [97°] (c. 280°), V.D. 182-2. Aniline salt $C_6H_5ONH_4Ph$ [37°]. (181°). Formed by boiling aniline with phenol (Dale & Schorlemmer, *A.* 217, 888; Dyson, *C. J.* 43, 466; Mylins, *B.* 19, 1002). Tables (from alcohol).— p -Toluidine salt $C_6H_4ONH_2C_6H_4Me$ [81°]. Needles (from oilgoin) (Dyson).

Combinations.—1. With SO_2 , phenol forms an unstable compound which may be distilled at 140° (best in a current of SO_2), and which crystallises in rectangular tablets. If exposed to air it absorbs water and gives off SO_2 . The compound melts between 25° and 30° (A. Hölzer, *J. pr.* [2] 25, 467).—2. With CO_2 . If salicylic acid be heated in a sealed tube for two hours at 260° it is resolved into phenol and CO_2 , but on cooling crystals resembling common salt with sides like staircases are formed. These melt at 37°. They are decomposed by heat, and also by water, alcohol, ether, and chloroform, into phenol and CO_2 (A. Klepl, *J. pr.* [2] 25, 464). The same compound is got from phenol and liquid CO_2 (Barth, *A.* 148, 49).

Formyl derivative C_6H_5OCHO . Liquid, boiling with decomposition at 180° (Seifert, *J. pr.* [2] 31, 467).

Acetyl derivative C_6H_5OAc . **Phenyl acetate**. (195°) at 733 mm. (Orndorff, *Am.* 10, 368). Formed by boiling an alcoholic solution of phenyl phosphate with $KOAc$ (Williamson, *A.* 92, 817; Kreyser, *B.* 18, 1716) and by the action of $AcCl$ on phenol (Cahours, *A.* 92, 816) or of $POCl_3$ (1 mol.) on phenol (3 mols.) mixed with $HOAc$ (3 mols.) (Nencki, *J. pr.* [2] 25, 282; Seifert, *J. pr.* [2] 31, 467). Obtained also by heating phenol with acetamide (Guarachi, *A.* 171, 142). Heavy oil, saponified by KOH aq. **Reactions**.—1. Sodium acts violently, giving off and forming $EtOAc$, phenol, salicylic acid, $C_6H_5O_2$ [48°] crystallising from alcohol in needles, and C_6H_5O [138°] nearly insol. alcohol, but crystallising therefrom in yellow needles (Hodgkinson, *A. W. H. Perkin, jun., C. J.* 87, 497, 721).—2. Benzyl chloride after heating for 14 days leaves an oil with strong blue fluorescence which when saponified by alcoholic potash forms C_6H_5O [89°] (c. 295°) and benzyl-phenol C_6H_5O [81°] (821°) (H. A. F.).—3. Benzyl chloride and $AlCl_3$ give HCl , toluene, anthracene, Ac_2O , and $OHPh.C_6H_4.OAc$.—4. $NaEt$ forms $PhONa$ and $EtONa$ (Seifert).—5. PCl_5 at 106° gives phenyl phosphate and $C_6H_5O.COCl$ [26°] (Michael, *Am.* 9, 207).—6. Chlorine in the cold forms $AcCl$, p -chloro-phenol, and $C_6H_4Cl(OAc)$. Chlorine at 160° yields $AcCl$,

$C_6H_4Cl(OAc)$, and mono- and di-chloro-phenols (Seelig, *J. pr.* [2] 39, 175).—7. Bromine forms $AcBr$ and $C_6H_4Br.OAc$. Excess of Br gives $C_6H_3Br_2OH$ and $C_6H_2Br_2OAc$ (Seelig).—8. $BaCl$ and a little $ZnCl_2$ give $PhOBa$ (Doebner, *A.* 210, 385).

Propionyl derivative $C_6H_5O.COEt$. [20°]. (211°). S.G. $\frac{1}{4}$ 1.0543; $\frac{1}{2}$ 1.0542. Formed by distilling phenol with excess of propionyl chloride (Perkin, *C. J.* 55, 548). Large transparent prisms. PCl_5 at 106° followed by water gives oily $C_6H_4Cl_2O$ (116°) (Michael, *Am.* 9, 212).

Butyryl derivative $C_6H_5O.CO.C_2H_5$. (228°). S.G. $\frac{1}{4}$ 1.0364; $\frac{1}{2}$ 1.0269. Formed from phenol and butyryl chloride (Perkin).

Benzoate derivative $C_6H_5O.Bz$. **Phenyl benzoate**. [89°]. (314° corr.). H.F. 61,804 (Stohmann, *J. pr.* [2] 38, 7). Made by melting benzoic acid (11 g.) with phenol (10 g.) and gradually adding $POCl_3$ (13 g.). The product is washed with dilute $NaOH$ and crystallised from dilute alcohol, the yield being fair (12 g.) (Rasinski, *J. pr.* [2] 26, 82; cf. Etling, *A.* 53, 87; Stenhouse, *A.* 53, 91; Laurent, *A.* Gerhardt, *A.* 75, 75; List & Lieprieht, *A.* 90, 190). Formed also by boiling phenol with benzamide (Guarachi, *A.* 171, 141) and from phenyl phosphate and $NaOBz$ (Kreyser, *B.* 18, 1719). Monoclinic prisms (from ether-alcohol). Not saponified by boiling aqueous KOH , but saponified by alcoholic potash.

Salicyl derivative v. o-OXY-BENZENOIC ACID.

Methyl derivative $C_6H_5O.Me$. **Anisole**. Mol. w. 108. (155°). V.D. 8.79 (calc. 8.78). S.G. $\frac{1}{4}$ 1.0110 (Pinette, *A.* 243, 84); $\frac{1}{2}$.997 (Vincent, *Bl.* [2] 40, 106). C.E. (0°-10°) .00383. S.V. 125.2 (R. Schiff, *A.* 220, 105). S.H. .405 at 0° (Schiff, *A.* 234, 800). R.p. 55.35° (Nasini & Bernheimer, *G.* 15, 93). H.F.p. 15,860. H.F.v. 13,830 (Thomsen, *Th.*); 32,718 [O_2 = 94,000; H_2O = 69,000] (Stohmann, *J. pr.* [2] 35, 28). Formed by distilling anisic acid or the methyl derivative of salicylic acid with baryta (Cahours, *A. Ch.* [3] 2, 274; 10, 353; 27, 439). Made also by heating $PhOK$ with MeI at 110° (Cahours, *A.* 78, 225). Prepared by heating $NaOPh$ at 200° in a rapid current of $MeCl$ (Vincent, *Bl.* [2] 40, 106). Oil with pleasant odour, v. sol. alcohol and ether. Conc. $HIAq$ at 140° splits it up into phenol and MeI (Graebe, *A.* 139, 149). At 400° it decomposes into phenol and ethylene (Bamberger, *B.* 19, 1820). Chlorine in the cold gives rise to $[1:2]C_6H_4Cl_2OMe$ (c. 200°), $[1:3:6]C_6H_3Cl_3OMe$, [28°], [233°], and $[1:3:5:6]C_6H_2Cl_4OMe$ [60°] (249°). In presence of iodine, chlorine forms $[1:2:3:5:6]C_6HCl_5OMe$ [100°] (279°) and also C_6Cl_5OMe [107°] (c. 289°). Chlorine with I at 60° forms C_6Cl_4 [220°], C_6HCl_3 [87°] and $C_6H_2Cl_4$ [186°]. Chlorine with I acting on boiling anisole forms CCl_4 , $COCl_2$, HCl , and some CCl_3 . Chlorine with $SbCl_5$ forms C_6Cl_4OH [187°] and CCl_3 . Chlorine with $SbCl_5$ at 100° gives C_6Cl_5O [107°] (Hugouennec, *A. Ch.* [6] 20, 504). $AcCl$ in CS_2 in presence of $AlCl_3$ forms $OH.CO.C_6H_5OMe$ (Gattermann, *B.* 22, 1139); $BaCl$ acts in like manner.

Ethyl derivative $C_6H_5O.Et$. **Phenetole**. (172°). S.G. $\frac{1}{4}$.9823 (Pinette, *A.* 243, 35). V.D. 4.27 (calc. 4.21). C.E. (0°-10°) .00037. S.V. 149.5 (R. Schiff, *A.* 220, 105). S.H. .439 (Nasini,

852

Bromo-nitro-, Chloro-, Tri-chloro-iodo-, Chloro-nitro-, Iodo-, Di-iodo-amido-, Iodo-nitro-, and Nitro-phenols.

Diphenol v. Di-oxy-diphenyl.

Tetraphenol v. Furfural.

PHENOL-AZO-COMPOUNDS v. Oxy-benzene-AZO-COMPOUNDS.

Phenol-bisazo-compounds v. Diazo-compounds.

PHENOL-BLUE v. Di-methyl-amido-phenyl-imide of QUINONE.

PHENOL CARBOXYLIC ACID v. OXY-BENZOIC ACID.

Phenol dicarboxylic acid v. OXY-PHTHALIC, OXY-ISOPHTHALIC, and OXY-TEREPHTHALIC ACIDS.

Phenol tricarboxylic acid v. OXY-TRIMESIC ACID.

PHENOLISATIN v. Di-oxy-diphenyloxim-DOLE.

PHENOL-PHTHALEIN $C_{12}H_8O_2$, i.e.

$O_2H_2 \begin{smallmatrix} \diagup & \diagdown \\ C_6H_4 & C_6H_4 \\ \diagdown & \diagup \end{smallmatrix} CO_2$ [p. 253]. Formed by

heating phenol with phthalic anhydride and conc. H_2SO_4 . Obtained also from di-amido-di-phenyl-phthalide by the diazo-reaction (Bayer, A. 20^e, 86; B. 9, 1230; 12, 642). Small crystals (from alcohol), μ -sol. hot alcohol, sl. sol. water. Its solutions in alkalis and alkaline carbonates are red, but become colourless on neutralisation, and also on addition of excess of KOHAq but not by NH_3 . The red colour of a solution in very dilute ammonia disappears on standing (Long, Am. 11, 84). Aniline does not give any colour with phenol-phthalein. $AgNO_3$ gives a violet pp.

Reactions.—1. H_2SO_4 , μ 100° forms a sulphonic acid, but at 200° it yields oxy-anthraquinone.—2. PCl_5 yields di-chloro-di-phenyl-phthalide [156°].—3. Zinc-dust and NaOHAq yield phenol-phthalin $CO_2H.C_6H_4.CH(C_6H_4OH)_2$.—4. Potash-fusion gives dioxybenzophenone and benzoic acid.—5. NH_3 at 170° forms $C_{12}H_8N_2O_2$ [266°].

Di-acetyl derivative $C_{12}H_8Ac_2O_2$ [143°]. Colourless tables (from wood-spirit).

Anhydride $C_{12}H_8O_2$ [175°]. A by-product in the preparation of phenol-phthalein (Bayer, A. 212, 347). Needles, insol. NaOHAq. Conc. H_2SO_4 forms a solution with green fluorescence. Bromine yields $C_{12}H_8Br_2O_2$ [258°]. Alcoholic potash and zinc-dust reduce it to phthalin $C_{12}H_8O_2$.

Tetra-bromo-phenol-phthalein $C_{12}H_4Br_4O_2$, i.e. $O_2H_2.C_6H_2Br_4.CO_2$ [220°, 230°]. Formed by adding Br in HOAc to a solution of phenol-phthalein in alcohol. Colourless needles (from ether), sl. sol. alcohol and HOAc. Alkalis form violet solutions, decolorised by excess. H_2SO_4 produces di-bromo-oxy-anthraquinone on heating to 160°. Ac_2O yields a di-acetyl derivative [184°]. H_2SO_4 containing KNO_3 forms bromoquinone $C_{12}H_4Br_2O_2$ separating from alcohol-chloroform in red crystals with steel-blue lustre, insol. water, forming a violet solution in H_2SO_4 , and converted by boiling alcoholic potash into $C_{12}H_4Br_2O_2$ [264°]. NH_3 at 170° forms $C_{12}H_4Br_2N_2O_2$ [above 280°], whence nitrous acid produces $C_{12}H_4Br_2N_2O_2$ and Ac_2O yields $C_{12}H_4Ac_2Br_2N_2O_2$ [241°].

PHENOL-PHTHALEIN $C_{12}H_8O_2$, i.e.

$O_2H_2 \begin{smallmatrix} \diagup & \diagdown \\ C_6H_4 & C_6H_4 \\ \diagdown & \diagup \end{smallmatrix} CO_2$ Di-oxy-

phenyl-anthranel. [313°]. Formed by oxidation of phenol-phthalidin by dilute alkaline $KMnO_4$ (Bayer, A. 202, 100). Monoclinic tables (from HOAc); $a:b:c = 46:1:40$; $\beta = 89^\circ$, v. sol. alcohol and acetone. It forms a pale-yellow solution in KOHAq, and is reprecipitated by HCl . Conc. H_2SO_4 forms a violet solution, and on heating produces oxyanthraquinone and phthalic acid. Reduced by zinc-dust and NaOHAq to phenol-phthalidin. PCl_5 yields di-chloro-phenyl-oxy-anthranel $C_{12}H_6Cl_2O_2$ [156°]. Bromine gives $C_{12}H_6Br_2O_2$ [above 230°], whence $C_{12}H_6Ac_2Br_2O_2$ [182°] may be obtained. On adding phenol to a solution of phenol-phthalidin in H_2SO_4 , the violet colour changes to blood-red, and on addition of water a red amorphous pp. is thrown down. This pp. forms a deep-violet solution in alkalis, and yields a crystalline bromo-derivative. A mixture of NH_3 and alcohol at 160° converts the red pp. into $C_{12}H_6N_2O_2$ [260°], crystallising in yellow needles.

Acetyl derivative $C_{12}H_8Ac_2O_2$ [109°]. Monoclinic prisms, $a:b:c = 2.78:1:1.44$; $\beta = 77^\circ$.

PHENOL-PHTHALEIN CHLORIDE v. Di-chloro-phenyl-oxy-anthranel.

PHENOL-PHTHALIDIN v. Di-oxy-phenyl-anthranel.

PHENOL-PHTHALIN $C_{12}H_8O_2$, i.e.

$CO_2H.C_6H_4.CH(C_6H_4OH)_2$ Di-oxy-tri-phenyl-methane carboxylic acid. [225°]. Formed by reduction of phenol-phthalein with zinc-dust and NaOHAq (Bayer, A. 202, 80; 212, 330). Small needles. Forms a colourless solution in potash, coloured red by K_2FeCy_4 through formation of phenol-phthalein. Yields a di-acetyl derivative [146°]. Sodium-amalgam yields phenol-phthalol $CH(OH).C_6H_4.CH(C_6H_4OH)_2$ [190°], which gives a tri-acetyl derivative [40°].

Anhydride $C_{12}H_8O_2$ [217°]. Formed by reducing the anhydride of phenol-phthalein. Small needles (from dilute alcohol).

Di-chloro-phenol-phthalin. Anhydride

$O \begin{smallmatrix} \diagup & \diagdown \\ C_6H_4 & C_6H_4 \\ \diagdown & \diagup \end{smallmatrix} CH_2Cl \begin{smallmatrix} \diagup & \diagdown \\ CH_2Cl & CO_2H \end{smallmatrix}$ [226°-230°]. Gd

by the action of zinc and NaOHAq on the compound $C_{12}H_8O_2Cl_2$ derived from fluorescein (v. vol. ii. p. 558). Small needles (from dil. alcohol).

Tetra-bromo-phenol-phthalin

$CO_2H.C_6H_2Br_4.CO_2$ [205°]. Formed by bromination. Crystals (from benzene). Yields a di-acetyl derivative [168°] (Bayer, A. 202, 80). Conc. H_2SO_4 converts it into tetra-bromo-phenol-phthalidin $C_{12}H_4Br_4O_2$, which crystallises from alcohol in golden needles, and is converted by oxidising agents into tetra-bromo-phthalidin $C_{12}H_4Br_4O_2$. Tetra-bromo-phenol-phthalidin is tetra-bromo-di-oxy-phenyl-anthranel, and its di-acetyl derivative crystallises in needles [256°].

PHENOL-QUINOLINE v. OXY-PHENYL-QUINOLINE.

PHENOLS: Compounds containing hydroxyl united to carbon, which forms part of a benzene nucleus (v. BENZENES AND ALCOHOLS). They much resemble the tertiary fatty alcohols, being more acid in character than primary alcohols. Thus phenols and tertiary alcohols form hardly any acetate on heating with HOAc. Phenols in which hydrogen in the o- or p- position has been displaced by NO_2 or by a halogen are even more strongly acid in character (e.g. picric acid).

Formation.—1. By potash-fusion from est

phenolic acids.—2. By the diazo-reaction from amido-compounds (p. DIAZO-COMPOUNDS).—3. By distillation of oxysulphonic acids either alone or with lime.—4. Halogens in a benzene nucleus may sometimes be displaced by hydroxyl by heating with KOHAq in sealed tubes; thus *o*- and *p*-chloro-nitro-benzenes give *o*- and *p*-nitro-phenols by this treatment.

Properties of Phenol and its homologues.—Dissolve in NaOHAq but not in $\text{H}_2\text{CO}_3\text{Aq}$. Phenols do not give rise on oxidation to an acid or aldehyde containing the same number of atoms of carbon in the molecule. They do not exchange H for H on treatment with KSH, nor do they form ammonium salts. They do not react (like alcohol) with HCl. FeCl₃ colours aqueous solutions of phenols, and products of oxidation are often produced. H₂SO₄ to which 6 p.c. of KNO₃ has been added gives with a solution of a phenol in H₂SO₄ a brown colour, changing on warming to green and blue (Liebemann, B. 7, 248, 806, 1098).

Reactions.—1. Readily undergo bromination, chlorination, and nitration.—2. H₂SO₄ forms sulphonic acids, the isomeric sulphuric acids being very unstable.—3. Sodium and CO₂ form oxy-acids on heating (Kolbe).—4. Chloroform and NaOHAq form, on boiling, oxy-aldehydes (Tiemann & Beimer, B. 9, 824).—5. CCl₄ and alcoholic potash at 100° form oxycarboxylic acids.—6. Ammoniacal ZnCl₂ at 200°–300° converts phenols into amines (Merz & Weith, B. 13, 1298; 20, 544).—7. Solutions of NaHCO₃ and (NH₄)HCO₃ yield oxycarboxylic acids on heating with dioxyphe-nols (Kostanecki, B. 18, 3203).—8. Distillation over zinc dust reduces the hydroxyl to hydrogen, forming the corresponding hydrocarbons.—9. Alkyl chlorides and anhydrides yield alkyl derivatives of phenols, especially if a little powdered zinc be added (Schiaparelli, G. 11, 69). When an alkyl chloride is used oxy-ketones are also often formed through the alkyl entering the benzene nucleus.—10. Organic acids mixed with phenols readily yield alkyl derivatives of the phenols on adding POCl₃ or on heating in presence of ZnCl₂ (Kasinski, J. pr. [2] 26, 62; Nencki, M. 10, 906). Alcohols in presence of ZnCl₂ form alkyl ether and higher homologous phenols.—11. Alkyl derivatives of phenols split up on distillation into phenols and olefines (Bamberger, B. 19, 1819).—12. The acid sulphuric ethers of the form C₆H₄X.O.SO₃H derived from *o*- and *p*-alkyl-phenols are oxidised by alkaline KMnO₄ to *o*- and *p*-oxy-benzoic acids (Heymann, B. 19, 704).—13. Alkaline solutions of phenols absorb atmospheric oxygen, forming dark-coloured products.—14. Homologues of phenol frequently yield oxycarboxylic acids on fusion with potash, the alkyl side-chain being oxidised to carboxyl.—15. Aldehydes in presence of dehydrating agents form compounds of the form XCH(OH), which change to XCH(Y".OH). Thus (β)-naphthol and benzoic aldehyde give PhCH(OH), changing to PhCH(C₆H₄OH), which is at once converted into the anhydride PhCH<C₆H₄>O

(Beeyer, B. 5, 25; Glaser, B. 19, 8316).—16. Phthalyl chloride usually forms phthalic ethers (B. Meyer, B. 24, 2600).—17. Iodine and potash give di- and tri- iodo- derivatives (Messinger & Voßmann, B. 23, 2515).—18. Nitrous

acid displaces hydrogen in the *o*- or *p*- position by nitroxy. The products are identical with the mono-oxims formed by warming quinones with hydroxylamine hydrochloride, but yield nitro-phenols on oxidation with alkaline K₂FeO₄.—19. Diazo-salts readily form azo-compounds (q.v.).—20. Diazo-amido-compounds form oxy-azo-compounds. Thus C₆H₄Cl.N.NHCO₂H.Cl heated with phenol on a water-bath yields C₆H₄Cl.N₂C₆H₄OH and C₆H₄Cl.NH₂ (Heumann & Oeconomidis, B. 20, 904).—21. Benzotrichloride acting on phenols in which there is an atom of hydrogen in the *p*- position to hydroxyl yields colouring matters related to aurin (Dönniger, A. 217, 228; 257, 56).

PHENOL *o*-SULPHONIC ACID C₆H₄(OH).SO₃H. Formed, together with the *p*- acid, by the action of H₂SO₄ on phenol, especially in the cold (Kekulé, Z. 1867, 199; B. 2, 380; Faust, Z. 1871, 339; Armstrong, O. J. 24, 1112; 25, 12, 857). Prepared by dropping H₂SO₄ on dry phenol at -10°, allowing the product to stand for a week, and then distilling, treating with BaCO₃ and KHCO₃ successively and crystallising the K salt (Allain le Canu, C. R. 109, 225). Crystals (containing 1½ aq), melting at 50° and decomposing at a higher temperature, with liberation of H₂SO₄. Sol. ether. When heated with water it changes to phenol *p*-sulphonic acid (Post, A. 205, 64). Possesses powerful antiseptic properties (Serrant, C. R. 102, 1079).

Reactions.—1. Potash-fusion gives some pyrocatechin. The action begins about 280° and attains a maximum (50 p.c.) at 320°. Soda-fusion also gives pyrocatechin. The action begins at 310°. At 330° the yield is 6 p.c. Fusion with a mixture of potash and soda gives a still smaller yield (1 p.c.) of pyrocatechin (Degener, J. pr. [2] 20, 308).—2. Bromine-vapour acting at -8° on the K salt yields bromo- and di-bromo-derivatives.—3. BaCl₂ forms PhOBa on heating with the K salt (Solomannoff, Z. [2] 5, 296).—4. Heated with dilute HCl at 140° it is split up into phenol and H₂SO₄ (Armstrong).

Salts.—KA' 2aq. [235°–240°]. Colourless trimetric prisms, sol. water.—NaA' 1½aq.—BaA' aq: needles. S. 25 at 100°.—BaA', 2aq.—PbA', aq: tables, sl. sol. water.—The aniline salt yields phenol and amido-benzene *p*-sulphonic acid on distillation (Kopp, B. 4, 978).

Methyl derivative C₆H₄(OMe).SO₃H. Formed from the acid, KOH, MeI, and MeOH (Kekulé).—KA' aq: needles, more soluble than its *p*-isomeride (Haitinger, M. 4, 178). Yields a chloride [58°].

Ethyl derivative. Forms a K salt crystallising in plates.

Phenol *m*-sulphonic acid C₆H₄(OH).SO₃H. Formed by potash-fusion from benzene *m*- or *p*-disulphonic acid (Barth & Bennefer, B. 9, 969). Needles (containing 2aq). FeCl₃ gives a violet colour. Yields resorcin on fusion with potash.—NaA' aq.—KA' aq. [200°–210°]. Efflorescent needles.—K₂O.H₂SO₄ aq.—PbA' aq: tables, v. sol. water.—BaA', 1½aq.—CuA', 6aq: green tables.

Ethyl derivative C₆H₄(OEt).SO₃H. Got by the action of KCH₃ and EtI on the acid (Delisle & Laget, B. 23, 8993). Deliquescent needles. Yields a chloride [58°] and an amide [131°], and is reduced by zinc dust and dilute H₂SO₄ to C₆H₄(OEt)SH (239°).—Salts: KA' aq BaA', 4aq: needles (from water).—CuA', 2aq.

Phenol *p*-sulphonic acid $\text{C}_6\text{H}_4(\text{OH})\text{SO}_3\text{H}$. Formed by warming phenol with H_2SO_4 or ClSO_3H . Formed also from amido-benzene *p*-sulphonic acid by the diazo-reaction. Highly deliquescent hydrated needles (Le Canu, *C. R.* 108, 385).

Reactions.—1. Bromine acting on a cold solution forms mono- and di-bromo-derivatives and finally tri-bromo-phenol (Le Canu).—2. Boiling HIAg gives phenol (Benedikt, a. Bamberger, *M.* 13, 4).—3. Potash-fusion forms a little resorcinol (Läncke, *J. pr.* [3] 8, 43).—4. PCl_5 gives *p*-di-chloro-benzene and $\text{C}_6\text{H}_4(\text{ClO})\text{POCl}_2$ (Kekulé, *B.* 5, 875; 6, 943).—5. MnO_2 and H_2SO_4 yield quinone (Schradner, *B.* 8, 759).—6. Dilute HCl at 150° forms phenol and H_2SO_4 .

Salts.— KA' . [400°]. Six-sided trimetric lamellae: $\alpha:b:c = 879:1:1002$.— NaA' 2aq: monoclinic prisms (Shadwell, *J.* 1881, 874).— BaA' 3aq. S. 50 at 100° .— $\text{BaO}_2\text{H}_2\text{SO}_4$ 2aq.— PbA' 2aq.— CoA' 8aq (Freund, *A.* 120, 85).— NiA' 8aq.— CuA' 10aq.— AgA' .—Aniline salt. Plates. [170°]. Decomposed at 190° into phenol and amido-benzene *p*-sulphonic acid.—*o*-Toluidine salt. [c. 192°]. S. 107 at 14° (Lecco, *J.* 1874, 747).—*p*-Toluidine salt. [202°]. S. 62 at 17° .

Benzoyl derivative $\text{C}_6\text{H}_4(\text{OBz})\text{SO}_3\text{H}$. Formed from PhOBz and SO_3 (Engelhardt, *A.* 1868, 76).— KA' : long needles (from water).— CaA' .— BaA' .— PbA' 2aq.— CuA' 6aq.— AgA' .

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{SO}_3\text{H}$. Got by methylation. The K salt forms needles.

Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{SO}_3\text{H}$. Formed from the acid, KOH , and EtI (Kekulé, *Z.* 1867, 200), and also, together with the *o*-isomeride, by sulphonating phenetole (Lippmann, *C. R.* 69, 1332).— BaA' 4aq: crystals, v. sl. sol. hot water.— KA' aq: needles (from alcohol).

Phenyl ether PhA' . Formed from phenol (3 mols.) and ClSO_3H (Engelhardt, *A.* 1869, 298). Syrup, split up by water into phenol and phenol sulphonic acid.

Anhydride $\text{C}_6\text{H}_4(\text{SO}_3)_2$. Formed from the acid and POCl_3 (Schiff, *A.* 178, 171). Powder, v. sol. water, v. sl. sol. HClAq . Coloured violet-red by FeCl_3 . Ppts. gelatin and alkaloids. Yields an *Acetyl derivative* $\text{C}_6\text{H}_4(\text{SO}_3)_2\text{Ac}$.

Phenol disulphonic acid $\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})_2$. [1:2:4]. Formed by warming phenol with H_2SO_4 and SO_3 , and by allowing separate vessels of phenol and fuming H_2SO_4 (S.G. 1.85) to remain for six months in *vacuo*, the acid absorbing the vapour of phenol (Kekulé, *Z.* 1866, 693; Le Canu, *C. R.* 109, 442). Formed also from diazo-benzene sulphate and fuming H_2SO_4 (Griess, *A.* 187, 69; Armstrong, a. Prevost, *B.* 6, 664). Nodular groups of deliquescent needles, v. sol. water and alcohol. HNO_3 yields picric acid. Potash-fusion gives pyrocatechin and its sulphonic acid; soda-fusion forms also pyrocatechuic acid (Barth, a. Schmidt, *B.* 13, 1260). FeCl_3 gives a red colour (Städeler, *A.* 144, 299).

Salts.— KA' aq. Needles, decomposing about 270° . S. 33 at 100° .— BaA' 4aq. S. 19 at 15° .— $\text{Ba}(\text{O}_2\text{H}_2\text{SO}_4)_2$ 8aq.— $\text{Ba}(\text{O}_2\text{H}_2\text{SO}_4)_2$ 8aq. v. sol. water.— $\text{Pb}(\text{O}_2\text{H}_2\text{SO}_4)_2$ 6aq. Sl. sol. water.— AgA' plates, v. sol. water.

Methyl derivative $\text{C}_6\text{H}_3(\text{OMe})(\text{SO}_3\text{H})_2$. Formed by sulphonation of anisic acid (Zerfas,

A. 104, 343), and also from SO_3 ($\text{C}_6\text{H}_4\text{OMe}$) and conc. H_2SO_4 at 170° (Annahme, *Z.* 175, 27).— BaA' 4aq: monoclinic crystals.

Ethyl derivative $\text{C}_6\text{H}_3(\text{OEt})(\text{SO}_3\text{H})_2$. [1:2:4]. Formed from amido-benzene disulphonic acid by the diazo-reaction (Zander, *A.* 196, 25). Very deliquescent needles. Yields a chloride [108°] and an amide [233°].— KHA' aq.— BaA' 2aq.— BaA' 3aq: v. sol. water.

Ethylene derivative $\text{C}_6\text{H}_3(\text{O}_2\text{C}_2\text{H}_4)_2\text{SO}_3\text{H}$. Formed from $\text{C}_6\text{H}_4(\text{OPh})_2$ and H_2SO_4 at 120° (Lippmann, *Z.* 1869, 447).— BaA' 2aq.— PbA' 2aq: plates, insol. cold water.

Phenol disulphonic acid, the trisulphonic acid is formed by heating the trisulphonic acid with KOH (3 pts.) and some water at 150° (Senhofer, *J.* 1879, 747).— Z fields KA' 3aq.— BaA' 4aq.— PhA' 4aq: loz. prisms, v. sol. water.

Phenol trisulphonic acid $\text{C}_6\text{H}_2(\text{OH})(\text{SO}_3\text{H})_3$ [1:2:4:6]. Formed by heating phenol (6 pts.) with H_2SO_4 (80 pts.) and P_2O_5 (15 pts.) at 180° (Senhofer, *A.* 170, 170). Formed also by heating SO_3 ($\text{C}_6\text{H}_4\text{OH}$) with fuming H_2SO_4 at 190° (Annahme, *A.* 172, 28). Needles or short prisms (containing 3 aq.). Coloured red by FeCl_3 .— BaA' 8aq.— KA' 4aq.— $\text{K}_2\text{O}_2\text{H}_2\text{SO}_4$ 2aq.— BaA' 4aq: scales.— BaA' 10aq: plates.— CaA' 7aq.— PbA' $\text{C}_6\text{H}_2(\text{SO}_3)_3(\text{OH})_2$ 4aq: crystalline powder.— AgA' 11aq: slender needles.

References.—AMIDO-, BROMO-, BROMO-NITRO-, DI-ISOPO-, IODO-NITRO-PHENOL-SULPHONIC ACIDS.

PHENOQUINONE $\text{C}_{12}\text{H}_6\text{O}_2$ [71°]. Formed from phenol (1 mol.) and quinone (2 mols.), or by boiling phenol with aqueous CrO_3 (Wichelhaus, *B.* 5, 248, 846; Nitzki, *A.* 215, 184; Hesse, *A.* 200, 232; Erhart, *Ar. Ph.* [3] 8, 481). Red needles with green lustre, sol. cold water, alcohol, ether, and ligroin. Reduced by SO_2 to hydroquinone. Bromine forms di-bromo-phenol.

PHENOSAFRANINE v. SAFRANINE.

PHENOSE $\text{C}_6\text{H}_{12}\text{O}_2$. Formed by the action of aqueous ClOH on benzene in the dark, the resulting $\text{C}_6\text{H}_5\text{ClO}$ [10°] being extracted with ether and heated with very dilute Na_2CO_3 (Carius, *A.* 186, 323). Formed also by the electrolysis of toluene mixed with alcohol and dilute H_2SO_4 (Renard, *C. R.* 92, 965). Deliquescent amorphous mass, v. sol. water and alcohol, insol. ether. Has a sweet taste. Decomposes above 100° . Turned brown by acids and alkalis. Prevents ppn. of cupric sulphate by potash, and reduces Fehling's solution. Does not undergo alcoholic fermentation. Reduced by HI to hexyl iodide. HNO_3 yields oxalic acid. Ammoniacal lead acetate ppts. $\text{C}_6\text{H}_5\text{PbO}_2$.

PHENOXYACETIC ACID v. *Phenyl derivative of GLYCOLLIC ACID*, vol. ii. p. 638, and *CHLORO-PHENOXYACETIC ACID*.

PHENOXYACETIC-ACETYLIC ACID v. *Carbonyl-methyl derivative of CORMACIC ACID*.

PHENOXYACETIC-CARBOXYLIC ACID v. *CARBOXY-PHENOXYACETIC ACID*.

PHENOXY-BUTYRIC ACID $\text{C}_6\text{H}_5\text{O}_2\text{C}_4\text{H}_7$ *Ac.* $\text{C}_6\text{H}_5\text{O}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [50°]. Made from the nitrile and HClAq at 100° . Silvery plates, insol. water, v. sol. alcohol.— AgA' : white crystalline powder, decomposing at 200° .

Nitrile $\text{PhO}_2\text{C}_4\text{H}_6\text{N}$ [46°]. [235°]. Formed from $\text{PhO}_2\text{C}_4\text{H}_6\text{Br}$, alcohol, and aqueous KCy (Lohmann, *B.* 24, 2640), and from γ -valerylbutyronitrile and NaOPh (Gabriel, *B.* 24, 2640).

White needles. Conc. H_2SO_4 converts it into $\text{C}_6\text{H}_5(\text{SO}_3\text{H})\text{O.C}_6\text{H}_4\text{CONH}_2$ [211°], a crystalline powder which gives BaA , as white crystals insol. Ag . Yields $\text{PhO.C}_6\text{H}_4\text{NH}_2$ (256°) on reduction.

PHENPROPYL-COMPOUNDS *o*. **PHENYL-PROPYL-COMPOUNDS**

PHENPROPYLAMINE *o*. **AMIDO-PHENYL-PROPANE**

PHENUVIC ACID *o*. **PHENYL-METHYL-FURANE CARBOXYLIC ACID**

PHENYL. The monovalent radicle C_6H_5 . It is more chlorous in character than methyl and ethyl (*N*. Meyer, B. 20, 534).

Diphenyl C_6H_5 , i.e. $\text{C}_6\text{H}_5\text{C}_6\text{H}_5$. Mol. w. 166. [70°]. (254°) (Schultz, A. 174, 205); (258° at 716 mm.) (Bamberger a. Loder, B. 20, 3077). H.C.v.: 1,492,890 (Stohmann, J. pr. [2] 40, 86); 1,508,700 (Berthelot, B. [2] 47, 865; A. Ch. [6] 10, 448). H.C.p. 1,494,300 (S.); 1,510,100 (B.). H.F. -19,800 (S.); -37,100 (B.). S.V.S. 154.25 (Schiff). Occurs in the coal-tar oils boiling at 200°-300° (Bühner, B. 8, 22; Schulze, B. 17, 1203).

Formation.—1. By adding slices of sodium to bromo-benzene and distilling after 24 hours (Fittig, A. 121, 861; 132, 201; Schultz, A. 174, 201; Engelhardt a. Latschinoff, Z. [2] 7, 259).—2. From chloro-benzene and sodium amalgam (Church, C. J. 46, 76).—3. With other hydrocarbons by passing benzene vapour through a red-hot tube (Berthelot, Z. 1866, 707), and formed consequently in many reactions in which benzene is produced at a high temperature.—4. By passing benzene vapour mixed with SnCl_4 or SnCl_2 through a red-hot tube (Watson Smith, C. J. 30, 30; Aronheim, B. 9, 1898).—5. A product of the passage of azobenzene through red-hot tubes (Claus, B. 8, 37).—6. By the action of red-hot zinc-dust on di-phenylene-ketone-oxide. 7. By heating diphenylene ketone dicarboxylic acid with lime (Bamberger a. Hooker, A. 229, 155).—8. From benzidine by the diazo-reaction (Griess, Z. 1864 [3] 692).—9. By heating phenol with K at 240° and ppg with water.—10. By subjecting bromo-benzene to an electric current, using zinc for the positive electrode (Christomanos, G. 5, 402).—11. In small quantity in the decomposition of azobenzene salts by alcohol (Griess) and by SnCl_2 (Culman a. Gasiorowski, J. pr. [2] 40, 97).

Preparation.—1. By slowly passing benzene through a red-hot iron tube. By successive passage of the unchanged benzene through the tube the yield may be raised to 97 p.c. of the theoretical (Adam, A. Ch. [6] 15, 224; Luddens, B. 8, 870).—2. 31 g. aniline are dissolved in 40 g. conc. H_2SO_4 and 150 g. water, and diazotised with 2 g. NaNO_2 . 100 g. 90 p.c. alcohol is then added, followed gradually by 50 g. finely-divided copper. After stirring for one hour it is finally distilled with steam. The yield is 6-7 grms. Iron and zinc-dust may also be used. The temperature must not rise above 80°-10° (J. Gattermann, B. 23, 1226).

Properties.—Iridescent macerous scales (from alcohol), v. sol. hot alcohol and ether.

Reactions.—1. Readily yields di-bromo- and di-nitro-derivatives. Chlorine, in presence of SnCl_4 , yields $\text{C}_6\text{H}_4\text{Cl}_2$ and $\text{C}_6\text{H}_3\text{Cl}_3$ (Kramer, A. 189, 149).—2. Heated in a stream of Cl in

presence of I the product is C_{12}Cl_4 (Bouff, B. 8, 1048; J. Mers a. Weigh, B. 16, 3831).—3. A mixture of diphenyl and ethylene passed through a red-hot tube yields benzene, styrene, anthracene, and phenanthrene (Barbier, A. Ch. [5] 7, 532).—4. CrO_3 in HOAc oxidises it to benzoic acid (Carstanjen, J. pr. [2] 2, 79).—5. AlCl_3 yields, on heating, benzene and a pitchy mass (Friedel a. Crafts, C. R. 100, 692). Diphenyl (15 pts.) heated with AlCl_3 (1 pt.) and CH_3Cl (10 pts.) yields diphenylene-methane (fluorene) [118°] and $(\text{C}_6\text{H}_4\text{CMe}_2)_2\text{CH}_2$ (210°-320°) (Adam, B. [2] 47, 886).—6. AlCl_3 and COCl_2 give $(\text{C}_6\text{H}_4\text{C}_6\text{H}_5)_2\text{CO}$ [229°]. Acetyl chloride and AlCl_3 give $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{COCH}_3$ [121°]. EtCl and AlCl_3 give $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{C}_2\text{H}_5$ (285°) and $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{Et}$ (c. 307°). In all these cases the compounds are derivatives (Adam, A. Ch. [8] 15, 224).

Dihydrate $\text{C}_{12}\text{H}_{10}$ (249°). Got by the action of boiling alcoholic potash on $\text{C}_{12}\text{H}_{12}\text{Br}_2$, which is formed from $\text{C}_6\text{H}_5\text{I}$ and Br (Bamberger a. Loder, B. 21, 843). Oil, volatile with steam, sol. ether. Yields $\text{C}_{12}\text{H}_{12}\text{Br}_2$.

Tetra-hydrate $\text{C}_{12}\text{H}_{14}$ (245°) at 716 mm. Got by reducing diphenyl dissolved in amyl alcohol with sodium (Bamberger a. Loder, B. 20, 3077). Liquid. Yields $\text{C}_{12}\text{H}_{12}\text{Br}_2$ and $\text{C}_{12}\text{H}_{14}\text{Br}_2$ [134°].

References.—AMIDO-, BROMO-, BROMO-AMIDO-, BROMO-NITRO-, CHLORO-, DI-CHLORO-DI-NITRO-, DI-iodo-, NITRO-, and OXY-, DIPHENYL.

PHENYL-ACETAMIDE *o*. Acetyl derivative of ANILINE and Amide of PHENYL-ACETIC ACID.

PHENYL-ACETAMIDINE $\text{C}_6\text{H}_5\text{N}$, i.e. $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NH})\text{NH}_2$. Formed from the thioamide $\text{CH}_3\text{Ph.CS.NH}_2$ by the action of ammonia and atmospheric oxygen, or of ammonia and HgCl_2 (Bernthsen, B. 9, 1819; 9, 429; A. 184, 321). Formed also from $\text{CH}_3\text{Ph.C}(\text{NHCl})\text{OEt}$ and ammonia (Lukenbach, B. 17, 1423). Crystals, decomposed by heat, v. sol. alcohol, ether, and warm water. Absorbs O_2 from the air. Decomposed by heating with water and alcohol into NH_3 and $\text{CH}_3\text{Ph.CONH}_2$.

Salts.— $\text{B}^+\text{HCl aq.}$ — $\text{B}^+\text{H}_2\text{PtCl}_6$.— $\text{B}^+\text{H}_2\text{SO}_4$; tables, v. sol. water and alcohol.— $\text{B}^+\text{H}_2\text{S}_2\text{O}_8$ [198°]. Needles (from alcohol).— B^+HNO_3 . Monoclinic crystals (Lossen, A. 265, 165).— B^+HOAc [198°]. Stellate groups of needles (from alcohol).— $\text{B}^+\text{H}_2\text{C}_2\text{O}_4$; prisms.

Di-acetyl derivative $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{OAc})\text{NHAc}$ [178°]. Four-sided tables (from water), sl. sol. alcohol and ether.

Phenyl-acetamidine $\text{CH}_3\text{C}(\text{NPh})\text{NH}_2$. Formed from acetonitrile and aniline hydrochloride at 170° (Bernthsen, A. 184, 358). Oil $\text{B}^+\text{H}_2\text{C}_2\text{O}_4$; v. s. sol. water.

Di-phenyl-acetamidine $\text{C}_{12}\text{H}_{14}\text{N}_2$, i.e. $\text{CH}_3\text{C}(\text{NPh})\text{NHPh}$. **Ethanyl-di-phenyl-amidine** [132°].

Formation.—1. From aniline (3 pts.), HOAc (2 pts.) and PCl_5 (2 pts.) (Hofmann, C. Z. 62, 729).—2. From acetonitrile (2 mols.) and PCl_5 (1 mol.) (Bippmann, B. 7, 544; Wallach, B. 8, 1567).—3. From acetonitrile and aniline hydrochloride at 240° (Bernthsen).—4. By passing HCl into heated acetanilide (Wallach, B. 15, 210).—5. By-product in the preparation of thioacetanilide from acetanilide and P_2S_5 .—6. By distillation of thioacetanilide (Jacobsen, B. 19, 1072).

Preparation.—By heating a mixture of equal weights of acetanilide and aniline hydrochloride.

Properties.—Slender needles or thin prisms, sl. sol. alcohol, forming a neutral solution, nearly insol. water, v. sol. ether. Conc. H_2SO_4 forms amido-benzene *p*-sulphonic acid and acetic acid. Tin and HCl reduce it to aniline and HOAc . Fuming HNO_3 forms the insoluble nitrate of a di-nitro-derivative $\text{C}_6\text{H}_3\text{N}_2\text{O}_4\text{HNO}_3$ [182°] (Biedermann, B. 7, 540). COCl_2 at 60° forms $\text{C}_6\text{H}_4\text{N}_2\text{O}_2\text{Cl}_2$, whence N_2OEt yields $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ [91°] crystallising from ether (Löffel, B. 18, 2427; 19, 2540). Excess of COCl_2 in benzene yields $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ [118°], which is decomposed by dilute HCl into aniline and phenyl cyanate. Cyanogen passed into an ethereal solution forms $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$, a white crystalline powder [165°]. Eth yields oily $\text{CH}_3\text{C}(\text{NPh})\text{NPhEt}$, whence MeI followed by moist Ag_2O produces strongly alkaline $\text{CH}_3\text{C}(\text{NPh})\text{NPhEtMe}(\text{OH})$.— B^+HCl : tables, m. sol. water.— $\text{B}^+\text{H}_2\text{PtCl}_6$.— HNO_3 .—*u*-Di-phenyl-acetamide $\text{CH}_3\text{C}(\text{NH})\text{NPh}_2$ [68°]. Formed from diphenylamine hydrochloride and acetonitrile by heating for a week at 150° (Bernthsen, A. 192, 25). Monoclinic tablets or thick prisms; *a:b:c* = 1.142:1.122:1.5. sol. alcohol, forming an alkaline solution. OsO_4 at 100° gives di-phenyl-thioacetamide. The hydrochloride is v. e. sol. water.— $\text{B}^+\text{H}_2\text{PtCl}_6$.— B^+HNCS . Colourless tablets.

Di-phenyl-acetamide
 $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NPh})\text{NH}_2$. Phenyl-phenyl-acetamide. [c. 128°]. Formed, with H_2S , by heating $\text{C}_6\text{H}_5\text{CH}_2\text{CSNH}_2$ with aniline hydrochloride (B.). Formed also by heating phenyl-acetonitrile (benzyl cyanide) with aniline hydrochloride at 230° and by the action of iodine on a mixture of aniline and phenyl-thioacetamide. Small needles or laminae, v. sl. sol. water, v. sol. alcohol and ether. May be sublimed. Boiling dilute alcohol decomposes it into aniline and $\text{CH}_3\text{Ph.CONH}_2$.

Tri-phenyl-acetamide
 $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NPh})\text{NHPh}$. [108°]. Formed from $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NH}_2\text{Cl})\text{OEt}$ (1 mol.) and alcoholic aniline (3 mols.) (Luckenbach, B. 17, 1427). Plates (from alcohol).— $\text{B}^+\text{H}_2\text{PtCl}_6$: plates.

Reference.—Di-Bromo-Di-Phenyl-Acetamide.

PHENYL ACETATE *v.* Acetyl derivative of PHENOL.

PHENYL-ACETCHLORAMIDE *v.* Chloracetanilide in the article ANILINE.

PHENYL-ACETIC ACID $\text{C}_6\text{H}_5\text{O}_2$ *i.e.* $\text{C}_6\text{H}_5\text{CH}_2\text{CO}_2\text{H}$. *Alphathoxylic acid*. Mol. W. 136. [77°]. (265° cor.). S.G. 1.0778; 1.0834. H.C.p. 933,200 (Stohmann, J. pr. [2] 407, 184). H.C.v. 932,600. H.F. 94,800 (Stohmann); 59,000 (von Rechenberg).

Formation.—1. By saponification of its nitrile (Cannizzaro, A. 96, 246; C. R. 62, 966; 64, 1225).—2. By boiling vulpic acid with baryta-water (Möller & Strecker, A. 113, 64).—3. By reducing mandelic acid with conc. HIAg and P (Orum Brown, Proc. Roy. Soc. Edinb. 5, 409).—4. By the putrefactive fermentation of proteins (Salkowski, B. 12, 649; H. Z. 420; 9, 507).

Preparation.—By converting benzyl chloride into the nitrile (benzyl cyanide), mixing 100 grms. of the cyanide with 300 grms. of a mixture of 3 vols. of H_2SO_4 and 2 vols. Et_2O , and heating till

gas bubbles begin to rise. A violent reaction occurs, heat being again applied when this subsides, until no further reaction takes place. The acid partly crystallises out, and is partly extracted with ether (W. Slædel, B. 19, 1949).

Properties.—Thin laminae, sl. sol. cold water, v. sol. hot water, alcohol, and ether.

Reactions.—1. Yields benzoic aldehyde, formic acid, and CO , when oxidised by chromic acid mixture.—2. HNO_3 yields *o*- and *p*-nitro-acids (Pirogoff, B. 8, 332).—3. Electrolysis of a dilute solution gives benzoic aldehyde and benzoic acid and two neutral substances [93°] and [125°] (Slawik, B. 7, 1051).—4. Oxidised oxygen yields $\text{PhCH}_2\text{CO}_2\text{CH}_2\text{Ph}$ [318°].—5. When administered to animals it appears in the urine as phenyl-aceturic acid, and increases the amount of urea (Salkowski, B. 12, 653; H. 12, 222).—6. Phthalic anhydride and HOAc form benzylidene-phthalide on heating. Tetra-chlorophthalic anhydride (40 pts.), phenyl-acetic acid (20 pts.), and NaOAc (1 pt.) form, in like manner, $\text{CHPh:C}_2\text{O}_2\text{C}_2\text{Cl}_4$, melting above 360°, whence NaOH forms $\text{CHPh.CO}_2\text{C}_2\text{Cl}_4\text{CO}_2\text{H}$ [175°] (Gabriel, B. 20, 2860). Dichloro-phthalic anhydride forms the corresponding compound $\text{CHPhC}_2\text{O}_2\text{C}_2\text{H}_2\text{Cl}_2$ [210°], whence alkalis yield $\text{C}_6\text{H}_5\text{C}_2\text{O}_2$ [117°].—7. HIAg and P at 200° form $\text{C}_6\text{H}_5\text{PO}$ [136°], which crystallises from water in needles, and gives CaA^2 2aq, BaA^2 2aq, and AgA^2 (Guye, J. 1884, 468).

Salts.— CaA^2 , 3aq.— CaA^2 , 2aq.— BaA^2 , 3aq: v. sol. water.— PbA^2 , aq.— AgA^2 : small laminae.

Methyl ether MeA^2 . [220°]. S.G. 1.044. Liquid (Radziszewski, Z. [2] 5, 358).

Ethyl ether EtA^2 . (229° cor.). S.G. 1.086. Converted by heating with sodium into acetic ether, sodium phenyl-acetate, a solid $\text{C}_6\text{H}_5\text{O}_2$ [175°] (? tri-phenyl-phloroglutin), and an oil (? $\text{CH}_2\text{Ph.CO.CHPh.CO.Et}$) (Hodgkinson, C. J. 37, 481; C. J. Proc. 2, 189).

Amido-ethyl ether $\text{CH}_3\text{NH}_2\text{CH}_2\text{CH}_2\text{A}^2$. Formed from $\text{C}_6\text{H}_5\text{Br.NH.CO.CH}_2\text{Ph}$ and hot water (Elfeldt, B. 24, 3222).— $\text{B}^+\text{C}_6\text{H}_5\text{N}_2\text{O}_2$ [188°].

***n*-Propyl ether** PrA^2 . (238° cor.). S.G. 1.0142. Made by heating alcoholic potassium phenyl-acetate with PrI for two days. Sodium acts on it, forming propyl acetate, sodium phenyl-acetate, a yellow oil $\text{C}_6\text{H}_5\text{O}_2$ (835° at 50 mm.), and a small quantity of a solid $\text{C}_6\text{H}_5\text{O}_2$, forming white needles (from petroleum), [170°], S.G. 1.039. This solid is also formed by the action of sodium on the oil $\text{C}_6\text{H}_5\text{O}_2$, as well as on the corresponding oil $\text{C}_6\text{H}_5\text{O}_2$ formed from ethyl phenyl-acetate. The solid forms an acetyl derivative [100°] (Hodgkinson, C. J. 37, 483).

Iso-butyl ether $(\text{CH}_3)_2\text{CHCH}_2\text{A}^2$. (147° cor.). Sodium gives isobutyl acetate and an oil (Hodgkinson, C. J. 37, 485).

Benzyl ether PhCH_2A^2 . (318°) (S.); (270° at 160 mm.). S.G. 1.094. Got by heating benzyl chloride with alcoholic potassium phenylacetate for a weak (H.). Heated with sodium it forms sodium phenyl-acetate, the salt of an acid $\text{C}_6\text{H}_5\text{O}_2$ [120°], possibly *o*-di-phenyl-propionic acid, and an oil, $\text{C}_6\text{H}_5\text{O}_2$ (320° at 60 mm.), possibly the benzyl ether of that acid.

Chloride $\text{CH}_2\text{Ph.COCl}$. (108° at 17 mm.). S.G. 1.1682 (Anschtütz & Berns, B. 20, 1889; Hinsberg, B. 23, 2962).

Acetyl chloride ($\text{CH}_3\text{Ph.CO.Cl}$), O. [72-5°]. Formed from the chloride and the Ag salt (A. a. B.).

Amide $\text{CH}_3\text{Ph.CO.NH}_2$. [158°]. (283°). Formed from the nitrile by heating with alcoholic KSH (Weddige, J. pr. [3] 7, 99). Formed also by heating phenylacetamide hydrochloride with oxalacetic ether and dilute (10 p.c.) NaOH aq. (Pinner, B. 23, 1627), and by the action of yellow ammonium sulphide on acetophenone (Willgerodt, B. 21, 534). Plates, v. sol. hot water. Forms with HgO a compound crystallising in needles [208°] (Reimer, B. 13, 741). KBrO_3 and HCl give $\text{CH}_3\text{Ph.CO.NHBr}$ [124°], crystallising from benzene in needles and yielding benzylamine on warming with potash (Hoogewerf a. Van Dorp, A. C. 6, 385). Aldehyde and a few drops conc. HCl aq. give ($\text{C}_6\text{H}_5\text{CH}_2\text{CO.NH}$) $_2\text{CHMe}$ [228°]. Chloral gives an analogous body.

Diethylamide $\text{CH}_3\text{Ph.CO.NEt}_2$. [86°]. (296° undr.). Formed from the chloride and diethylamine in ether (Häusknacht, B. 22, 324).

Bromo-ethyl-amide $\text{CH}_3\text{Ph.CO.NH.C}_2\text{H}_4\text{Br}$. [85°]. Plates.

β -Bromo-propyl-amide $\text{CH}_3\text{Ph.CO.NH.CH}_2\text{CH}_2\text{CH}_2\text{Br}$. [46°]. Formed from the chloride and $\text{C}_3\text{H}_7\text{Br(NH)}$. Needles.

γ -Bromo-propyl-amide $\text{CH}_3\text{Ph.CO.NH.CH}_2\text{CH}_2\text{CH}_2\text{Br}$. [44°]. Needles, converted by KOH into $\text{CH}_3\text{Ph.C(=O)CH}_2\text{CH}_2\text{CH}_2\text{N}$ (Elfeldt, B. 24, 3224).

Anilide $\text{CH}_3\text{Ph.CO.NHPh}$. [117°] (Hofmann, B. 13, 1225). Got by intramolecular change, by the action of PCl_5 on the oxim of deoxybenzoin (Günther, A. 252, 71).

Di-phenyl-amide $\text{CH}_3\text{Ph.CO.NPh}_2$. [72°]. Silky needles (from ether) (Häusknacht).

Phenyl hydrazide $\text{C}_6\text{H}_5\text{N}_2\text{O}$. [167°]. White flakes (Bülow, A. 236, 196).

Nitrile $\text{C}_6\text{H}_5\text{CH}_2\text{CN}$. **Benzyl cyanide**. (232° cor.). S.G. 1.015. H.C. 1,023,000. H.F. -27,900 (Berthelot a. Petit, C. R. 108, 1219). The chief constituent of the oils of garden cress (*Lepidium sativum*) and of nasturtium (*Tropaeolum majus*) (Hofmann, B. 7, 1293). Formed by boiling benzyl chloride with alcoholic KC_2 (Cannizzaro, A. Ch. [3] 45, 468). Preparation.—By digesting benzyl chloride (1 kilo.), crude KC_2 (1 kilo.), and dilute alcohol for a week. Tribenzylamine remains in the retort after distilling off the benzyl cyanide below 300°.

Reactions.—1. A specimen (200°–230°) treated with ZnEt_2 , the temperature being kept below 180°, formed a product which, when decomposed by alcohol, gave cyanbenzine ($\text{C}_6\text{H}_5\text{N}$), and benzoin, $\text{C}_6\text{H}_5\text{CH}_2\text{N}_2\text{O}$, an indifferent body [150°].—2. Reduced by zinc and HCl aq. to $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{NH}_2$ (Bernthsen, B. 8, 661).—3. Alcoholic ammonium sulphide forms $\text{C}_6\text{H}_5\text{CH}_2\text{CS.NH}_2$ [38°].—4. Water at 250° forms the amide; ammonium acetate acts in like manner (Bernthsen, B. 9, 429).—5. Bromine forms $\text{C}_6\text{H}_5\text{CHBr.CN}$ and very sparingly soluble $\text{C}_6\text{H}_5\text{CHBr.CBr(NH)}$ [c. 200°], which is crystalline, is decomposed by hot water and alcohol, and yields mandelic acid when heated with dilute HCl at 150° (Reimer, B. 14, 1797).—6. Pyruvic acid and H_2SO_4 in the cold form $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [145°] (Böttger, B. 14, 1600).

Paranitride ($\text{C}_6\text{H}_4\text{N}_2$), $n=3$? **Cyanobenzene**. [171°] (E. a. T.); [321°] (P.). Obtained by ex-

tracting with alcohol the product of the action of ZnEt_2 on the isomeric nitrile (Frankland a. Tompkins, C. J. 37, 568). Occurs in small quantity in the product of the action of alcoholic KC_2 on benzyl chloride (Pinner, B. 17, 2010). Silky needles. Hardly sol. alcohol, sol. CS_2 and glacial acetic acid. Forms a gummy mass with warm dilute HCl , possibly a salt.

Di-phenyl-acetic acid $\text{C}_6\text{H}_5\text{CH}_2\text{CO}_2\text{H}$. **Deoxybenzilio acid**. Mol. w. 212. [148°]. Formed by reducing benzoic acid with H_2 aq. (Jena, A. 155, 84) and by heating $\text{C}_6\text{H}_5\text{CH}_2\text{CO.H}$ (1 mol.) with benzene (1 mol.) and zinc dust (Symons a. Zincke, B. 6, 1188; A. 171, 122). Obtained also by saponifying its nitrile of amide. Needles (from water); al. sol. cold water, v. sol. alcohol and ether. Yields benzophenone on oxidation, and di-phenyl-methane on distillation with soda-lime. Bromine forms $\text{C}_6\text{H}_5\text{CHBr.CO.H}$.

Salts.— BaA , 2 aq. Efflorescent monoclinic crystals. CaA , 2 aq. AgA : amorphous pp.

Methyl ether MeA . [60°]. Plates (from alcohol) (Mattner, B. 21, 1316).

Ethyl ether EtA . [58°]. Prisms.

Amide $\text{CHPh}_2\text{CONH}_2$. [106°]. Got by action of KOH (6 g.) in alcohol on the nitrile (2 g.) (Anschütz a. Romig, A. 233, 837), and by heating the ammonium salt under pressure at 230° (Neure, A. 250, 141). Plates (from alcohol).

Nitrile CHPh_2CN . (70°). (N.); [73°] (F. a. S.). (183° at 12 mm.). Formed by heating CHPh_2Br with Hg_2C_2 for 18 hours at 165°, and extracting with benzene (Friedel a. Balsohn, B. [2] 20, 589) and by heating the acid with lead sulphocyanide at 170° (Friedel a. Immerwahr, B. 23, 2845). Got also, together with a polymeride [168°], by treating diphenyl-ethane and reducing the resulting $\text{C}_{12}\text{H}_{10}\text{N}_2\text{O}$ [142°] with SnCl_4 and alcoholic HCl (A. a. R.), and by treating the amide with PCl_5 in POCl_3 (N.). White needles (from ligroin and ether). Alcoholic NaOEt and benzyl chloride form $\text{CPh}_2(\text{CH}_2\text{Ph})\text{CN}$ [126°]. An ethereal solution of iodine (1 mol.) gradually added to an alcoholic solution of the nitrile (2 mols.) and NaOEt (1 mol.) forms $\text{CN.CPh}_2\text{CH}_2\text{CN}$ [c. 230°].

Tri-phenyl-acetic acid $\text{CPh}_3\text{CO}_2\text{H}$. [264°]. Formed by the action of fuming HCl aq. and HOAc on the nitrile at 200° (E. a. O. Fischer, B. 11, 1598; A. 194, 242). Prepared by heating $\text{CCl}_3\text{CO}_2\text{H}$ (250 g.), benzene (840 g.), and AlCl_3 (250 g.), mixing the product with water and distilling with steam; the residue of aluminium triphenylacetate is decomposed by NH_4Aq and the filtrate p.p.d. by HCl ; the yield being 5 g. (Elbs a. Töle, J. pr. [2] 32, 624). In this preparation two by-products ($\text{C}_6\text{H}_5\text{O}$), [325°] and ($\text{C}_6\text{H}_5\text{O}$), [75°] crystallising in yellow needles are also formed. Monoclinic prisms (from alcohol), al. sol. HOAc . Very feeble acid. The NH_4 salt gives off NH_3 spontaneously. The H salt, p.p.d. as needles by conc. KOH aq., is decomposed by water. Fuming H_2SO_4 at 100° forms $\text{SO}_3\text{H.C}_6\text{H}_4\text{CPh}_2\text{CO}_2\text{H}$, which yields BaA aq., an amorphous salt. Salt: AgA . Powder, not affected by light.

Nitrile CPh_3CN . [127-5°]. Formed from HgCy and CPh_3Cl at 160° and from KC_2 and CPh_3Br (Elbs, B. 17, 700). Monoclinic prisms

(from HgO or HOAc). Converted by alcoholic potash into a polymeride [310°] crystallising in colourless needles.

References.—AMIDO-, BROMO-, BROMO-AMIDO-, BROMO-NITRO-, CHLORO-, IODO-, and OXY-PHENYL-ACETIC ACID.

PHENYL-ACETIC ALDEHYDE $C_6H_5 \cdot CH_2 \cdot CHO$ i.e. $C_6H_5 \cdot CH_2 \cdot CHO$. (206°) (Radziszewsky, *B.* 9, 372); (194°) (Etard).

Formation.—1. By distilling calcium phenylacetate with calcium formate (Cannizzaro, *d.* 119, 354).—2. From α -bromo- (or chloro-) β -oxyphenyl-propionic acid $CHPh(OH)CHBr.CO_2H$ by distilling with dilute Na_2CO_3 ; the yield being 75 p.c. (Lipp, *B.* 16, 1238; Erlenmeyer, *A.* 219, 179).—3. By boiling $PhCH(OH)CH_2OH$ (1 pt.) for an hour with H_2SO_4 (8 pts.) and water (12 pts.) (Zincke, *A.* 216, 301). Stronger H_2SO_4 yields $C_6H_5 \cdot CH_2 \cdot [101^\circ]$.—4. From ethyl-benzene by successive treatment with CrO_3 and water (Etard, *A. Ch.* [5] 22, 248).—5. By distilling phenyl-glycidic acid with dilute H_2SO_4 (Erlenmeyer, *B.* 13, 804).

Properties.—Oil. Forms a crystalline compound with $NaHSO_3$.

Reactions.—1. With acetoacetic ether and NH_3 , it yields benzyl-di-methyl-pyridine di-carboxylic ether dihydride $C_6H_5 \cdot CH_2 \cdot (C_2H_5 \cdot Me_2 \cdot CO_2Et)_2$ [135:5:2] [115°] (Jeaurenaud, *B.* 21, 1784).—2. HCO_2 forms $CHPh.CH(OH).CN$ (58°), *S.* 1 at 15°, crystallising in stellate groups of colourless needles, *v. sol.* alcohol.—3. HNO_3 (*S.G.* 1.49) at -12° gives *o*- and *p*-nitro-benzoic aldehyde.

Phenyl-hydrazide $CHPh.CH:N.HPh$. (58°). Prisms, *v. sol.* alcohol. Converted into phenyl-indole by heating with $ZnCl_2$ at 180° (Fischer & Schmitt, *B.* 21, 1072).

α -Ethyl derivative $C_6H_5 \cdot CH:CH.OEt$. (217°) *S.G.* $\frac{2}{3}$ 981. Formed from ω -chloro-styrene and alcoholic potash (Erlenmeyer, *B.* 14, 1868). Oil, easily decomposed by heating with water into alcohol and the aldehyde.

Di-phenyl-acetic aldehyde $\cdot CHPh_2 \cdot CHO$. (315°). Formed by heating hydrobenzoin (1 pt.) or isohydrobenzoin with (6 pts. of) dilute (20 p.c.) H_2SO_4 for 8 hours at 210° (Zincke & Breuer, *B.* 9, 1769; *A.* 198, 182; Weise, *A.* 248, 38). Oil, *v. sol.* alcohol and ether. Yields benzophenone and CO_2 on oxidation. Forms a crystalline compound with $KHSO_4$. Alcoholic potash yields di-phenyl-carbinol and di-phenyl-methane. Nascent HCO_2 yields $CHPh_2 \cdot CH(OH).CN$, upon which alcoholic hydrogen chloride reacts with formation of $CHPh_2 \cdot CH(OH)C(NH_2Cl).OEt$ [185°]. The aldehyde appears to form condensation products [169°] and [214°] on standing.

Phenyl Hydrazide $CHPh_2 \cdot CH:N.HPh$. Flat stellate needles (from hot alcohol), *v. sol.* ether (Budelph, *A.* 248, 101).

Oxim $CHPh_2 \cdot CH:NOH$. [120°]. White needles, formed together with another body [145°] by the action of hydroxylamine in dilute alcohol (Anvers, *B.* 24, 1790).

PHENYL-ACETIC CARBOXYLIC ACID or CARBOXY-PHENYL-ACETIC ACID.

PHENYL-ACET-IMIDO-ACETATE $C_6H_5 \cdot CH_2 \cdot C(NH) \cdot OAc$. [129°]. White needles. *V. sol.* alcohol, *al. sol.* cold water. Formed by boiling phenyl-acet-imido-ethyl-ether with AqO (Lutkenbach, *B.* 17, 1463).

PHENYL-ACETIMIDAMIDE or PHENYL-ACETIMIDE.

PHENYL-ACET-IMIDO-ETHYL ETHER $C_6H_5 \cdot CH_2 \cdot C(NH) \cdot OEt$. The hydrochloride B/HCl [c. 85°] is formed by passing dry HCl into a solution of phenyl-acetonitrile in absolute alcohol (Lutkenbach, *B.* 17, 1421). The free base is a colourless liquid of aromatic odour, decomposed on distillation into alcohol and phenyl-acetonitrile. The hydrochloride is resolved on fusion into phenyl-acetamide and $EtCl$.

PHENYL-ACETONITRILE *sp.* Nitrile of PHENYL-ACETIC ACID.

PHENYL ACETONYL SULPHIDE $C_6H_5 \cdot SO \cdot Ph \cdot CH_2 \cdot CO \cdot CH_3$ [85°]. (144° *at* 15 mm.). Formed from chloro-acetone and $NaSPH$ (Döllé, *B.* 22, 308). Large, tables (from ether), turned dark violet by hot H_2SO_4 . Yields $\frac{1}{2}$ phenyl-hydrazide [88°].

The corresponding sulphone $Ph \cdot SO_2 \cdot CH_2 \cdot Ac$ [58°] is formed from chloro-acetone and sodium benzene sulphinate (R. Otto, *B.* 19, 4642).

PHENYL-ACETOPHENONE

[1:3] $C_6H_5 \cdot CH_2 \cdot CO \cdot CH_3$. [121°]. (*c.* 326°). Formed from diphenyl, $AcCl$, and $AlCl_3$ (Adam, *A. Ch.* [6] 15, 266). *Ph*ams, reduced by sodium amalgam to the carbinol [86°].

DI-PHENYL-ACETOXIM (so-called) *v.* Oxim of BENZOPHENONE.

PHENYL-ACETURIC ACID

$CHPh.CO.NH \cdot CH_2 \cdot CO \cdot H$. [442°]. *S.* $\frac{2}{3}$ at 12° . Occurs in horses' urine, and is also found in urine after a dose of phenyl-acetic acid (Balkowski, *B.* 17, 8010; *H.* 7, 162). Formed by the action of the chloride or anhydride of phenyl-acetic acid on glycoceol (Hotter, *B.* 20, 81; *J. pr.* [2] 38, 98). Small trimetric crystals (from alcohol); *a:b:c* = 890:1:2374. *V. sl. sol.* ether, *v. sol.* hot water and alcohol.— CaA' , 2aq. *S.* 8:16 at 11.2° .— CuA' , aq.— PbA' , aq.: prisms.— ZnA' : plates, *v. sol.* hot water.— AgA' : amorphous.

Methyl ether MeA' . [86°]. Needles.

Ethyl ether EtA' . [79°]. Prisms.

Propyl ether PrA' . [31°]. Plates.

Amide $CHPh.CO.NH.CO.NH.CO.NH_2$. [174°]. Pearly hexagonal plates, *v. sol.* hot water. With HgO it yields $Hg(C_6H_5 \cdot N_2O_2)_2$.

PHENYL-ACETYL-ACETONE $C_6H_5 \cdot CH_2 \cdot O \cdot C_6H_5 \cdot CH_2 \cdot CO \cdot CH_3$. *Benzyl-methyl-methylene-di-ketone*. (266°–269° at 748 mm.). Has weak acid properties.

Formation.—Phenyl-acetyl-acetoacetic ether, formed by the action of phenyl-acetyl chloride upon sodio-aceto-acetic ether, is boiled with water for 6 hours.

Properties.—Colourless oil. *Sol.* alcohol, ether, benzene, hot water, strong acids, and dilute alkalis, *al. sol.* cold water. With phenyl-hydrazine it condenses to phenyl-benzyl-methyl-pyrazole.

Salts.— $A'Ag$: white pp.— $A'Na$: crystalline solid (Fischer & Bülow, *B.* 18, 2186).

PHENYL-ACETYLENE $C_6H_5 \cdot C \equiv C \cdot CH_2 \cdot OH$. *Acetylenyl-benzene*. (141.6° cor.). *S.G.* $\frac{2}{3}$ 9395, $\mu = 1.542$ (Brühl, *A.* 285, 18). *S.V.* 125.8.

Formation.—1. By distilling phenyl-propionic acid with dry $Ba(OH)$ (Weger, *A.* 221, 70).—2. By boiling styrene dibromide with alcoholic potash, and heating the resulting bromo-styrene with alcoholic potash (Glaser, *B.* [8] 9, 91; *A.* 154, 155; Hollmann, *B.* 20, 2060).—3. From

acetophenone by treatment with PCl_5 , the resulting $\text{C}_6\text{H}_5\text{COCl}$, being heated with conc. alcoholic potash at 220° (Friedel, Z. [2] 6, 123).

4. By the passage through a red-hot tube of a mixture of styrene and hydrogen, or of benzene and ethylene (Berthelot, C. R. 67, 953).

Properties.—Liquid with peculiar odour. Its alcoholic solution forms a yellow pp. $\text{Cu}_2(\text{C}_6\text{H}_5)_2\text{O}$ with ammoniacal cuprous chloride and a white pp. $\text{Ag}_2(\text{C}_6\text{H}_5)_2\text{O}$ with ammoniacal AgNO_3 . These pps. are explosive. Sodium added to its ethereal solution ppts. $\text{C}_6\text{H}_5\text{CN}$ as a white powder, which takes fire in the air, and is reconverted by water into phenyl-acetylene.

Reactions.—1. Unites with bromine. 2. Sodium and CO give sodium phenyl-propionate, (Paterno, G. 2, 553). 3. Sodium and EtI give PhC_2CEt (202°) (Morgan, C. 27, 29, 162). 4. H_2SO_4 , followed by water, yields acetophenone (Friedel a. Balzohm, B. [2] 35, 54). 5. Boiling HOAc and zinc-dust reduces it to styrene (Aronstein a. Höllefmann, B. 22, 1181).

Di-phenyl-acetylene C_{10}H_8 , i.e. $\text{C}_6\text{H}_5\text{CPh}$. Tolane. (71°) (Béhal). Formed by boiling $\text{C}_6\text{H}_5\text{H}_2\text{CPh}$ or the corresponding di-chloro-di-phenyl-ethane, with alcoholic potash (Lieprieht a. Schwanert, A. 145, 347; Fittig, A. 163, 74). Formed also by the action of sodium-amalgam on an alcoholic solution of $\text{C}_6\text{H}_5\text{CH}_2\text{CPhCl}$ (Lieberman a. Homeyer, B. 12, 1974). Large crystals (from ether). May be distilled. Yields di-phenyl-ethylene (stilbene) when heated with HIAg and P at 180° (Barbier, J. 1876, 366). Yields benzoic acid on oxidation. Conc. H_2SO_4 gives a green colour, and on warming to 60° , diluting with water and distilling with steam, phenyl benzyl ketone (deoxybenzoin) (55°) is produced (Béhal, B. [2] 49, 337).

Chlorides v. Di-chloro-di-phenyl-ethylene and Tetra-chloro-di-phenyl-ethane.

Dibromide v. Di-bromo-di-phenyl-ethylene.

Di-phenyl-di-acetylene C_{10}H_8 , i.e. $\text{C}_6\text{H}_5\text{C}_2\text{CPh}$. (97°) (G.); (88°) (H.). Formed by shaking the cuprous compound of phenyl-acetylene with alcoholic NH_3 and air, or, better, with alkaline K_2FeCy (Glaser, A. 154, 159; Baeyer a. Landsberg, B. 15, 57). Long needles (from dilute alcohol), v. sol. ether. Hot H_2SO_4 carbonises it. In ethereal solution Br forms $\text{C}_{10}\text{H}_8\text{Br}_2$ (178°) and $\text{C}_{10}\text{H}_8\text{Br}_2$ (149° – 158°) (Holle-mann, B. 20, 3081).

Picric acid compound $\text{C}_{10}\text{H}_8\text{O}_6\text{N}_3$, i.e. (108°). Yellow crystals (from alcohol).

References.—Amido-, Iodo-, and Nitro-phenyl-acetylene.

TRI-PHENYL-ACETYLENE-TRIAMINE $\text{C}_{18}\text{H}_{12}\text{N}_3$, i.e. $\text{N}_3\text{H}_2(\text{C}_6\text{H}_5)_3$. (190°). Formed from acetylene tetrabromide, aniline, and alcoholic potash (Sabatjeff, A. 178, 125). Needles, v. sol. cold alcohol. Salts: $\text{B}^+\text{H}_2\text{PtCl}_6^-$, $\text{B}^+\text{H}_2\text{HgCl}_4^-$; amorphous pp.

DI-PHENYL-ACETYLENE-DI-THIO-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

DI-PHENYL-ACETYLENE-DI-UREA $\text{OS}(\text{NH.C}_6\text{H}_5\text{NH})_2\text{OS}$. Formed from benzil and thio-urea at 145° (Anschütz a. Gel-dermann, A. 261, 184). Crystals, decomposing at 300° ; v. sol. alcohol.

by heating benzil with urea at 175° (Anschütz a. Gel-dermann, A. 261, 183; Angeli, B. 24, 606; G. 19, 563). Crystals, not decomposed at 315° ; v. sol. alcohol and ether. Reduces ammoniacal AgNO_3 .

Di-acetyl derivative $\text{C}_{10}\text{H}_8\text{Ac}_2\text{N}_2\text{O}_2$ (266°).

PHENYL-ACETYL-SUCCINIC ACID v. ACETYL-PHENYL-SUCCINIC ACID. The mono-ethyl-ether of this acid yields on treatment with alcoholic NH_3 , a compound $\text{C}_{10}\text{H}_{11}\text{N}_2\text{O}_2$ (264°), which forms, on saponification, a compound $\text{C}_{10}\text{H}_{11}\text{NO}$ (148°), crystallising in small needles (Volmer, B. 19, 95).

PHENYL-ACRIDINE $\text{C}_{10}\text{H}_7\text{N}$, i.e.

$\text{C}_6\text{H}_5\text{C}_2\text{N}(\text{C}_6\text{H}_5)_2$ (181°). (a. 404°). V.D. 129.7 ($\text{H} = 1$).

Formation.—(Bernthsen, B. 15, 3011; 16, 1809; 19, 425; 20, 1552; A. 192, 19; 224, 12.)

1. By heating benzoyl-diphenylamine (30 g.) with ZnCl_2 (30 g.) at 210° – 280° . 2. From benzotrifluoride, diphenylamines and ZnCl_2 . 3. By heating benzonitrile with diphenylamine hydrochloride at 240° . 4. By heating di-phenylbenzamidine hydrochloride to 260° . 5. In small quantity by heating di-phenyl-amine with cinnamic acid and ZnCl_2 . 6. By diazotising chrysianiline (di-amido-phenyl-acridine), and boiling the product with alcohol (Fischer a. Körner, B. 17, 206; A. 226, 184).

Preparation.—By heating benzoic acid (50 g.) diphenylamine (70 g.) and ZnCl_2 (150 g.) at 260° for 10 hours. The yield of crude base (50 g.) is good.

Properties.—Colourless thin prisms (from alcohol), thick yellowish prisms (containing C_6H_5) or tables (from benzene). V. sol. benzene, m. sol. ether, al. sol. alcohol, insol. water. Solutions of its salts exhibit green fluorescence. Not affected by boiling dilute HNO_3 , by fuming HCl at 260° , by AcCl , by Ac_2O at 190° , by Bz_2O at 180° , by potash-fusion, by heating with H_2SO_4 (3 vols.) diluted with water (1 vol.), or by distillation with soda-lime.

Reactions.—1. CrO_3 in HOAc gives benzoic acid and CO_2 . 2. On oxidation with KMnO_4 it gives phenyl-quinoline carboxylic acid. On the other hand, its alkyl-halogen addition products give rise to phenyl-amido-benzoic acid $\text{C}_{10}\text{H}_7(\text{NHPh})\text{CO}_2\text{H}$ on oxidation with KMnO_4 (Claus a. Nicolaysen, B. 18, 2708). 3. Yields on nitration with H_2SO_4 and fuming HNO_3 di-nitro-phenyl-acridine $\text{C}_{10}\text{H}_7(\text{NO}_2)_2$, which is g. sol. aqueous or alcoholic HCl but sl. sol. alcohol, and tri-nitro-phenyl-acridine, which crystallises from toluene and alcohol in minute yellow needles, hardly sol. alcoholic HCl , and converted by hot SnCl_4 into a red dye (tri-amido-phenyl-acridine), which becomes colourless on further reduction.

Salts.—Partially decomposed by water. B^+HCl : orange needles or prisms, al. sol. cold water, sol. alcohol. Its solution exhibits dark-green fluorescence. B^+HCl 8 aq. red crystals. — $\text{B}^+\text{H}_2\text{PtCl}_6^-$. — Nitrate. (188°). Yellow needles, al. sol. HNO_3 . — Sulphate: yellowish-red trimetric crystals, v. sol. hot water. — Picrate: hair-like crystals (from alcohol). Phenyl-acridine does not appear to form an acetate.

Methylo-chloride $B'MeCl$: soluble needles.— $B'Me.PtCl$: decomposes below 70° .

Methylo-nitrate $B'MeNO_3$: Sparingly sol. yellow needles.

Methylo-iodide $B'MeI$: Black monoclinic prisms (from alcohol), insol. ether. Converted by KOH aq. by NH_4Ag , or by moist Ag_2O , into $B'MeOH$ [108°], which is also got by oxidising $C_6H_5CHPh \cdot NMe > C_6H_4$, a body to which it is reduced by tin and HCl aq.

Hydride $C_6H_5 \cdot \begin{smallmatrix} CHPh \\ NH \end{smallmatrix} > C_6H_4$ [164°].

Formed by reducing phenyl-acridine hydrochloride in aqueous solution with zinc dust or by adding sodium-amalgam to an alcoholic solution. Colourless needles, with no basic properties; sol. alcohol and ether. Alcoholic $AgNO_3$ oxidises it to phenyl-acridine, a change which is slowly effected, even by air. It yields an acetyl derivative $C_{10}H_7 \cdot AcON$ [128°]; and is converted by MgI at 140° into $C_{10}H_7 \cdot N$ [104°], whence HCl and $NaNO_2$ produce the methylo-hydroxide of phenyl-acridine (v. *supra*).

Di-sulphonic acid: Got by heating phenyl-acridine (10 g.), H_2SO_4 (15 g.), and H_2O (15 g.) for 12 hours at 150° . Its dilute solutions exhibit green fluorescence. The salt $C_{10}H_7 \cdot N(SO_3Na)_2$ is insol. absolute alcohol, and in very dilute solutions exhibits blue fluorescence. The Ba and mercurous salts are nearly insol. Aq.

References.—AMIDO- and OXY-PHENYL-ACRIDINE.

PHENYL-ACRIDINE CARBOXYLIC ACID

$C_6H_5 \cdot \begin{smallmatrix} Q(C_6H_4 \cdot CO_2H) \\ N \end{smallmatrix} > C_6H_4$ *Acridyl-benzoic acid*. Formed by heating phthalic anhydride (30 g.) with diphenylamine (45 g.) and $ZnCl_2$ (75 g.) for 12 hours at 190° (Bernthsen & Traube, *B.* 17, 1510; *A.* 224, 45). Yellow crystalline powder, sol. acids and alkalis, insol. water, sl. sol. boiling alcohol. Its solutions in dilute acids have a green fluorescence, in alkalis a blue fluorescence. Split up by heat into CO_2 and phenyl-acridine. Yields a hydride [160° – 165°].

Salts.— NaA aq.: colourless pearly plates or long needles.— $HA \cdot HCl$ [168°]. Yellow crystals (from hot dilute HCl), sl. sol. hot water.

An isomeric acid $C_6H_5 \cdot \begin{smallmatrix} CPh \\ N \end{smallmatrix} > C_6H_4 \cdot CO_2H$, [252° – 255°], formed by oxidation of phenyl-methyl-acridine with chromic acid mixture, is sl. sol. alcohol, and gives sparingly soluble BaA . (Bonna, *A.* 249, 62).

PHENYL-ACRYLIC ACID v. CINNAMIC ACID and ATROPIC ACID.

• Di-phenyl-acrylic acid v. PHENYL-CINNAMIC ACID.

PHENYL-ALANINE v. α -AMIDO-PHENYL-PROPIONIC ACID and PHENYL-AMIDO-PROPIONIC ACID.

PHENYL-ALDEHYDE v. PHENYL-ACETIC ALDEHYDE.

PHENYL ALDEHYDO-BENZYL KETONE $Ph.CO.CHPh.CHO$ [110°]. Formed from benzoylbenzoin, formic ether, and $NaOEt$ in ether (Claisen & Meyerowitz, *B.* 23, 3279). Yellowish-white crystals. $FeCl_3$ gives a dark-violet colour.

PHENYL ALDEHYDO-ETHYL KETONE $Ph.CO.CH_2Me.CHO$ [119°]. Formed from

phenyl ethyl ketone, formic ether, and $NaOEt$ in Et_2O (Claisen & Meyerowitz, *B.* 23, 3276). White needles, v. sol. alcohol and water. $FeCl_3$ colours its alcoholic solution dark-violet. Gives an anilide [182°] crystallising in needles.

PHENYL ALDEHYDO-PROPYL KETONE

$Ph.CO.CH_2Et.CHO$ [87°]. Formed from phenyl *n*-propyl ketone, formic ether, and $NaOEt$ in ether (Claisen & Meyerowitz, *B.* 23, 3279). White plates. $FeCl_3$ gives a dark-violet colour. The anilide [120°] crystallises in white needles.

TETRA-PHENYL-ALDINE v. TETRA-PHENYL-PYRAZINE.

PHENYL-ALLENYL-AMIDOXIM v. OXAMIDOXIM.

PHENYL ALLOPHANIC ACID. *Ethyl ether* $C_6H_5.NH.CO.NH.CO_2Et$ [120°]. Formed from phenyl-urea and chloro-glyoxylic ether $COCl.CO_2Et$ (Stojentin, *J. pr.* [2] 82, 18). Needles, v. sol. alkalis and conc. HCl aq.

Phenyl ether $NHPh.CO.NH.CO_2Ph$. Formed from phenol and cyanic acid vapour (Tuttle, *J.* 1857, 454). Crystals (from alcohol), insol. cold water. Decomposes at 150° into phenol and cyanuric acid.

Benzyl ether $NHPh.CO.NH.CO_2C_6H_5$ [158°]. Formed by heating phenyl cyanate with benzyl carbonate at 150° under pressure (Traube, *B.* 22, 1574). V. sl. sol. water, m. sol. alcohol.

Di-phenyl-allophanic acid $NHPh.CO.NPh.CO_2H$.

Methyl ether MeA [331°].

Ethyl ether EtA [98°]. Formed from di-phenyl di-isocyanate $Ph_2N_2C_2O$, and alcohol (Hofmann, *B.* 4, 240), and by the action of H_2O and alcoholic NH_3 on $NHPh.CS.NPh.CO_2Et$ (Seidel, *J. pr.* [2] 82, 266). Needles, sl. sol. ether. Yields $(C_6H_5)_2N_2O_2$, $3HgO$ [129°], crystallising in prisms (from alcohol).

Isomyl ether $C_6H_5.A$ [58°].

Reference.—DI-BROMO-DI-PHENYL-ALLOPHANIC ACID.

PHENYL ALLYL-BENZYL KETONE

$C_6H_5.CO.CHPh.C_6H_5$ (837°). Formed from oxybenzoin, $NaOEt$, and allyl iodide (Buddenberg, *B.* 23, 2067). Oil, v. sol. alcohol.

PHENYL-ALLYL-CYANAMIDE $C_6H_5 \cdot N \cdot C_6H_5 \cdot N:C:NCO_2H$. *Carboallylphenylimide* [106°]. Formed from phenyl-allyl-thio-urea and $Pb(OH)_2$ (Bizio, *J.* 1861, 497). Silky needles (from dilute alcohol).— $B'HgCl$: amorphous.— $B'H.PtCl$.

PHENYL-ALLYLENE $C_6H_5 \cdot CH=CH_2$ (185°). Formed by the action of alcoholic potash on the bromo-propenyl-benzene, which is got by boiling $CHPhBr.CMe.CO_2H$ with water (Körner, *B.* 21, 276). Yellowish liquid, with unpleasant odour. Yields a liquid dibromide (c. 258°) and a solid tetrabromide (75°). Aqueous $HgCl_2$ forms white amorphous $(C_6H_5)_2HgCl_2O$, which on heating with HCl yields phenyl ethyl ketone.

• **PHENYL-ALLYL-HYDRAZINE**

$C_6H_5.NPh.NH_2$ (198° at 184 mm.). Formed by reducing the nitrosamine derived from allyl-aniline (Michalis & Claessen, *B.* 23, 2338). Got also from allylbromide and phenyl-hydrazine. Oil, v. sol. dilute HCl . Reduces Fehling's solution on warming. Oxidised by aqueous $FeCl_3$ to the tetrazone $C_6H_5.NPh.N:N.NPh.C_6H_5$ [103°]. Benzoic aldehyde yields $C_6H_5.NPh.NHPh$ [57°].— $B'HCl$ [187°]. Silky needles.

• **Benzoyl derivatives** $C_6H_5 \cdot C_6H_5$ [100°].

Phenyl allyl-hydrazine $C_9H_{11}N_2$, i.e. $Ph.NH.NH.C_3H_5$. (172° at 60 mm.). Got from phenyl-hydrazine and allyl bromide (Fischer & Knoevenagel, A. 239, 208). Oil; sol. dilute acids. Reduces cold Fehling's solution. Oxidises by H_2O to benzene-azo-propylene $Rh.N.C_3H_5$, an oil, (95°-100° at 27 mm.).

DI-PHENYL-DI-ALLYLDIENE-DIAMINE $C_{18}H_{20}N_2$, i.e. $NPh.(C_3H_5)_2$. Formed from aniline and acrolein below 0° (Schiff, A. Suppl. 8, 858). Yellow resin. B. H. PtO.

DI-PHENYL-DI-ALLYLDIENE-ETHYLENE DIAMINE $C_{18}H_{20}N_2$, i.e. $N(C_2H_4CH_2CH_2)_2$. (110°). Formed by mixing ethylene-diamine (1 mol.) with cinnamic aldehyde (2 mols.) (Mason, B. 20, 271). Large colourless tables (from ether). V. sol. alcohol and benzene, m. sol. ether. Decomposed into its constituents by acids.

PHENYL ALLYL OXIDE $C_9H_9O.C_3H_5$. (19°). Formed from allyl bromide and $NaOPh$ (Henry, B. 5, 455). Liquid.

PHENYL ALLYL SULPHIDE $C_9H_9S.C_3H_5$. (a. 209°). Formed by distilling the acid $CH_3.C(SPh).CH_2.CO_2H$ (Escales & Baumann, B. 19, 1792). Liquid, forming a blue solution in H_2SO_4 .

PHENYL-ALLYL-THIOSEMICARBAZIDE $C_9H_9NH.CS.NH.C_3H_5$. [119°]. Formed from phenyl-hydrazine and allyl thiocarbimide dissolved in benzene (A. E. Dixon, C. J. 57, 263; Avenarius, B. 24, 268). Silvery needles, insol. water, v. sol. alcohol and ether. Gives a mahogany colour with $FeCl_3$.

Di-phenyl-allyl-thiosemicarbazide $C_9H_9NH.CS.NHPh$. [108°]. Formed from phenyl-allyl-hydrazine and phenyl-thiocarbimide (Michaelis & Claessen, B. 22, 2237). Needles (from hot alcohol).

PHENYL-ALLYL-THIO-UREA $C_9H_9.N_2S$, i.e. $NHPh.CS.NH.C_3H_5$. Phenyl-thiosinamine. [98°]. S. (alcohol) 70 at 16°. Formed by the action of aniline on oil of mustard (Zinin, A. 84, 348) and of allylamine on phenyl thiocarbimide (Weith, B. 8, 1629). Monoclinic crystals, insol. water. Cyanogen passed into its alcoholic solution forms $C_9H_9.N_2S$, which crystallises from alcohol in stellate forms, and is converted by dilute H_2SO_4 into $OS.N(C_3H_5).CO$ [161°], whence alcoholic silver nitrate forms $CO.N(C_3H_5).CO$ [108°], which is resolved by baryta-water into oxalic acid and phenyl-allyl-urea (Maly, Z. [2] 5, 258).

PHENYL-ALLYL-THIO-UREA CARBOXYLIC ACID v. ALLYL-THIO-URAMIDO-BENZOIC ACID.

PHENYL-ALLYL-UREA $NHPh.CO.NH.C_3H_5$. [97°]. Formed as described under phenyl-allyl-thio-urea. Shining white needles.

PHENYL-AMENYL-AMIDINE $C_{11}H_{11}N_3$, i.e. $CM_2.C(NH_2)(NHPh)$. The oxalate $B'H_2C_2O_4$ [192°] is formed by heating the corresponding valeronitrile with aniline hydrochloride at 170° (Freund & Lenz, B. 24, 2155).

PHENYL-AMIDO-ACETIC ACID C_9H_9NO , i.e. $CH_2(NHPh).CO_2H$. Phenyl-glycooic. Anilido-acetic acid. [127°]. Formed by the action of aniline on bromo-acetic acid and on chloro-acetic acid (Michaelson & Lippmann, Z. 1866,

15; Schöbel, B. 10, 2045). Prepared by boiling aniline (45 g.) dissolved in a little ether with chloro-acetic acid (35 g.) and water (1500 c.c.) for half an hour, and rapidly evaporating to crystallisation (Rebuffat, G. 17, 238). By products are C_9H_9NO , [99°] (Meyer, B. 14, 1825) and $C_9H_9N_2O$, [218°], which is perhaps $CH_2(NHPh).CO.NPh.CH_2.CO_2H$, though this formula may also be assigned to an isomeric acid [180°] formed by the action of alcoholic potash on di-oxy-di-phenyl-pyrazine (Häusdörfer, B. 23, 1803; Abenius, J. pr. [2] 40, 432).

Properties. Small crystals, m. sol. water, insol. ether. By fusion with potash at 260° it yields a mass which forms indigo on oxidation (Heumann, B. 23, 3043; cf. Lederer, J. pr. [2] 42, 388; Biedermann & Lepetit, B. 28, 3260).

Salt. CaA' , 2aq. Needles (from dilute alcohol), m. sol. hot water, insol. alcohol. On distillation with calcium formate it yields indole (Mauthner & Suida, M. 10, 251).

Methyl ether MeA' . [48°]. Formed by heating aniline with methyl chloro-acetate (Meyer, B. 8, 1157) and by the action of aniline on methyl diazo-acetate (Currius, J. pr. [2] 38, 437). Rectangular plates (from ether) or needles (from alcohol).

Ethyl ether EtA' . [59°]. Formed in like manner. Colourless plates (from ether).

Formyl derivative $NPh(CHO).CH_2.CO_2H$. [124°]. Formed by saponification of its ether (296-295°), which is the product of the action of chloro-acetic ether on sodium formanilide (Paal & Otten, B. 23, 2593). Needles, v. sol. ether and hot water. Yields $C_9H_9NO.Na$, a hygroscopic mass.

Acetyl derivative $NPhAc.OH.CO_2H$. [191°]. Formed from phenyl-amido acetic acid, $Ac.O$, and benzene (R.). Formed also by heating aniline with chloro-acetic acid and $NaOAc$ at 110°-150° (Häusdörfer, B. 22, 1797), and by the action of boiling alcoholic potash on its ether (300°, which is got from sodium acetanilide and chloro-acetic ether (P. a. O.). Pear plates (from water) or needles (from $HOAc$ -ligroin), v. sol. alcohol and hot water. Yields the salts NaA' , BaA' , 3aq, and CuA' .

Chloro-acetyl derivative $CH_2Cl.CO.NPh.CH_2.CO_2H$. [183°]. Formed from phenyl-amido-acetic acid and chloro-acetyl chloride (Abenius, J. pr. [2] 40, 429, 499). Plates or prisms, v. sol. alcohol. On boiling with aqueous sodium carbonate it yields $CH_2(OH).CO.NPh.CH_2.CO_2H$ [128°], which crystallises in plates, forms the salt CaA' , 6aq, and BaA' , the anhydride $PhN.CO.OH.CO$ [169°], and the amide $CH_2(OH).CO.NPh.CH_2.CONH_2$. [128°].

Bromo-acetyl derivative. Plates, decomposing at 158° (Häusdörfer, B. 23, 1803).

Benzoyl derivative $CH(NHPh_2).CO_2H$. [68°]. Amorphous pp. (Rebuffat).

Nitrosamine $NPh(NO).CH_2.CO_2H$. [105°]. Yellow needles (Schöbel, B. 11, 1182), v. sol. warm water.

Anhydride C_9H_9NO . [263°]. Got by heating the acid at 150° (Meyer, B. 10, 1967). Needles (from alcohol), insol. water.

Amide $CH_2(NHPh).CONH_2$. [183°]. Formed by heating chloro-acetamide with aniline and

PHENYL-AMIDO-ACETIC ACID.

NaOAc at 180° (Bischoff, B. 22, 1809; Meyer, B. 8, 1154). Minute needles (from water).

Anilide $\text{CH}_3(\text{NHPh})\text{CO.NHPh}$. [112°]. Formed by boiling chloro-acetic ether or $\text{CH}_3\text{Cl.CO.NHPh}$ with aniline (Wilm a. Velsch, B. 23, 1868, 74; Meyer, B. 8, 1156; Hausdörfer, B. 23, 1796). Formed also by heating aniline with alcohol and the compound of glyoxal with NaHSO_4 (Hinsberg, B. 21, 110). Needles (from alcohol), sl. sol. cold water.

p-Toluide $\text{CH}_3(\text{NHPh})\text{CO.NHCH}_3$. [165°]. Formed by heating aniline with fused NaOAc and $\text{CH}_3\text{Cl.CO.NHCH}_3$ (Meyer, B. 8, 1156; Bischoff, B. 23, 2000; Meyer, B. 8, 1156).

Nitrile $\text{CH}_3(\text{NHPh})\text{CN}$. Formed from chloro-acetonitrile and aniline in ether at 90° (Engler, B. 6, 1004). Thick oil, forming a crystalline hydrochloride, decomposed by water.

Reference. — Bromo-phenyl-amido-acetic acid.

Isomeric. — Amido-phenyl-acetic acid. Di-phenyl-di-amido-acetic acid $\text{C}_{14}\text{H}_{11}\text{N}_3\text{O}_2$, i.e. $\text{CH}_3(\text{NHPh})\text{CO}_2\text{H}$. Formed as a yellow crystalline powder by adding aniline to an aqueous solution of glyoxylic acid (Böttger, B. 11, 1559). Decomposed by hot water.

Aceto-phenyl-amido-acetophenone $\text{C}_{14}\text{H}_{11}\text{ON}$, i.e. $\text{CH}_3\text{CO.CH}_2\text{NHPh}$. **Aceto-dienone-anilide**. [98°]. Prepared by the action of aniline on α -bromo-acetophenone (Möhler, B. 14, 171; Meyer, B. 8, 1156). Prisms or fine needles. Sol. alcohol, ether, chloroform, benzene, and CS₂. On boiling with aniline it gives phenyl-indole. Nitrous acid forms a nitrosamine $\text{C}_{14}\text{H}_{11}\text{ONH.NO}$ [78°] — B'HCl: prisms, decomposed by water. — B'HCl.

Acetyl derivative $\text{C}_{14}\text{H}_{11}\text{NO}_2$. [127°].

Benzoyl derivative. [145°]. Prisms.

PHENYL-AMIDO-ACRIDINE

$\text{C}_{14}\text{H}_9\text{N}_3$, i.e. $\text{C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{NHPh}$. [170°]. Formed by heating di-phenyl-m-phenylene-diamine (5 g.) with ZnCl_2 (10 g.) and formic acid (5 g. of 90 p.c.) for 5 hours at 250° (Besthorn a. Curtman, B. 24, 2042). Flat brownish-red needles, m. sol. alcohol, sl. sol. ether.

PHENYL-AMIDO-ACRIDYL-BENZOIC ACID

$\text{C}_{14}\text{H}_9\text{N}_3\text{O}_2$, i.e. $\text{C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{NHPh}$. [above 300°]. Formed by heating di-phenyl-m-phenylene-diamine (5 g.) with phthalic anhydride (10 g.) at 250° (Besthorn a. Curtman, B. 24, 2047). Small red crystals, sol. HOAc.

PHENYL-AMIDO-ACRYLIC ACID

$\text{CH}_3(\text{NHPh})\text{CH=CHCO}_2\text{H}$. [194°]. Formed from the product of the action of aniline on α -bromo-succinic acid by boiling with potash (Reijser, B. 20, 8105). Insol. water, v. sol. alcohol. — Na⁺ 2: aq: silky plates.

Ethyl ether Et₂O. [124°].

PHENYL-AMIDO-AMIDOBENZENE a. Benz-

me-azo-diphenylamine.

DI-PHENYL-AMIDO-BENZAMIDINE

$\text{C}_{14}\text{H}_{11}\text{N}_3$, i.e. $\text{C}_6\text{H}_4(\text{NH})_2\text{CNPh}$. **Carbo-triphenylamine**. [198°]. Prepared by heating p-nitro-benzoic acid with aniline and PCl_5 for 2 hours at 190° and reducing the product with tin and HCl (Viel, B. 12, 101). Formed also by the action of $\text{C}_6\text{H}_5\text{N}_3$ and of $\text{COI.SO}_2\text{Cl}$ on aniline (Hofmann, Pr. 9, 284; Bolas a. Groves, J. 180, 178; Michler a. Walder, B. 14,

2174). Four-sided tables. Split up by heating with HCl at 180° into aniline and p-amido-benzoic acid. Decomposed by distillation. — B'HCl. [323°]. — B'H.PtCl.

PHENYL-DIAMIDOBENZENE a. AMIDODIPHENYLAMINE.

TRI-PHENYL-TRI-AMIDO-BENZENE

$\text{C}_6\text{H}_3(\text{NHPh})_3$. [198°]. Made by heating phloroglucin with aniline at 610° (Münch, B. 21, 1984). Needles (from alcohol). — B'HCl: yellow powder, melting below 100°, decomposed by warm water. — B'H.PtCl. [c. 240°].

Tri-acetyl derivative [178°]. Needles.

Tri-benzoyl derivative. [above 300°].

PHENYL-AMIDO-BENZOIC ACID

$\text{C}_6\text{H}_4(\text{NHPh})\text{CO}_2\text{H}$. [223° uncor.]. Formed by oxidation of the methyl-iodide of phenyl-asidrine with KMnO_4 (Claus a. Nicolayen, B. 18, 2709). Small colourless needles. V. sol. ether and chloroform, insol. water.

Salts. — Na 4: aq: easily-soluble colourless plates. — A : Ba 5: aq: small sparingly-soluble colourless plates. — A : Ag⁺: very sparingly-soluble white curdy pp.

PHENYL-AMIDO-BENZYL KETONE

$\text{C}_6\text{H}_4\text{CO.CH}_2(\text{NH})_2\text{C}_6\text{H}_5$. [60°-70°]. Formed by reducing the mono-oxim of benzil with HCl and SnCl₂ (Braun, B. 22, 558) and by heating desyl-phthalamic acid with HCl (Segmann, B. 23, 996). White crystalline mass, becoming brown in air. — B'HCl. [210°]. White needles. — B'H.PtCl. [198°]. — Picrate $\text{C}_{14}\text{H}_9\text{N}_3\text{O}_7$.

Carboxy-benzoyl derivatives

$\text{C}_6\text{H}_4\text{CO.CHPh.NH.CO.C}_6\text{H}_4\text{CO}_2\text{H}$. [168°]. Got by warming desyl-phthalimide with NaOH aq. — $\text{AgC}_6\text{H}_4\text{NO}_2$: crystalline.

Phenyl p-amido-benzyl ketone

$\text{C}_6\text{H}_4\text{CO.CH}_2\text{C}_6\text{H}_4\text{NH}_2$. [95°]. S. 38 at 100°. Formed by reducing nitro-benzil or nitro-deoxybenzoin with tin and HCl (Golubeff, J. R. 6, 114; 11, 101; Bn. 8, 109). Thin needles (from dilute alcohol). — B'HCl. Tables (from alcohol). S. 25 in the cold. — B'H.PtCl. — B'H₂SO₄.

Oxim $\text{C}_6\text{H}_4\text{C(=NOH).CH}_2\text{C}_6\text{H}_4\text{NH}_2$. [141°].

Crystallises from alcohol (Ney, B. 21, 2449).

PHENYL-AMIDO-BUTYRIC ACID

$\text{C}_{14}\text{H}_{13}\text{NO}_2$, i.e. $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{NHPh}$. [140°]. Prepared by heating α -bromo-butyric acid with an ethereal solution of aniline at 100° (Devillier, A. Ch. [5] 20, 205; Nastrov, B. 23, 1792). Feebly acid. — B'HCl. — EtA⁺. [378°].

Phenyl- β -amido-butyric acid

$\text{CH}_3\text{CH}_2\text{CH(NHPh)CH}_2\text{CO}_2\text{H}$. [138°]. Formed by the action of butyryl on the neutral isomeride (β -betalne) which is obtained, together with the anilide, by boiling β -chloro-butyric ether with aniline (Baldiano, G. 10, 144; B. 19, 612). Tufts of needles, sl. sol. water. — BaA⁺ (dried at 100°). Scales. — B'HCl. — B'H₂CO. [189°].

Anilide $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{NHPh}$. The hydrochloride B'HCl [307°] crystallises in colourless plates, sl. sol. hot water.

Phenyl- α -amido-isobutyric acid

$\text{CH}_3\text{CH}_2\text{CH(NHPh)CO}_2\text{H}$. [185°]. Formed saponification of the nitrile of the ether (Lemann, B. 15, 2042; Bischoff, B. 24, 1048). Needles, m. sol. water. May be sublimed.

Ethyl ether Et₂O. [80°]. [371°].

Formed by heating aniline (3 mols.) with isobutyric acid (1 mol.). Thick oil.

PHENYL-AMIDO-GLUTARIC ACID PHENYLIMIDE.

847

Amide. $\text{C}_6\text{H}_5\text{C}(\text{NHPh})\text{CONH}_2$. [187].
Needles, sol. alcohol and HClAq .
Nitrile. $\text{C}_6\text{H}_5\text{C}(\text{NHPh})\text{CN}$. [94]. Made by heating acetone cyanhydrin with aniline. Long white prisms, sl. sol. hot water.
Di-phenyl-di- β -amido-butyric acid. *Nitrile*. $\text{C}_6\text{H}_5\text{C}(\text{NHPh})\text{CH}_2\text{CH}_2\text{CN}$. [103]. Formed by heating $\text{CHO}.\text{CH}_2\text{CH}_2\text{CN}$ with aniline at 350° (Chautard, *A. Ch.* [6] 16, 185). Scales, sol. water and alcohol.

PHENYL-AMIDO-CHLORO- v. CHLORO-AMIDO-.

PHENYL-AMIDO-BENZOIC ACID

$\text{C}_6\text{H}_5\text{C}(\text{NHPh})\text{CH}_2\text{CO}_2\text{H}$.
Methyl ether MeA'. [93]. Formed from methyl benzoyl-acetate and aniline (Knorr, *A.* 245, 372). Prisms.

Ethyl ether EtA'. Formed in like manner (Conrad a. Limpach, *B.* 21, 521). Oil, v. sol. alcohol. At 250° it yields (Py. 1,8)-oxy-phenyl-quinoline and alcohol.

Anilide. $\text{C}_6\text{H}_5\text{C}(\text{NHPh})\text{CH}_2\text{CO}.\text{NHPh}$. [133]. Needles (from alcohol), almost insol. Aq.

PHENYL-AMIDO-GLUTARIC ACID PHENYL-IMIDE? $\text{C}_6\text{H}_5\text{C}(\text{NHPh})\text{CO} > \text{NPh}$. [160]. Formed

by heating methyl-oxalacetate ether with aniline at 180° (Wislicenus a. Spiro, *B.* 22, 351). Golden plates, v. sol. hot alcohol.

PHENYL-AMIDO-CRESOL $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{NHPh})\text{CH}_2\text{Me.OH}$ [1:3:5]. [79]. (345).

Formed by heating orcin (1 pt.), aniline (2 pts.), and CaCl_2 (1 pt.) at 260° - 270° (Zoga a. Buch, *J. pr.* [2] 33, 538). Thick needles (from alcohol). Reduced by distilling over zinc-dust to phenyl-methyl-amine.

Salt. -B'HCl: crystalline powder, decomposed by water.

Isomeride: OXY-BENZYL-ANILINE.

PHENYL-AMIDO-CROTONIC ACID. *Methyl ether* $\text{CH}_3\text{C}(\text{NHPh})\text{CH}_2\text{CO}_2\text{Me}$. [51]. Formed by mixing aniline with methyl acetoacetate (Conrad a. Limpach, *B.* 21, 1965). Prisms (from MeOH). Yields (Py. 1,8)-oxy-methyl-quinoline when heated to 240° .

Ethyl ether $\text{C}_6\text{H}_5\text{C}(\text{NHPh})\text{CH}_2\text{CO}_2\text{Et}$. Formed by allowing a mixture of aniline (1 mol.) and acetoacetic ether (1 mol.) to stand for some days in the cold, drying with K_2CO_3 and filtering (Knorr, *B.* 20, 1897; cf. Conrad a. Limpach, *B.* 20, 944; 22, 83). Strongly refracting oil, split up by acids and alkalis into its components. At 200° it forms (Py. 1,8)-oxy-methyl-quinoline and a smaller quantity of oxy-phenyl-di-methyl-pyridine carboxylic ether.

The anilide of acetoacetic acid (vol. i. p. 19) $\text{CH}_3\text{CO}.\text{CH}_2\text{CONHPh}$ [85], which is isomeric with phenyl-amido-crotonic acid, is completely decomposed by heat, but yields the same oxy-methyl-quinoline on treatment with conc. HClAq .

PHENYL-AMIDO- β -CUMYL KETONE

$\text{C}_6\text{H}_5\text{CO}.\text{C}(\text{HMe}(\text{NH}))_2$ [51:3:4:6]. *Benzocumide*. [130]. (c. 360°). Formed by saponification of its phthalyl derivative (Froehlich, *B.* 17, 1804, 2674). Long yellow needles or plates, v. sol. alcohol and ether, not volatile with steam. -B'H.PtCl₅: orange needles. -MeI forms $\text{C}_6\text{HMe}.\text{Ba}.\text{NMe}_2$ [187], crystallising from water in prisms (containing aq.). -ClCO₂Et gives

$\text{C}_6\text{HMe}.\text{Ba}.\text{N}(\text{HCO}_2\text{Et})_2$ [105], crystallising in needles.

Acetyl derivative. [170]. Needles.

Benzoyl derivative. [227]. Needles.

Phthalyl derivative

$\text{C}_6\text{HMe}.\text{Ba}.\text{N} < \begin{smallmatrix} \text{CO} \\ \text{CO} \end{smallmatrix} > \text{C}_6\text{H}_4$. [181]. Formed by

heating the phthalyl derivative of β -cumidine with BzCl and a little ZnCl_2 at 180° . Small rhombohedra, v. sol. hot water. On saponification by alcoholic potash it yields the acid $\text{C}_6\text{HMe}.\text{Ba}.\text{NH}.\text{CO}.\text{C}_6\text{H}_4.\text{CO}_2\text{H}$ [195], which crystallises in minute needles (containing 2 J.

PHENYL-AMIDO-CYANURIC ACID v. *Cyanuric acid* in the article CYANTIC ACID.

PHENYL-AMIDO-ETHANE SULPHONIC ACID $\text{C}_6\text{H}_5\text{NH}.\text{CH}_2\text{CH}_2.\text{SO}_3\text{H}$. *Phenyl-taurine*. (c. 280°).

Formation. -1. By heating the anilide with HCl . -2. By heating chloro-isethionic acid with an ethereal solution of aniline at 190° (Leymann, *B.* 18, 871; James, *C. J.* 47, 869; *J. pr.* [2] 31, 415). -3. By the oxidation of phenyl-thiohydantoin with KClO_4 and HCl there is formed diphenyltartricarbanic anhydride $\text{C}_6\text{H}_5\text{N}.\text{SO}_2$ [266], which is split up by boiling baryta-water into aniline, CO_2 , and phenyl-taurine (Andreasch, *M.* 4, 137).

Properties. -Colourless leaflets, insol. alcohol and ether, sol. water forming an acid solution. Aqueous cyanamide at 110° forms phenyl-taurocyamine $\text{NH}_2\text{C}(\text{NH})\text{NPh}.\text{C}_6\text{H}_5\text{SO}_3\text{H}$, which crystallises from water in plates melting above 800° . - BaA'_2 3aq: leaflets, in. sol. water.

Anilide $\text{NHPh}.\text{C}_6\text{H}_5.\text{SO}.\text{NHPh}$. [74]. Formed, together with the anhydride $\text{C}_6\text{H}_5\text{N}.\text{SO}_2$ [69], by the action of an ethereal solution of aniline (8 mols.) on $\text{CH}_3\text{Cl}.\text{CH}_2\text{SO}_2\text{Cl}$ (1 mol.). -B'HCl. [169]. Colourless crystals.

DI-PHENYL-AMIDO-ETHYL-AMIDO-ACETIC ACID $\text{NHPh}.\text{CH}_2\text{CH}_2.\text{NPh}.\text{CH}_2\text{CO}_2\text{H}$. [116]. Formed from oxy-di-phenyl-pyrazine hexahydrate and alcoholic potash (Bischoff, *B.* 23, 2026). Prisms, sol. ether. Converted into the parent substance by boiling with water or alcohol.

PHENYL-AMIDO-ETHYL KETONE

$\text{C}_6\text{H}_5\text{CO}.\text{C}_6\text{H}_4.\text{NH}_2$. Formed by the action of boiling HClAq on $\text{C}_6\text{H}_5\text{C}(\text{N}.\text{C}_6\text{H}_4.\text{CO}_2\text{H})_2$ [30], which is got from $\text{C}_6\text{H}_5\text{CO}.\text{C}_6\text{H}_4.\text{Br}$ and potassium phthalimide (Schmidt, *B.* 22, 3251). -B'HCl: crystalline, v. sol. water and alcohol.

-B'H.PtCl₅. -B'C₆H₅N.O₂. [160]. Needles.

PHENYL-AMIDO-ETHYL-PHTHALIMIDE

$\text{C}_6\text{H}_5\text{C}(\text{CO}_2\text{N}.\text{CH}_2\text{CH}_2.\text{NHPh})_2$. [109]. Formed by heating bromo-ethyl-phthalimide with aniline at 150° (Gabriel, *B.* 22, 2224). Lemon-yellow needles, v. sol. dilute HClAq . Converted by NaOBAq into $\text{C}_6\text{H}_5\text{C}(\text{CO}_2\text{H})_2.\text{CO}.\text{NH}.\text{C}_6\text{H}_5.\text{NHPh}$ [120-180], a crystalline powder.

PHENYL-AMIDO-FUMARIC ACID

$\text{C}(\text{NHPh}) < \begin{smallmatrix} \text{CO} \\ \text{CO} \end{smallmatrix} > \text{NH}_2$. [203]. Formed by heating bromo-fumarimide with aniline (Loeber, *B.* 21, 2718). Golden plates, sl. sol. hot water.

PHENYL-AMIDO-GLUTARIC ACID PHENYL-IMIDE $\text{C}_6\text{H}_5\text{N}.\text{O} > \text{C}_6\text{H}_4$.

$\text{C}(\text{NHPh}) < \begin{smallmatrix} \text{CH}_2\text{CO} \\ \text{CH}_2\text{CO} \end{smallmatrix} > \text{NPh}$. [270]. Formed from acetone dicarboxylic ether and aniline (Emery, *B.* 23, 3764). Yellowish plates, v. sl. sol. alcohol.

PHENYL-AMIDIMIDO-ETHENYL-O-AMIDO-PHENYL-MERCAPTAN $C_6H_5N_2S$ probably $C_6H_5\langle\begin{smallmatrix} N \\ S \end{smallmatrix}\rangle C(O)(NHPh)NH$. [118°]. Formed together with the di-phenyl derivative, by heating amido-imido-ethenyl-o-amido-phenyl-mercaptan with aniline, ammonia being evolved (Hofmann, B. 20, 2254). Plates. Sol. alcohol and ether.

Salts.— $B''H_2Cl.PtCl_4$: small needles, m. sol. water.— $B''HClAuCl_4$: soluble yellow plates.

Di-phenyl-amidimido-ethenyl-o-amido-phenyl-mercaptan $C_{12}H_8N_4S$ which is probably $C_6H_5\langle\begin{smallmatrix} N \\ S \end{smallmatrix}\rangle C(O)(NHPh)NH$. [129°]. Formed as above. White silvery plates. V. sol. alcohol and ether.

Salts.— $B''H_2Cl.PtCl_4$: dark-yellow sparingly-soluble plates.— $B''H_2Cl.AuCl_4$: yellow needles.

PHENYL-AMIDO-JUGLONE v. JUGLON.

PHENYL-AMIDO-MALEIC ACID.

The phenylimide $NHPh.C_6H_4.C_2O.NH$ [282°] is formed, together with the mono-anilide $NHPh.C_6H_4(CO_2H).CONHPh$ [176°] by boiling dibromo-succinic acid or chloro- or bromo-maleic or fumaric acids with aniline and water (Reissert & Tiemann, B. 19, 626; Michael, B. 1, 1377). The phenylimide is also formed by heating aniline with oxalacetic ether at 140° (Wislicenus & Spiro, B. 22, 3850).

PHENYL-AMIDO-MALONIC ACID. *Anilide.* $CH(NHPh)(CO.NHPh)$. [162°]. Formed by boiling chloro-malonic acid with aniline (Conrad & Bischoff, A. 209, 231). Prisms.

PHENYL-AMIDO-METHENYL-AMIDO-NAPHTHOL $C_{10}H_7\langle\begin{smallmatrix} O \\ N \end{smallmatrix}\rangle C(O)NHPh$. [168°].

Formed from benzene-azo-(8)-naphthol by heating with CS_2 at 250° (Jacobson, B. 21, 419). Small needles, v. e. sol. cold alcohol. With $HClAq$ at 190° it yields amido-(8)-naphthol, aniline, and CO_2 .—Picrate [210°]. Acetate [120°–180°].

PHENYL-AMIDO-METHENYL-AMIDO-

PHENYL MERCAPTAN $C_6H_5\langle\begin{smallmatrix} N \\ S \end{smallmatrix}\rangle C(NHPh)$.

[159°]. Formed from $C_6H_5NS:CCl$ and aniline (Hofmann, B. 12, 1136). Formed also by heating phenyl thiocarbimide with azobenzene at 270° (Jacobson & Frankenhächer, B. 24, 1410). Needles, sol. alcohol insol. water. Decomposed by alcoholic potash at 200° into aniline and amido-phenyl mercaptan.— $B''HCl.B''H_2AuCl_4$.— $B''H_2PtCl_4.B''H_2H_2N_2O_4$. [222°].

Acetyl derivative. [187°]. Needles.

PHENYL-AMIDO-METHENYL-AMIDO-PHENOL $C_6H_5\langle\begin{smallmatrix} N \\ O \end{smallmatrix}\rangle C(NHPh)$. [176°]. Formed

by boiling $C_6H_5\langle\begin{smallmatrix} N \\ O \end{smallmatrix}\rangle CSH$ with aniline (Kalkhoff, B. 16, 1826). Needles, sol. alcohol, ether, and $HOAc$. May be distilled. Weak base.— $B''H_2PtCl_4$.

PHENYL-AMIDO-METHENYL-AMIDO-

PHENYL-MERCAPTAN $C_6H_5\langle\begin{smallmatrix} N \\ S \end{smallmatrix}\rangle C(NHPh)$. [159°]. Formed by heating chloro-phenyl-thiocarbimide with aniline (Hofmann, B. 12, 1139; 13, 12). Needles.

PHENYL-AMIDO-METHENYL-BENZAMIDESULPHIM

$C_6H_5\langle\begin{smallmatrix} N \\ S \end{smallmatrix}\rangle C(NHPh)$. [174°]. Formed by boiling benzamidoxim (1 mol.) with phenyl thiocarbimide (2 mols.) for 10 hours (Koch, B. 24, 894). White plates, insol. water, sol. alcohol, ether, and conc. $HClAq$, insol. water and alkalis. Conc. $HClAq$ at 150° decomposes it into S , H_2S , aniline, $HOBr$, and NH_3 . Bromine forms $CPh.N.NHCl.C_6H_5Br$ [14]. Yields a nitrosamine [119°] and an acetyl derivative [126°], both being crystalline.

PHENYL-AMIDO-METHYL-ACRIDINE

$C_6H_5\langle\begin{smallmatrix} N \\ OMe.C_6H_4.OH \end{smallmatrix}\rangle$. [216°]. Formed by heating the di-acetyl derivative of m-phenylene-di-phenyl-diamine (1 pt.) with $ZnCl_2$ (2 pts.) for 6 hours, at 250° (Besthorn & Curtman, B. 24, 2044). Brownish-red needles, v. sol. alcohol, sl. sol. ether. Splits up by $HClAq$ at 250° into aniline and oxy-methyl-acridine.

DI-PHENYL-DI-AMIDO-METHYLENE-O-PHENYLENE-DIAMINE

$C_6H_5\langle\begin{smallmatrix} NH \\ NH \end{smallmatrix}\rangle C(NHPh)$. [169°]. Formed from m-phenyl-cyanamide $C(NPh)$, and o-phenylene-diamine at 185° (Moore, B. 22, 1635; 3190). Needles (from benzene-ligroin), insol. ligroin, v. sol. alcohol. Yields with nitrous acid a nitrosamine $C_6H_5\langle\begin{smallmatrix} N \\ N \end{smallmatrix}\rangle C(NPhNO)$. [188°]. **Salts.**— $B''H_2Cl_4$: needles, v. sol. water.— $B''H_2SO_4$: needles, sl. sol. hot water.— $B''H_2PtCl_4$: needles, sl. sol. hot water. [165°].

Di-benzoyl derivative. [165°].

Tetra-benzoyl derivative. [148°].

Tetra-phenyl-tetra-amido-di-methylene-o-phenylene-diamine $C_6H_5\langle\begin{smallmatrix} N \\ N \end{smallmatrix}\rangle C(NHPh)_2$. [139°]. Formed by heating $C(NPh)$, with o-phenylenediamine at 200° (Moore). Colourless prisms, v. sol. alcohol. Split up by heat into aniline and the preceding body.

Salts.— $B''H_2Cl_4$: needles, v. sol. hot water.— $B''H_2PtCl_4$.— $B''H_2H_2SO_4$: prisms, v. sol. hot water.

Tetra-acetyl derivative

$C_6H_5\langle\begin{smallmatrix} N \\ N \end{smallmatrix}\rangle C(NPhAc)_2$. [126°]. White prisms.

Tetra-benzoyl derivative. [182°].

DI-PHENYL-DI-AMIDO-METHYLENE-O-PHENYLENE-PHENYL-GUANIDINE

$C_6H_5\langle\begin{smallmatrix} N \\ N \end{smallmatrix}\rangle C(NPh)C(NHPh)$. [188°]. Formed from phenylene-phenyl-guanidine and $C(NPh)$, at 210° (Keller, B. 24, 2506). The homologous compound from o-tolylene-phenyl-guanidine melts at 200° while the corresponding body from o-tolylene-p-tolyl-guanidine melts at 176°. All three compounds crystallise from alcohol in white needles, sol. benzene.

PHENYL-AMIDO-METHENYL-DI-ETHYL-

PYRIMIDINE $N\langle\begin{smallmatrix} OEt \\ OEt \end{smallmatrix}\rangle C(NHPh)$.

[99°]. Formed from chloro-methyl-di-ethyl-pyrimidine (derived from cyanethine) by heating with aniline and alcohol at 220° (Von Meyer, J. pr. [3] 89, 274). Needles, v. sol. alcohol.— $B''H_2PtCl_4$: needles.

PHENYL-AMIDO-METHENYL-MALONIC

ACID. *Amide ether.* $CO_2Et.CO_2Et.C(NHPh).CONHPh$. [96°]. Formed by dissolving the nitrile in cold conc. H_2SO_4 , and

soluble in water (Gersen, B. 19, 2985). The acid $\text{CO}_2\text{Et} \cdot \text{C}_6\text{H}_4(\text{NHPh})\text{ON}$ [102°] is formed by heating $\text{CO}_2\text{Et} \cdot \text{C}_6\text{H}_4(\text{OH})\text{ON}$ with an alcoholic solution of aniline for 24 hours at 80°. The acid ether crystallizes in white needles, sol. hot water, and is converted by boiling aqueous NaOH into $\text{C}_6\text{H}_4(\text{OH})(\text{NHPh})\text{CO}_2\text{H}$.

**PHENYL-(a)-AMIDO-METHYL-NAPHTHO-
PHENAZINE** $\text{C}_6\text{H}_5\text{Me} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{NHPh}$.

[214°]. Formed by heating (1,5,8)-tolylene-diamine with benzene-azo-phenyl-(a)-naphthylamine hydrochloride and alcohol at 140° (Eicker, B. 28, 8896). Massy yellow needles, forming yellowish-red solutions with yellowish-green fluorescence. — $\text{B}^1\text{H}_2\text{PtCl}_4$ minute dark red needles.

PHENYL-AMIDO-DI-METHYL-PYRIDINE $\text{C}_6\text{H}_5\text{Me} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

[230°] (C. a. E.); [144°] (G. a. M.). (235°-238°). Obtained by heating chloro-di-methyl-pyridine with aniline at 185° (Conrad a. Epstein, B. 20, 185). Formed also by heating the corresponding oxy-di-methyl-pyridine (1 mol.) with phenyl cyanate (1 mol.) and benzene at 100°, CO_2 being evolved (Goldschmidt a. Weisser, B. 28, 274). White crystalline solid, sol. alcohol, ether, and dilute acids. With H_2SO_4 and a trace of HNO_3 it gives a blood-red coloration. — $\text{B}^1\text{H}_2\text{Cl}_4\text{PtCl}_4$ [209°] (C. a. E.); [244°] (G. a. M.), microscopic yellow needles.

PHENYL-AMIDO-DI-METHYL-PYRROLE $\text{C}_6\text{H}_5\text{Me} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

[92°] (c. 270°). Formed by heating its dicarboxylic acid, and also by the action of phenyl-hydrazine on acetyl-acetone (Gorr, B. 18, 1568; 22, 170). Crystalline mass, volatile with steam. Insol. water and alkalis, sol. conc. HClAq . Reddens pine-wood moistened with HClAq .

**PHENYL-AMIDO-DI-METHYL-PYRROLE-
DICARBOXYLIC ACID** $\text{NHPh} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{CO}_2\text{H} \cdot \text{C}_6\text{H}_4\text{CO}_2\text{H}$.

Needles. Got from its ether Et.A" [127°], which is formed by mixing solutions of di-acetyl-succinic ether and phenyl-hydrazine in HOAc (Know, B. 18, 904, 1568).

**PHENYL-(Py. 1)-AMIDO-(Py. 3)-METHYL-
QUINOLINE** $\text{C}_6\text{H}_5\text{Me} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

Formed by heating chloro-methyl-quinoline with aniline at 190° (Conrad a. Limpach, B. 20, 958). Prisms, sol. ether, v. sol. alcohol.

Phenyl-(Py. 3)-amido-(Py. 1)-methyl-quinoline $\text{C}_6\text{H}_5\text{Me} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$. [180°]. Formed by heating (Py. 3,1)-chloro-methyl-quinoline with aniline (Know, B. 28, 286, 102). Shining plates. — $\text{B}^1\text{H}_2\text{PtCl}_4$ [285°]. Yellow needles, insol. H_2O .

Phenyl-(Py. 1)-amido-tri-methyl-quinoline $\text{C}_6\text{H}_5\text{Me} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

[150°]. Formed by heating the corresponding chloro-tri-methyl-quinoline with aniline at 185° (Conrad a. Limpach, B. 21, 528). Prisms (from dilute alcohol).

PHENYL-AMIDO-METHYL-THIAZOLE $\text{C}_6\text{H}_5\text{Me} \cdot \text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

[117°]. Formed by heating tri-methyl-thiazole with aniline (Hantzsch a. Weber, B. 30, 5180), and by the action of chloro-acetone on phenyl-thio-urea (Traumann, A. 249, 188, 111).

[47]. Small white needles (from alcohol). Yields aniline when heated with HClAq at 240°.

PHENYL-AMIDO-NAPHTHALENE

PHENYL-NAPHTHYL-AMINE

Di-phenyl-di-amido-naphthalene $\text{C}_6\text{H}_5\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

Tri-phenyl-tri-amido-naphthalene $\text{C}_6\text{H}_5\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

[148°]. One of the products formed by heating benzene-azo-(a)-naphthylamine with aniline at 160° (Fischer a. Hepp, A. 256, 251). Needles, v. sol. alcohol.

Yields phenyl-rosinduline and a yellow substance [124°] on oxidation.

Tetra-phenyl-tetra-amido-naphthalene $\text{C}_6\text{H}_5\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$. [194°]. Accompanies the preceding body. On oxidation it yields phenyl-amido-phenyl-rosinduline, di-phenyl-di-amido-naphthoquinone, and a body melting at 169°.

PHENYL-AMIDO-(a)-NAPHTHOQUINONE $\text{C}_6\text{H}_5\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$.

Formed by heating (a)-naphthoquinone with an alcoholic solution of aniline (Zincke, B. 32, 1645), by boiling phenyl-amido-(a)-naphthoquinone with HCl , and by the action of aniline and HOAc on oxy-(a)-naphthoquinone (Liebmann, B. 14, 1665). Long red needles, v. sol. hot alcohol and ether, insol. cold alkalis. Alcoholic potash forms a purple solution. Boiling dilute NaOH splits it up into aniline and oxy-(a)-naphthoquinone.

Antilide $\text{C}_6\text{H}_5\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$. Di-phenyl-di-imidonaphthol, [180°].

Formation.—1. By heating each of the naphthoquinone oxides with aniline and H_2Ac at 100° (Fuchs, B. 10, 1028; Brömmel, B. 2, 998).—2. By heating di-imido-(a)-naphthol hydrochloride with aniline at 120° (Görs, B. 18, 124).—3. By boiling (a)-naphthoquinone with an alcoholic solution of aniline (Zincke, B. 14, 481).—4. By heating di-bromo-(a)-naphthol with aniline (Melzola, C. J. 45, 167).—5. By the action of aniline and aniline hydrochloride at 100° on benzene-azo-(a)-naphthol, on benzene-azo-(a)-naphthylamine, and on similar bodies (Möcher, Hepp, B. 21, 679).

Properties.—Orange-red needles (from alcohol), forming orange solutions in benzene, acetone, and CHCl_3 . Weak base. Its solution in HOAc is orange when hot, but crimson when cold. Hot HClAq forms a red solution. Insol. alkalis. Not attacked by boiling with alkalis, or by Ac_2O , AcCl , and MeI . H_2SO_4 at 120° yields oxy-naphthoquinone and aniline. Zinc dust and HOAc reduce it to aniline and naphthalene. Alcoholic KCl or EtBr at 160° yield aniline and phenyl-amido-(a)-naphthoquinone. HNO_3 forms a di-nitro-derivative [143°].

Salts.— B^1HCl : golden-green plates, forming a violet solution in alcohol. Decomposed by water. — $\text{B}^1\text{H}_2\text{PtCl}_4$: bronze needles. — $\text{B}^1\text{H}_2\text{ZnCl}_4$: bronze-green plates. — B^1HI : black needles. — $\text{B}^1\text{H}_2\text{SO}_4$, B^1HNO_3 : plates.

Di-anilide $\text{C}_6\text{H}_5\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N} \cdot \text{C}_6\text{H}_4\text{N}$. [169°]. A product of the action of benzene-azo-(a)-naphthylamine on aniline (Fischer a. Hepp, B. 25, 246). Orange-yellow prisms.

Phenyl-amido-(β)-naphthoquinone

(β)-Naphthoquinone anilide. [245°-250°]. Prepared by adding aniline to an alcoholic solution of β -naphthoquinone (Zincke, B. 14, 1494; 15, 79; Liebermann, B. 14, 1664). Red needles, m. sol. alcohol. Weak acid. Readily converted by boiling with HNO_3 into the isomeric phenyl-mido-(α)-naphthoquinone. Boiling HCl splits it up into aniline and oxy-(α)-naphthoquinone. Nitrous acid passed into a solution in alcohol and HNO_3 forms a nitroso-derivative $\text{C}_{10}\text{H}_7(\text{NHPH})\text{NO}$, crystallising in red needles, and converted by NaOH into a yellow body [217°]. Salts: Ba^+ , red needles, m. sol. water. Ba^+ : brown pp. Zn^+ , Hg^+ , Ag^+ : red pp. **Methyl ether MeA.** [151°]. Formed from the Ag salt and MeI . Yellow needles, sol. alcohol and ether.

Ethyl ether EtA. [104°]. Prisms.

n-Propyl ether PrA. [104°]. Prisms.

Isopropyl ether IPA. [100°]. Prisms.

Di-phenyl-amido-(α)-naphthoquinone

$\text{C}_{10}\text{H}_6(\text{NHPH})_2$ [164°]. Formed by boiling (α -naphthoquinone (5 g.) with diphenylamine (6 g.), alcohol, and conc. HCl (10 c.c.) for twenty minutes, and ppg. with water (Plimpton, O. J. 37, 644). Needles (from alcohol).

Acetyl derivative $\text{C}_{10}\text{H}_6(\text{AcNH})_2$ [178°].

PHENYL-AMIDO-NAPHTHYL-UREA

$\text{NHPH.CO.NH.C}_6\text{H}_4\text{NH}_2$. Formed from (1,2)-naphthylene-diamine and phenyl cyanate (Schieffelin, B. 22, 1377; cf. Goldschmidt, B. 23, 502). Granules (from alcohol); not fused at 335°.

DI-PHENYL-DE-AMIDO-OIAZTHIOLE

$\text{C}_{10}\text{H}_6(\text{NHPH})_2$ [181°]. Formed by adding hydrogen peroxide solution (3 p.c.) to phenyl-urea dissolved in dilute alcohol, acidulated with HCl (Hector, B. 22, 1176). Needles, m. sol. water, v. sl. sol. cold alcohol. Nitrous acid forms $\text{C}_{10}\text{H}_6(\text{NO})\text{N}_2\text{S}$, a green insoluble powder, exploding at 179°. Cyanogen passed into the warm alcoholic solution ppts. $\text{C}_{10}\text{H}_6\text{N}_2\text{S}$, crystallising in needles. B^+HNO_3 . $\text{B}^+\text{H}_2\text{PtCl}_6$. B^+AgNO_3 : granules, v. sl. sol. hot alcohol.

Acetyl derivative $\text{C}_{10}\text{H}_6(\text{AcNH})_2$ [233°].

Benzoyl derivative $\text{C}_{10}\text{H}_6(\text{BzNH})_2$ [238°].

PHENYL-AMIDO-PALMITIC ACID

$\text{C}_{10}\text{H}_7(\text{NHPH})\text{O}_2$ [142°]. Formed by boiling α -bromo-palmitic acid with aniline (Hell a. Jordanoff, B. 24, 942). Sol. ether and benzene.

PHENYL-AMIDO-PHENOL

$\text{C}_6\text{H}_5(\text{NHPH})\text{OH}$. **Oxy-di-phenyl-amido-**

Di-phenyl-di-amido-phenol. **Hydrochloride** $(\text{C}_6\text{H}_5(\text{NHPH})_2\text{OH})\text{HCl}$ [12°]. Formed from azophenin, Sn , and HCl in presence of AcOH (Fischer a. Hepp, A. 256, 280). Eates.

PHENYL-AMIDO-PHENYL-ACETIC ACID

$\text{C}_6\text{H}_5(\text{NHPH})\text{CO}_2\text{H}$, i.e. $\text{C}_6\text{H}_5\text{CH}(\text{NHPH})\text{CO}_2\text{H}$ [164°-168°] (3). Formed by saponification of the nitrile (Tiemann a. Piest, B. 15, 2030), and also by boiling bromo-phenyl-acetic acid with aniline and alcohol (Stoekelius, J. 1878, 779). Plates, subliming at 175° as slender white needles (T. a. P.). V. sl. sol. water, sol. alcohol. HA^+HCl : nodules, decomposed by water. HA^+HNO_3 : thin needles. Ba^+ : radiating mass.

Ethyl ether EtA. [84°]. Needles.

Amide $\text{C}_6\text{H}_5\text{CH}(\text{NHPH})\text{CONH}_2$. **Sulky** plates, v. sol. alcohol, nearly insol. in water.

Nitrile $\text{C}_6\text{H}_5\text{CH}(\text{NHPH})\text{CN}$ [85°]. Formed by heating an alcoholic solution of the cyanhydrin of benzaldehyde with aniline at 100°. Formed also by the action of KCN and HCl on benzylmethyl-aniline (Coch, B. 11, 248). Needles or prisms, sol. ether and hot alcohol.

Phenyl-amido-di-phenyl-acetic acid $\text{C}_6\text{H}_5(\text{NHPH})\text{CO}_2\text{H}$ [168°]. Formed by passing HCl into an alcoholic solution of benzoic acid and treating the resulting $\text{C}_6\text{H}_5\text{CO}_2\text{Et}$ with aniline (Klingens. Standke, B. 22, 1212). Needles, v. sl. sol. water. Conc. H_2SO_4 forms a yellow solution, becoming crimson on warming.

Methyl ether MeA. [107°]. Mesosolonic.

Ethyl ether EtA. [115°].

PHENYL-AMIDO-PHENYL-AURIDINE

$\text{C}_6\text{H}_5\text{CH}(\text{NHPH})\text{CONH.C}_6\text{H}_4\text{NH}_2$ [197°]. Formed by heating the di-benzoyl derivative of *m*-phenylenedi-phenyl-di-amine (10 g.) with SnCl_4 (25 g.) at 250° (Besthorn a. Curtman, B. 24, 2045). Brownish-red needles, m. sol. alcohol, ether, and benzene. The dilute ethereal solution exhibits a greenish fluorescence. The hydrochloride is v. sl. sol. water, and forms a red solution in alcohol.

DI-PHENYL-DE-AMIDO-TRI-PHENYL-CARBINOL

$\text{C}_6\text{H}_5(\text{CH}(\text{C}_6\text{H}_5\text{NHPH}))_2$. Formed by heating diphenylamine with benzyl chloride and oxidising the product with arsenic acid. Formed also by heating diphenylamine with ZnCl_2 and benzoyl chloride or benzoic chloride, the resulting chloride $\text{C}_{10}\text{H}_8\text{N}_2\text{Cl}$ being decomposed by alcoholic NH_3 (Meldola, C. J. 41, 187). Amorphous, v. sol. ether, sol. hot alcohol and acetone. The chloride $\text{C}_{10}\text{H}_8\text{N}_2\text{Cl}$, called 'diphenylamine green,' forms bronzed granules, and, in alcoholic solution, dyes wool bluish-green, and gives a dark-green pp. with H_2PtCl_6 . Hot H_2SO_4 converts the chloride into the sulphonic acid $\text{C}_{10}\text{H}_8\text{N}_2\text{SO}_3$, p.p.d. by water in dark-green flakes.

Tri-phenyl-tri-amido-tri-phenyl-carbinol The chloride $\text{C}_{10}\text{H}_8(\text{NHPH})_3$, or 'diphenylamine blue,' is obtained by heating diphenylamine (1 pt.) with oxalic acid ($\frac{1}{2}$ pts.) (Willm a. Girard, D. P. J. 221, 199; Hausdörfer, B. 33, 1963). Formed also by heating paracosaniline with aniline. Brownish-red powder, v. sol. hot aniline and nitro-benzene, cl. sol. cold alcohol.

Hexa-phenyl-tri-amido-tri-phenyl-carbinol $\text{C}_6\text{H}_5(\text{CH}(\text{C}_6\text{H}_5\text{NHPH}))_3$. Formed by the action of alcoholic NH_3 on the chloride $\text{C}_{10}\text{H}_8(\text{NHPH})_3\text{Cl}$, which is got by heating triphenylamine with COCl_2 at 190° (Heydrich, B. 19, 733). White amorphous pp., forming a bluish-violet solution in H_2SO_4 , turned blue by addition of alcohol.

PHENYL-AMIDO-PHENYL-ISOTOXIC ACID

$\text{C}_6\text{H}_5\text{CH}(\text{CH}_2\text{OH})\text{CH}(\text{NHPH})\text{CO}_2\text{H}$ [164°]. Formed by saponification of the nitrile (Peine, B. 17, 2116). Minute needles, v. sol. alcohol and ether.

Amide [171°]. Thin plates.

Nitrile $\text{C}_6\text{H}_5\text{CH}(\text{NHPH})\text{CN}$ [130°]. Formed by heating $\text{CHPh}^+\text{CH}(\text{OH})\text{CN}$ with aniline in alcoholic solution. Crystalline solid, sol. hot alcohol.

PHENYL-AMIDO-PHENYL-ETHYL-ANTHRACENE

$\text{C}_6\text{H}_5(\text{NHPH})\text{CO}_2\text{C}_2\text{H}_5$. **Homophenacylanilide**

[187]. Formed from phenyl bromo-ethyl ketone and aniline in alcoholic solution (Pampel a. Schmidt, B. 19, 2898). Yellow crystals. Yields an acetyl derivative [108].

PHENYL-AMIDOPHENYL-HYDRAZINE. Acetyl derivative $C_6H_5.NH.C_6H_4.NHAc$. [146]. Got by reduction of $C_6H_5.NH.C_6H_4.NHAc$ with alcoholic ammonium sulphide (Schultz, B. 17, 463). Glistening plates, v. sol. alcohol and ether. $SnCl_4$ reduces it to aniline and p-phenylene-diamine. Conc. HCl forms a blue compound.

PHENYLAMIDO-DI-PHENYL-METHANE. $CH_3Ph.C_6H_4.NHPh$. [c. 89°]. Formed by heating diphenylamine with benzyl chloride and $ZnCl_2$ at 100° (Meldola, C. J. 41, 198). White powder, v. sol. benzene, insol. alcohol.

Di-phenyl-di-amido-tri-phenyl-methane $C_6H_5.NH.N.C_6H_4.C_6H_4.NHPh$. [c. 170°]. Formed by heating diphenylamine with benzylidene chloride, and also from diphenylamine, benzoyl aldehyde, and $ZnCl_2$ (Meldola, C. J. 41, 192). White granules, v. sol. ether, yielding diphenylamine green on oxidation.

Reference. — CHLORO-DIPHENYLDIAMIDOTRI-PHENYLMETHANE.

PHENYLAMIDO-PHENYL-METHYL-PYRIMIDINE. $IMIDINE$ $C_6H_5.N.CMe_2.C_6H_4.NHPh$. [150°-153°].

Formed from chloro-phenyl-methyl-pyrimidine and aniline (Fischer, B. 18, 2852). $HNHO$, [87°]. HCl . [240°]. Long slender needles.

PHENYLAMIDO-PHENYL-PROPIONIC ACID. Nitrite $CH_3.C_6H_4.NHPh.CN$. [152°]. Formed by digesting an ethereal solution of acetophenone cyanhydrin and aniline at 50° (Jacoby, B. 19, 1515). White prisms (from alcohol). With alcoholic hydroxylamine it yields the oxim of acetophenone. Alcoholic HCl gives a tri-phenyl-benzene.

Amide $CH_3.C_6H_4.NHPh.CO.NH_2$. [119°]. Formed from the nitrile by heating with H_2SO_4 at 100° and pouring into water. Insol. water.

PHENYLAMIDO-TRI-PHENYL-PYRROLE. $CH_3.C_6H_4.NHPh.C_6H_4.NHPh$. [232°]. Formed from anhydrazetophenone-benzil (1 mol.) and phenylhydrazine (2 mols.) in alcoholic solution at 100° (App, B. 21, 551; 23, 2885). Yellow needles.

PHENYLAMIDO-TRI-PHENYL-QUINOXALINE DEHYDRIDE.

$[C_6H_5.NHPh.C_6H_4.NHPh.C_6H_4.NHPh]$. [223°]. Formed by heating di-phenyl-(1,3,4)-tri-amido-benzene with benzoin at 160° (Fischer, B. 24, 729). Yellow plates, sl. sol. alcohol, forming a yellow solution with green fluorescence.

PHENYLAMIDO-PHENYL-ROSINDULINE. $[C_6H_5.NHPh.C_6H_4.NHPh.C_6H_4.NHPh]$. [192°].

Formed by heating benzene-azo-(a)-naphthyl-amine with aniline and benzene (Fischer a. Hepp, A. 262, 237). Formed also by oxidation of (1,2,3,4)-tetra-phenyl-tetra-amido-naphthalene (Fischer a. Hepp, A. 262, 252). Bronzed plates, forming a dark-green solution in conc. H_2SO_4 , becoming reddish-violet on dilution. — HCl + bronzed plates.

TRI-PHENYL-TRI-AMIDO-DI-PHENYL-TOLYL-CARBYNOL. $CO.NH.C_6H_4.NHPh.C_6H_4.NHPh$. Aniline blue.

Lyons Blue. Tri-phenyl-rosaniline. Formed, together with mono- and di-phenyl-rosaniline by heating rosaniline acetate or benzoate with aniline (Girard a. De Launay, D. P. J. 162, 297; Hofmann, Pr. 12, 578; 13, 9). Prepared by heating rosaniline (1 pt.) with aniline (10 pts.) and a little Lenoic acid, dissolving in alcoholic NH_3 , and pouring into water. White pp., insol. water, v. sol. alcohol, m. sol. ether. Yields di-phenyl-amine on distillation. Reduced by zinc and HCl to tri-phenyl-tri-amido-di-phenyl-tolyl-methane or tri-phenyl-leucaniline (Hofmann, C. B. 57, 26). — $C_6H_5.NHCl$. Spirit soluble blue. Small brassy crystals, insol. water and ether, sl. sol. alcohol. Becomes brown at 100°. Left with coppery lustre on evaporation of the alcoholic solution. Blue dye. — $(C_6H_5.NH)_3SO$; v. sl. sol. alcohol. The salts of mono-phenyl-rosaniline dye violet; those of di-phenyl-rosaniline a bluish-violet. Tri-phenyl-rosaniline yields mono-, di-, tri-, and tetra-sulphonic acids, the Na salts of which are v. sol. water and dye wool blue (Nicholson; Bulk, B. 6, 417).

The mono- and di-sulphonic acids are known as *Nicholson's* or *Alkali blue*, the tri-sulphonic acid as *Soluble blue*.

Reference. — TRI-CHLORO-TRI-PHENYL-ROSANILINE.

TRI-PHENYLAMIDO-PHOSPHIDE OXIDE. $PO(NHPh)_3$. [208°]. Formed from $POCl_3$ and aniline (Michaelis a. Boden, A. 229, 334). Six-sided plates, insol. water, sl. sol. ether and alcohol, v. sol. $HOAc$. Yields $PO(NHPh)_3.HBr$, crystallizing in needles [253°]. The compound $HO.PO(NHPh)_3$, [197°] may be got by treating aniline with ether and P_2O_5 , followed by water.

TRI-PHENYL-TRI-AMIDO-PHOSPHINE SULPHIDE. $PS(NHPh)_3$. [158°]. Formed from aniline and P_2S_5 below 160° (Anop, B. 20, 3852). Monoclinic crystals.

PHENYLAMIDO-PROPIONIC ACID. $C_6H_5.NH.CO.C_6H_4.NHPh$. [162°]. Formed by saponification of the nitrile or of the ether (Tiemann a. Stephan, B. 15, 2086; Nastvogel, B. 22, 1792; 23, 2010). Plates (from hot water), sol. alcohol. May be sublimed. Yields a hydrochloride decomposed by water, and a white silver salt.

Ethyl ether EtA' . [272°]. S.G. 1.060. Formed by heating a-bromo-propionic ether with aniline on the water-bath. Oil.

Formyl derivative. $CH_3.C_6H_4.NHPh.CHO$. Prepared from $NaNPh(CHO)$ and a-bromo-propionic ether (Paal a. Otten, B. 23, 2597). Large prisms, sol. alcohol and ether. — BA , aq. white powder. Acetyl derivative $CH_3.C_6H_4.NHPh.CO.H$. [148°]. Plates (from hot benzene), sl. sol. cold water. — $Me.C_6H_4.NHPh$, 8 ag. plates. — EtA' . [294°-298°]. Oil, formed from sodium acetanilide and a-bromo-propionic ether.

Amide $CH_3.C_6H_4.NHPh.CO.NH_2$. [141°]. Plates, sol. alcohol and hot water.

Amide $CH_3.C_6H_4.NHPh.CO.NHPh$. [426°]. Needles, v. sol. hot water.

Nitrile $CH_3.C_6H_4.NHPh.CN$. [92°]. Formed by heating the cyanhydrin of aceto aldehyde with aniline (T. a. S.). White plates, sol. alcohol and ether. Weak base. — HCl . [262°].

Isomerides v. **AMIDO-PHENYL-PROPIONIC ACID.**

Di-phenyl-di-amido-propionic acid. Nitride.
 $\text{CH}(\text{NHPH})_2\text{CH}_2\text{CN}$. [118°]. Formed by heating $\text{CH}_3\text{OCH}_2\text{CN}$ with aniline for 90 hours at 810° (Ohanard, A. Ch. [6] 16, 180). Needles, v. sol. water and benzene. — $\text{B}^*\text{HCl} - \text{B}^*\text{H}_2\text{PtCl}_2$: small yellow needles, v. sol. water.

Reference. — **TRI-BROMO-PHENYL-AMIDO-PROPYLIMIDE.**

PHENYL-8-AMIDO-PROPYL-PHTHALIMIDE
 $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{O}_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{NHPH}$. [93°]. Formed from 8-bromo-propyl-phthalimide and aniline (Seitz, B. 24, 2631). Yellow needles. Decomposed by HCl at 190° into phthalic acid and propylene-diamine.

Phenyl-8-amido-propyl-phthalimide
 $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{O}_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{NHPH}$. [93°]. Formed by heating 7-bromo-propyl-phthalimide (54 g.) with aniline (37 g.) at 150° (Goldenring, B. 23, 1168). Yellow crystals (from boiling ligroin). Split up by heating with HCl , yielding phenyl-trimethylene-diamine.

PHENYLAMIDO-PROPYL-UREA
 $\text{NHPH.C}_6\text{H}_5\text{NH.CO.NH}_2$. [98°]. Formed by warming $\text{C}_6\text{H}_5(\text{NH}_2\text{Cl})\text{NHPH}$ with potassium cyanate at 100° (Goldenring, B. 23, 1173). Rose-coloured needles, v. sol. alcohol. Decomposes at 120° in NH_3 and phenyl-trimethylene-diamine.

PHENYLAMIDO-PYROTARTARIC ACID
 $\text{CO}_2\text{H.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO}_2\text{H}$. *Anilido-methylsuccinic acid*. [102°]. Obtained by saponification of its ester. (Schiller-Wechler, B. 18, 1037). White needles (containing aq.), v. sol. hot water and alcohol, nearly insol. ether. Its solution in KOH aq. is colourless. $\text{NH}_4\text{aq.}$ forms a violet solution. — $\text{Cu}^+\text{aq.}$ — Cu^+NH_4 : green ppt. — $\text{H}_2\text{SO}_4\text{HCl aq.}$: white crystalline solid.

Acetyl ether of the mono-amide
 $\text{CO}_2\text{Et.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO}_2\text{NH}$. [125°]. Formed by digesting $\text{CO}_2\text{Et.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO}_2\text{OH}$ with aniline in ether, dissolving the resulting compound $\text{CO}_2\text{Et.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO}_2\text{NH}$ in H_2SO_4 , and pouring into water. Plates, sol. hot water. Converted into the imide by heating with water, alcohol, acids, or alkalis.

Imide $\text{CH}_3\text{CO.NHPH.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO.NH}$. [150°]. Formed as above. White prisms, sol. alcohol and hot water. Yields a nitrosamine $\text{C}_6\text{H}_5(\text{NO})\text{N}_2\text{O}$. [178°], an acetyl derivative [285°], and a benzoyl derivative [190°].

Methylimide $\text{CH}_3\text{CO.NHPH.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO.NMe}$. [108°]. Formed from the imide, MeI , MeOH , and KOH . Prisms. Yields a nitrosamine $\text{C}_6\text{H}_5(\text{N}_2\text{O})$, crystallizing in needles [147°]. Formed also $\text{C}_6\text{H}_5\text{MeI}$, O_2Me , PtCl_2 , which in sol. Ag .

Phenylimide $\text{CH}_3\text{CO.NHPH.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO.NPh}$. So-called *n-Phenyl-1-acyl-2-oxo-4-oxo-dimethyl-6-anilido- α -tetra-hydroxyridine- γ -carboxylic lactone*. [181°]. A product of the action of heat on phenylamido-pyrotartaric acid (Reissert, B. 31, 1886; Anschütz, A. 261, 140). Prisms (from alcohol). Its acetyl derivative [169°] forms tabular crystals.

Mono-anilide
 $\text{C}_6\text{H}_5(\text{NHPH})(\text{CO}_2\text{H})(\text{CO}_2\text{NHPH})$. [150°]. Got by boiling the diacylimide with NaOH aq. Forms with nitrous acid a compound melting at 204°.

Acetyl derivative of the anhydride
 $\text{CH}_3\text{CO.O}$. [186°]. Got by boiling $\text{NHPH.C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO.O}$ with AcCl (Anschütz, Tables, v. sol. chloroform, sl. sol. ether.)

Acetyl derivative of the anilide
 $\text{C}_6\text{H}_5(\text{NHPH})(\text{CO}_2\text{H})(\text{CONHPH})$. [141°]. Formed from the preceding body by the action of aniline on its ethereal solution: Prisms.

PHENYL-(Py. 8)-AMIDO-QUINOLINE
 $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{N}(\text{O.NHPH})$. *Phenyl-quinolinamine*. [98°]. (above 800°). Formed by heating (Py. 2) chloro-quinoline with aniline (Friedländer a. Weikberg, B. 18, 1558). White plates.

Reference. — **BROMO-PHENYL-AMIDO-QUINOLINE.**

PHENYL-AMIDO-QUINOLINQUINONE-ANILIDE $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{CO.NHPH}$. [222°].

Formed by adding excess of aniline to an alcoholic solution of CH_3COCl and $\text{C}_6\text{H}_5\text{N}$ (Zebebrand, B. 21, 2986). Long needles (from alcohol and EtOAc), forms a deep-blue solution in dilute HCl aq. — B^*HCl : dark-golden needles. — Acetate . [199°]. Broiled needles, decomposed by water. — $\text{B}^*\text{C}_6\text{H}_5\text{N}_2\text{O}$: Coppery needles.

PHENYLAMIDO-QUINONE. Dianilide
 $\text{C}_6\text{H}_5(\text{NHPH})_2(\text{NHPH})$. [142°]. [240°]. Formed from azophenone and HCl at 160° (Fischer a. Hepp, A. 256, 261). Reddish-brown needles, forming a blue solution in conc. H_2SO_4 .

Di-phenyl-di-amido-quinone
 $\text{C}_6\text{H}_5(\text{NHPH})_2(\text{NHPH})$. [142:2:5]. *Quinone dianilide*. Formed, together with hydroquinone, by boiling quinone with an alcoholic solution of aniline (Hofmann, Pr. 13, 4; Wiechelt, B. 5, 851; Zincke, B. 16, 1556; Knapp a. Schultz, A. 216, 178). Formed also by heating chloro-quinone with aniline and HOAc (Niemeier, A. 238, 832) and by strongly heating aniline with di-oxy-quinone (Nietzki a. Schmidt, B. 22, 1655). Small violet plates, sol. HOAc and aniline, nearly insol. alcohol. May be sublimed. Conc. H_2SO_4 forms a reddish-violet solution.

Anilide $\text{C}_6\text{H}_5(\text{NHPH})_2(\text{NPh})$. [208°]. A product of the action of aniline on quinone in HOAc (Zincke a. Hagen, F. 18, 786), on *o*-nitrophenol (Fischer a. Hepp, A. 262, 247), and on quinone phenylimide (Bandrowski, M. 9, 415). Reddish-brown needles, forming a blood-red solution in H_2SO_4 . On warming with alcoholic

H_2SO_4 , it yields $\text{C}_6\text{H}_5(\text{NHPH})(\text{OEt})(\text{NPh})$. Alcoholic potash forms $\text{C}_6\text{H}_5\text{N}_2\text{O}$, crystallising in red needles [192°], v. sol. alcohol, and forming a green solution in H_2SO_4 .

Di-anilide $\text{C}_6\text{H}_5(\text{NHPH})_2(\text{NPh})$, is **ANOPHENINE**.

DI-PHENYL-DI- β -AMIDO-QUINONE-DI-CARBOXYLIC ETHER
 $\text{C}_6\text{H}_5(\text{NHPH})_2(\text{CO}_2\text{Et})_2$. [142:2:3:6]. *Di-anilido-quinone di-carboxylic ether*. [246°]. Formed by the action of aniline in alcoholic solution upon *p*-di-chloro-quinone-di-carboxylic ether $\text{C}_6\text{H}_2\text{Cl}_2(\text{CO}_2\text{Et})_2$ (Bantzsch a. Zeckendorf, B. 20, 1812). Glistening garnet-red crystals.

PHENYLAMIDO-SUCCINIC ACID
 $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{CH}(\text{NHPH})\text{CO}_2\text{H}$. *Phenylsuccinic acid*. [182°]. Formed by boiling benzene-succinic

with aniline, and by the decomposition of an aqueous solution of acid maleate of aniline (Anschütz a. Wirts., *Ann.* 9, 248; *A.* 259, 140). Small crystals, HCl : monoclinic prisms.

Phenylimide $\text{C}_6\text{H}_5(\text{NHPh})\cdot\text{C}_6\text{H}_5\text{NPh}$ [211°]. Formed by heating maleic anhydride with aniline. Formed also, together with the dianilide $\text{C}_6\text{H}_4(\text{NHPh})(\text{CONHPh})$, [206°] by heating asparagine with aniline (Pittu, *G.* 14, 474). Small needles (from alcohol). Yields a nitrosamine [180°]. Alcoholic NH_3 forms the amide-anilide [200°]. The dianilide yields a nitrosamine [190°].

Imide [168°]. Formed from bromo-succinimide and aniline (Kusseroff, *A.* 252, 158°).

Ethyl ether $\text{C}_6\text{H}_5(\text{NHPh})(\text{CONEt})$ [244°]. Oil, forming a crystalline sulphate.

Di-phenyl-di-amido-succinic acid $\text{CO}_2\text{H}\cdot\text{CH}(\text{NHPh})\cdot\text{CH}(\text{NHPh})\cdot\text{CO}_2\text{H}$ [*c.* 190°].

Formed by saponifying the ether, which is formed by heating di-bromo-succinic ether with aniline in alcohol (Lobatin, *C. R.* 105, 280; Gorodetzky a. Hell, *B.* 21, 1796). Plates (from HOAc), nearly insol. water, m. sol. alcohol.

Ethyl ether $\text{Et}_2\text{A}''$ [150°]. Needles. Forms with Br a hexa-bromo-derivative [104°].

PHENYL-AMIDO-SULPHO-BENZOIC ACID $\text{C}_6\text{H}_5(\text{NHPh})(\text{SO}_2\text{H})\cdot\text{CO}_2\text{H}$ [124°]. Formed from bromo-sulpho-benzoic acid and alcoholic aniline (Fischer, *B.* 24, 3802). Plates—Ba HPO_4 —($\text{NH}_4\text{P}_2\text{O}_7$): needles (from water).

PHENYL-AMIDO-THIAZOLE $\text{C}_6\text{H}_5\text{N}_3\text{S}$ [*s.* $\text{C}_6\text{H}_5(\text{NHPh})$]. $\text{CH}=\text{CH}\cdot\text{N}$ [126°]. Formed by the action of phenyl-thio-urea on di-chloro-di-ethyl ether (Hantzsch a. Traumann, *B.* 21, 940; *A.* 249, 47). Small white needles, sl. sol. water, v. sol. alcohol.

PHENYLAMIDO-TOLUQUINONE $\text{C}_6\text{H}_5\text{NO}$, [*s.* $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\text{O}$]. [145°]. Formed in small quantity, together with di-phenyl-amido-toluquinone and its phenylimide, by the action of aniline in alcohol and HOAc on toluquinone (Hagen a. Zinke, *B.* 16, 1559). Red needles (from dilute alcohol).

Anilide $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\cdot\text{NPh}$ [151°].

Formed by reducing the anilide of di-phenyl-di-amido-toluquinone with SnCl_4 and HOAc (Fischer a. Hepp, *A.* 256, 259). Red needles.

Di-phenyl-di-amido-toluquinone $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\cdot\text{O}$ [238°]. Formed as above. Brown needles (from alcohol), forming a red solution in H_2SO_4 .

Anilide $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\cdot\text{NPh}$ [178°].

Toluquinone trianilide. Formed as above, and also by heating nitroso-*o*-cresol (tolu-quinone mono-oxim) (1 pt.) with aniline (4 pts.) and aniline hydrochloride (2 pts.) (O. Fischer a. Hepp, *B.* 21, 678). Brown plates with bluish lustre, sol. hot alcohol.— HCl . Brownish needles.— $\text{B}^*\text{H}_2\text{PO}_4$ — B^*HBr : dark-green needles.

PHENYLAMIDO-TOLYL-ACETIC ACID $\text{C}_6\text{H}_5\text{NO}_2$, [*s.* $(1/2)\text{C}_6\text{H}_5\text{Me}\cdot\text{CH}(\text{NHPh})\cdot\text{SO}_2\text{H}$]. [169°].

Formed by saponifying its nitrile, which is made by heating $\text{C}_6\text{H}_5\cdot\text{CH}(\text{OH})\cdot\text{CN}$ with aniline in ether at 100° (Bergmann, *B.* 17, 1471). Sl. v. plates (from dilute alcohol), v. sol. hot Aq .— $\text{A}''\text{H}_2\text{SO}_4$ $\text{C}_6\text{H}_5\text{N}(\text{OO}\cdot\text{NH})$. [138°]. Plates. Nitrile $\text{C}_6\text{H}_5\text{N}\cdot\text{CN}$. [95°]. Plates.

PHENYL AMIDO-TOLYL KETONE

Phthalyl derivatives

$\text{C}_6\text{H}_5\cdot\text{CO}\cdot\text{C}_6\text{H}_4\text{MeN}(\text{C}_6\text{H}_5)_2$ [308°]. Formed, together with an isomeride [180°], by heating the phthalyl derivative of *p*-toluidine with benzoyl chloride and ZnCl_2 (Fröhlich, *B.* 17, 2679). Dimetric crystals, v. sol. hot HOAc .

DI-PHENYL-AMIDO-*p*-TOLYL-UREA [$1/3:2/3$] $\text{C}_6\text{H}_5\text{Me}(\text{NH})\cdot\text{NH}\cdot\text{CO}\cdot\text{NPh}$ [187°].

Formed by reducing the nitro-compound in alcoholic solution with SnCl_4 and HCl (Lallmann a. Bonhöfer, *B.* 20, 2123). Needles, solidifying at 106°–170°, and melting a second time at 230°–240°, yielding diphenylene and tolylene-urea at 800°.

PHENYLAMIDO-ISOBUTYRIC ACID

$\text{CHMe}_2\cdot\text{CH}(\text{NHPh})\cdot\text{CO}_2\text{H}$ *B.* 7 at 140°. Formed from bromo-isobutyric acid and aniline (Duvillier, *A. Ch.* [5] 21, 446; *C. R.* 88, 425). Scales (from hot water), v. sol. alcohol and ether.— B^*HCl : needles, decomposing at 100°–110°.

DI-PHENYL-*o*-DI-AMIDO-*o*-XYLENE

$\text{C}_6\text{H}_4(\text{OH})_2(\text{NHPh})_2$ [172°]. Formed by boiling *o*-xylene bromide with an alcoholic solution of aniline (Leser, *B.* 17, 1825). Small colourless plates. Weak base.

PHENYLAMINE v. ANILINE.

Diphenylamine $\text{C}_6\text{H}_5\text{N}(\text{C}_6\text{H}_5)_2$. Mol. w. 169. [54°] (302°) (Graebe, *A.* 288, 323). *S.V.* 203.4 (Lossen, *A.* 254, 72); 203.8 (Ramsey).

Formation.—1. By the dry distillation of tri-phenyl-rosaniline (Hofmann, *A.* 186, 2637).—2. By heating aniline (3 m.) with aniline hydrochloride (2 mols.) for thirty hours at 210° (De Laire, Girard, a. Chapoteaut, *Bl.* 40, 7, 860; *C. R.* 74, 811, 1254; Merz a. Weith, *B.* 5, 268; *G.* 1511).—3. By distilling *o*-di-phenyl-urea or tri-phenyl-urea (Müller, *B.* 9, 715).—4. By heating phenol with arsenic-zinc-chloride to 250° (Merz a. Weith, *B.* 18, 1298).—5. By heating a mixture of aniline, phenol, and SbCl_5 at 150°–160° (Buch, *B.* 17, 2639).

Preparation.—By heating aniline with aniline hydrochloride at 230° and treating the warm product with HClAq followed by water.

Properties.—Monoclinic plates. Forms a colourless solution in H_2SO_4 , changing on warming to blue, when a trace of nitrous or nitric acid is present (test for nitrous acid in H_2SO_4 : Kopp, *B.* 5, 284; Pittu, *A.* 227, 181). A solution in conc. H_2SO_4 (5 c.c.) is coloured blue by shaking with a solution (1 c.c.) containing nitric acid (test for nitric acid: Müller, *Bl.* [8] 2, 670). With PbO , and alcoholic HOAc it gives a bright olive-green colour (Lauth, *C. R.* 111, 976). Picryl chloride forms dark-red needles of $\text{NPh}\cdot\text{C}_6\text{H}_4(\text{NO}_2)_3\text{Cl}$ [68°] (Merz, *B.* 23, 2540).

Reactions.—1. When passed through a red-hot tube it yields carbazole, aniline, benzene, and NH_3 (Graebe, *A.* 174, 177).—2. COCl_2 forms $\text{NPh}\cdot\text{COCl}$ (Müller, *B.* 9, 1684).—3. COCl_2 forms $\text{NPh}\cdot\text{CO}\cdot\text{Et}$ [72°].—4. *Oxaluria* in presence of I yields $\text{NH}(\text{C}_6\text{H}_5)_2$, and finally $\text{C}_6\text{H}_5\text{Cl}$ (Buon, *B.* 9, 1483).—5. *Bromine* and I yield tetra-, hexa-, octa-, and deca-bromo-diphenylamines (Gessner, *B.* 9, 1505).—6. Alkaline KMnO_4 yields oxalic acid, a resin, and a substance $\text{C}_6\text{H}_5\text{N}_3$, crystallising in yellow needles [16°–180°], which yields quinone on oxidation by MnO_2 , and conc. HNO_3 , may be reduced to *o*-phenylene-di-phenyl-diamine [185°], and yields a hexa-*o*-bromo-

derivative [248°] (Bandrowski, *M.* 7, 3754, 8, 475; 9, 418).—7. Yields acridine on warming with AlCl_3 and chloroform. HNO_3 and ZnCl_2 give methacridine, and other acids act in like manner.

8. PCl_5 and ZnCl_2 at 250° yield $\text{C}_{12}\text{H}_9\text{NPO}$, a white powder (Michaelis, *B.* 21, 1504; *A.* 230, 89).—9. *Acridine* in alcoholic solution forms $(\text{C}_{12}\text{H}_9\text{N})_2\text{C}_2\text{H}_4$, an amorphous powder, sol. chloroform, capable of combining with Br (Leeds, *B.* 15, 1158; *A. C. J.* 82).—10. Heated with oxalic acid it gives diphenylamine blue.—11. Heated with sulphur it gives imide-di-phenyl sulphide.—12. HNO_3 forms a hexa-nitro-derivative which decomposes carbonates.

13. $\text{B}^+\text{H}^-\text{Cl}$: needles (from alcohol), decomposed by water.— H_2SO_4 . [125°]. Insol. ether and benzene, decomposed by water.—Benzene sulphonate. [117°].—Toluene *p*-sulphonate. [64°] (Norton, *Am.* 10, 129, 140).

Formyl derivative $\text{C}_{12}\text{H}_9\text{NO}$ is. NPh_2CHO . [74°]. Formed by heating diphenylamine with oxalic or formic acid (Willm. Girard, *B.* 6, 1195). Insol. water, sol. benzene and alcohol. Yields acridine on heating with ZnCl_2 .

Acetyl derivative NPh_2Ac . [103°]. Plates (from ligroin), sol. hot water. Yields NPh_2Bz on heating with BzCl (Pictet, *B.* 28, 8013). PCl_5 followed by water forms an acid $\text{C}_{12}\text{H}_9\text{ClNPO}_2$, and an oil converted by alcoholic NH_3 into $\text{C}_{12}\text{H}_9\text{NO}$ [186°] (Claus, *B.* 14, 2367).

Thioacetamide derivative $\text{NPh}_2\text{CSCH}_3$. [111°]. Formed by heating *o*-di-phenyl-acetamide with CS_2 at 100° (B.). Tables, sl. sol. water, v. e. sol. ether.

Benzoyl derivative NPh_2Bz . [137°]. Formed from diphenylamine and BzCl (Hofmann, *A.* 182, 166; Böttgen, *A.* 192, 13; 224, 13; Wallach, *A.* 214, 235), and also by the action of Ph_2NCOCl on benzene in presence of AlCl_3 (Lellmann a. Bonhöffer, *B.* 19, 3231). Trimetric needles; $a:b:c = .950:1:824$. Sl. sol. ether and water, m. sol. hot alcohol.

p-Toluyll derivative. [155°].

Di-methyl-benzoyl derivative $[\text{A}:\text{B}:\text{C}] \text{C}_6\text{H}_4\text{Me}_2\text{CONPh}_2$. [186°]. Formed from *o*-xylene, NPh_2COCl , and AlCl_3 (Lellmann, *B.* 20, 3119).

Nitrosamine NPh_2NO . [66-5°]. Yellow four-sided tables (from benzene-alcohol) (Witt, *B.* 8, 856; Fischer, *A.* 190, 174). Yields azophenine when heated with aniline and aniline hydrochloride at 120°. Its hydrochloride heated with *p*-bromo-aniline at 80° yields tetra-bromo-azophenine $\text{C}_{12}\text{H}_8\text{Br}_4\text{N}_2$ [248°] (Ikuta, *A.* 248, 285). On heating with aniline it yields $\text{PhN}_2\text{C}_6\text{H}_4\text{NHPh}$, PhN_2NPhPh , and diphenylamine. By heating with alcoholic HCl it is converted into nitroso-diphenylamine.

Tri-phenylamine $\text{C}_{18}\text{H}_{15}\text{N}$ is. NPh_3 . Mol. w. 245. [127°]. Formed by dissolving K or Na in aniline and diphenylamine and digesting the product with bromo-benzene (Merz a. Weith, *B.* 6, 1514; Heydrich, *B.* 18, 2156). Monoclinic crystals (from ether), $a:b:c = .991:1:412$; $\beta = 88^\circ 26'$. Sl. sol. hot alcohol, m. sol. benzene. Does not form salts. AcCl at 160° gives a greenish substance. Cold conc. H_2SO_4 gives a violet colour, changing to blue. HNO_3 and ZnCl_2 give a green colouring matter on heating. A solution in

HOAc is coloured green by a little FeCl_3 . Chlorine and I yield $\text{N}(\text{Cl})\text{Cl}_2$, and finally CCl_4 (Ruch, *B.* 9, 1488).

Isomeride of triphenylamine $\text{C}_{18}\text{H}_{15}\text{N}$. Got by distilling the compound of cinnamic aldehyde with $(\text{C}_6\text{H}_5)_2\text{HSO}$ (Gosmann, *A.* 100, 57). Liquid, volatile in current of H at 140°-150°, sl. sol. water, v. sol. alcohol and ether. Forms unstable salts, decomposed by water and alcohol. It yields H_2SO_4 , whence moist Ag_2O yields oily B^+EtOH , while platinum chloride forms $\text{B}^+\text{EtPtCl}_2$.— $\text{B}^+\text{H}^-\text{PCl}_2$: monometric crystals.— $\text{B}^+\text{H}^-\text{PCl}_2$.

References.—AMIDO-DIBROMO-BROMO-DINITRO-, CHLORO-, CHLORO-NITRO-, NITRO-, and OXY-DIPHENYLAMINE.

DIPHENYLAMINE SULPHONIC ACID $\text{C}_{12}\text{H}_9\text{NSO}_3$. $\text{NHPh}_2\text{C}_6\text{H}_4\text{SO}_3\text{H}$. [300°]. Formed, together with the disulphonic acid, by heating diphenylamine with H_2SO_4 at 160° (Merz a. Weith, *B.* 5, 283; 6, 1512). Formed also by heating NPh_2HSO_3 at 120° for 2 hours (Vignon, *C. R.* 107, 263). Crystalline mass, becoming blue in air.— KA' : plates.— BAa' : plates, sl. sol. water.— PbA' : nodules, sl. sol. water.

Diphenylamine disulphonic acid $\text{NH}(\text{C}_6\text{H}_4\text{SO}_3\text{H})_2$. BaA' , 2aq nodules; v. e. sol. water. Hydrolysed by HClAq at 200° (Girard, *Bl.* [2] 23, 2).

Diphenylamine disulphonic acid $\text{C}_{12}\text{H}_9(\text{NHPh})(\text{SO}_3\text{H})_{1.2-4}$. Formed from bromo-benzene disulphonic acid and aniline in glycerin (Fischer, *B.* 24, 3807). V. e. sol. water.— BAa' : 8aq.

Anilide $\text{C}_{12}\text{H}_9(\text{NHPh})(\text{SO}_3\text{NHPh})$. [320°]. Yellowish crystals, insol. water.

Triphenylamine trisulphonic acid $\text{N}(\text{C}_6\text{H}_4\text{SO}_3\text{H})_3$. Formed by adding powdered triphenylamine to fuming H_2SO_4 at 60° (Hofmann, *B.* 23, 2541).— $\text{Na}_3\text{A}'''$: crystalline powder (from 95 p.c. alcohol), v. e. sol. water, insol. alcohol.

PHENYL-AMYL-AMINE v. *Cyanuric acid* in the article CYANIC ACID.

PHENYL-AMYL-AMINE v. *AMYL-ANILINE*.

Di-phenyl-isoamyl-amine $\text{NPh}_2\text{C}_6\text{H}_{11}$. [380°-340°]. Formed from diphenylamine, amyl alcohol, and HCl (Girard, *Bl.* [2] 28, 2). Gives a blue colouring matter when heated with oxalic acid and H_2SO_4 .

DIPHENYL-DI-ISOAMYL-TETRAZINE

$\text{NPh}(\text{C}_6\text{H}_{11})_2\text{N}_2\text{NPh}(\text{C}_6\text{H}_{11})_2$. [86-5°]. Formed from phenyl-isoamyl-hydrazine in ether and HgO (Michaelis a. Philips, *A.* 252, 286). Yellowish crystals.

PHENYL-AMYLENE CHPh:CHPh . (210°-215°). Formed by passing bromide-vapour into amyl-benzene at 150° and distilling the product (Schraem, *A.* 218, 892). Yields a dibromide [54°].

Phenyl-isoamylene CHPh:CHPr . (301° at 787 mm. S.G. 1.8-1.878. Made in like manner from isomyl-benzene (S.). Yields a dibromide [129°].

Phenyl-amylene CHPhEt:CH:CH . (175° S.G. 1.846. Formed by boiling $\text{CHPhEt.C}_6\text{H}_5\text{Br}$ with water or alcoholic potash (Dufort, *M.* 6, 621). Liquid, readily converted into the polymeride $\text{C}_{12}\text{H}_{15}$, (208°-212°), S.G. 1.860; V.D. 10-2 (calc. 10-1).

DI-PHENYL-AMYLENE DIBROMIDE

$(\text{C}_6\text{H}_5\text{CO.CH}_2\text{CH}_2\text{CH}_2)_2\text{Br}_2$. *Di-phenyl-amine*. [68°]. Formed by the action of boiling KOH in

PHENYL-THIAZOLE CARBOXYLIC ACID.

Phenyl angelic acid $\text{CH}_3\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$, which is got from sodium benzoyl-acetic ether and phenyl bromo-butyl ketone (Kipping & W. H. Perkin, jun., *C. J.* 53, 849). Long colorless needles, insol. water, m. sol. cold alcohol. *Di-Form.* (176°). Small needles.

PHENYL-ISOAMYL-HYDRAZINE

$\text{NPh}(\text{O}_2\text{H})_2\text{NH}_2$ (360°). Formed from iso-amyl bromide and sodium phenyl-hydrazine in benzene (Michaelis & Phillips, *A.* 258, 284). Reduces warm Fehling's solution. *Acid* yields $\text{NPh}(\text{C}_6\text{H}_5)_2\text{NHAc}$ (125°) or crystallising in scales.

DI-PHENYL-AMYLIDENE-DISULPHONE

$\text{C}_6\text{H}_5(\text{SO}_2\text{Ph})_2$ (181°). Formed from NaOH , $\text{CH}_3(\text{SO}_2\text{Ph})_2$ and EtI (Frcmm, *A.* 253, 193). Crystalline, v. al. sol. hot alcohol.

PHENYL AMYL KETONE

$\text{C}_6\text{H}_5\text{COCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$ (280°) at 710 mm. Formed by heating di-ethyl-benzoyl-acetic acid with dilute alcoholic potash (Baeyer & Perkin, jun., *B.* 16, 2131; *C. J.* 45, 185). Thick oil.

Phenyl amyl ketone $\text{C}_6\text{H}_5\text{COCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$ (140°) at 720 mm. Formed by heating isobutyl-benzoyl-acetic ether with dilute alcoholic potash (W. H. Perkin, jun., & Calman, *C. J.* 49, 166). Oil, with aromatic odour.

PHENYL AMYL KETONE CARBOXYLIC ACID

$\text{C}_6\text{H}_5\text{COCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ (82°). Formed by boiling the compound $\text{CH}_3\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ with KOH in MeOH (Perkin & Kipping, *C. J.* 55, 350). Plates (from light petroleum), or needles (from water). Yields an oxim (75°). *AgA'*: amorphous pp. *Isomerides*, Vol. I. p. 482.

PHENYL ISOAMYL OXIDE

$\text{C}_6\text{H}_5\text{OCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$ (225°). Got from phenol (Cahours, *A.* 78, 227).

DI-PHENYL-ISOAMYL-PHOSPHINE

$\text{Oxide P}(\text{C}_6\text{H}_5)_2(\text{O}_2\text{H})_2$ (97°). Formed from $\text{PPh}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$ and Ag_2O (Michaelis & Soden, *A.* 229, 317). Needles, sol. water and ether.

DI-PHENYL-ISOAMYL-THIO-SEMICARBAZIDE

$\text{C}_6\text{H}_5\text{NPh.NH.CS.NHPh}$ (160°). Formed from phenyl-isoamyl-hydrazine and phenyl thiocarbimide (Michaelis & Phillips, *A.* 252, 285). Yellow needles.

PHENYL-AMYL-THIO-UREA

$\text{O}_2\text{H}_2\text{N}_2\text{S}$ i.e. $\text{NHPh.CO.NH.CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ (136°). Formed from the corresponding amylamine and phenyl-thiocarbimide (Freund & Lenze, *B.* 23, 2869).

PHENYL-AMYL-UREA

$\text{C}_6\text{H}_5\text{N}_2\text{O}$ i.e. $\text{NHPh.CO.NH.CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ (155°). Formed from phenyl cyanate and the corresponding amylamine in alcoholic solution (Freund & Lenze, *B.* 23, 2867; 24, 2158). White needles.

PHENYL-ANGELIC ACID

$\text{CHPh.CHEt.CO}_2\text{H}$ Mol.w. 176. (704°). Formed by heating benzoic aldehyde with sodium butyrate and Ac_2O at 100° (Perkin, *C. J.* 31, 391; 32, 661; 35, 136; Blooom, *A.* 227, 53). Formed also by heating benzoic aldehyde with butyryl chloride at 125° (Fittig, *A.* 153, 864). Needles, v. sol. ligroin (unlike cinnamic acid). Melts at 61° after having been fused. *BaA'*: needles, m. sol. hot water. *CaA'*. *AgA'*: white pp.

Chloride

$\text{C}_6\text{H}_5\text{COCl}$. Oil.

Amide

$\text{C}_6\text{H}_5\text{CONH}_2$ (128°).

Phenyl angelic acid

$\text{CHPh.CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$. Formed from $\text{CHPh.CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ by reduction with sodium amalgam (Perkin; Baeyer & Jackson, *B.* 13, 123). Liquid. *AgA'*: white pp.

Phenyl angelic acid

$\text{CHPh.CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ (110-5°). Formed by boiling the dibasic acid $\text{CHPhBr.CH}(\text{CO}_2\text{H})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ with water (Fenfield, *A.* 216, 128) and by distilling

$\text{CHPh} \xrightarrow{\text{CH}(\text{CO}_2\text{H})} \text{CHMe}$ (Fittig & Liebmann, *A.* 255, 362). Plates (from water). *BaA'*: aq:

needles, v. sol. water.

Phenyl angelic acid

$\text{CHPh.CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$

(113°). Formed by distilling the lactic acid

$\text{CHPh} \xrightarrow{\text{CM}(\text{CO}_2\text{H})} \text{CH}_2$ (F. a. L.). Thin

tables, al. sol. water. *BaA'*: groups of needles,

water

Phenyl angelic acid Nitride

$\text{C}_6\text{H}_5\text{CHPh.CN}$ (c. 205°). Formed by heating

phenyl-acetonitrile with NaOH and amyl iodide

(Buddeberg, *B.* 23, 2068). Oil, converted by

NaOEt and benzyl chloride into the benzyl

derivative $\text{C}_6\text{H}_5\text{CPh}(\text{CH}_2\text{Ph})\text{CN}$ (c. 825°).

PHENYL-ANTHRACENE

$\text{C}_{14}\text{H}_{10}$ i.e. $\text{C}_6\text{H}_5\text{Ph}$

(158°). (477°). Formed by heating phenyl-

anthranol with zinc dust (Baeyer, *A.* 202, 61),

and by the action of chloroform and AlCl_3 on

benzene (Friedel, Crafts, & Vincent, *Bl.* 240, 97;

A. Ch. [6] 495). Le-tets (from alcohol), form-

ing solutions with blue fluorescence. Reduced

by P and HI to a crystalline dihydride (120°),

which is oxidised by CrO_3 in HOAc to phenyl-

oxanthranol.

PHENYL-ANTHRANOL

$\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{OH}$ (141°-144°). Formed by

dissolving tri-phenyl-methane ϕ -carboxylic acid

in H_2SO_4 and ppg. with water (Baeyer, *A.* 202, 57).

Golden needles, sol. hot alcohol. Its ethereal

solution shows greenish-yellow fluorescence.

Acetyl derivative. (160°). Golden

needles, turned red by NaOAc .

Reference.—DI-CHLORO-PHENYL-ANTHRANOL

PHENYL-ARSINE v. vol. I. p. 219. These

sulphides PhAsS (152°) and PhAsS_2 (180°)

have been prepared by Schulte (*B.* 15, 1956).

PHENYL-AZIMIDO-COMPOUNDS v. AZIMIDO-

COMPOUNDS.

DI-PHENYL-TETRAZINE

$\text{C}_6\text{H}_5\text{N}_4$ i.e.

$\text{NPh} \xrightarrow{\text{NCH}} \text{NPh}$ (180°). Mol. w. 240 by

Raoult's method (calc. 236). Formed by the

action of chloroform and alcoholic potash on

phenyl hydrazine (Ruhemann, *C. J.* 53, 850;

55, 243). White needles (from alcohol). HNO_3

yields $\text{C}_6\text{H}_5(\text{NO}_2)_2\text{N}$ (above 800°). H_2SO_4 forms

$\text{C}_6\text{H}_5(\text{SO}_3\text{H})\text{N}$. Bromine gives $\text{C}_6\text{H}_5\text{BrN}$

(220°), $\text{C}_6\text{H}_5\text{Br}_2\text{N}$ (131°) and $\text{C}_6\text{H}_5\text{Br}_3\text{N}$, de-

composing at 224°.

Salts.— B'HO : needles. B'HO.PtCl_4 .

B'MeCl (244°). Needles. B'Me.PtCl_4 .

B'MeI (214°). Yellow needles, v. sol. alcohol.

PHENYL-AZO-COMPOUNDS v. AZO-COM-

POUNDS.

PHENYL-TETRAZOLE

$\text{C}_6\text{H}_5\text{N}_4$ i.e.

$\text{N} \xrightarrow{\text{N.NPh}} \text{N}$

$\text{N} \xrightarrow{\text{N.H}} \text{N}$. Formed by heating its carboxylic

acid (138°) at 155° (Bladh, *B.* 18, 8907). Heavy

oil, v. sol. alcohol and ether. Explodes when

strongly heated. Sol. acids, but reppd. on dilu-

tion.

PHENYL-TRIAZOLE CARBOXYLIC ACID

$\text{CH} \xrightarrow{\text{N.NPh}} \text{N}$

$\text{CH} \xrightarrow{\text{N.CO}_2\text{H}} \text{N}$ (180°). Formed by boiling

PHENYL-TRIAZOLE CARBOXYLIC ACID

phenyl-hydrazine dicyanide $\text{NH}_2\text{NPhCO}_2\text{NH}_2$ with formic acid and heating the resulting formyl derivative with alcoholic potash (Bladin, B. 28, 3788). Silver plates (from water).

Methyl ether MeA'. [118°]. Prisms.

Phenyl-triazole dicarboxylic acid

$\text{CO}_2\text{H} \cdot \text{C}_6\text{H}_4 \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{CO}_2\text{H}$ Formed by oxidising phenyl-methyl-triazole carboxylic acid with alkaline KMnO_4 (Bladin, B. 23, 3785). The free acid is unstable, readily changing to the preceding acid. The acid K and Na salts also readily give off CO_2 .—CuA' 2aq: blue needles.—AgA' 2aq? Bulky white pp.

Methyl ether MeA'. [169°]. Needles.

Ethyl ether EtA'. [82°]. Needles.

Di-phenyl-triazole carboxylic acid

$\text{C}_6\text{H}_5 \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{CO}_2\text{H}$ Formed by saponification of the nitrile (Bladin, B. 22, 797). Crystals (containing EtOH), decomposing at 172°-182° V. sol. alcohol, m. sol. ether.—CuA' 2: white pp.

Methyl ether MeA'. [159°]. Needles.

Ethyl ether EtA'. [165°]. Needles.

Nitrile $\text{CN} \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{CN}$. [156-5°]. Formed from phenyl-hydrazine dicyanide, alcohol, and benzoin aldehyde. Needles, v. sol. benzene.

Amide $\text{CN} \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{CO}_2\text{NH}_2$. [196°]. Formed from the nitrile by the action of dilute (3 p.c.)

H_2O and KOH aq. Plates (from alcohol), needles (from water).

Amidoxim $\text{CN} \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{C}(\text{NOH})\text{NH}_2$. [114°]

Formed from the nitrile and hydroxylamine (Bladin, B. 22, 1753). Prisms (from alcohol).

Yields an acetyl derivative [177°] which yields

$\text{C}_6\text{H}_5 \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{C} \begin{smallmatrix} \text{O} \\ \text{O} \end{smallmatrix} \text{Me}$ [153°], and a benzoyl derivative [180°] which yields in like manner

$\text{C}_6\text{H}_5 \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{C} \begin{smallmatrix} \text{O} \\ \text{O} \end{smallmatrix} \text{C}_6\text{H}_5$ [206°].—EtA' 2: crystal line.

PHENYL-TETRAZOLE CARBOXYLIC ACID

$\text{N} \begin{smallmatrix} \text{N} \\ \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{CO}_2\text{H}$. [138°]. Got by saponification of its nitrile, which is formed by the action of nitrous acid on phenyl-hydrazine dicyanide (Bladin, B. 18, 12907). Colourless needles, v. sol. alcohol.—KA' 2: plates, v. sol. water.—CuA' 2aq.—AgA': colourless crystalline pp.

Methyl ether MeA'. [116°]. Plates.

Ethyl ether EtA'. [74°]. Needles.

Amide $\text{CN} \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{CO}_2\text{NH}_2$. [168°]. Formed from the nitrile by treatment with hydrogen peroxide. Crystals, sl. sol. cold water.

Amidoxim $\text{CN} \cdot \text{N} \begin{smallmatrix} \text{N} \\ \text{N} \\ \text{N} \end{smallmatrix} \text{Ph} \cdot \text{C}(\text{NOH})\text{NH}_2$. [177°].

Formed from the nitrile and hydroxylamine (Bladin, B. 22, 1755). Scales, v. sl. sol. water.

Yields an acetyl derivative [205°] and a benzoyl

derivative [206°]. both crystallising in needles

END OF THE THIRD VOLUME.
